PERTUSSIS.

PERTUSSIS, in *Medicine*, popularly termed the *kink-cough*, *kin-cough*, *chin-cough*, and *hooping* or *whooping-cough*, is a violent convulsive cough, occurring but once during life, and therefore chiefly affecting children, and propagated by a specific contagion.

Different opinions have been entertained respecting the origin of these names, which are of popular invention, for it would appear, that the disease was familiarly known to the vulgar (like many others), before any clear account was given of it by medical writers. The term *whooping*-cough, indeed, is obviously taken from the peculiar sound which is produced during the fit of coughing, in drawing in the breath, and which is commonly called a *whoop*. The term *chin-cough* Dr. Johnson was disposed to derive from the Dutch word *kinckin*, which signifies *to pant*; but this is probably a mistake. The word *kink* is still a provincial term, used in the north, as synonimous with *fit* or *paroxysm*; whence in Scotland they speak of a kink of laughing, a kink of crying, &c. as well as of a kink of coughing. (See Dr. Watt's Treatise on Chin-cough, p. 18.) The term *kink-cough*, therefore, very appropriately expresses a species of cough, which is principally distinguished by its violent *fits* or *paroxysms*. *Kin-cough* and *chin-cough* are apparently the same word; abbreviated, in the former instance, by dropping the final *k*; and softened by the southern dialect, in the latter, in the same manner as *kirk* is softened into *church*.

Among medical writers in Latin, the disease has been designated by a variety of names. Sydenham appears to have given it the appellation of *Pertussis*, which was adopted by Dr. Cullen, and has become the nosological term. By Willis, Hoffmann, and others, it has been called *Tussis convulsiva*, *ferina*, *clangosa*, *suffocativa*, *puerilis*, &c., all which epithets refer to some circumstance supposed to be peculiar to the disease. By the French, it is called *la coqueluche*.

This disease usually commences with the ordinary symptoms of a catarrh arising from cold, and commonly retains this character for the space of a fortnight or more. In some instances, indeed, although evidently originating from the contagion of chin-cough, it has never put on any other form than that of a common catarrh. This, however, is a rare occurrence: for, in general, about the end of the second, or beginning of the third week, the symptoms undergo a remarkable change, and the disease exhibits its peculiar and characteristic symptoms, a *convulsive* cough. This is a cough in which the expirations are made with extraordinary rapidity and violence, and so long and frequently repeated, that the whole air seems to be expelled from the lungs, and the patient appears to be in danger of suffocation. At length a full and violent inspiration is necessarily made for his relief, which, from the unusual velocity with which the air rushes in, produces the peculiar sound, or *whoop*, which resembles the crowing of a cock, or the rapid passage of air through a brazen tube. After this sonorous inspiration, the convulsive coughing and expirations are again renewed, and followed by another *whoop*: and thus the alternate actions go on, until a quantity of mucus is thrown up from the lungs, or the contents of the stomach are ejected by vomiting. Either of these evacuations commonly puts an end to the coughing, and the patient remains free from it for some time after. The duration of the paroxysm and the relief obtained are very different in different instances. Frequently expectoration or vomiting takes place after the second coughing, and terminates the fit; but sometimes this happens only after several alternate coughings and whoopings: and in very severe cases, the paroxysm ends in the complete exhaustion of the patient, without any discharge whatever.

The fits of coughing return at various intervals, rarely observing any exact period. They happen several times in the

Strahan and Preston

the courſe of the day, and more frequently in the courſe of the night. In general they come on without any obvious cauſe; but they are alſo brought on ſooner and more violently by various ſources of irritation, as by conſiderable bodily exertion, ſuch as running, or even laughing, turning from ſide to ſide in bed, diſtending the ſtomach by food, or irritating it by ſuch as is indigeſtible, ſwallowing food or drink, &c. Fretting and exciting the patient to anger, eſpecially if it produce crying, commonly brings on the fit. Though the paroxyſms come on ſuddenly, the patient has commonly ſome warning, which excites his alarm; and to avoid the violent and painful concuſſion which the coughing occaſions to the whole body, he ſometimes throws himſelf on the ground, or clings faſt to any thing that is near him, or demands to be held faſt by any perſon that he can come at, and will even run acroſs the room for that purpoſe, with terror and ſupplication expreſſed in his countenance. Even when the patient is lying in bed, it ſeems to give him a ſort of relief to have his back and head ſupported. When the fit is over, if it has been ſevere, he breathes faſt and ſeems to be fatigued for a ſhort time; but in ordinary caſes very little of this appears; and children are commonly ſo entirely relieved, that they immediately return to their play, as if nothing had happened. If the fit of coughing ends in vomiting up the contents of the ſtomach, the patient is commonly immediately after ſeized with an irreſiſtible craving for food, which he ſwallows greedily.

At the commencement of the diſeaſe, there is ſometimes very little expectoration, and that of a thin mucus only; and while this continues to be the caſe, the fits of coughing are more violent, and continue much longer: but commonly the expectoration ſoon becomes conſiderable, and a very thick mucus, often in great quantity, is thrown up; and as this is more readily expectorated, the fits of coughing are of ſhorter duration. If the fits are violent and long continued, they neceſſarily interrupt the free tranſmiſſion of the blood through the lungs, and conſequently alſo the free return of blood from the veſſels of the head. This gives riſe to that turgeſcence and ſuffuſion of the face, which commonly attend the fit of coughing, and ſeems to occaſion alſo thoſe eruptions of blood from the noſe, and even from the eyes and ears, which ſometimes happen in this diſeaſe.

Sydenham ſpeaks of the whooping-cough as unconnected with fever; and Dr. Cullen does not ſeem to have conſidered fever as an eſſential part of the diſeaſe, ſince he has not placed it among the *Pyrexiæ*, in his noſology. Nevertheleſs, this able obſerver remarks, "though Sydenham had ſeldom obſerved it, we have found the diſeaſe very frequently accompanied with pyrexia, ſometimes from the very beginning, but more frequently only after the diſeaſe had continued for ſome time. When it does accompany the diſeaſe, we have not found it appearing under any regular intermittent form. It is conſtantly in ſome degree preſent; but with evident exacerbations towards evening, continuing till next morning." (Firſt Lines, parag. mccccx.) Dr. Watt obſerves, upon this point, "as far as my experience goes, I am diſpoſed to believe, that, even in the mildeſt caſes, as long as the kinks (paroxyſms) continue, there is always ſome part of the day when the preſence of fever can be detected. It may be ſo ſlight as hardly to deſerve notice; but ſtill, to an attentive obſerver, who has opportunities of ſeeing the patient day and night, it is abundantly obvious. I have remarked it even in thoſe favourable caſes, where the appetite continued good, and where the patients ſeemed to ſuffer little or nothing in their general health." Treatiſe on Chin-cough, p. 50.

In almoſt every caſe of the diſeaſe, the breathing is more or leſs affected. Frequently there is a difficulty of breathing, not only immediately before and after the fits of coughing, but conſtantly preſent. Even in the mildeſt caſes, the patient is ſooner out of breath than uſual; and in the more ſevere, he pants on the leaſt exertion, as if he had run a race, or performed ſome feat of bodily ſtrength.

The courſe and event of this diſeaſe are very uncertain. In the mildeſt form, in which it appears, it commonly continues from one to three months; and, in the more ſevere, conſiderably longer. Even after it has nearly or wholly ceaſed, an accidental expoſure to cold occaſions a return of the diſeaſe. When it proves fatal in very young children, Dr. Watt affirms, it is generally by inducing ſuffocation, convulſions, or by bringing on ſuch a ſtate of debility, that the patient ſeems to expire from pure exhauſtion. But, in children ſomewhat farther advanced in age, the ſymptoms of pneumonic inflammation, though ſometimes of a ſlow and obſcure character, more generally enſue. Dr. Cullen ſtates that he had hardly ever ſeen an inſtance of fatal chincough, in which a conſiderable degree of pyrexia and dyſpnæa had not been for ſome time conſtantly preſent. In fact, it would appear that the diſeaſe commonly proves fatal; in conſequence of inflammation ſupervening in the bronchial cells and tubes, conſtituting a ſort of peripneumonia notha, by which theſe air-paſſages are choaked up, a copious excretion of mucus taking place, beyond the powers of the conſtitution to expel. In ſeveral inſtances, in which the ſtate of the lungs was aſcertained by diſſection after death, the moſt remarkable phenomena that preſented themſelves, were, an inflamed condition of the trachea and bronchia, particularly of the latter, and an almoſt entire plugging up of the bronchial paſſages with a ſerous or mucous fluid, interſperſed with flakes of a ſemi-purulent matter. See Watt, on Chincough, p. 123.

From theſe conſiderations, the following circumſtances have been pointed out, as affording the means of prognoſticating the favourable or unfavourable event of the diſeaſe. The younger the ſubject, the more dangerous the diſorder; ſo that a large majority of thoſe who die from its attacks are obſerved to be under two years of age. The converſe of this is alſo true, the older children are, they are the more ſecure againſt an unhappy event, provided they be of ſound conſtitution. Children born of phthiſical and aſthmatic parents, are moſt liable to ſuffer from the violence of the diſeaſe.

When the diſeaſe begins in the form of a ſevere catarrh, and is attended with difficult breathing, and with little expectoration, it often proves fatal, without aſſuming the character of whooping-cough; that is to ſay, the inflammation is ſo rapid and extenſive as to terminate life, before the uſual courſe of whooping-cough is run; but, in the majority of caſes, the occurrence of the convulſive cough and whooping, bringing on at the ſame time a more free expectoration, generally removes the danger.

When the diſeaſe is fully formed, if the fits are neither frequent nor violent, the expectoration moderate, and the patient, during the intervals of the fits, is eaſy, retains his appetite, ſleeps well, and is without fever or difficulty of breathing, the diſeaſe muſt be conſidered as free from danger; and theſe circumſtances becoming daily more favourable, it very ſoon ſpontaneouſly terminates. But an expectoration, either very ſcanty or very copious, is attended with danger, eſpecially if the latter is accompanied with great difficulty of breathing. The danger of the diſeaſe in general, indeed, may be ſaid to be in proportion to the fever and difficulty of breathing attending it, which imply the

the degree of inflammatory action going on in the cheſt; ſometimes, though very rarely, the danger ariſes from the violence of the fits of coughing, which may be ſuch as to occaſion apoplexy, epilepſy, or immediate ſuffocation. When the diſeaſe attacks perſons under a ſtate of great debility, it has very often an unhappy event.

On the contrary, thoſe caſes in which the fits terminate by vomiting, and are immediately followed by a craving for food, are generally without danger. A moderate hæmorrhage from the noſe often proves ſalutary; but very large hæmorrhages are generally very hurtful. Cullen, Firſt Lines, § 1413.

Treatment of Pertuſſis.—The cure of whooping-cough has always been conſidered as difficult; for in its mildeſt form, it will run through its courſe without any interruption or abbreviation from medicine, no antidote to its ſpecific contagion being known; and in its more violent and dangerous ſhape, its ſymptoms are not eaſily mitigated by the active meaſures, which are generally remedial in violent affections of the cheſt ariſing from other cauſes. From this conſideration, however, it will follow, that in thoſe caſes in which the ſymptoms are mild, and the diſeaſe appears to proceed without any untoward tendency, very little medical interference is neceſſary. When the diſeaſe has continued a conſiderable length of time, it ſeems that in this, as in other contagious maladies, the contagion ceaſes to act, and that then the complaint is prolonged, after the manner of convulſive diſeaſes in general, by the power of habit alone. From this view of the matter, it will appear that when more violent ſymptoms demand the application of remedies, the practice muſt be directed to different purpoſes according to the period of the diſeaſe. In the early ſtages of the cough, the remedies to be employed muſt be ſuch as obviate the violent effects of the diſorder, and its fatal tendency; but after it has been of ſome continuance, and the ſevere and urgent ſymptoms are abſent, the only medicines to be adviſed, are thoſe which may interrupt its courſe, and break the habit of recurrence, and thus anticipate its ſpontaneous ceſſation.

The moſt urgent and dangerous ſymptoms are thoſe which indicate the occurrence of inflammation, whether it be ſeated in the mucous membrane lining the trachea and air-paſſages, or in the ſubſtance of the lungs, conſtituting a true peripneumony. In proportion, therefore, as the dyſpnæa and fever are ſevere, and as the patient is ſtrong and plethoric, it becomes neceſſary to employ *blood-letting*, and even to repeat it according to the urgency of the circumſtances. Even in more delicate and younger children, ſome evacuation may be neceſſary by means of the lancet, in the commencement of the diſeaſe; and local bleeding, by leeches applied to the cheſt, may be reſorted to, where general blood-letting is deemed inadmiſſible. The difficulty of the tranſmiſſion of blood through the lungs ſhould be watched, and early attacked by this efficient remedy, or the diſeaſe will often baffle all the ſubſequent efforts that can be made.

The next moſt important mode of diminiſhing irritation, and an inflammatory tendency, eſpecially in children, is the exhibition of *purgatives*. Every practitioner muſt have obſerved the almoſt conſtant derangement of the excretions of the bowels, under any acute diſeaſe in children, but more eſpecially under thoſe affecting the lungs, and the relief obtained, even in reſpect to the original diſorder, by regulating the alvine diſcharges. It is important, therefore, when the diſeaſe aſſumes an inflammatory type, to keep up a conſtant free ſtate of the bowels from the firſt, by the repeated uſe of laxatives, eſpecially of thoſe which contain a portion of calomel. According to the ſtate of actual conſtipation, or of mere derangement of the excretions, the purgatives will be uſed more actively at intervals, or more conſtantly in ſmaller doſes.

Of all other remedies, *emetics* appear to be among the moſt uſeful in this diſeaſe. For they not only tend to determine the fluids to the ſurface, and ſtill more effectually to relieve the lungs by promoting its ſecretions, but they tend to interrupt the recurrence of the ſpaſmodic affections, and alſo to relieve the ſtomach and bowels from their vitiated contents. Perhaps the kind of emetic adminiſtered is not of ſo much importance to be conſidered, as ſome writers have contended. The antimonial preparations, and thoſe of ipecacuanha, afford a ſufficient number for our choice, and the milder or more active will be choſen, according to the urgency of the caſe, and the vigour of the patient.

As a ſecondary expedient, with a view to obviate or remove inflammatory determination to the lungs, when it occurs in this diſeaſe, the application of *bliſters* is often beneficially reſorted to; and it may be adviſable to repeat the application ſeveral times, where the inflammatory tendency continues to prevail, after the more active meaſures have been carried to the extent which circumſtances admit of, or where the debility of the patient interdicts blood-letting altogether. The bliſters ſhould be applied to the cheſt, and not to diſtant parts. They do not, however, appear to act ſo beneficially in the relief of the pain and dyſpnæa attending this diſeaſe, as in ordinary caſes of catarrhal cough; and ought not to be relied on, where the inflammatory congeſtion in the lungs is conſiderable. They are moſt beneficial, when this inflammatory condition has been already partly ſubdued by the more active evacuations. *Iſſues* have been recommended by ſome practitioners; but their operation muſt be too ſlow to be depended upon in the acute ſtages of the diſeaſe; and they can only be indicated, therefore, where the diſeaſe has ultimately aſſumed a chronic form, or ſome phthiſical ſymptoms have ſupervened, with conſiderable local pain.

Theſe methods of treatment, together with the exhibition of light diaphoretic medicines, and the uſe of a cooling diet, are adapted to the early ſtages of whooping-cough, where the uſual urgent ſymptoms occur, and are calculated to obviate its fatal tendency, and to put it into a ſafe train. But in the after-ſtages, when the operation of the contagion may be ſuppoſed to have ceaſed, and the convulſive cough to be continued through the influence of habit, a different indication ariſes, and different remedies are to be employed. That the power of habit contributes to keep up the diſeaſe, after the influence of the contagion has declined, is to be inferred from theſe circumſtances, *viz.* that the ſymptoms have diſappeared, like other nervous ſymptoms, in conſequence of the impreſſion of terror, or other ſtrong emotions of the mind; that any conſiderable change in the ſtate of the ſyſtem, ſuch as the occurrence of ſmall-pox, has alſo cured it; and that it has yielded to antiſpaſmodic and tonic medicines: none of which agents can be ſuppoſed to have the power either of correcting or expelling a morbific matter from the conſtitution, but which are evidently ſuited to change the ſtate and habits of the nervous ſyſtem. It might perhaps, indeed, be alleged, that when the contagion is extinguiſhed, it implies that the violence and danger of the diſeaſe are over, and conſequently that the diſeaſe will ſoon ſpontaneouſly ceaſe. This ſuppoſition, however, is contradicted by experience; as the diſeaſe, like many other convulſive and ſpaſmodic affections, may continue for a long time by the power of habit alone, and the repetition of the paroxyſms may be productive of hurtful effects, and more eſpecially as their violence and injurious influence may be much aggravated by various external caufes, that may be accidentally applied.

The indication, therefore, of breaking the habit of recurrence is proper to be attended to; and it is principally to be fulfilled by thofe means which leffen irritability local or general, and give tone to the fyftem at large; in other words, by *antifpafmodics* and *tonics*.

The moft effectual means of allaying irritability are found in the *narcotic* antifpafmodics, fuch as *opium*, *henbane*, and *hemlock*, in their various preparations; and the moft powerful of thefe is opium. This medicine requires confiderable caution, however, in its adminiftration. "If very liberally employed," to ufe the words of Dr. Watt, "it fuppreffes the cough, allows the mucus to accumulate, obftructs the breathing, increafes the fever, and in fact aggravates every fymptom of the difeafe. This is ftill more particularly the cafe, if previous evacuations have been neglected. Where the bowels are already in a loaded and torpid ftate, opiates invariably do harm. Some practitioners have fuppofed, that they may be given in fuch fmall dofes as to compofe the nervous fyftem, and yet not interfere with the operation of other remedies. If this can be done, the practice is lefs objectionable." It is only in fmall dofes that opiates can be adminiftered, even in the later ftages of whooping-cough, on account of this aftringing and fuppreffing power over the difcharges. On this account, perhaps, the *conium* or *hyofcyamus* are preferable remedies. They are more gently anodyne, and have no aftringency, and therefore interfere little with the fecretion of mucus, and perhaps not at all with the alvine fecretions. The conium, or hemlock, has been extolled by Dr. Butter as almoft a fpecific in this difeafe; and from our own experience, we can fpeak favourably of its influence, when the inflammatory ftage of the diforder is paft. The hyofcyamus is likewife beneficial under the fame circumftances. The *digitalis*, or fox-glove, from its power in moderating vafcular action, and thus of reftraining exceffive fecretion, as well as of acting upon the urinary difcharge, might be expected to be ferviceable in this difeafe; and experience feems to have proved its utility.

The more ftimulant antifpafmodics, fuch as *affafœtida*, *caftor*, *mufk*, *oil of amber*, *camphor*, &c. have alfo been recommended by feveral practitioners for the relief of whooping-cough. The evidence, however, which the fubfequent obfervation of cautious phyficians has obtained, is by no means favourable to the efficacy of thefe medicines; and if there is any tendency to fever, or congeftion about the lungs, the influence which they do exert muft prove hazardous, if not always injurious.

But thefe ftimulants have been frequently applied *externally*, fince the time of Hoffmann, in liniments and embrocations; and they are popularly employed, in various empirical noftrums, in the fame manner. The oils of turpentine, amber, thyme, nutmeg, &c. with foap, camphor, the compound fpirit of ammonia, tincture of opium, of cantharides, &c. the juice of garlic, liniments of tartrite of antimony, and various other irritants, have been employed, feparately and combined, being rubbed into the cheft, and on the back in the courfe of the fpine, and even on the feet, by continued but moderate friction. This mode of ufing antifpafmodics is certainly productive of beneficial effects; and thefe may be produced in two ways, namely, by the actual abforption of the fubftance fo applied to the fkin, or by the mere ftimulation of the furface, which thus occafions a fort of counter-irritation. Opiate liniments unqueftionably operate in the former manner, and produce fimilar effects, though in a fmaller degree, with opiates taken by the mouth. They relieve the difficulty of breathing, and diminifh the cough, and difpofe the patient to reft, and therefore have been deemed by fome writers the fafeft form in which opium can be employed. It is probably, however, in the fecond mode only that the majority of embrocations and liniments operate; and accordingly it will generally be found, that they are productive of the greateft relief, when they excite fome degree of rednefs or eruption on the fkin.

The adminiftration of tonics, and efpecially of the *Peruvian bark*, has been much extolled by Dr. Cullen, as the moft effectual mode of curing the difeafe in its fecond ftage, when the fever had difappeared. This remedy may doubtlefs be reforted to with advantage, towards the conclufion of the difeafe, when all the inflammatory fymptoms have been previoufly fubdued by other means, or where they have been naturally very mild, and have fpontaneoufly fubfided. But in other circumftances, the bark is not only a doubtful, but a dangerous remedy.

It was perhaps originally with the view of interrupting the force of habit, that a confiderable change in the fituation and manner of life was fuggefted as a remedy for whooping-cough, and efpecially a *change of air*, which has been very generally deemed the moft effectual remedy in the advanced ftages of the difeafe. So ftrong, indeed, has this impreffion been made upon the public, that it has been generally believed, that any change of air, even from a better to a worfe, is beneficial. This, however, feems improbable; and the fact perhaps is as Dr. Watt has ftated it. "It no doubt frequently happens," fays that intelligent writer, "that a child is better on being taken from one place to another, even when the air in the latter place is fuppofed to be worfe than the former. Here, however, I fhould be difpofed to attribute the good effects, not to coming into a more impure atmofphere, but to the child's *being abroad*, any atmofphere being better than confinement to the houfe." (Loc. cit. p. 222.) In fummer, or when the temperature is mild and dry, the fymptoms of whooping-cough, even in the early ftage, appear to be alleviated by expofure to the open air, and to be aggravated when the patient returns into the houfe: but this alleviation only takes place, when it is unaccompanied by actual pneumonic inflammation, when the pulfe is neither ftrong, nor full, nor frequent, when the cough is not very violent, when there is no pain of the cheft, and, above all, when there is no oppreffion of the breathing. Under the prefence of thefe fymptoms, fuch expofure is extremely deleterious. Towards the conclufion of the difeafe, travelling, or other conftant exercife in the open air, as in other cafes of convalefcence from coughs, is doubtlefs one of the moft effectual remedies that can be reforted to.

PERU, in *Geography*, a viceroyalty of South America, the limits of which have been greatly reftricted during the courfe of the laft century; for in the year 1718 the provinces of Quito in the north, as far as the river Tumbez, were annexed to the viceroyalty of New Granada; and in 1778, feveral opulent provinces in the fouth of Peru were annexed to the new viceroyalty of La Plata. Modern Peru, therefore, according to the ftatement of Mr. Pinkerton, extends N. and S. from the river Tumbez to the chain of Vilcanota, being, by the computation of Eftalla, 289 geographical leagues; but along the coaft to the river Loa, the length may be 423 leagues; its medial breadth may be about 80 leagues; fo that its whole content may be eftimated at 33,630 fquare leagues. By the map of La Cruz, the fouthern extremity of the chain of Vilcanota is 15°, and the river Tumbez in 3° 30', both S. lat.; and the difference, being 11° 30', will give 690 geographical miles; but that long ftrip, called the province of Arica, extending to the river Loa 21° 15', the nominal length will be augmented by by about 6° 15', or 375 geographical miles. The viceroyalty of Peru borders, towards the N., on that of New Granada; on the N.E. with the Pampa del Sacramento; on the E. with the savage nations of the Pajonal, which is a vast steppe, covered with stony grass, whence its name; and on the S.E. with the viceroyalty of Buenos Ayres, which embraces the province and desert of Atacama, formerly the boundary between Peru and Chili. But if Peru extends eastwards so as to include Colonna, or the land of the Missions, which depend on the viceroy, it will thus reach to the Portuguese frontier.

Before we farther describe this viceroyalty geographically, we shall introduce a brief account of its history. The first intelligence which any European received concerning this country, was communicated to Vasco Nugnez de Balboa, governor of a small Spanish colony at Santa Maria, in Darien, in the year 1512; and he flattering himself with sanguine ideas of the wealth it would afford from the vague description that was given of it, prepared to make a voyage in search of it. But being superseded in the government of Darien by Pedrarias Davila, who was appointed by Ferdinand of Spain to succeed him, he was disappointed in the accomplishment of the schemes which he had projected; and it was reserved for Francisco Pizarro to obtain the patronage of Pedrarias, and to set sail, with some chosen associates, on this adventurous expedition. After encountering various difficulties, they at length, in the year 1526, discovered the coast of Peru, and landed at Tumbez, about 3° S. of the line; a place of some note, distinguished for its stately temple and a palace of the Incas or sovereigns of the country. Pizarro, however, was under the necessity of satisfying himself with a general view of the opulence and civilization of the country; as the force, which he commanded, was not equal to any attempt that would be likely to succeed for gaining possession of it. Having explored the country along the coast, maintaining a peaceable intercourse with the natives, he took with him some specimens of the productiveness of the territory and opulence of the inhabitants, and returned to Panama towards the close of the third year of his departure from it. The governor discouraged his scheme of conquest, but the three associates, Pizarro, Almagro, and Luque, determined to persevere; and Pizarro went to Spain, in order to procure the force that was necessary for their purpose. Here he disregarded his associates, and secured the sole command to himself, as well as the appointment of governor, captain-general, and adelantado of the whole country, which he had discovered and hoped to conquer. With a supply of men, money, and military stores, apparently very inadequate to the necessary demands of his proposed expedition, and accompanied by his three brothers Ferdinand, Juan, and Gonzalo, and his mother's brother Francisco de Alcantara, he returned to Panama. Pizarro, with an armament consisting of three small vessels, and 180 soldiers, set sail in February, 1531, for Peru, in order to invade that great empire, and after a voyage of thirteen days landed his troops in the bay of St. Matthew, 100 leagues N. of Tumbez, the place of his destination. The imprudence of Pizarro in attacking the natives, soon after landing on their coast, the apparent infertility, unhealthfulness and scanty population of the adjoining country, and the difficulties that occurred in their march, discouraged his companions; and struggling with famine, fatigue, and various kinds of diseases, they began to complain and to reproach their leader: but in the month of April they arrived in the province of Coaque, and having surprised a principal settlement of the natives, they seized vessels and ornaments of gold and silver, amounting, in value, to 30,000 pesos, besides other booty, which dispelled their doubts, and inspired the most desponding with sanguine hopes. Having taken measures for obtaining a reinforcement from Panama and Nicaragua, he continued his march along the coast, and met with hardly any resistance, until he attacked the island of Puna in the bay of Guayaquil. From Puna, which he had not been able to reduce to subjection in less than six months, he proceeded to Tumbez, where, on account of the distemper which raged among his troops, he was obliged to remain for three months. From Tumbez he advanced, in May 1532, to the river Piura, and in an advantageous situation near its mouth, he established the first Spanish colony in Peru, to which he gave the name of St. Michael.

At the time when the Spaniards invaded Peru, the dominions of its sovereigns extended in length, from N. to S., above 1500 miles along the Pacific ocean: and their breadth, from E. to W., was much less considerable, being uniformly bounded by the vast ridge of the Andes, stretching from one of its extremities to the other. Peru, like other parts of the new world, was originally possessed by small independent tribes, differing from each other both in manners and policy. It is generally said, that they were savage and uncivilized, and that they roamed about naked in the forests, with which the country was covered, more like wild beasts than like men. Whilst they were struggling with the hardships and calamities of this barbarous state, tradition reports, that there appeared on the banks of the lake Titiaca, a man and woman of majestic form, and clothed in decent garments, who declared themselves to be children of the sun, sent by their beneficent parent to instruct and to reclaim them. At their persuasion, it is said, several of the dispersed savages united together, and receiving their commands as heavenly instructions, followed them to Cuzco, where they settled and began to lay the foundation of a city.

From what country the ancient Peruvians originated has been matter of considerable dispute; but while the Mexicans bore many marks of innate African cruelty, the Peruvians display the mildness of an Asiatic tribe. The monarchs, however, and the ruling people, seem to have been very distinct from the general population.

The names of the extraordinary personages above mentioned were Manco Capac, and Mama Ocollo (or Oello.) Manco was the first Inca, and he is supposed to have reigned in the 12th or 13th century. Oello was his wife. Having collected some wandering tribes, Manco instructed the men in agriculture, and other useful arts; and Oello taught the women to spin and weave. After securing the objects of first necessity in an infant state, Manco turned his attention towards introducing such laws and policy as might perpetuate their happiness. In consequence of these laws and institutions which served to reclaim and civilize a savage race, he received from his people the title of "Capac," or rich in virtue. Manco Capac founded the temple of the sun at Cuzco, the capital of his empire, and appointed virgins of the royal blood to serve that divinity. Thus, according to the Indian tradition, was founded the empire of the Incas or lords of Peru. At first, its extent was small. The territory of Manco Capac did not reach above eight leagues from Cuzco, within which narrow precincts he exercised absolute and uncontrolled authority. The Incas, his successors, arrogated a similar authority over their subjects, and the despotism of Asia was not more complete. The Incas were not only obeyed as monarchs, but revered as divinities. Their blood was held to be sacred, and, by prohibiting intermarriages with the people, was never contaminated

taminated by mixing with that of any other race. The family was distinguished by dress and ornaments, which it was unlawful for others to assume. The monarch himself appeared with ensigns of royalty reserved for himself alone: and received from his subjects marks of obsequious homage and respect, which approached almost to adoration. But, among the Peruvians, this unbounded power of their monarchs seems to have been uniformly accompanied with attention to the good of their subjects. It was not the rage of conquest, as it has been said, that prompted the Incas to extend their dominions, but the desire of diffusing the blessings of civilization, and the knowledge of the arts which they possessed, among the barbarous people whom they reduced. Of these Incas, Dr. Robertson says, there was a succession of twelve, and it is said, that not one deviated from this beneficent character. Alcedo, in his account of Peru, cited by Mr. Pinkerton, reckons seventeen of these Incas. The 2d was Sinchi Roca, or Roca the brave, son of the former, who extended his dominions about 60 miles to the S. of Cuzco: the 3d was Lloque-Yupanqui, who subjected many tribes, and extended his kingdom, or empire, in many directions: the 4th was Maita Capac, son of the former, who also subdued several districts, and erected some edifices: the 5th, Capac Yupanqui, was another conqueror: the 6th, Inca-Roca, subdued several little districts and tribes: the 7th was named Yahuar-Huacac: the 8th, Inca-Ripac, with an army of 30,000 men, conquered many provinces; and the chief of Tucma, or Tucuman, is said to have paid homage at Cuzco: the 9th, Inca Urco, was deposed after 11 days: the 10th, Pachacutec, subdued Jauja, Tarma, and other provinces: the 11th, Yupanqui the third, carried his conquests to the river Mauli in Chili, and over the Majos, far to the E. of the Andes, about the year 1450: the 12th, Tupac Yupanqui, was also a conqueror: the 13th, Huayna Capac, subdued, as far as Tumbez, the kingdom of Quito, which he left to Atahualpa, and his own sceptre to his eldest son: the 14th, Inti-Cusi-Hualpa, who fought a bloody battle with his brother in the vicinity of Cuzco, but lost the day, and was made prisoner: the 15th, Atahualpa, the usurper, reigned at the time when Pizarro landed at Tumbez, and was made prisoner in a battle with that conqueror near Caxamalca, (Caxamarca,) and was beheaded in prison, thus suffering a punishment which he had inflicted on his brother and legal sovereign: the 16th, Manco Capac, was crowned, with permission of Pizarro, at Cuzco, and being afterwards defeated by the Spaniards, retired to the mountains, and is thought to have died about 1553: the 17th, and last of the Incas, or emperors of Peru Sayri Tupac, resigned the sovereignty to Philip II. of Spain, and died a Christian, leaving only one daughter, who married Onez de Loyola, a Spanish knight, from whom descend the marquisses of Onepesa and Alcanises. If we reckon 15 reigns to 1532, at 20 years each, we shall have 300 years for the duration of the monarchy. The monarchy of the Incas, extending from the river Tumbez 3° 30′, (without mentioning the subjection of Quito) to the river Mauli in Chili, 35°, that is, 31° 30′, or nearly 1900 geographical miles, may well deserve the name of an empire; while the Mexican princes only ruled a country of about one-third of the extent, and which might be honoured by the title of a kingdom. We need not, therefore, be surprised by the comparative magnificence of the Peruvian monarchs.

When the Spaniards first visited the coast of Peru, in 1526, Huayna Capac, the 12th (or by the last enumeration, the 13th) monarch from the founder of the state, was seated on the throne. He died about the year 1529, and appointed his son Ahatualpa, his successor in the kingdom of Quito, and left the rest of his dominions to Huascar (Inca-Cusi, Hual), his eldest son, by a mother of the royal race. The arrangement of Huayna Capac excited general disgust, and terminated in a contest between the two brothers. When Pizarro landed in the bay of St. Matthew, this civil war raged in its greatest fury, and contributed in no small degree to the success of his plan of conquest. Without detailing all the previous measures which he adopted, and extending the article far beyond our prescribed limits, we shall merely observe, that he left St. Michael with a force, consisting of 62 horsemen, and 102 foot soldiers, of whom 20 were armed with cross-bows and three with muskets, and pursued his course to Caxamalca, a small town at the distance of twelve days' march from St. Michael, where Ahatualpa was encamped with a considerable body of troops. Pretending that his views were pacific, and that he meant merely to assist the Inca against those enemies who disputed his title to the throne, the Inca gave him a friendly reception. On his arrival at Caxamalca, Pizarro took possession of a large court, on one side of which was a house, called by the Spanish historians a palace of the Inca, and on the other a temple of the sun; the whole being surrounded with a strong rampart, or wall of earth.

Ahatualpa, relying on the perfidious professions of Pizarro, left his camp, about a league distant from the town, and, in compliance with the invitation of the invader, determined to pay him a visit. As the Inca drew near the Spanish quarters, father Vincent Valverde, chaplain to the expedition, advanced, with a crucifix in one hand, and a breviary in the other; and having stated to him a variety of theological doctrines, intermixed with the claims of St. Peter and the popes, and with an account of the donation made to the king of Castile, by pope Alexander, of all the regions in the new world, he required Ahatualpa to embrace the Christian faith, to acknowledge the supreme jurisdiction of the pope, and to submit to the king of Castile as his lawful sovereign; promising, on this condition, that the Castilian monarch would protect his dominions, and permit him to continue in the exercise of his royal authority; and at the same time denouncing war and vengeance in his master's name, if he impiously refused to obey this summons. Ahatualpa's reply to this strange harangue, a great part of which he could not be supposed to understand, was temperate: after observing, that he was lord of the dominions over which he reigned by hereditary succession, and that he could not conceive how a foreign priest should pretend to dispose of territories which did not belong to him; and that if such a preposterous grant had been made, he, who was the rightful possessor, refused to confirm it: he declared that he had no inclination to renounce the religious institutions established by his ancestors, and that he would not forsake the service of the sun, the immortal divinity whom he and his people adored, in order to worship the gods of the Spaniards, who were subject to death; but with respect to other matter, new to him and unintelligible, he wished to be informed where the priest had learned things so extraordinary. Valverde replied, "in this book," holding out to him his breviary. The Inca eagerly opened it, and turning over the leaves, lifted it to his ear: "This," says he, "is silent: it tells me nothing:" and threw it with disdain upon the ground. The enraged monk, running towards his countrymen, exclaimed "To arms, Christians, to arms: the word of God is insulted; avenge this profanation on these impious dogs." Pizarro, instantly throwing off the mask, gave the signal of assault, which was immediately commenced with great fury: and Pizarro himself advancing, at the head of his whole band,

band, towards the Inca, feized him by the arm, dragged him to the ground, and carried him to his quarters as a prifoner. The fate of the monarch increafed the precipitate flight of his followers, who were purfued by the affailants, and flaughtered, though the wretched fugitives did not once offer to refift. The carnage did not ceafe till the clofe of the day; and, by taking a medium of different accounts, 4000 Peruvians were killed. Pizarro himfelf was wounded, but not a fingle Spaniard fell. The plunder of the field was immenfe; and the march of the Spaniards was followed by the moft extravagant exultation. The Inca made a moft liberal offer of a ranfom. The apartment in which he was confined was 22 feet in length, and 16 in breadth; neverthelefs, the captive monarch undertook to fill it with veffels of gold as high as he could reach. Pizarro clofed eagerly with this tempting propofal; and a line was drawn upon the walls of the chamber, to mark the ftipulated height to which the treafure was to rife. Ahatualpa, tranfported with the profpect of regaining his liberty, difpatched meffengers to Cuzco, Quito, and other places, to collect the gold that was neceffary for completing his ranfom. In the mean while, the Spaniards remained tranquil and unmolefted in Caxamalca. At this time Almagro arrived with a confiderable reinforcement, which was highly acceptable and encouraging to the Spaniards, and no lefs alarming to the Inca. Perceiving his own deftruction to be inevitable, and apprized that his brother Huafcar had promifed to the Spaniards, on condition of their efpoufing his caufe, a quantity of treafure very much exceeding what Ahatualpa had engaged to pay for his ranfom, determined to facrifice his brother's life, that he might fave his own; and his orders for this purpofe were immediately executed. The treafures promifed by Ahatualpa being collected, and fome pieces of curious fabric being referved as a prefent for the emperor, the dividers of the fpoil fet apart a fifth part for the crown, and 100,000 pefos as a donation to the foldiers who had arrived with Almagro, and there remained 1,528,500 pefos to Pizarro and his followers. In this divifion, above 8000 pefos, at that time not inferior in effective value to as many pounds fterling in the laft century, fell to the fhare of each horfeman, and half that fum to each foot foldier. Pizarro himfelf, and his officers, received dividends proportioned to the dignity of their rank. Although the Inca's ranfom was paid, Pizarro had no thoughts of fulfilling his promife by granting liberty to the captive fovereign. While Almagro and his followers, who had made a demand of an equal fhare in the Inca's ranfom, infifted eagerly on putting him to death, that all the adventurers in Peru might afterwards be on an equal footing, Pizarro himfelf either actually felt or feigned fome apprehenfions on account of the forces that were affembled in the remote provinces of the empire. Ahatualpa alfo inadvertently contributed to haften his own fate, by expreffing his contempt of Pizarro, as a perfon of mean attainments. All thefe circumftances concurred to bring him to a kind of mock-trial; Pizarro, Almagro, and two affiftants being appointed judges, with full power to acquit or condemn. The refult was what might have been expected, the condemnation of Ahatualpa to be burnt alive; but Valverde, availing himfelf of the fears of the Inca, prevailed upon him to be baptized, in token of his having embraced the Chriftian faith; and thus, inftead of being burnt, he was ftrangled at the ftake. On the death of Ahatualpa, the government was diffolved, and Pizarro invefted one of his fons with the enfigns of royalty; hoping to take advantage of the inexperience of youth, rather than to entruft power in the hands of an ambitious monarch, who had been accuftomed to independent command. This happened in the year 1533. Pizarro haftened his march to Cuzco, and took quiet poffeffion of that capital. During this march, that fon of Ahatualpa, whom Pizarro treated as Inca, died; and as the Spaniards fubftituted no perfon in his place, the title of Manco Capac, a brother of Huafcar, whom the people of Cuzco and the adjacent country acknowledged as Inca, feems to have been univerfally recognized. In the mean time Benalcazar, governor of St. Michael, marched to Quito, and reduced it. Whilft thefe operations were carried on, Ferdinand Pizarro arrived in Spain; and by the immenfe quantities of gold and filver which he carried with him, fecured a very favourable reception; and in recompence of his brother's fervices, his authority was confirmed with new powers and privileges, and the addition of 70 leagues, along the coaft, to the fouthward of the territory, granted in his former patent. On Almagro was conferred the title of Adelantado, or governor, with jurifdiction over 200 leagues of country, ftretching beyond the fouthern limits of the province allotted to Pizarro. Ferdinand himfelf was admitted into the military order of St. Jago, and foon fet out on his return to Peru, accompanied by many perfons of higher rank than any of thofe who had yet ferved in that country.

In the year 1534, Pizarro, after fettling fome differences between him and Almagro, began to introduce a form of regular government into the extenfive provinces fubject to his authority. He diftributed the country into various diftricts; he appointed proper magiftrates to prefide in court; and eftablifhed regulations concerning the adminiftration of juftice, the collection of the royal revenue, the working of the mines, and the treatment of the Indians, extremely fimple, but well calculated to promote the public profperity. In his march through the country, he was ftruck with the beauty and fertility of the valley of Rimac, one of the moft extenfive and beft cultivated vallies in Peru. There, on the fide of a fmall river of the fame name with the vale which it watered and encircled, at the diftance of fix miles from Callao, the moft commodious harbour in the Pacific ocean, he founded a city, which he deftined to be the capital of his government, and gave it the name of Ciudad de los Reyes; but it is now better known by the appellation of Lima.

In 1536, an infurrection took place in Peru, which was excited and encouraged by the Inca, Manco Capac; who recovered poffeffion of one-half of Cuzco, though it was vigoroufly defended by the three brothers Juan, Gonzalo, and Ferdinand Pizarro. On this occafion Juan was killed. But the intereft and power of the Pizarros were ftill more endangered by Almagro; who was at length, in 1538, defeated and taken prifoner, and foon after impeached of treafon, formally tried, and condemned to die. The fentence was executed by firft ftrangling him in prifon, and afterwards publicly beheading him. In 1540 Pizarro divided Peru among his followers; but in the following year the adherents of Almagro confpired againft his life, and without much delay put him to death. Pizarro was fucceeded in the government by Vaca de Caftro. During thefe convulfions in Peru the emperor and his minifters were employed in preparing regulations for reftoring tranquillity there, and introducing a more perfect fyftem of internal policy into all their fettlements in the new world. Blafco Nugnez Vela was appointed governor of Peru, with the title of viceroy. His conduct after his arrival increafed the difaffection and tumult which had begun to take place; and the malcontents made choice of Gonzalo Pizarro for their leader, which happened in 1544, and occafioned a civil war. After a decifive victory gained by Pizarro in a battle, which terminated his life, Pizarro was advifed to affume the fovereignty of Peru; but he chofe to negociate with the court of Spain.

In the mean while the Spanish government were preparing to send over as president Pedro de la Gasca, a priest of no higher station than counsellor of the inquisition. Upon his arrival in Peru, in the year 1548, he first made every effort in his power towards an accommodation with Pizarro; but his attempts of a pacific nature were ineffectual: and both parties prepared for battle. Pizarro, whose government had been unpopular, was deserted by his followers, and he surrendered himself to one of Gasca's officers; and was beheaded on the day after he surrendered. In the year 1550, Gasca having accomplished every object of his mission, and wishing to return again to a private station, committed the government of Peru to the court of audience, and set out for Spain, where he was received with an universal admiration both of his abilities and his virtue. The tranquillity of Peru was not of long continuance after his departure. Several successive insurrections desolated the country for some years. However, the commotions that occurred subsided; and men less enterprising, less desperate, and more accustomed to move in the paths of sober and peaceable industry than the first invaders, settled in Peru; and the royal authority was gradually established as firmly there as in the other Spanish colonies.

The most singular and striking circumstance in the ancient Peruvian government, says Dr. Robertson, is the influence of religion upon its genius and laws. The whole system of civil policy was founded upon religion. The Inca appeared not only as a legislator, but as the messenger of heaven. Hence it followed, that his authority was, in the most extensive sense, unlimited and absolute; and to this circumstance it was also owing, that all crimes were punished capitally, because they were not considered as transgressions of human laws, but as insults offered to the Deity. It is observed, that the superstition on which the Incas engrafted their pretensions to the high authority which they assumed and exercised, was of a very different genius from that established among the Mexicans. By directing their veneration to that glorious luminary, which, by its universal and vivifying energy, is the best emblem of divine beneficence, the rites and observances which they deemed acceptable to him were innocent and humane. They offered to the sun a part of the productions which his genial warmth had called forth from the bosom of the earth and reared to maturity: they sacrificed as an oblation of gratitude some of the animals who were indebted to his influence for nourishment; and they presented to him choice specimens of those works of ingenuity which his light had guided the hand of man in forming; but the Incas never stained his altars with human blood, nor could they conceive that their beneficent father, the sun, would be delighted with such victims. Accordingly, the Peruvians, unacquainted with those barbarous rites which extinguish sensibility, or suppress the feelings of nature at human sufferings, were formed, by the spirit of the superstition which they had adopted, to a national character more gentle than that of any people of America. The influence of this superstition operated favourably on their civil institutions, correcting whatever was adverse to gentleness of character, and also on their military system, so that the wars in which the Incas engaged were carried on with a spirit very different from that of other American nations.

It is further observed, that the state of property in Peru was no less singular than that of religion, and contributed towards giving a mild character to the people. All the lands capable of cultivation were distributed into three shares; one share was consecrated to the sun, and its product was applied to the support of religious rites; the second belonged to the Incas, and was devoted to the support of government; and the third, being the largest share, was reserved for the maintenance of the people. No person had a right of exclusive property in the portion allotted to him; he possessed it only for a year, at the expiration of which a new distribution was made, according to the rank, number, and exigencies of each family. All these lands were cultivated by the joint industry of the community; and the people were summoned by a proper officer to the fields, and performed their common task, while songs and musical instruments cheared them to their labour. In consequence of this mode of distribution selfish principles were restrained and extinguished, and each individual felt his connection with those around him; and the state thus constituted might be considered as one great family, in which the union of the members was so complete, and the exchange of good offices so perceptible, as to create stronger attachment than subsisted under any form of society established in America. From this resulted gentle manners, and mild virtues unknown in the savage state, and with which the Mexicans were little acquainted. Notwithstanding the bonds of affection which the institutions of the Incas served to strengthen among their subjects, there subsisted among them a great inequality of condition; and the distinction of ranks was fully established.

Such a form of society, from the union of its members, as well as from the distinction in their ranks, was favourable to progress in the arts; and the Peruvians had, in fact, advanced far beyond the Mexicans, both in the necessary arts of life, and in such as have some title to the name of elegant. In Peru, agriculture was more extensive and improved than in any part of America. The defects peculiar to their climate and soil served to call forth the exertions of the people. In order to render that part of the country which was sandy and barren, and which was never refreshed with rain, fertile and productive, the Peruvians conducted water from the torrents that poured across their country by means of canals to the fields that wanted a regular supply of moisture; they also enriched the soil by manure obtained from the dung of sea-fowls, that were numerous on the islands, which lay scattered along their coasts; and though the use of the plough was unknown, they turned up the earth with a kind of mattock of hard wood.

In the construction of their houses and buildings also the Peruvians manifested their superior ingenuity; but it was in the temples of the sun, and in the buildings destined for their monarchs, that they displayed the utmost extent of their art and contrivance. The temple of Pachacamac, together with a palace of the Inca, and fortress, were so connected together, as to form one great structure, above half a league in circuit. Though they had not discovered the use of mortar or of any other cement in building, the bricks or stones are joined with so much nicety, that the seams can hardly be discerned. Notwithstanding the inconvenient arrangement of the apartments, and the want of windows, the architectural works of the Peruvians, which still remain, must be considered as stupendous efforts of a people unacquainted with the use of iron, and with the mode of applying the mechanical powers. The voyage of Ulloa, referred to by Dr. Robertson and other late writers, may be consulted for other remains. Among the ancient edifices of Peru we might mention the obelisks and statues of Tiahuanacu, and the mausolea of Chachapoyas, which are conical buildings of stone supporting large rude busts, probably resembling those of Easter island.

Their public roads are also entitled to high praise; particularly those two great roads from Cuzco to Quito, extending

tending without interruption above 500 leagues; the one through the interior and mountainous country, and the other through the plains on the fea-coaft. Thefe works of the Incas might be compared even to the famous military ways, which remain as monuments of the Roman fkill and power. The formation of thefe roads introduced another improvement, which was that of bridges, equally unknown over all the reft of America. See Bridge, Balza, and Boat.

The Peruvians had alfo made confiderable progrefs in arts, that may be called elegant. As they poffeffed metals in greater abundance than any people of America, they manifefted great fkill and contrivance in procuring them, and in applying them to purpofes of ufe and ornament. Accordingly in works of mere curiofity, and of an ornamental nature, their ingenuity has been highly celebrated. Many fpecimens of thefe have been dug out of the "Guacas," or mounds of earth, with which the Peruvians covered the bodies of the dead. Among thefe are mirrors of various dimenfions, of hard fhining ftones highly polifhed; veffels of earthen ware of different forms; hatchets, and other inftruments, fome deftined for war, and others for labour. Some were of flint, fome of copper, hardened by an unknown procefs to fuch a degree as to fupply the place of iron on feveral occafions. But notwithftanding a variety of circumftances, fome of which have been enumerated, and which feem to indicate a high degree of improvement in Peru, others occur that fuggeft the idea of a fociety ftill in the firft ftages of its tranfition from barbarifm to civilization. The Peruvians had no cities befides Cuzco. Every where elfe, the people lived moftly in detached habitations, difperfed over the country, or, at the utmoft, fettled together in fmall villages. In confequence of this ftate of limited affociation and imperfect union, they had no perfect feparation of profeffions, which was lefs complete than that which fubfifted among the Mexicans. From the want of cities in Peru, there was little commercial intercourfe among the inhabitants of this great empire. But the moft remarkable, as well as moft fatal defect in their character, was their unwarlike fpirit. By reafon of this character, their country was fubdued at once, and almoft without refiftance, and remained in a ftate of fubjection; and the fame character, connected with mildnefs of temper and manners, has defcended to pofterity: fo that the Indians of Peru are now more tame and depreffed than any people of America. Their feeble fpirits, relaxed in lifelefs inaction, feem hardly capable of any bold or manly exertion.

Spanifh writers have recorded fome facts, which manifeft, notwithftanding all their good qualities, a great degree of remaining barbarifm in their manners. On the death of the Incas, and of other eminent perfons, a confiderable number of their attendants was put to death, and interred around their Guacas, that they might appear in the next world with their former dignity, and be ferved with the fame refpect. On the death of Huana Capac, the moft powerful of their monarchs, above 1000 victims were doomed to accompany him to the tomb. In one particular, their manners appear to have been more barbarous than thofe of moft rude tribes. Although they were acquainted with the ufe of fire in preparing maize, and other vegetables for food, they devoured both fifh and flefh perfectly raw, and aftonifhed the Spaniards by a practice repugnant to the ideas of all civilized people. For other particulars we refer to the third volume of Dr. Robertfon's "Hiftory of America."

The account which is given of the difpofition, character, and condition of the Peruvian Indians, in the "Mercurio Peruano," a periodical paper publifhed at Lima in 1791, and the following years, differs in many particulars from that of Dr. Robertfon, and alfo of Kotzebue and Marmontel. They are faid to be of very limited capacities, and of little or no variety in their characters; melancholy from temperament; timid and difpirited from oppreffion; daftardly in moments of danger; favage and cruel after victory; and fevere and inexorable in the exercife of authority. They ftand greatly in awe of the Spaniards, and are docile and obedient to their commands; but they fecretly diflike them, and fhun their fociety, and only hate them lefs than they do the negroes and mulattoes. They are of diftruftful tempers, and fufpect every one who does them a kindnefs, of a defign to impofe upon them. They are ftout and robuft, and capable of enduring labour; but lazy, dirty, and improvident. Their habitations are miferable hovels, deftitute of every convenience or accommodation, and difguftingly filthy. Their drefs is poor and mean, and their food coarfe and fcanty. Their ftrongeft propenfity is to fpirituous liquors; and to this indulgence they facrifice every other confideration. Their religion is ftill tainted with the fuperftition of their forefathers; but they are great obfervers of the external rites and ceremonies of the church, and they fpend large fums of money in maffes and proceffions; a fpecies of profufion to which they are naturally excited and encouraged by their priefts, who profit by it.

We fhall here add fome particulars from the work referred to, concerning the prefent condition of thefe people; firft premifing that foon after the conqueft of America, that country was parcelled out into encomiendas, a fort of feudal benefices, which were diftributed on certain conditions to the Spaniards. The encomendero, or holder of the benefice, befides owing military fervice to the ftate, was bound to refide on his encomienda, to protect and defend the Indians living upon it, and to fee them properly inftructed in the principles of religion. The Indians were bound in return to pay him a ftipulated tribute; but fo far were they from being reduced to flavery, that he could not lawfully exact from them any perfonal fervice whatever. The fyftem of encomiendas was introduced by the emperor Charles V.; and though varioufly modified and changed by his fucceffors, it was not finally abolifhed till the reign of Philip V. All accounts agree, that, however well intended, it was in its effects oppreffive and injurious to the Indians. The encomendero was continually exacting from them more than he was entitled to demand, and doing for them lefs than he was bound to perform.

The fyftem of encomiendas was followed by the ftill more fatal plan of repartimientos; according to which the government, in confideration of the limited faculties and improvident character of the Indians, directed the corregidor or judge of the diftrict in which they lived, to fupply them with cattle, feed-corn, inftruments of agriculture, and even clothes and other neceffaries of which they were in want, according to his difcretion and opinion of their neceffities; but at a price regulated by law, and without any profit to himfelf. The abufes to which this fyftem muft have led, may eafily be conceived. They became at length fo enormous, as to call again for the interference of the government, which, after mature deliberation, determined on abolifhing the repartimientos. This was accordingly done in 1779.

The fyftem followed at prefent with regard to the Indians, is more confonant to reafon and juftice, and more favourable to the developement of their faculties, than any under which they have lived fince the conqueft. They are left to manage their own concerns as they pleafe; and no one, under pretence of doing them good, can interfere with the difpofal of their time or their property. It muft be confeffed, that, in fome parts of the country, the indolence and fluggifhnefs

 of

of their character have fo far prevailed, fince they were taken from under the controul of the corregidor, that they have fuffered the breed of mules, fo neceffary for the mines, to decreafe ; but in other parts they have been roufed to greater induftry and exertion. At Lambayeque, in particular, they have applied to agriculture, manufactures and commerce, with fuch affiduity, as far to furpafs the Spaniards ; and as the produce of their farms and induftry is exempt from the alcabala, and all other taxes, they have great advantages over the other cafts, of which they want only induftry and ability to make a proper ufe.

The Indians pay a perfonal tax or tribute, which is extremely moderate, and to be regarded rather as a diftinctive mark and token of vaffalage, than as a ferious burden. Indians of noble birth, that is, of the families from which the caziques are taken, enjoy an exemption from tribute, and are equally qualified with Spaniards to fill all kinds of offices under the crown. Where the Indians are the fole inhabitants, they are governed by their caziques ; and none of the other cafts are permitted to encroach upon their lands, or to fettle among them, without their confent.

The Indians are fubject to another burden, the mita, or compulfory labour in the mines. Every male Indian from 18 to 50 muft take his fhare in this fervice ; and, for that purpofe, a lift is kept of all the Indians of the requifite age, who are divided into feven parts, each of which ferves in its turn. The term of fervice lafts for fix months ; and, therefore, returns once in three years and a half. The mitayo, when it comes to his turn, is forced to leave his farm or other occupation, and go to the mine where he is ordered to ferve. Some Indians are compelled to travel 200 or 300 leagues from home ; and many take their families with them to the mines. They have a fmall allowance for their travelling expences, and receive, for their work in the mines, at leaft have a dollar a day, and, in general, a greater fum.

The Indians and Meftizoes are the only cafts in America who are able to endure the fatigue and unwholefomenefs of the mines. The Spaniards and Negroes have been often tried in this fpecies of labour, but they always fink under it after a fhort time. Befides the mitayos, there are Indians who ferve voluntarily in the mines, and engage themfelves for a ftipulated hire. The greater part of the miners is indeed of that defcription ; and it is to be regretted, that there fhould be any perfons who ferve upon other terms. A more intolerable hardfhip, and more flagrant injuftice than the mita, cannot well be imagined. A forced confcription for national defence, though liable to great abufe, is on every principle a juftifiable meafure ; but a forced confcription, for the purpofe of digging riches from the bowels of the earth for the profit of another, is the extremity of cruelty and injuftice.

The number of Indians in South America has diminifhed confiderably fince the conqueft ; and as the other cafts have not increafed in a degree correfponding to this diminution, the whole population of the country is lefs than when firft difcovered by the Spaniards. The firft cenfus after the conqueft was made in 1551, when the Indian population of Peru, Santa Fé, and Buenos Ayres, amounted to 8,255,000 fouls ; but the fame countries hardly contain, at prefent, four millions of inhabitants, of all claffes and defcriptions. A fecond enumeration of the Indians was made in 1581, by D. Francifco Toledo, viceroy of Peru, previoufly to the eftablifhment of the mita ; from which it appeared, that Peru and Potofi, without including Quito, Tucuman, Chili, or Buenos Ayres, contained, at that time, 1,067,697 male Indians, from 18 to 50, making a total population of at leaft 4,270,788 perfons. But the whole population, from Tumbez to Buenos Ayres, does not exceed, at prefent, two millions and a half, or three millions of fouls. Of whom not more than one-third are Indians.

Independent of thefe computations, there are many proofs of Peru having been formerly more populous and better cultivated than it is at prefent. Veftiges of former cultivation, and remains of extenfive works for irrigation, are ftill to be feen, where the country is now uncultivated and deferted ; and travellers meet continually with the ruins of towns and villages, which have been long fince abandoned, and without inhabitants.

That this devaftation is to be attributed, in a great meafure, to the miftaken policy, not to the inhumanity of the Spanifh government, cannot be doubted ; but many other caufes have contributed to thin fo dreadfully the number of the Indians. The abufe of fpirituous liquors deftroys vaft numbers of them. Ulloa alleges, that the ufe of fpirits is fatal to more Indians in one year than the mines are in fifty. The Indians of the Sierra are fo immoderately fond of ardent fpirits, that they are often found dead in the fields at break of day, from the intoxication of the preceding evening. In 1759, the government was compelled to prohibit entirely the fale and manufacture of fpirits, on account of an epidemic fever then raging among the Indians, which owed its deftructive power in a great meafure to their habits of intoxication. The fmall-pox and meafles make alfo great havock among them ; and a peftilential fever, which broke out in 1720, fwept away the inhabitants of whole villages, and caufed every where the greateft mortality. Another caufe, which is continually diminifhing the number of the Indians, and which muft, in the end, extinguifh them as a feparate race, is the progrefs of the other cafts. It is obferved, that wherever the Indians are fettled along with the Spaniards, their numbers decreafe ; but as their place is fupplied with Meftizoes and Samboes, this lofs is not to be deplored, but viewed as the indication of a future period, when all the pure races, whether Creoles, Indians, or Negroes, will be loft and confounded.

Both the Peruvian Indians and the Creoles are remarkably long lived, and retain their vigour and bodily faculties to a very advanced age. In the fmall province of Caxamarco, containing hardly 70,000 inhabitants, there were eight perfons alive in 1792, whofe ages were 114, 117, 121, 131, 132, 135, 141, and 147 ; and in the fame province, a Spaniard died in 1765, aged 144 years, 7 months and 5 days, leaving 800 perfons lineally defcended from him.

The Meftizoes, or offspring of the Spaniards and Indians, are the next clafs in rank to the Spaniards, and the moft numerous after the Indians. They have neither the privileges and exemptions of the Indians, nor are they fubject to the fame burdens. They are cordially attached to the Spaniards, but conftantly at variance with the Indians. The Quarteroons, or offspring of the Spaniards and Meftizoes, are hardly to be diftinguifhed from Spaniards. The Cholos, on the contrary, fprung from the Indians and Meftizoes, are claffed with the Indians, and fubjected to tribute.

The Negro flaves in Peru are either employed in domeftic fervice, or on the fugar plantations and farms of their mafters. About 500 negroes are annually imported from Africa, formerly by Panama, but now by Chili and Buenos Ayres. The free negroes, who are very numerous, are in general idle and diforderly, and the authors of moft of the murders and robberies committed in the kingdom.

The Mulattoes are called by Spanifh writers the gypfies of South America, on account of their refemblance in complexion, manners, and character to the Spanifh gypfies. The female mulattoes are ufually employed by the Creole ladies as wet nurfes for their children ; and they often ac-

quire

quire the confidence and entire management of their miſtreſſes. The free mulattoes are uſually tradeſmen, and ſeveral mechanical trades are chiefly in their hands.

The language of the ruling people in Peru was called the "Quechua;" and it is ſtill cultivated by the Spaniſh clergy as indiſpenſable in the converſion of the natives. The Quechua is declined by altering the termination, as "Runa" a man, "Runap" of a man, "Runapac" to a man, &c. The verbs have alſo moods and conjugations, the terminations extending to great length. In this dialect, the letters *b*, *d*, *g*, *r*, *x*, *z*, are wanting. The grammar of this language, and it is ſaid even that of the Tehuels (ſee PATAGONIA) is nearly as variegated and artificial as the Greek; a circumſtance which may ſerve to abate our wonder at the refinement of the Sanſcrit. Mr. Pinkerton has given in his "Geography" ſpecimens of this celebrated dialect of the Incas.

We now proceed to the geographical diviſion of the viceroyalty of Peru. Its provinces, or diſtricts, proceeding from S. to N. are as follow: *viz.* Arica, Arequipa, Canes and Canches, Paucartambo, Chilques, Chumbivilcas, Guancavelica, Aymaraez, Cotabamba, Cuzco, Abancay, Calca y Lares, Andahuaylas, Parinacochas, Lucanas, Ica, Caſtrovireyna, Vilcaſhuaman, Huanta, Angaraes, Yauyos, Canete, Guarohiri, Jauja, Tarma, Canta, Checras, Huanuco, Caxatambo, Santa, Huaylas, Conchucos, Paſtas, Caxamarquilla, Huamachucos, Truxillo, Sana, Caxamarca, Chacapoyas, Lamas, Luya y Chilloas, Piura, and ſome other ſmall diſtricts.

The moſt ſouthern province is that of Canes and Canches, bounded or pervaded by the Apurimac or genuine Maranon. The name is derived from two tribes, who originally occupied the country, and who were conquered by Roca, the ſecond Inca. This province abounds in cattle and ſheep, and alſo pacos; and in the heights and ſkirts of the Cordilleras there is alſo a great number of guanacos, vicunas, pacochas, venados, or a kind of deer, viſcachos, or a kind of rabbits, partridges and quails, and many birds of prey; the mountains contain gold, ſilver, copper, loadſtone, lead, tin, and quickſilver. The language of this diſtrict is the Quechua; the chief town is Siquani, containing about 6000 perſons, but only 92 Spaniards. The articles of culture are papas, or a kind of potatoe, beans, wheat, and barley. The province is governed by a judge, who is a delegate of the Intendant of Cuzco. The trade conſiſts in cattle and woollen cloths; but the moſt flouriſhing buſineſs is the weaving. The Indians bring wine, brandy, and cotton from the coaſt.

The government of this viceroyalty is divided, like that of the others, into political and eccleſiaſtic. By the new conſtitution there are ſeven intendants, and fifty-two ſub-delegates; all ſubordinate to the viceroy. The royal audience, created in 1543, (ſee AUDIENCE,) is now compoſed of a regent, an office created in 1776, eight oidors or judges, four alcalds of the court, and two fiſcals, the viceroy being preſident. It is divided into three chambers. There is alſo a ſuperior junta of the royal treaſury, compoſed of the viceroy, the regent, the dean of the tribunal of accounts, and other officers. The tribunal of accounts determines cauſes of the revenue. See LIMA.

According to Eſtalla, the population of this viceroyalty, by a cenſus very recently taken, amounts to 1,076,122 perſons of all denominations, *viz.* Spaniards, Indians, and Negroes, from the mixture of which reſult various caſts and colours: and the number of towns and villages is computed at 1460. But this cenſus is ſaid to have been careleſsly taken, and that the returns were conſiderably under the real population. The higheſt eſtimate does not raiſe them above 1,400,000 perſons, and the more probable opinion is, that it does not exceed 1,300,000. Lima may be called the maritime capital of Peru, and Cuzco the inland metropolis. The other cities or chief towns of the viceroyalty of Peru, are the biſhoprics of Arequipa, Guamanga, and Truxillo. Arica and Oropeſa have declined; nor is Piura of much conſequence. For an account of the other chief diſtricts and towns, ſee their reſpective titles.

The revenue of Peru amounts to near 5,000,000 of dollars annually; of which 300,000 are remitted to Panama; 15,000 to the iſle of Chiloe; and a third ſum to Valdivia. The clear revenue, after theſe remittances, and after defraying the expence of the government of Peru, does not exceed 500,000 dollars; and we are diſpoſed to regard that ſum as the total revenue which the king of Spain derives from this part of his dominions.

The commerce of Peru may be conſidered under three diviſions; *viz.* that by Cape Horn, that with the ports on the Pacific, and that of the interior with the ſouthern provinces. Since the freedom of commerce in 1778, the principal trade of Peru has been carried on by Cape Horn. The exports and imports have been nearly doubled ſince the freedom of commerce has been allowed, though ſeveral rich provinces have been withdrawn from the viceroyalty.

The exports of Peru, in a general view of them, are gold and ſilver, wine, brandy, ſugar, pimento, Jeſuits' bark, ſalt, Vicuna wool, coarſe woollens, and ſome other manufactures of little value; and it receives, in return, European goods, live ſtock, proviſions, tallow, cacao, Paraguay tea, coca leaf, indigo, timber, cordage, pitch and copper.

As luxury of dreſs is the predominant paſſion in Peru, and eſpecially at Lima, ſilks, ſuperfine cloths, fine linen, &c. form conſiderable articles of imports. Iron is alſo indiſpenſable in the mines and in agriculture. Moſt of the linens are from Brittany, with a few from other parts of France and Holland: the cottons, woollens, and ſilks are chiefly Spaniſh. The annual demand for rough iron is 6000 hundred weight, beſides many articles of hardware. Mercury, wax, paper, pepper, ſaffron, medicines, liqueurs, books, glaſs, and furniture, form alſo principal articles of import.

Lima carries on a conſiderable commerce with various ports of the Pacific. The fertile and opulent kingdom of Chili ſupplies abundance of grain and fruits, ſo that its mines, though they produce annually 1,400,000 dollars, are regarded as of ſecondary importance; the three havens of Valparaiſo, Conception, and Coquimbo, furniſh convenient outlets for its opulence. Lima annually imports from Chili vegetable products amounting to more than 1,100,000 dollars. Wheat forms the chief article ſent by Chili to Peru; but ſlaves from Africa, ſalted meat, ſoap, wine, copper, dried fruits, ſaffron, &c. &c. form alſo conſiderable articles. The returns from Peru are European goods, ſugar, cloths of home manufactory, pita, which yields a kind of flax, rice, chocolate, &c. See CHILI.

The ports of the viceroyalty of Peru, which are chiefly frequented, are thoſe of Arica, Ilo, Iquique, and Quilca: theſe are called "intermediate," and belong to the intendancy of Arequipa, and, with Piſco, in the diſtrict of Ica, form the whole number in the viceroyalty to the S. of Lima. Towards the N. are thoſe of Chancay and Guacho, both in the province of Lima; Guanchaco, Pacaſmayo, and Payta, in the intendancy of Truxillo. With the ſouthern ports, the trade is wine, brandy, iron, dried fruits, copper, tin, lead, &c.; with the northern, in wool, cotton, cordovan, rice, chocolate, and ſalted fiſh; Lima chiefly carrying from the northern ports to the ſouthern, and the contrary.

The

The chief markets and moft populous towns are on the coaft, Piura, Lambayeque, Truxillo; and, in the Sierra, Caxamarca, the royal ftation of the mines of Chota; and towards the S. Ica, Arequipa, and the royal ftation of Tarapaca; and towards the interior, Pafco, which is a mineral ftation belonging to the intendancy of Tarma, Guanacha, Jauja, Guancavelica, Guamanga, and Cuzco. At thefe and other places, as Guarochiri, Caxatanbo, &c. traders or agents fell for the merchants of Lima, European goods, liquors, and other articles fufficient for the confumption of the neighbourhood; and the returns are generally in bullion or coin, but fometimes in articles of food for the ufe of the capital. The trade may yearly amount to 1,500,000 dollars in products; while that in bullion and money may amount to 4,000,000.

Upon the whole, according to Liquanda, cited by Pinkerton, the viceroyalty lofes, during five years, in the balance of maritime commerce, more than 6,500,000, but gains a balance with the viceroyalty of La Plata of nearly 1,200,000 annually; fo that the amount being deducted, the lofs will be reduced to about 700,000 dollars, without mentioning the interior commerce, which cannot enter into the account.

From the "Mercurio Peruano," we learn that the exports of Peru to Potofi, and the other provinces of the Rio Plata, are valued at more than 2,000,000 of dollars annually, and the imports at 860,000 dollars; fo that the balance in favour of Peru is near 1,200,000, independent of the profits on the carriage of the goods, which belongs alfo ot Peru, as the carriers are Peruvians. Cuzco and Arequipa are the routes through which this trade paffes.

The chief exports to the Rio Plata are brandy, wine, maize, fugar, pimento, indigo, and woollens. The brandy alone amounts to near 1,000,000 of dollars. The woollens, which are next in value, are chiefly made in Peru, but part of them are brought from Quito. The provinces of the Rio Plata ufed formerly to take woollens, to a great amount, from Quito; but it is now found more economical to procure thefe articles from Europe by the way of Buenos Ayres. The indigo exported from Peru is previoufly imported from Guatimala.

The chief imports from the Rio Plata, are mules, fheep, hams, tallow, wool, coca leaf, paraguay leaf, and a fmall quantity of tin from Oruro: 20,000 mules are imported annually from Tucuman, for the fervice of the mines.

The commerce of Peru, by fea, with the other colonies of Spanifh America, will appear from the following tables.

I.—Commerce of Callao with Chili, Guayaquil, Panama, and Guatimala, for the Years 1785, 1786, 1787, 1788, and 1789.

	Imports.	Exports.	Balance for Callao.	Balance againft Callao.
Chili - - - -	5,533,775 1	4,686,423 3		847,351 6
Guayaquil - - - -	2,547,643 1	2,906,305 0	358,661 7	
Panama - - - -	59,035 5	201,631 7	142,596 2	
Guatimala - - - -	210,295 7	29,416 4		180,879 3
	8,350,749 6	7,823,776 6	501,258 1	1,028,231 1
Annual Average - - -	1,670,149 7	1,564,755 3		
Annual balance againft Callao - - - - - - -				105,394 4

II.—Commerce of Arica, Payta, and other Ports of Peru, with the Kingdom of Chili, and the Ports of Panama and Guayaquil.

	Imports.	Exports.	Bal. againft Peru.
Chili - - - -	46,675		46,675
Panama and Guayaquil	350,000	130,000	220,000
	396,675	130,000	266,675

III.—Refult of both.

	Imports.	Exports.	Bal. againft Peru.
Annual trade of Peru, by fea, with the other colonies	2,066,824 7	1,694,755 4	372,069 4

Forty-one veffels, of different fizes and defcriptions, are employed in this trade; and all of them, except three, belong to Peru. Their united tonnage amounts to 351,500 quintals, and they are manned by 1460 feamen.

The chief exports from Peru to Chili are European goods, previoufly imported at Callao. Sugar, coarfe woollens, made in Peru, indigo from Guatimala, falt, cotton, pita, yarn, and fome other trifling articles. The imports are chiefly wheat, copper; Negro flaves, fome of them natives of Chili, but the greater part from Rio de Janeiro and Buenos Ayres; tallow, wine, paraguay tea, falt meat, timber, cordage, and leather. Part of the copper is ufed in the mint at Lima, and the remainder, except a fmall quantity fent to Guayaquil, re-exported to Spain. The ports of Chili that trade with Peru, are Valparaifo, Conception, and Coquimbo; but Valparaifo alone carries on three times as much trade as the other two. The timber is brought from the ifle of Chiloe.

Three-fourths of the exports to Guayaquil confift of European goods, and the remaining fourth of flour, wine, brandy, and copper. The imports are chiefly cacao and timber. There is alfo imported into Peru, on account of the government, a confiderable quantity of tobacco, the growth of Guayaquil, which is afterwards re-exported to Chili; but this is not included in the preceding tables.

The trade with Panama, which was formerly of fuch magnitude, has declined fince the middle of the laft century, and is now reduced to a fmall importation of timber and cacao, and to the remains of a flave trade, which is every day diminifhing. The exports from Peru to Panama are coarfe woollens, fugar, flour, and brandy. There is alfo a remittance of 300,000 dollars a-year from the treafury of Lima, to pay the garrifon and civil government of Panama; without which that city muft have fallen to ftill greater infignificance.

Indigo is the principal article of import from Guatimala. Small quantities of logwood, pitch, timber, and cacao, are alfo imported. The exports, which are very trifling, confift chiefly of wine and woollens. The wines and brandies of Peru might be exported with advantage to San Blas, for the confumption of Cinaloa, Sonora, and California; but though permiffion has been frequently folicited from the government, it has been conftantly refufed, from an apprehenfion of interfering with the trade of the mother country in thefe articles.

The trade of Peru with Spain was carried on by Porto Bello and Panama till 1748, when regifter fhips were fubftituted for galleons, and the voyage by Cape Horn, for the circuitous route formerly in ufe. It is amufing to confider the progrefs made fince that time in the art of navigation. The firft Spanifh veffels which failed by Cape Horn, were infured againft fea rifk at Cadiz, at the exorbitant rate of 20 *per cent.* of their value; but the veffels which perform the fame voyage at prefent are infured for two. The regifter fhips, though liable to objections, were preferable in every refpect to the galleons. They fhortened the intercourfe between the mother country and the colony, and leffened the expence attending it. By affording quicker returns, they led to more frequent adventures; and by meeting more effectually the demand, they diminifhed the inducements to contraband. But the trade was ftill clogged and impeded with much ufelefs expence and unneceffary delay, and fubjected to an arbitrary licence, which was withheld or burdened with reftrictions at the caprice of the minifter.

The regifter fhips continued to be employed in the trade of Peru with the mother country, till the war for American independence, during which there was little intercourfe between Spain and this diftant colony. At the peace of 1783, the fyftem of free trade, the order for which had been iffued at Madrid fome years before, began to be carried into effect in the South Sea. According to this fyftem, the moft wife and liberal which Spain has ever laid down for her colonies, an unlimited intercourfe, without licences or other reftrictions, is permitted between certain ports of Spain and certain ports of Spanifh America; and among the privileged ports of America, are Callao and Arica, both fituated in Peru.

The refult of thefe innovations has been highly favourable to Peru. Its inhabitants enjoy foreign luxuries and conveniences at a cheaper rate, and in greater abundance than before; while their induftry has been excited, the value of their exports increafed, and the produce of their mines nearly doubled. Nor has the change of fyftem been lefs beneficial to the mother country, though fome individuals have fuffered by it. From 1714 to 1739, a period of twenty-five years, the whole exports to Spain from Peru, Chili, the Rio Plata, and Santa Fé, did not exceed 34,000,000 of dollars. But at prefent, the exports from Peru and Chili alone, exceed 6,000,000 annually; and the imports from Europe have increafed in the fame proportion. For fome years, indeed, after the opening of the free trade, the merchants of the mother country, ignorant of the real ftate and refources of Peru, poured into that country a greater quantity of goods than its effective demand required, or enabled it to confume; and by the confequent want of fale, and depreciation of thefe goods, the importers paid dearly for their rafhnefs. But though fome merchants fuffered by their over-fpeculation, the manufactures of the mother country were benefited by it; and with regard to Peru, it would be difficult to fhew how the abundance and low price of goods could be injurious to the confumer. On the contrary, the fpirit of induftry has been awakened in that kingdom, by the fight of luxuries and accommodations, formerly unknown to its inhabitants, or placed beyond their reach; and the increafe of its exports fince the free trade, is the fureft proof of its growing profperity.

Tables of the Commerce of Peru with the Mother Country.

I.—Imports of Lima from Spain in the Years 1785, 1786, 1787, 1788, and 1789.

	National Goods.	Foreign Goods.	Prime Coft when exported.	Coft, with Duties and other Expences to Lima.
In the year 1785	1,932,040 $0\frac{7}{8}$	3,106,056 $2\frac{3}{4}$	5,038,096 $3\frac{5}{8}$	6,965,231 $3\frac{3}{4}$
1786	5,113,389 $5\frac{1}{8}$	6,358,901 5	11,472,221 $2\frac{1}{8}$	14,734,084 $4\frac{1}{2}$
1787	3,225,167 $3\frac{3}{4}$	2,426,581 $6\frac{7}{8}$	5,651,749 2	7,257,741 $6\frac{3}{4}$
1788	1,298,250 $7\frac{1}{8}$	995,055 $6\frac{7}{8}$	2,293,306 $5\frac{7}{8}$	2,940,992 $7\frac{3}{4}$
1789	1,007,663 $7\frac{4}{8}$	1,216,855 $3\frac{1}{8}$	2,224,517 $2\frac{7}{8}$	2,856,965 $0\frac{7}{8}$
Total, according to the Cuftom-houfe entry	12,576,510 $0\frac{3}{8}$	14,103,450 $7\frac{1}{2}$	26,679,960 $7\frac{7}{8}$	34,755,015 $7\frac{5}{8}$
Addition of 22 *per cent.*	2,727,064 1	2,990,428 5	5,717,492 6	7,344,297 7
Total	15,303,574 $1\frac{3}{8}$	17,093,879 $4\frac{1}{2}$	32,397,453 $5\frac{7}{8}$	42,099,313 $6\frac{5}{8}$
Annual average	3,060,714 $6\frac{5}{8}$	3,418,775 $7\frac{1}{4}$	6,479,490 $5\frac{7}{8}$	8,419,862 $6\frac{1}{8}$

In this table are included imports from China by the Philippine Company to the value of 421,120 dollars; and imports of European goods from other ports of America to the value of 270,237 dollars $7\frac{5}{8}$ reals.

The addition of 22 *per cent.* to the official value, is confidered as the difference between the real and the official value.

The freightage, infurance, duties, and other expences, from the time the goods leave the wharf, when they are embarked in Spain, till they are warehoufed at Lima, are eftimated at 28 dollars $3\frac{5}{8}$ reals *per cent.* on all goods fent round Cape Horn. A feparate charge is made for the goods from China, and from the American ports.

The

The European goods in greateſt requeſt in Peru are, ſilks, ſuperfine cloth, lace, fine linen, and other articles of luxury and ſhow. There is alſo a conſiderable demand for ordinary linen, and for the inferior ſorts of cloth and woollens. Cutlery, and all inſtruments of iron, are alſo in great requeſt.

II.—Exports from Lima to Spain in the ſame Period.

	Coin and Bullion.	Produce.	Total.	Total, with Coſt and Duties, to Spain.
In the year 1785	7,144,325 $2\frac{1}{8}$	733,587 4	7,877,912 $6\frac{1}{8}$	8,823,115 6[illegible]
1786	8,285,659 $7\frac{6}{8}$	882,807 1	9,168,467 $0\frac{5}{8}$	10,369,502 $3\frac{6}{8}$
1787	4,518,246 $3\frac{4}{8}$	906,022 0	5,424,268 $3\frac{4}{8}$	6,503,961 2[illegible]
1788	5,463,973 $1\frac{7}{8}$	579,160 2	6,043,133 $0\frac{7}{8}$	6,798,374 0[illegible]
1789	2,449,495 $6\frac{7}{8}$	523,080 0	2,972,575 $6\frac{7}{8}$	3,484,386 2[illegible]
Total - -	27,861,700 $4\frac{7}{8}$	3,624,656 7	31,486,357 $3\frac{7}{8}$	35,979,399 $6\frac{7}{8}$
Annual Average -	5,572,340 1	724,931 3	6,297,271 4	7,195,879 $7\frac{7}{8}$

In this table is included the ſum of 2,790,000 dollars exported to Aſia by the Philippine Company.

Silver brought from Lima to Spain, coſts, in freightage, inſurance, and duties, $9\frac{1}{2}$ *per cent.*; and gold $2\frac{1}{2}$ *per cent.*

The articles of produce are chiefly Jeſuits' bark, Vicuna wool, copper from Chili, cacao from Guayaquil, and a ſmall quantity of cotton.

III.—Commerce of Peru with Spain, from 1775 to 1779, compared with the Commerce between the ſame Countries, from 1785 to 1789.

	Imports.	Exports.
From 1775 to 1779 -	23,838,183 $4\frac{4}{8}$	21,302,385 2
From 1785 to 1789 -	42,099,313 $6\frac{6}{8}$	35,979,339 $6\frac{7}{8}$
Total for ten years -	65,937,497 $3\frac{1}{8}$	57,281,725 $0\frac{7}{8}$
Exceſs of the 2d period above the 1ſt	18,261,130 $2\frac{7}{8}$	14,676,954 $4\frac{7}{8}$

It is further to be obſerved, that during the firſt of theſe periods, Potoſi, and the other provinces now annexed to the Rio Plata, formed part of the viceroyalty of Peru; and that, by the ſeparation of theſe provinces, Peru, during the ſecond period, contained only 49 or 51 diſtricts, inſtead of 74, of which it was formerly compoſed.

But, to form a juſt eſtimate of the commerce of Peru, we muſt take Buenos Ayres into the account, and conſider theſe two countries, and Chili, as part of the ſame commercial ſyſtem. It will then more fully appear, how ſmall are the means, and limited the reſources, of theſe extenſive colonies, and what falſe and exaggerated notions have been circulated in this country with regard to them.

View of the Reſources of Peru, Chili, and the Rio Plata, for maintaining Foreign Commerce.

	Dollars.
Annual coinage of Lima, from 1790 to 1794	5,593,513 0
Coinage of Potoſi in 1791 - - - -	4,365,175 0
Annual coinage of Santiago of Chili, eſtimated at - - - - - - -	1,400,000 0
Annual export of produce from Callao, from 1785 to 1789 - - - - -	724,931 3
Export of produce from Buenos Ayres in 1796 - - - - - - -	1,328,840 0
	13,412,459 3

It appears from this ſtatement, that the effective demand of theſe countries for foreign commodities, does not exceed, at preſent, 3,000,000 ſterling annually. It is true, that with a better government, and a more liberal ſyſtem of commercial regulations, theſe reſources might be greatly augmented, but ſuch improvements are in general the work of time, and in South America, many difficulties muſt firſt be ſurmounted. The population of the country is wonderfully ſmall, ſcattered over an immenſe ſurface, and compoſed of caſts which mutually hate and diſtruſt each other. The Indians, who are the moſt numerous claſs, prefer a life of indolence and apathy, to enjoyments that muſt be purchaſed with labour. Among the other caſts, emancipation from the mother country would be the ſignal of diſcord and political diſcuſſions the moſt adverſe, during their continuance, to the progreſs of opulence, and the ſteady exertions of induſtry. Some improvement might be expected in the mines. The labour of extracting the ore might be abridged by machinery, and the proceſſes for reducing it meliorated by more ſkilful applications of chemiſtry. But the ſcarcity of hands would prevent any great increaſe in the productiveneſs of the mines; and a ſeparation from the mother country, by increaſing the difficulty of finding a ſupply of quickſilver, might render them even leſs productive than they are at preſent. The mines of quickſilver in China are ſaid, within theſe few years, to have been exhauſted. None could be expected from Europe, in the preſent ſtate of that quarter of the world. No reſource would then remain but to repair the works at Huacavelica, and extract from it quickſilver for the other mines, without which, the greater part of them muſt be abandoned.

In ſome branches of produce, it is true, the exports from this part of America might be inſtantly augmented. The exports of hides, tallow, and ſalted proviſions from Buenos Ayres, might be greatly increaſed. Copper, the value of which is riſing every day at home, might be procured, in great abundance, from Chili and the Rio Plata. Valuable firs might be obtained in great numbers from the Andes; and in this ſpecies of induſtry the Indians, like their North American brethren, would more readily engage them in more ſettled occupations. Flax and hemp of the very beſt quality are raiſed in Chili; and if greater care were taken to gather the cotton of Peru, and more attention beſtowed on the art of packing, both that article, and the wool of the ſame country, might be ſent to Europe at a price that could not exclude them from the market. Cacao, coffee, dye-

dye-ſtuffs, and medical drugs, might alſo be exported in greater quantity.

The viceroyalty of Peru has peculiarities of climate, which are owing to its ſingular form. The mountains that are extended on the weſtern ſide of South America occaſion a diviſion into three parts, *viz.* the maritime plains or vallies, the mountains themſelves, and the high table land or upland plain, between the ridges of the Andes. Where we ſhould be led by theory to expect perpetual rain from the influence of the tropical ſun, in the lower part of Peru, on the contrary, rain is almoſt unknown; and it has been aſſerted, that in the part between 5° and 15° rain has never been known to fall. The chain of the Andes, at a mean height of 14,000 feet above the ſea, arreſts the clouds, except during the months of January, February, and March, when the ſummits are covered with ſnow. Theſe clouds diſſolve on the mountains in rain and vapours, accompanied with lightning and tremendous thunder. In the provinces unviſited by rain, the wind may be ſaid to blow conſtantly from the ſouth, along the courſe of the Andes, correſponding with our north wind, which is generally dry; the cold of the antarctic pole being equal, if not ſuperior, to the arctic. Vegetation is ſupported by liberal dew throughout this region, computed at a length of 10° of latitude, or 600 geog. miles, while the breadth may be from 12 to 15 leagues. Bouguer obſerves, that from the gulf of Guayaquil to the deſert of Atacama, a ſpace of 400 leagues, rain is unknown; and the houſes at Arica, like thoſe of Lima, may be ſaid to have no roofs, being only covered with mats, and a light ſprinkling of aſhes to abſorb the dew of the night. The high table land, called the "Sierra," or High Peru, preſents a more fertile aſpect, and from its height of 10,000 feet above the ſea enjoys a different climate. While the low lands are rather ſandy and barren, except along the courſe of the rivers, the uplands may be ſaid to enjoy a perpetual ſpring, united with a perpetual autumn. The height of the mountains inveſts them with perpetual winter.

In Low Peru, as that part of the country is called which lies between the Cordillera of the coaſt (thus diſtinguiſhing it from the Cordillera of the Andes) and the ſhore, the ſoil is dry and has no rain; and, therefore, the only ſpots capable of cultivation are the banks of the rivers, and the places ſuſceptible of being artificially irrigated. The Sierra, or High Peru, though at its greateſt elevation it conſiſts of barren mountains and rocks, is interſected with fertile and cultivated vallies. Its climate, though variable, is not inſalubrious, if we may judge from the longevity of its inhabitants. The climate of Lima, under the want of rain, is remarkable for the inconſiderable variations of its temperature. The thermometer at noon is never obſerved in winter below 60° Fahrenheit, and ſeldom riſes in ſummer above 85°. The hotteſt day ever known at Lima was in February 1791, when the thermometer roſe to 96°.

It is obvious, therefore, that the firſt object of attention in Peru ought to be, not its agriculture, but the improvement of its mines, and the amelioration of its roads and internal communications. In proportion as a market is opened for its productions, the attention of its inhabitants will be turned towards agriculture; and without ſuch inducement, it is fruitleſs for the government to attempt forcing their induſtry into that channel. So languid and backward is the agriculture of Peru at preſent, that Lima, and many other towns upon the coaſt, depend on Chili for their proviſions. This has been the caſe ever ſince the earthquake of 1693, which was followed by ſuch ſterility of the vallies of Low Peru, that the people ceaſed in many places to cultivate them; and though the country has ſince recovered, in a great meaſure, its former fertility, it ſtill remains uncultivated, and the maritime places continue to be ſupplied with proviſions by importation.

Deſerts of 20, 30, or 40 leagues in extent occur in every part of the coaſt from Tumbez to Atacama. The immenſe foreſts which clothe the maritime plains indicate that the population has been always ſcanty. Theſe foreſts conſiſt of acacias, mangle trees, brooms and ferns in prodigious variety, with tall aloes, and other ſucculent plants. Here we find the ferula or gigantic fennel, cedars of different kinds, cotton trees, many ſorts of ebony, and other woods. The talleſt tree is the "maria," uſed for maſts; and of the palm trees there are ten or twelve kinds. At the diſtance of ſeven or eight leagues from the coaſt the trees increaſe in ſize, and are often clothed with paraſitical plants. On paſſing the firſt chain of the Andes, the traveller finds the new region already deſcribed, and the face of the country as different as the climate.

As to the botany of this country, we know from the reports of travellers and navigators, that the vicinity of the coaſt produces many of the tropical plants and vegetables, ſuch as the cabbage-palm, the cocoa nut, the chocolate nut, the cotton ſhrub, the pine apple, the canna, amomum, turmeric, plantain, and ſugar cane; and, in the more temperate climate of the high plains, and upon the ſides of the Andes, it is natural to expect more hardy plants. The beſt and the moſt intereſting of theſe are the ſeveral ſpecies of cichona. Here are alſo found the cardana alliodora, which is a large timber tree, whoſe leaves and freſh wood emit a ſmell of garlic; and the coffæa racemoſa. Around the neighbourhood of Lima, the large-flowered jeſſamine and datura arborea diffuſe their evening fragrance. Among the Peruvian natives are reckoned no fewer than twenty-four ſpecies of pepper, and five or ſix of capſicum, beſides ſeveral eſculent kinds of ſolanum. Tobacco and jalap abound in the groves at the feet of the Andes, and many of the ornamental flowers of our Engliſh gardens and green-houſes owe their origin to theſe countries.

The zoology of Peru is little different from that of *La Plata*; which ſee.

In exploring the mineralogy of the Peruvian viceroyalty, it is found that, from the extreme province of Piura in the north to that of Canes and Canches in the ſouth, gold and ſilver follow the grand chain of the Alps; and though this country has loſt Potoſi and the ſouthern provinces, which have been annexed to the viceroyalty of La Plata, the amount of the coinage of Lima exceeds that of Potoſi. In Piura, at Hayabaca, muriate of copper has been found; and in the village called Amatape, 16 leagues from the town of Piura, is a celebrated mine of pitch or bitumen; and another mine has been more recently diſcovered, at the point of St Helena, in the juriſdiction of Guayaquil.

From the Mercurio Peruviano, cited by Mr. Pinkerton, we deduce an account of the chief mines, with the names of the new intendancies, the moſt modern diviſion of the viceroyalty, in which they are found. In the intendancy of *Lima*, with its dependency of *Guarachiri*, there are four mines of gold, 131 of ſilver, one of quickſilver, and four of copper; all of which were wrought in 1791, when this enumeration was taken. In the intendancy of *Tarma*, with its dependencies of *Paſco* and *Huallanca*, 227 mines of ſilver were actually wrought, 21 being neglected; and here were two lead mines, which furniſhed an abundant ſupply of this metal. In the intendancy of *Truxillo*, with its dependency of *Chola*, two of three gold mines, and 34 ſilver mines were worked, and 161 were abandoned. In the intendancy of *Guamanga*, with its dependency of *Lucanos*, 60 mines of gold,

gold, 102 of silver, and one of quicksilver, were wrought; three mines of the first metal and 63 of the second having been abandoned. In the intendancy of *Cuzco*, with its dependency of *Curahuasi*, 19 mines of silver were wrought. In the intendancy of *Arequipa*, with its dependency of *Cailloma*, one mine of gold, and 71 mines of silver were wrought; four of the former metal and 28 of the latter having been abandoned. In the intendancy of *Guantajaya*, with its dependency of *Tacna*, one mine of gold, and 20 mines of silver were wrought; 19 of the former metal and also 30 of silver having been abandoned. In the intendancy of *Guancavelica*, with its dependencies of *Castrovirayna* and *Lirca*, one mine of gold, 80 mines of silver, two of quicksilver, and ten of lead, were wrought; two of gold and 215 of silver having been abandoned. It is observed, that during a space of ten years, from the commencement of 1780 to the end of 1789, the above mines yielded 35,359 marks of gold, 22 carats fine; and 3,739,763 marks of silver. In the year 1790, the silver mines yielded 412,117 marks of that metal; being an excess of 38,147 marks over the average produce of the ten antecedent years. If we estimate the mark of gold at 125 piastres, and that of silver at eight piastres, the whole amount, in sterling money, of the produce of the mines, during the above ten years, will be found to have been 7,703,545*l.* Among the mines of Peru the most celebrated seem to be those of Cailloma, Pasco, Piedra-Parada, and Chota.

Peru produces a great number and variety of other minerals; such as basalt, the stone of the Incas, which is a compact marcasite capable of a high polish, the piedra del gulinazo, or obsidian, rock salt, besides curious stones of various colours. Ulloa's Voyage. Pinkerton's Geography, vol. iii. Mercuro Peruano. Edinb. Rev., No. 18.

PERU, a post-town of America, in Clinton county, New York, on the west side of lake Champlain; incorporated in 1791, and containing 1347 inhabitants.

PERU, *Balsam of.* See BALSAM.

PERVENCHERES, in *Geography*, a town of France, in the department of the Orne, and chief place of a canton, in the district of Mortagne. The place contains 771, and the canton 9728 inhabitants, on a territory of 190 kiliometres, in 14 communes.

PERUGIA, anciently *Perusin*, one of the most ancient and distinguished cities of Etruria. The era of its foundation long preceded that of Rome, and, like the origin of "Clusium, Cortona," &c. is almost lost in distance of time. In conjunction with all the other Etrurian states, it long resisted the Romans; and when subjected, or rather reconciled to them, it became a faithful and courageous ally. It defied the power of Hannibal, and flourished in peace and opulence till the reign of Augustus, when unfortunately it engaged in the rebellion of Lucius Antonius, uncle of the triumvir, and under his command shut its gates against Augustus, who took it, and, as it is asserted, wished to spare it; but one of its principal citizens setting fire to his own house, which he intended as a funeral pile for himself and his family, the flames communicated to the neighbouring buildings, and spreading rapidly, reduced the city to ashes. Perugia, however, rose immediately from its ruins; and, on its restoration, by a strange inconsistency, chose for its patron Vulcan, a divinity to whom it seems to have had very few obligations, as the god had spared his own temple only in the general conflagration. In the Gothic war it displayed much spirit, and stood a siege of seven years against these barbarians. It afterwards, with the whole Roman state, submitted to the pope; and, with some intervals of turbulent independence, has remained ever since attached to the Roman see.

Perugia is now a large, clean, well-built, and well-inhabited city. Seated on the summit of a mountain, it commands from its ramparts, and particularly from its citadel, an extensive view over a vast range of country, fertile, covered with hill and dale, and enlivened with villages and towns. There are many churches, convents, and palaces in this city, most of which were adorned with the paintings of Pietro Perugino, the master of Raffaello: of these the French carried off a considerable number, and defaced others, particularly such as were painted on walls, and could not be removed. The cathedral is in itself a very indifferent edifice, and its deformity is increased by the bad taste that seems to have prevailed in its repair and decorations. Several other churches merit attention, particularly that of St. Pietro, belonging to a Benedictine abbey: it is supported by eighteen pillars of fine marble, and adorned with an altar of the same materials, very rich and well disposed. Perugia has an university supplied with able professors, and several academies, all of which can boast of illustrious names; and it is upon the whole an interesting city, capable of entertaining the curious and inquisitive traveller for several days; 60 miles S.E. of Florence. N. lat. 43° 6'. E. long. 12° 17'.

PERUGIANO, a province of Italy, bounded on the north by the duchy of Urbino, on the east by Umbria, on the south by the Orvietan, and on the west by Tuscany; its greatest extent from north to south, and also from east to west, being 28 miles. It is crossed from north to south by the Tiber, and in it is a large lake, abounding in fish, called "Lacus Thrasimenus," near which Flaminius was defeated by Hannibal. The country is very fertile, and abounds in corn and wine. Its capital is *Perugia;* which see.

PERUGINO, PIETRO, in *Biography*, whose real name was Pietro Vanucci, was born at Perugia in 1446, of parents very low in station, but who finding in their son an inclination to painting indulged it, and placed him with an artist for instruction, under whose tuition he eagerly exerted himself, and acquired by his industry a degree of power very considerable among the earlier practitioners of the art.

He advanced still more with the assistance of Andrea Verrochio, and his talents were repaid with very great respect, particularly for a picture he painted of St. Jerome devoutly praying before a crucifix, which so raised his reputation, that his works were eagerly sought for through all the south of Europe.

Though Perugino thus obtained distinction as a painter, and very honourable employment, having considerably improved upon the style of his masters; yet he was very far indeed from successful rivalry with the powers of Massaccio. He was dry and hard in design, and too laboriously minute in finishing. His greatest glory arises from having been the first instructor of Raffaello; but his pupil, as soon as he beheld the grander style of Michael Angelo, L. da Vinci, and Fra. Bartolomeo, burst the bonds of the meaner style in which he had been educated, and left his master at a very humble distance.

The most capital work of Pietro Perugino in oil colour, is in the church of St. Peter at Perugia. It is an altar piece, and the subject is the ascension of our Saviour, with the disciples observing and adoring. He died in 1524, aged 78.

PERVIGILIA, in *Antiquity*, an appellation given to nocturnal festivals, celebrated in honour of several deities, as Ceres, Venus, Fortune, &c. They were so called because the nights were spent in waking.

PERVIGILIUM, in *Medicine*, exceſſive waking, or watching.

PERVINCA, in *Botany*. See VINCA.

PERUIPE, in *Geography*, a river of Braſil, which runs into the Atlantic, S. lat. 18° 20'.

PERVISE, or PARVISE, a term in our old *Law Books*, ſignifying, according to Selden in his notes on Forteſcue, an afternoon's exerciſe, or moot, which the pleaders held for the inſtruction of the younger ſtudents; bearing originally the ſame name with the parviſiæ in Oxford. See MOOT.

Mr. Somner ſays, that perviſe ſignifies *palatii atrium, vel area illa a fronte aulæ Weſtmonaſterienſis, hodie*, the *Palace-yard:* and Spelman thinks, that the lawyers turned thither to meet their clients, not to hold moots.

PERULA, in *Botany*, ſo altered by Schreber, from *Pera*, the name given by Mutis, which alludes to the form of the capſule, reſembling a little bag or ſatchel. Schreb. Gen. 703. Mart. Mill. Dict. v. 3. (Pera; Mutis in Stockh. Tranſ. for 1784. 299.)—Claſs and order, *Dioecia Polyandria*. Nat. Ord. *Tricoccæ*, Linn. *Euphorbiæ*, Juſſ.

Gen. Ch. Male, *Cal.* Perianth of two minute, oppoſite, oblong, rather concave, ſpreading leaves, the uppermoſt of which is twice the largeſt. *Cor.* of one petal, concave, hemiſpherical, dependent; heart-ſhaped at the baſe; ſcarcely emarginate at the ſummit. Nectary of ſeveral ſmall, many-cleft, ſomewhat plaited, erect membranes, inſerted into the receptacle between the two rows of ſtamens. *Stam.* Filaments numerous, (from 24 to 30,) diſpoſed tranſverſely in a double row, thickiſh, erect, the height of the nectary; anthers thickiſh, quadrangular, oblong, obtuſe, erect, riſing above the nectary. *Piſt.* Germens four, barren, minute, nearly globular, placed on very ſhort ſtalks at the angles of the receptacle above the nectary; ſtyle very ſhort, erect; ſtigmas three, in minute peltate ſegments, with prominent points.

Female, on a ſeparate tree, *Cal.* Perianth as in the male, deciduous. *Cor.* as in the male. Nectary as in the male, but its membranes are approximated, ſomewhat inflated, occupying all the diſk of the receptacle. *Piſt.* Germens four, fertile, inſerted into the receptacle as in the male, but rather larger, on ſhort ſtalks; ſtyle to each erect, ſhort, triangular; ſtigmas as in the male. *Peric.* Capſule obovate, ſlightly triangular, hanging out of the flower on its own elongated ſtalk, of three cells and three valves; the valves cloven, and finally divided to the very bottom. *Seeds* ſolitary, obovate, abrupt, ſmooth, ſmall.

Obſ. Mutis ſuſpects that what he has called calyx, may be bracteas. In this we readily concur. We would alſo call his corolla the calyx, concerning which point, if we are right as to the natural order, there can be no doubt. The part in queſtion is, according to him, globoſe before its expanſion, with a longitudinal ſuture, by the burſting of which the original or proper orifice becomes tranſverſe, the receptacle projects almoſt out of this corolla (or calyx), the flower becoming pendulous from the ſlightly drooping ſummit of the incurved flower-ſtalk. Under this view of the ſubject, we propoſe the following.

Eſſ. Ch. Male, Calyx concave, of one leaf. Petals none. Nectary a plaited membrane. Anthers quadrangular, ſimple. Germens four, abortive.

Female, Calyx concave, of one leaf. Petals none. Nectary a plaited membrane. Capſule ſtalked, obovate, of three cells and three valves. Seeds ſolitary.

1. P. *arborea*. (Pera arborea; Mutis as above, t. 8.)—Native of New Granada, about Mariquita, where it was found by Mutis. *Martyn.*

Our copy of the Stockholm Tranſactions being in this part defective, we have ſeen no figure of this plant, nor have we any ſpecimen.

PERUVIAN BARK. See CORTEX *Peruvianus*.

PERUVIAN *Emerald*. See EMERALD.

PERUVIAN *Maſtic Tree*. See SCHINUS.

PERUWELZ, in *Geography*, a town of France, in the department of the Jemmappe, and chief place of a canton, in the diſtrict of Tournay. The place contains 5302, and the canton 14,962 inhabitants, on a territory of 107½ kilometres, in 14 communes.

PERUZZI, BALDASSARE, in *Biography*, was born at Accajano, in the territory of Sienna, in 1481, in poor and diſtreſſed circumſtances; his father having been reduced from a ſtate of comparative affluence, by the civil wars which ravaged Florence and its territory. Baldaſſare exhibited his genius at a very early age; firſt by imitation of the works of others, and afterwards by original productions in the city of Volterra, where his family reſided. Thence he went to Rome, and placed himſelf with the father of Maturino; and becoming conſpicuous for ability, was at length employed by pope Alexander VI., and alſo in many churches and convents in that city, in which he produced pictures juſtly entitled to exalted praiſe.

Together with painting, he ſtudied architecture; and practiſed it with conſiderable ſucceſs. He was alſo renowned for his knowledge of perſpective; and the works he produced in imitation of architectural projections, excited even the ſurpriſe and admiration of Titian. But his higheſt renown is founded upon works of a much more elevated claſs; *viz.* his paintings in freſco and in oil; in which he exhibited a taſte and ſtyle not unworthy of Raphael. There is at Wilton a picture of his of the four evangeliſts in glory, with their peculiar characteriſtic accompaniments, which bears ample teſtimony to the truth of this remark; and perhaps it is the only real ſpecimen of his pencil in England. He wrote a treatiſe upon the antiquities of Rome, and a commentary on Vitruvius, but did not live to publiſh them; being poiſoned by ſome who were probably envious of his reputation and talents. He died in 1536, aged 55.

PERWEZ, in *Geography*, a town of France, in the department of the Dyle, and chief place of a canton, in the diſtrict of Nivelles. The place contains 904, and the canton 9612 inhabitants, on a territory of 145 kiliometres, in 28 communes.

PERYGUA, in *Botany*, a name given by ſome authors to a plant of the caſſine kind, called the *caſſioberry* buſh, and by ſome the *Paraguay tea*.

PERYSIAS, a word uſed by authors to expreſs wine of the laſt year's vintage.

PERZAGNO, in *Geography*, a town of Albania, on the canal of Cattaro.

PERZENE, a town of Italy, in the department of the Reno; eight miles N.E. of Bologna.

PES, a long meaſure, in Engliſh called foot.

PES *Foreſtæ*. See FOOT *of the Foreſt*.

PES *Leonis*, in *Botany*, a name by which ſome authors expreſs the *alchemilla*, or lady's mantle.

PES *Monetæ*, in *Ancient Records*, ſignifies a true and reaſonable adjuſtment of the real value of all current coin.

PES *Anſerinus*, in *Botany*. See CHENOPODIUM and ATRIPLEX.

PES *Capræ*. See CONVOLVULUS and OXALIS.

PES *Columbinus*. See GERANIUM.

PES *Tigridis*. See IPOMÆA.

PES *Anſerinus*, in *Anatomy*, the diviſion of the trunk of the

the fascial nerve into the ramifications, which spread over the face. See NERVE.

PESA, an old law-term for a weigh, or certain weight of cheese, wool, &c.

PESADE, or PESATE, in the *Manege*, that action taught a horse, wherein he rises with his fore feet, and bends them up to his body, without stirring the hind feet.

The pesade takes its name from the motion of the horse, which, in this action, leans and lays all the weight of his body upon his haunches. To be perfect, the hinder feet, which support the whole, ought to be fixed and immoveable, and the fore-part of the horse more or less raised, according as the creature will allow; but the fore-legs, from the knee to the feet, must always be extremely bent and brought under him.

The pesade is the first lesson taught a horse, in order to bring him to curvets, &c.: unless he performs this well, he will never go well in any air; yet he is not to be taught it at the first riding.

This is the foundation of all the *airs*, (see AIRS,) and is necessary to dispose and prepare the horse for all sorts of maneges: however, great caution should be used not to teach a horse to rise up, or stand upon his haunches, unless he is quite exact and obedient to the hand and heel: for in this case he would be thrown into disorder, his mouth would be spoiled, the appui falsified, and he would become restive. When he is fit for this exercise, work him upon the walk, the trot, and the gallop; stop him in the hand, keep him firm and moderately together; aid with the tongue, the switch, and your legs; and when he begins to comprehend what you would have him do, encourage and caress him, working him gently and by degrees. Sluggish and heavy horses require, in the beginning, stronger and sharper aids. There are other horses, which are apt to rise of themselves; this should be prevented, by driving them forward. Berenger's Art of Horsemanship, vol. ii. chap. 16.

PESAGE, PESAGIUM, a custom or duty paid in certain markets, &c. for weighing of merchandises, or wares.

PESAGOONDAN, in *Geography*, a town on the W. coast of Borneo. N. lat. 2° 12′. E. long. 109° 58′.

PE-SAN, a small island near the coast of China. N. lat. 26° 52′. E. long. 120°.

PESARO, or PEZARO, a town of Italy, in the duchy of Urbino, at the mouth of the Fogna, on the Adriatic; the see of a bishop, suffragan of Urbino; containing eight churches, and twelve convents. In its environs are figs and olives, which are much valued. Its ancient name was "Pisaurum:" it was made a Roman colony about A.U.C. 568; and a temple was built here to Jupiter Pisaurus. According to Plutarch, it was ruined by an earthquake, and rebuilt by order of Augustus. Totila, king of the Goths, took and ruined it; but it was afterwards rebuilt by Belisarius, general to the emperor Justinian. It became successively subject to the dominion of the Malatesta, Sforza, and Borgia families, and last of all, of the popes. It is situated upon a small eminence near the Adriatic sea, and pretty well fortified; 15 miles N.E. of Urbino. N. lat. 43° 56′. E. long. 12° 52′.

PESATE, in the *Manege*. See PESADE.

PESCA PAGANI, in *Geography*, a town of Naples, in Basilicata; six miles N.W. of Muro.

PESCARA, a town of Naples, in Abruzzo Citra, at the mouth of a river of its name, which runs into the Adriatic at this place; it is fortified and defended by a castle; 10 miles N. of Civita di Chieti. N. lat. 42° 27′. E. long. 14° 6′.

PESCAROLO, a town of Italy, in the department of the Upper Po; nine miles N.E. of Cremona.

PESCE VACCA, the *Cow-fish*, in *Ichthyology*, a name given by Augustino Scilla to a kind of dog-fish, not described by any author before his time, but accurately drawn by him in his book on petrifactions, on occasion of its teeth: many species of the glossopetræ of the island of Malta, and other places, being plainly the same with the teeth in the jaws of this fish.

PESCHIERA, in *Geography*, a town of Italy, in the department of the Benaco, on the S. coast of the lake Garda. This small, but important fortress, was built by the Venetians in 1549. Its houses are few, and on the side of the lake it has an arsenal for some light gallies; 15 miles W. of Verona. N. lat. 45° 7′. E. long. 10° 42′.

PESCHISE, a town of Naples, in Capitanata; 11 miles N.W. of Vieste.

PESCIA, a town of Etruria, the see of a bishop; containing three parochial, and seven other churches, and five convents. It has a manufacture of oil, which is much esteemed; 10 miles S.W. of Pistoya.—Also, a town of Italy, in the Trevisan; seven miles S. of Trevigio.

PESCINA, a town of Naples, in Abruzzo Ultra; five miles S.E. of Celano.

PESCINA *Pompeia*, a town of Naples, in the province of Bari; nine miles N. of Matera.

PESCINA *di Fratri*, a town of Naples, in Capitanata; eight miles W. of Vieste.

PESCO CASTRARO, a town of Naples, in Abruzzo Ultra; 11 miles N.E. of Aquila.

PESCO *Costanzo*, a town of Naples, in Abruzzo Citra; seven miles S.E. of Sulmona.

PESCO *Laurino*, a town of Naples, in Principato Citra; 18 miles N.W. of Policastro.

PESCO *Pagano*, a town of Naples, in the province of Otranto; 11 miles N.E. of Tarento.

PESCO *Verraro*, a town of Naples, in Principato Ultra; 12 miles from Benevento.

PESEQUEIRO, a small island in the Atlantic, near the coast of Portugal. N. lat. 37° 40′. W. long. 8° 52′.

PESHWA, or PAISHWA, the hereditary title of the head of the Poona or western Mahrattas. The word has a meaning analogous to our first or prime minister; but has been retained by the persons who, for several generations, have hereditarily succeeded to the sovereignty. The history of the peshwas, according to the best authorities, is briefly this. About the year 1740, the peshwa and bukshi, minister and paymaster-general to the ram raja, acknowledged sovereign of the whole Mahratta empire, threw off their allegiance to the weak successor of the great Sevaji, and divided his extended empire between them. (See MAHRATTAS.) The bukshi was of the military tribe, out of which, in strictness of Hindoo law, all sovereigns must spring, and he assumed the title and authority of raja of Berar, and fixed his capital at Nagpour, where, with that title, his successors continue as sovereigns of the Berar, or eastern Mahratta state. (See BERAR and NAGPOUR.) The peshwa was a Brahman, to which tribe sovereignty is positively prohibited by the laws of Menu. (See MENU.) And in obedience no Brahman hath ever become a king; for although the peshwa have, in fact, the power, he by a political fiction professes to be only peshwa to the reigning family at Sattara, where the descendant of Sevajee is kept a state pageant, whose patent and dress of investiture are still thought or feigned to be essential to the peshwa's authority, though that authority has been hereditary for several generations,

rations, each of which has kept the raja in honourable thraldom at his ancient capital.

At the time of the above-mentioned violent partition of the empire, Balaji, fon of Vifwanatha, was pefhwa, he was fucceeded by his fon Bajy Rao, or Bajerow. He was fucceeded by his fon Balaji Baji Rao, who died in 1761, when his fon and fucceffor Mhadu Rao was but fifteen years old. Raganath Rao, the brother of the late pefhwa, affumed the guardianfhip of the minor, and retained the power of a regent to an undue period, which involved the ftate in fome troubles, and himfelf in imprifonment. He was, however, releafed by his nephew, who foon after died, in 1772, leaving the pefhwafhip to his brother Narayan Rao, and confiding him to the efpecial care of the uncle Raganath. It may be noted here, that the widow of Mhadu Rao burnt herfelf on the pile with her hufband's corpfe. Her name was Rama Bye. (See SATI). Raganath Rao, better known in the fubfequent troubles of the weftern fide of India by the name of Ragoba, pledged himfelf to the protection of the young pefhwa Narayan Rao, whom he caufed to be murdered the following year. His widow Gangabye was defirous of becoming a fati, or felf-devoted victim to the flames, but fhe was found to be pregnant, and the Brahmans foretold a future pefhwa; and the facrifice was not permitted.

The Mahratta nation was indignant at the atrocious murder of the pefhwa, and Ragoba was compelled to flee from its juft refentment. After various attempts to obtrude himfelf on the nation, he was forced to yield, and was with his family imprifoned, and he died in confinement. He had two fons, Baji Rao, and Chimnaji Appah; and he had, before their birth, in defpair of male iffue, adopted a lad named Amrit Rao. Thefe three were alfo kept in confinement.

The widow of the murdered Narayan Rao was delivered of a fon, who was acknowledged as the rightful pefhwa, and Nanna Furnaveefe, as dowan, or minifter; and during the minority, the latter great man ruled the empire. The pofthumous fon of the late Narayan Rao was named Mhadu Rao, and he was killed by a fall from his palace at Poona in 1795, leaving no fon. Nanna Furnaveefe, the fole minifter, during a long minority, unwilling to refign his power, endeavoured to obtain another minority, by caufing the widow of the deceafed to adopt a child; but finding his political opponents determined on fruftrating his views by an act of juftice, he refolved on anticipating them in that point, and brought the family of Ragoba from their imprifonment, and placed the eldeft, Baji Rao, in the pefhwafhip, to which he had the hereditary right. In confequent troubles and contentions of parties, he has been more than once depofed and forced to flee his capital, and latterly his country; to both of which he was reftored by the interpofition of a Britifh force under general Wellefley, (now field marfhal Wellington), and it feems likely, that under the prefent government, guaranteed and protected by the Englifh, the Mahratta empire will enjoy a feries of peaceful years, which it has hitherto never known. It may be noticed, that Amrit Rao has been fufpected of fomenting the troubles that have of late years convulfed the Mahratta ftates. Difappointed in his views on the pefhwafhip for himfelf or his fon, he has contrived to obtain Britifh fecurity for about 70,000*l.* fterling *per annum*, and under Britifh protection has retired to Benares, the ufual refuge with Hindoos of difcontentment and difappointed ambition.

PESINGAN, in *Geography*, a town of Candahar; 90 miles S.E. of Candahar.

PESMES, a town of France, in the department of the Upper Saone, and chief place of a canton, in the diftrict of Gray; 10 miles S. of Gray. The town contains 1688, and the canton 15,188 inhabitants, on a territory of 282½ kiliometres, in 37 communes. N. lat. 47° 17'. E. long. 5° 39'.

PESOLA, a lake of Naples, in Bafilicata, at the foot of the Apennines.

PESQUERA, a town of Spain, in the province of Leon, near the Duero; 28 miles S.E. of Leon.

PESSAC, a town of France, in the department of the Gironde, and chief place of a canton, in the diftrict of Bourdeaux. The place contains 1336, and the canton 7686 inhabitants, on a territory of 505 kiliometres, in 8 communes.

PESSARY, an inftrument, machine, or contrivance, invented for the purpofe of reftraining the uterus, and preventing it from defcending into the vagina, of paffing the external orifice, and appearing externally. This complaint, a defcent of the uterus, is in a particular manner incident to women who have had feveral children, efpecially fuch as have had difficult labours, or who have fuffered from laceration of the perinæum. It is not, however, entirely confined to fuch fubjects. Some women who have never been pregnant, of feeble habit of body, or who have long fuffered from fluor albus, are fubjected to this accident; alfo wafher-women, laundreffes, and thofe whofe occupations oblige them to be much on their feet, or to carry heavy loads.

Reft, cold aftringent injections into the vagina, and bracing or ftrengthening medicines, may affift fomewhat in the cure, but it is only to be completely effected by wearing a peffary. See *Bearing down of the* WOMB.

Peffaries are of various forms; but that in moft frequent ufe, and which is generally found to anfwer the purpofe, is the ring peffary; a circular piece of box, or other light wood, two, three, or four inches in diameter, and about a third of an inch in thicknefs, with a hole cut through its centre to allow a paffage for the menftrual flux. Some prefer them of an oval fhape, and made of cork, but they are not fo eafily retained in the paffage. Others make ufe of a globular ball; but thefe, for obvious reafons, can only be ufed by women who have no hufbands. Women fometimes conceive while wearing a ring peffary. In fuch cafes, the peffary muft be taken away when they are about five months advanced in pregnancy.

When a peffary is intended to be introduced, the woman fhould confine herfelf to her room for a day or two, and principally in a recumbent pofture, and take an opening medicine, that the uterus may have an opportunity of retracting or returning to its natural fituation, and may be reduced in bulk. Thefe preliminary fteps being taken, fhe muft be laid on a bed, on her left fide, her head only raifed on a pillow, her knees drawn up to her belly. The furgeon will then open the labia of the pudenda with the forefinger of his left hand, which he will pafs through the external orifice, to enlarge it a little, then taking a peffary, of a proper fize, anointed with lard, in his right hand, he will introduce it edgeways. When it is completely within the vagina, he will turn it, that it may lie horizontally, one face of it oppofite to the os uteri, the other looking downward to the os externum.

The peffary fhould be fo large as to pafs the os externum with difficulty, otherwife it will fall out again when the woman is on her legs. The hole in the centre fhould be large, that if the os uteri fhould enter it, it may not be ftrangled, which might occafion pain, and perhaps fome ferious mifchief.

PESSOMANTIA, Πεσσομαντεια, in *Antiquity*, the fame with cleromancy.

PEST, or PESTH, in *Geography*, a royal and free town of Hungary, on the E. fide of the Danube, oppofite to Buda. See BUDA.

PESTDON, a town of Pruffia, in Pomerelia; 10 miles S. of Marienburg.

PESTERABLE, in our *Old Writers*, an epithet for fuch wares as *pefter*, or take up much room in a fhip. Stat. 32 Hen. VIII. cap. 14.

PEST-HOUSE, a lazaretto, or infirmary, where goods, perfons, &c. infected, or fufpected to be infected with fome contagious difeafe, are difpofed, and provided for. See LAZARETTO.

PESTI, in *Geography*, a town of Naples, in Principato Citra, fituated near the ruins of the ancient *Pæftum*; which fee.

PESTICCIA, a town of Naples, in Bafilicata; 9 miles N. of Turfi.

PESTILENCE, formed from *peftis*, which fignifies the fame, in *Medicine*, an epidemical, malignant, and contagious difeafe, ufually mortal, popularly known under the name of *plague*; which fee.

PESTILENCE-*Wort*, in *Botany*. See TUSSILAGO.

PESTILENTIAL CARBUNCLE. See CARBUNCLE.

PESTILENTIAL *Difeafes*. See DISEASE.

PESTILENTIAL *Fevers*, among *Phyficians*, are fuch as do not only afflict the patient with a vehement heat, but alfo with fome malignant and venomous quality, and in fome approach to the nature of the plague.

PESTIVIEN, in *Geography*, a town of France, in the department of the North coaft; 9 miles S.S.W. of Guingamp.

PESTOVSKOI, a town of Ruffia, in the government of Viatka, on the Suran; 48 miles N.N.E. of Slobodfkoi.

PESU, or SIU, a city of China, of the fecond rank, in Kiang-nan, on the river Hoang. N. lat. 34° 10′. E. long. 117°.

PESVER, a town of Perfia, in the province of Irac; 60 miles W. of Kermanfha.

PESUNSCUT, a river of America, in Cumberland county, Maine, which purfuing a winding courfe of 20 miles, carries off the furplus water of Sebacook pond into Portland bay.

PETACCIATA, a town of Naples, in Abruzzo Citra; 22 miles S.E. of Civita Borella.

PETAGUIL, a territory of South America, in Brazil; bounded N. by Dale, E. by the South Atlantic ocean, S. by the captainfhip of Rio Grande, and W. by Tupuy: it contains mines of filver.

PETAJA, a town of Sweden, in Tavaftland; 22 miles N. of Jamfio.

PETALIONS, a clufter of fmall iflands in the Grecian archipelago, near the S.W. coaft of the ifland of Negropont. N. lat. 37° 59′. E. long. 24° 16′.

PETALISM, PETALISMUS, πεταλισμος, in *Antiquity*, a kind of exile or banifhment, for the term of five years.

The petalifm at Syracufe was nearly the fame thing as the oftracifm at Athens, except that the latter was for ten years, and the former only for five.

The petalifm was performed by the people's writing the name of the perfon condemned, on a leaf; whence the term from πεταλον, *leaf*.

PETALODES, πεταλωδης, a name given to urine, when it feems to have little leaves, flakes, or fcales in it.

PETALOMA, in *Botany*, a new Weft Indian genus, eftablifhed by Swartz, and named by him, from πεταλον, *a petal*, and λωμα, *a border*; becaufe the petals are inferted into the margin of the calyx, between its teeth. Swartz Prodr. 73. Ind. Occ. v. 2. 831. Schreb. 802. Willd. Sp. Pl. v. 2. 542. Mart. Mill. Dict. v. 3. (Mouriria; Juff. 320. Lamarck Illuftr. t. 360. Mouriri; Aubl. Guian. v. 1. 452.)—Clafs and order, *Decandria Monogynia*. Nat. Ord. *Calycanthemæ*, Linn. *Onagræ*, Juff.

Gen. Ch. *Cal.* Perianth fuperior, of one leaf, cup-fhaped, permanent, with five acute, equal, flightly fpreading teeth. *Cor.* Petals five, oblong, fpreading, their claws inferted between the teeth of the calyx, deciduous. *Stam.* Filaments ten, inferted into the rim of the calyx, longer than the corolla; anthers oblong, incumbent, opening by two pores at one end. *Pift.* Germen inferior, ovate; ftyle elongated, awl-fhaped; ftigma fimple, acute. *Peric.* Berry globofe, flefhy, crowned by the calyx, of one cell. *Seeds* from one to four, angular on one fide, convex on the other.

Eff. Ch. Calyx pitcher-fhaped, five-toothed. Petals five, inferted between the teeth of the calyx. Stamens inferted into its border. Berry of one cell.

1. P. *myrtilloides*. Sw. Ind. Occ. 833. Willd. n. 1. (Myrti folio arbor, cortice argenteo, foliis oblongis ad bafin latioribus, acuminatis, inodoris, ex adverfo fitis, flore pentapetaloide pallidè albicante; Sloane Jam. v. 2. 78. t. 187. f. 3.)—Stalks folitary, fingle-flowered. Leaves nearly feffile, ovate, taper-pointed, oblique at the bafe.—Native of Hifpaniola and Jamaica, in low woods; being known in the laft-mentioned ifland by the name of Silver wood. Swartz defcribes it as a *fhrub*, two or three feet high; Sloane fays the *trunk* is twenty feet in height, ftraight and undivided. Both agree that the *bark* is fpotted with white, whence arofe the Englifh name. The *leaves* are oppofite, entire, thin, fmooth, and inodorous, one and a half or two inches long. *Flowers* axillary, folitary, rarely oppofite, on fhortifh ftalks, white, fmaller than a currant bloffom, but with long projecting *ftamens* and *ftyle*. *Berry* ovate, crowned with the *calyx*, black and fhining when ripe, with feldom more than one *feed*. The afpect of the whole plant is like fome fpecies of myrtle, but it wants the ftrong tafte and fmell of that genus, and the ftructure of the *flowers* is totally different.

2. P. *Mouriri*. Sw. Ind. Occ. 835. Willd. n. 2. (Mouriri guianenfis; Aubl. Guian. v. 1. 453. t. 180.)—Stalks cluftered. Leaves ftalked, broad-ovate, pointed. Berries with four feeds—Native of woods in Guiana, near the river of Sinemari, where Aublet found it flowering in November, and bearing ripe fruit in January. The *trunk* of this tree is thirty or forty feet high, and eighteen inches in diameter, bearing at the top numerous *branches*, fpreading in every direction. The *bark* is grey; the *wood* whitifh, hard and clofe-grained. *Leaves* longer, and much broader than thofe of the foregoing, as well as of a firmer texture, paler underneath, but fmooth and fhining on both fides. *Footftalks* fhort and thick. *Flower-ftalks* axillary, cluftered, and fomewhat umbellate, with fmall, oppofite, acute *bracteas*. *Flowers* yellow. *Anthers* with a fort of fpur at their bafe. *Berry* yellow, minutely dotted with red, containing four *feeds*. Nothing is recorded of the qualities or ufe of this tree, but the inhabitants of the country where it grows name it *Mouririchira*.

PETALOSTEMUM, fo called by Michaux, from πεταλον, *a petal*, and στημων, *a ftamen*, on account of the union of thofe two parts of the flower into a tube. Michaux Boreal-Amer. v. 2. 48. t. 37. See DALEA.

PETALUM, the petal, or leaf of the flower, πεταλον of the

the Greeks, is either simple, as in the Primrose and Jasmine, or compound, as in the Rose. The two former are termed monopetalous flowers, the latter polypetalous. Linnæus observes, that when the nectary is a distinct organ from the petals, flowers so constructed are to be suspected as poisonous. Both together constitute the COROLLA; see that article, as well as NECTARIUM, and FECUNDATION *of Plants*.

PETAMINARIUS, in *Antiquity*, a name given to certain persons who performed extraordinary feats of activity; took perilous leaps, vaults, &c.

The word is formed from the Greek, πέταμαι, *volo*, *I fly*. Some authors write it *petiminarius:* and derive it from *petimen*, which, according to Servius, signifies the hunch of a camel: alluding to the manner in which these operators bend the body, in exhibiting postures, &c.

PETAPA, in *Geography*, a town of Mexico, in the province of Culiacan, on a river of its own name; 120 miles N.W. of Culiacan. N. lat. 25° 30′. E. long. 104° 34′.

PETAPOLLY, a town of Hindoostan, in the circar of Rajamundry; 26 miles N.E. of Rajamundry.

PETARD, in *War*, a kind of engine of metal, somewhat in shape of a high crowned hat, or truncated cone; serving to break down gates, barricades, draw-bridges, or the like works which are intended to be surprised.

The petard may be considered as a piece of ordnance, very short, narrow at the breech, and wide at the muzzle, made of copper mixed with a little brass; or of lead with tin; usually about 8.5 inches within at the bottom; the diameter at the beginning of the round part is six, and distant from the lower base nine inches: the circular part is described from the point where the perpendicular to the sides meets the middle line or axis; the thickness of metal is 1.6 inches; there is a brim at the bottom, that projects the metal by two inches, and is one inch thick, in which are six holes of half an inch diameter, which serve for screws to fasten the petard on a board in a firm manner; there is a cavity within at the bottom, half an inch deep, and as much in height, to fix a board, in order to keep the charge in the petard before it is fixed to the board or plank. There are likewise two handles, of about three inches from the flat ring, five inches long, $\frac{7}{10}$ thick, and 1.8 from the outside of the metal. Lastly, a hole of an inch diameter is made either at the top, or on the side, to screw in an iron fuse, by which the powder is fired, which fuse is filled with a slow composition, in order that when it is lighted, the petardier may have time to retire out of danger. See the section of a petard in *Plate* I. *Gunnery*, *fig.* 4.

In Grose's "Military Antiquities," vol. i. we have a plate, with figures, representing the petard, and the boards, &c. to which it is fixed, and also two different methods of applying it.

Petards are made of various dimensions: but the biggest should not weigh above seventy pounds when loaded and fixed to its plank, and the least not less than forty-five or fifty. The common and best way of loading the petard is to fill it gradually with powder, and between every layer of two or three inches thick, to put a wooden mould into the petard, which should be beat upon with a mallet, so as to press the powder as close together as possible, without bruising the grains; and when it is quite full, the board is put upon the powder, and over this a cloth with rosin, and bound round the brim with packthread, to keep the charge and board together till the petard is screwed on the plank or board, called the "madrier;" then the part that exceeds the brim is cut off, and the other being pressed by the brim, prevents any air from coming to the powder. The board to which the petard is fixed has two iron bands on the back, placed cross-ways, and a hook to hang it up against the gate or door, by means of a screw, when it is to be used. Some moisten the powder with spirits of wine, and dry it in the sun, in order to make it stronger, and then sprinkle every layer of powder of two inches in thickness with mercury, upon which they lay powder again, and press it down, sprinkling it with mercury, till the petard is filled.

Its use is in a clandestine attack, to break down gates, bridges, barriers, &c. to which it is hung: which it does by means of the wooden plank. It has been also used in countermines, to break through the enemies galleries, and give vent to their mines; but in later years the use of petards has been discontinued.

Petards are sometimes also made of wood, bound round with iron hoops.

The invention of petards is ascribed to the French Huguenots, in the year 1579. Their most signal exploit was the taking of the city of Cahors by means of it, as we are told by d'Aubigne. In December 1641, Arundel castle was taken by the parliamentary forces, under sir William Waller and Col. Browne, who coming unexpectedly, and finding the castle-gate shut, blew it open with a petard.

PETARDIER, in the *Military Art*, is he who loads, fixes, and fires the petard.

PETASITES, in *Botany*, πετασίτης of the Greeks, the Butter-bur, owes that name to its large round leaf, resembling a very broad hat or umbrella, πέτασος. See TUSSILAGO.

PETASUS, among the Romans, a covering for the head, not unlike our hats; it had a broad brim, and was used in journies, to save the face from being sun-burnt.

The pileus differed from the petasus, as having no brim.

The petasus is observed upon the head of ancient figures of Mercury; who wore it in the quality of the god of travellers and merchants.

PETATLAN, in *Geography*, a town of Mexico, in the province of Culiacan, on a river of the same name, which runs into the Pacific ocean, N. lat. 25° 30′. The town is distant 120 miles N.W. from Culiacan. N. lat. 25° 30′. W. long. 104° 34′.—Also, a town of Mexico, in the province of Mechoacan; 70 miles S.E. of Zacatula. N. lat. 18°. W. long. 102° 6′.

PETAWONTAKAS, an Indian nation of America, formerly in alliance with the Hurons.

PE-TA-YANG, a small island in the Chinese sea. N. lat. 26° 2′. E. long. 119 49′.

PE-TCHE-LI, or PE-CHE-LEE, called also *Tcheli*, or *Li-pa-fou*, the principal province of China, which approaches to the form of a right-angled triangle, and is bounded on the N. by the great wall and part of Tartary, on the E. by the sea of Corea, on the S. by the provinces of Chang-tong, and Ho-nan, and towards the W. by the mountains of Chan-si. It contains nine cities of the first class, with their respective jurisdictions, which comprehend a great number of other cities, less considerable, but all surrounded with walls and ditches. Cities of the first rank are distinguished by the appellation *fou;* those of the second rank by *tcheou;* and those of the third rank by *kien*. The capital of this province is Pekin; which see. Pe-tche-li is very much a level country, and has few mountains; and therefore it allows of the use of a singular kind of carriage, with one wheel, and constructed so that there is room in the middle for only one person, who sits as if he were on horseback; the driver pushes behind, and by means of wooden levers,

levers, makes the carriage, which is a fort of chariot, advance with fafety and expedition. The foil of this province is fandy, and produces very little rice; but all other kinds of grain are abundant, as well as moft of the fruit-trees which we have in Europe. The rivers fupply abundance of fifh, and the mountains have mines of coal. The temperature does not feem to agree with its latitude. Although it extends no farther than to 42° N. lat., yet all the rivers are frozen, during four months in the year, from the middle of November to the middle of March, to fuch a degree, that horfes and waggons, with the heavieft load, may fafely pafs over them. It is remarked, as a fingular circumftance, that the whole body of ice is formed in one day, and that feveral days are requifite to thaw only the furface. The rainy feafon occurs towards the end of July, and the beginning of Auguft: there is little rain at any other time, but the night dew fupplies the want of it. It is obferved by Grofier that the people of this province have not the fame aptitude for acquiring literature and fcience, as thofe who inhabit the fouthern provinces of the empire; but they are more robuft and warlike, and better fitted for enduring the hardfhips and fatigues of war. The fame obfervation applies to the Chinefe of all the other northern countries. This province is diftinguifhed from all others, by being, as it were, the depot of the richeft productions of the whole empire. According to the ftatement of fir George Staunton, in the appendix to the fecond volume of the "Embaffy to China," this province contains 58,949 fquare miles, or 37,727,360 acres, and 38,000,000 of people. The revenue which it remits into the imperial treafury at Pekin, amounts to 3,036,000 takels, or ounces of filver, *viz.* 2,520,000 land, 437,000 falt, and 79,000 other taxes.

PETCHORA, or Petshora, a river of Ruffia, called alfo *Bolfkaia*, or great *Petchora*, by way of diftinction from the Vifhera, which the Siryanes call Petfhoyra, whence originates the name, takes its rife on the weftern fide of the Ural mountains, in the government of Vologda, follows a N.W. courfe, and falls into the Frozen ocean, in the government of Archangel, after dividing into feveral powerful arms. It now flows through a low, forefty, and almoft uninhabited country. At firft, when Siberia was conquered, the way thither was generally by the Petchora. Thofe who vifited that country, failed up the Duina, the Vichegda, and the Vim, then went a fhort fpace by land to the Petchora, then up that river, and by land over the Ural mountains to the Sofva; hence into the Tavda, the Tobol, the Irtyfh, the Oby, the Ket, and from the Ket into the Yeniffey, &c.

PETECHIÆ, in *Medicine*, otherwife called *Peticulæ*, *Puncticula*, *Senticulæ*, &c., are fmall purple, reddifh, livid, or blackifh fpots upon the fkin, occafioned by the effufion of a minute portion of blood under the cuticle, or fcarf-fkin. When thefe fpots are very minute, like fmall points, they are called *ftigmata*; when they are large, and fpread into broad irregular patches, like the effufions occafioned by a bruife, they are called *ecchymofes* and *ecchymomata*; and when they occur in ftripes, like the effects of the ftrokes of a whip, they are denominated *vibices*.

Petechiæ occur under various circumftances, but are moft frequently feen in fevere fevers, of a dangerous and malignant character, efpecially in typhus, when it exifts in gaols, hofpitals, and the ill-ventilated habitations of the poor; they are occafionally feen intermixed with the puftules of fmall-pox, efpecially of the confluent kind, and with the worft fpecies of fcarlet fever. Whence they have generally been accounted indications of great danger, and have been confidered as figns of the general putrefcency of the circulating fluids, and as demanding the exhibition of the moft powerful ftimulants and antifeptics, whenever they appear.

On the contrary, however, petechiæ of the largeft dimenfions, and even extenfive ecchymofes and vibices, together with actual hæmorrhages, are occafionally feen, unaccompanied by fever, and fometimes with but little derangement of the health. Whence authors have written of "Petechiæ fine febre" as a diftinct difeafe, which has been alfo called Purpura, Hæmorrhæa *Petechialis*, &c. See the former of thefe words, where this chronic petechial difeafe will be found defcribed at length.

It is but too obvious, that the nature of thefe petechial fpots is not yet fufficiently underftood: but fome recent light has been thrown upon the fubject by medical obfervers, which bids fair to lead both to a more fatisfactory theory and practice in refpect to them, as will be ftated in the article juft referred to.

PETECHIAL Fevers are thofe varieties of typhus, in which petechiæ occur in confiderable numbers, conftituting one of the moft prominent features of the difeafe. See Typhus and Fever.

PETELMA, in the *Turkifh Military Orders*, is the procurator-general of the effects of the Janizaries. When any one dies under the protection of this body, he feals up their houfes, to fecure the tenth part of their effects; which is due to the Janizaries.

PETER, Simon, in *Scripture Biography*, whofe furname Cephas, or Petrus, Peter, fignifies a ftone or rock, was born at Bethfaida, upon the banks of the fea of Galilee; and his occupation was that of a fifherman upon this lake, as was alfo, in all probability, that of his father Jonas, Jonah, or John. He had a brother, whofe name was Andrew, fuppofed by fome writers to have been older, but more generally, younger than himfelf. Andrew, as we learn from the gofpel of St. John (ch. i. 35—42.), firft introduced his brother, Peter, to an acquaintance with our Saviour; and as he had received Jefus as the Meffiah, Peter readily concurred in the fame belief and profeffion. From the teftimony of John, by whom they had been probably baptized, and from perfonal converfation with our bleffed Lord, they were convinced that he was the promifed Meffiah; and it is likely that from this time they had frequent intercourfe with him, and were witneffes of fome of the miracles which were wrought by him, and particularly of that performed at Cana in Galilee. (John, ii. 1. 2.) The call of Andrew and Peter to a ftated attendance on Jefus is recorded by three evangelifts; after which event they became his intimate companions, and when he completed the number of his apoftles, they were included among them. At the time of Simon Peter's being called to attend upon our Lord, he was married, and upon occafion of that alliance, he feems to have removed from Bethfaida to Capernaum, where his wife's family refided. It appears alfo, that when our Lord "left Nazareth, and came and dwelled at Capernaum" (fee Matt. iv. 13.), he took up his occafional refidence in Peter's houfe, and hither the people reforted to him in the evening, as we read in Luke, iv. 40. Matt. viii. 16. Mark, i. 32. 34. See alfo Matt. xvii. 24—27. In the evangelical hiftory of this apoftle, the diftinguifhing features of Peter's character are very fignally pourtrayed; and it redounds in no fmall degree to the credibility of the hiftorians, that they have blended, without difguife, feveral traces of his precipitance and prefumption with the honourable teftimony which their narration of facts affords to the fincerity of his attachment to Chrift, and the fervour of his zeal in the caufe of his bleffed mafter. Of his

his modesty and humility we have a memorable instance in the account which St. John has given of our Saviour's washing the feet of his disciples (ch. xiii. 1—10.); and the ardour of his spirit is strikingly evinced in his conduct towards the servant of the high priest, whom he smote with his sword, and whose right ear he cut off, when the Jewish officers were about to apprehend our Lord. (John, xviii. 10, 11. Matt. xxvi. 51—54. Mark, xiv. 46, 47. Luke, xxii. 50, 51.) In the subsequent scene, however, his resolution, notwithstanding the vehemence with which he had avowed his invincible attachment to his master, and the caution which he had received, unhappily failed him. Although he followed his master afar off unto the high priest's palace, an anxious witness of the event, when the rest of the disciples forsook him and fled, he thrice disowned him, peremptorily denying that he was one of his disciples, or had any knowledge of him. This dereliction and denial of Christ, in circumstances of peculiar trial, soon after humbled and grieved him, and he wept bitterly. It does not appear, that Peter followed our Lord any farther, or that he at all attended the crucifixion. It is likely, that he was too deeply affected with sorrow and shame to appear in public, and that he chose retirement, as most suitable to his present temper and circumstances. In the sequel of his history, our blessed Lord manifested, in the most amiable and impressive manner, the singular sympathy and condescending benevolence of his temper; for he singles out Peter by name as one of the disciples to whom the report of his resurrection was to be announced; and on the same day on which he arose from the dead, he appeared to this apostle, though the circumstances of this appearance are no where related. (See Luke, xxiv. 33, 34. 1 Cor. xv. 4, 5.) Hence it has been observed, to the honour of our Lord's philanthropy and compassion, that as Mary Magdalene was the first woman, so Peter was the first man to whom Jesus shewed himself after he was risen from the dead. On another occasion, recorded in the 21st chapter of St. John's gospel, our Lord affords Peter an opportunity of making a three-fold profession of love for him; and notwithstanding his late unsteadiness, he encouraged this disciple to hope, that in his future conduct he would set an example of resolution and fortitude under great difficulties, and at length glorify God by his death, in the service to which he had been appointed.

Dr. Lardner has selected from the four evangelists several particular instances, which serve to indicate the peculiar distinction of St. Peter, and that redound in no small degree to his honour. He concludes this detail with observing, that as our sacred historians were not envious, and that Peter was not assuming and arrogant among his brethren, so neither were they fond and partial. The several advantages and virtues of Peter are recorded by some only; but his fault in denying Christ, when under persecution, is related by all.

Soon after our Lord's ascension, Peter, who seems to have presided in the college of the apostles, proposed a successor to Judas; and he seems to have had a primacy of order among the apostles, being named first when several of them are mentioned; although there is not the least foundation, either in the gospels, or the Acts, for ascribing to Peter any jurisdiction over his brethren. On the day of the ensuing pentecost, Peter distinguished himself by a discourse delivered to a very numerous audience, in which he asserted the resurrection of Christ, with such commanding energy, that about 3000 were converted and baptized. (Acts, ii. 14—47.) On another occasion he accompanied a miracle, wrought by himself and John, with an address to the people, by which many were awakened and convinced; and in a short time after this, the number of believers at Jerusalem was about 5000. (Acts, iii. and iv. 4.) But the Jewish priests and rulers were much offended; and whilst Peter and John were speaking to the people, the officers, whom they had commissioned for this purpose, laid hold on them and put them in prison till the next day, when they were examined, and at length dismissed, with a strict charge, enforced by a severe menace, not to preach any more in the name of Jesus.

Peter and John, after a visit to Samaria, returned to Jerusalem; and in their way thither preached the gospel in many villages of the Samaritans. (Acts, viii. 1—25.) During the tranquil state of Judea, Galilee and Samaria, which commenced in the year 40, and continued a year or more, Peter passed through all parts of the country, availing himself of the opportunity that was thus afforded him of disseminating the knowledge of Christianity, and confirming the faith of those who had embraced it. Whilst on this peregrination he remained at Joppa, where he restored to life a Christian woman of excellent character, named Tabitha, and where a message was sent to him from Cornelius, an inhabitant of Cæsarea, by the sea-side, which was a city where the Roman governor resided, requesting a visit from him, for the purpose of farther instruction on the subject of religion. At Cæsarea his preaching was attended with signal success; and thus the door of faith, or the kingdom of heaven, or of the Messiah, was opened to Gentiles, and they were received into the church of God. Upon his return to Jerusalem, he gave an account to the Jewish Christians of the event of his mission, and satisfied them with regard to the propriety of his conduct in preaching the gospel to the uncircumcised Gentiles, and receiving them into communion by baptism without circumcision according to the law of Moses. From this time the gospel was freely preached to Gentiles as well as Jews, and the success corresponded to the zeal of those who were engaged in this interesting cause. Soon after the conversion of Cornelius the tranquillity of the churches was interrupted; nevertheless Peter, and the other apostles, still continued in Judea; and as far as circumstances allowed, employed themselves in confirming the believers and making additions to their number. Towards the end of his reign, Herod Agrippa became an open persecutor of the believers; and not only put to death James the brother of John, but committed Peter to prison. This was at the Easter, or passover, of the year 44. After a miraculous deliverance from confinement, he lived privately at Jerusalem, till the death of Herod Agrippa, which happened before the end of that year. Some have thought that Peter now went to Antioch, or Rome; but Dr. Lardner thinks that there is no good evidence of either of these opinions. When the council of Jerusalem was assembled in the year 49 or 50, Peter was present, and in the debate, which had occasioned this assembly, he clearly declared his opinion, that *the yoke of the law should not be laid upon the neck of the disciples* from among the Gentiles. Some short time after this council, Peter was at Antioch; where at first he conversed freely with the Gentile converts; but when some Jewish believers, who were zealous for the law, came thither from Judea, *he separated himself, fearing them of the circumcision;* thus acting in a manner contrary to his own judgment and declared opinion, through fear of the displeasure of others. St. Paul resented his conduct, as chargeable with dissimulation or hypocrisy; and convinced him that he was blameable. It was at this time, *viz.* in the year 50, that Peter first went from Judea into Gentile countries, never more deviating into that duplicity, for which he had been justly censured, but maintaining a firm and consistent conduct. This is the last time that Peter is expresly mentioned in the New Testament,

ment, except in his own epiſtles, and in 1 Cor. i. 12. and ch. iii. 22.

We have no where any very diſtinct account of this apoſtle's travels. From Antioch he might return to Judea. Epiphanius ſays, that he was often in the countries of Pontus and Bithynia; and Origen, according to Euſebius, expreſsly declares, that "Peter is ſuppoſed to have preached to the Jews of the diſperſion in Pontus, Galatia, Bithynia, Cappadocia, and Aſia: who, at length, coming to Rome, was crucified with his head downwards, himſelf having deſired it might be in that manner." As to the time of Peter's coming to Rome, no ancient writer is more regarded by learned moderns than Lactantius, or the author of the book of the Deaths of Perſecutors, whoever he be; and this author ſays, that Peter came thither in the time of Nero. But allowing that he came to Rome in the reign of Nero which began in the year of Chriſt 54, the preciſe time is not aſcertained. To Dr. Lardner it appears very probable, that St. Peter did not come to Rome before the year of Chriſt 63 or 64, nor till after St. Paul's departure thence, at the end of his two years' impriſonment in that city: and this author, who is no leſs induſtrious in his reſearches than impartial in his reports, ſuppoſes, that he obtained the crown of martyrdom in the year 64 or 65; conſequently St. Peter could not have reſided very long at Rome before his death. The learned Cave is of opinion that the apoſtle died a martyr at Rome in the year of Chriſt 64, at the beginning of Nero's perſecution. Jerom concludes his article of St. Peter, with ſaying, "He was buried at Rome in the Vatican, near the triumphal way, and is in veneration all over the world." Caius alſo, about the year 212, ſpeaks of the tombs of the two apoſtles, Peter and Paul, at Rome; and Chryſoſtom ſuppoſes St. Peter to have been buried in that city. Some have aſſerted, but without ſufficient authority, that he travelled into Perſia or Parthia. Several other circumſtances are mentioned with regard to St. Peter, which are equally deſtitute of foundation: ſuch as his epiſcopate at Antioch, and his having been twenty-five years biſhop of Rome, which is altogether inconſiſtent with his hiſtory in the Acts. Several ancient writers mention his having children, and the martyrdom of his wife about the ſame time with himſelf. Some have alſo ſaid that he eſcaped from priſon, and endeavoured to ſave his life by flight; but that in paſſing through the gates of the city, he ſaw Chriſt entering into it; and that in conſequence of this interview, and a converſation that occurred, he turned back, and being ſoon after taken up, he was crucified. But this account ſeems to have been fabulous. As to the manner of his cruciſixion, we have already given Origen's account of it. St. Jerom alſo ſays "that he was crucified by order of Nero, and ſo crowned with martyrdom, his head downward, and his feet lifted up, ſaying, he was unworthy to be crucified as his maſter was." Chryſoſtom alſo ſeveral times ſpeaks of Peter's being crucified with his head downwards. It ſeems to me, ſays Dr. Lardner, that Peter might be crucified in that manner, and that it might be owing to the ſpite and malice of thoſe who put him to death. The ſaying, that it was at his own deſire, may have been at firſt only the oratorical flight of ſome man of more wit than judgment. But the thought was pleaſing, and has therefore been followed by many.

We may add, that ſome learned men have denied that Peter ever was at Rome; among them are Scaliger, Salmaſius, and Frederick Spanheim. Mr. Bower has adopted this opinion. However, many learned men, among the Proteſtants, as well as Romaniſts, whoſe impartiality has never been queſtioned, have believed and argued that Peter was at Rome, and ſuffered martyrdom there. To this claſs we may refer Cave, Pearſon, Le Clerc, Baſnage, Barratier, and Lardner. Among the ancient writers, who teſtify to the ſame fact, we may enumerate Clement of Rome, in his epiſtle to the Corinthians, written before the year of Chriſt 70, or, as ſome think, about the year 96, Ignatius about 108, Dionyſius about 170, Irenæus about 178, Clement of Alexandria about 194, Tertullian about 200, Caius about 212, Origen about 230, Cyprian about 248, Lactantius about 306, Euſebius, Athanaſius, Ephrem the Syrian about 370, Epiphanius, Jerom, Chryſoſtom, Sulpicius Severus about 401, Prudentius about 405, Oroſius about 416, Theodoret about 423, Auguſtine, &c. &c. The preaching of Peter, or of Peter and Paul, quoted by ſeveral ancient writers, though not as a book of authority, compoſed about the middle of the ſecond century, or ſooner, makes mention of Peter's being at Rome.

For an account of the epiſtles of St. Peter, we refer to the articles Epistle and Canon, adding here ſome particulars reſpecting their genuineneſs. The firſt of theſe two epiſtles has been always received by Catholic Chriſtians as authentic and genuine. This epiſtle ſeems to be referred to by Clement of Rome; is plainly referred to ſeveral times by Polycarp; alſo referred to by the martyrs at Lyons: it was received by Theophilus, biſhop of Antioch, and quoted by Papias, Irenæus, Clement of Alexandria, and Tertullian. But the ſecond epiſtle, mentioned as doubtful by Jerom and Origen, is not cited by Papias, Irenæus, Tertullian, or Cyprian. However both theſe epiſtles were generally received in the 4th, and following centuries, by all Chriſtians, except the Syrians. For they were received by Athanaſius, Cyril of Jeruſalem, the council of Laodicea, Epiphanius, Jerom, Ruffin, Auguſtine, and others. Such are the teſtimonies of ancient writers concerning theſe two epiſtles; and if we conſult the epiſtles themſelves, and endeavour to form a judgment by internal evidence, it will appear very probable that both belong to the ſame author. Allowing the firſt to be St. Peter's, the following arguments may be alleged in favour of the other. It bears in the inſcription the name of the ſame apoſtle. From chap. i. 16, 17, 18, it appears, that the writer was one of the diſciples who were with Jeſus in the mount at the time of our Lord's transfiguration, which leads us to St. Peter, who was there.

In ch. iii. 1. there is an expreſs reference to the former epiſtle, which has been always acknowledged to be St. Peter's. (See alſo ch. i. 12—15.) In ch. iii. 15, 16, the writer calls Paul brother, and otherwiſe ſo ſpeaks of him and his epiſtles, as muſt neceſſarily be reckoned moſt ſuitable to an apoſtle. The writer therefore is the apoſtle Peter, whoſe name the epiſtle bears in the inſcription. The opinion advanced by Grotius, that this ſecond epiſtle was written by Simeon, biſhop of Jeruſalem, after James, the Lord's brother, is deſtitute of all authority from antiquity, and is inconſiſtent with the whole tenour of the epiſtle itſelf, or at leaſt with many things that occur in it. Jerom, already cited, ſays that Peter wrote two epiſtles, called Catholic; the ſecond of which was by many denied to be his, becauſe of its differing in ſtyle from the former. But Baſnage ſays, he is not able to diſcern ſuch difference of ſtyle in the two epiſtles. However Dr. Sherlock, biſhop of London, in his "Diſſertation concerning the Authority of the Second Epiſtle of St. Peter," obſerves, that the firſt and third of the three chapters, into which this epiſtle is now divided, agree in ſtyle with the firſt epiſtle. The only difference is in the ſecond chapter, the ſtyle of which is no more like to that

that of the other two than it is to that of the firſt epiſtle. The occaſion of this difference ſeems to be, that in the ſecond chapter there is a deſcription of the falſe prophets and teachers, who infeſted the church, and perverted the doctrines of the goſpel. Some ancient Jewiſh writer had left behind him a deſcription of the falſe prophets of his own, or perhaps earlier times; which deſcription is applied both by St. Peter and St. Jude to the falſe teachers of their own times. His lordſhip adds, St. Jerom ſuppoſed, and others have followed his opinion, that St. Peter made uſe of different interpreters, to expreſs his ſenſe in his two epiſtles. But if that had been the caſe, the difference of ſtyle would have appeared in the whole, and not in one part of it only; which is the preſent caſe: and he ſees no reaſon for thinking, that St. Peter did not write both his epiſtles himſelf. Some, however, may think, that this difference of ſtyle ariſes from the ſubject treated of in the ſecond chapter. Dr. Lardner concludes, upon the whole, that the two epiſtles, generally aſcribed to the apoſtle Peter, were indeed his. Theſe epiſtles were ſent to all Chriſtians in general, both Jews and Gentiles, living in Pontus, Galatia, Cappadocia, Aſia and Bithynia, but chiefly thoſe of Gentile ſtock and original: who were for the moſt part the converts of the apoſtle Paul.

There has been a conſiderable difference of opinion concerning the place where theſe epiſtles were written: and more eſpecially about the place called Babylon, at the cloſe of the firſt epiſtle. Some have thought this to have been Babylon in Aſſyria, or Babylon in Egypt, and others interpreting the paſſage figuratively, ſuppoſe that it denoted Jeruſalem or Rome. It is the opinion of Grotius, Whitby, Valeſius, and all the learned writers of the Roman communion in general, that by Babylon St. Peter figuratively means Rome; and this opinion is the more probable, as it is uncertain whether St. Peter ever was at Babylon in Chaldæa, or in Egypt, and altogether improbable, that he made any conſiderable ſtay there, if he ever viſited either of theſe places. As to the time of writing theſe epiſtles, Dr. Lardner thinks it to have been the year 63 or 64, or at the lateſt 65. Lardner's Works, vol. vi.

Peter, in *Biography*, a ſaint in the Roman calendar, and one of the moſt illuſtrious prelates of his time, was educated, and probably born, at Alexandria. Here he acquired a high character for his proficiency in ſacred literature, and alſo for his exemplary manners and diſtinguiſhed piety. On the death of Theonas, in the year 300, he was choſen his ſucceſſor, and according to Euſebius he obtained great honour during his epiſcopate, which laſted twelve years. He was an excellent teacher of the Chriſtian doctrine: an ornament to the epiſcopal character, both for the holineſs of his life, and his laborious application in ſtudying and explaining the ſacred ſcriptures. He governed the church three years before the perſecution. The reſt of his time he paſſed in a more ſtrict and mortified courſe of life, but without neglecting the common good of the churches. It is probable, that during a conſiderable part of that diſtreſſing period he reſided in ſome private place, unknown to the inſtruments of perſecution, where, however, the Chriſtians had acceſs to him, and received his advice and inſtructions. After this, according to Euſebius, he was, without any crime, of any kind, being laid to his charge, on a ſudden, for no other reaſon but the will of Maximin, taken into cuſtody, and beheaded. This martyrdom took place in the year 311. He is the reputed author of "A Book of Penance," of which thirteen canons are inſerted, in Greek and Latin, in the firſt volume of the Collect. Concil. Some fragments of another treatiſe attributed to him "Concerning the Divinity," are to be met with in the third and fourth volumes of the ſame collection. Gen. Biog.

Peter, ſurnamed *Chryſologus*, a ſaint in the Roman calendar, and a celebrated prelate in the fifth century, was of noble extraction, and born at Imola, anciently known by the name of Forum Cornelii. He was educated by Cornelius, biſhop of his native city, who admitted him into holy orders, and appointed him to the office of his deacon, which he retained many years. He was elected biſhop of Ravenna in the year 433, and died before 451. His eloquence was greatly admired, whence he had the ſurname of Chryſologus, or the golden preacher. What remains of his productions conſiſt chiefly of "Sermons," or "Homilies," containing ſhort explanations of portions of the ſacred ſcriptures, accompanied with moral reflections. They are ſaid to be drawn up in a perſpicuous and pleaſing ſtyle; and are diſtinguiſhed by a happy union of conciſeneſs and elegance. They were collected 250 years after his death, by Felix, one of his ſucceſſors in the ſee of Ravenna, and were firſt printed at Cologn, in the year 1541. Afterwards they underwent repeated impreſſions at the ſame place, Antwerp, Paris, Lyons, Venice, and Bologna, and were inſerted in the ſeventh volume of the Bibl. Patr. Six others, on the Lord's Prayer, are gived by Father A'Achery, in his "Spicilegium." There is alſo ſtill extant "A Letter to Eutyches the Archimandrite," from our prelate, in which he declares againſt the ſentiments of that monk, and expreſſes his approbation of the conduct of the patriarch Flavianus. Moreri.

Peter, ſurnamed the *Cruel*, king of Caſtile, was the only legitimate ſon left by Alphonſo XI., whom at the age of ſixteen he ſucceeded in 1350. He was at firſt under the influence of his mother and Don Juan de Albuquerque, her favourite; and to the queen dowager is to be attributed the treacherous execution of Leonora de Guzman, the late king's miſtreſs, by whom he had three ſons. Peter, at an early period, diſplayed a diſpoſition equally perfidious and ſanguinary. He cauſed the objects of his diſpleaſure to be murdered without trial, and ſcrupled no means to get into his power thoſe whom he feared or ſuſpected. In 1352 Albuquerque, with a view of confirming his own authority, introduced the young king to the Maria de Padilla, of whom he became ſo much enamoured, that her influence over him was attributed even to witchcraft. At the ſame time a marriage was negociating for him with Blanca, daughter of the duke of Bourbon. It took place in 1353, but he remained with his bride only three days, and then returned to his miſtreſs. Soon after he put his wife in priſon, and then divorced her, in order that he might marry Joanna de Caſtro, whom he alſo abandoned, after a very ſhort cohabitation. Donna Blanca was ſent to Toledo, the citizens of which revolted in her favour, but they paid dearly for their attachment to a much injured lady. In 1356 a trifling quarrel produced a war between him and Peter king of Arragon, in which the king's natural brother, Henry de Traſtamare, who had, to avoid danger, retired into France, had a command under the latter ſovereign. His wife, who was left in the power of Peter, was fortunately reſcued from his vengeance. This eſcape ſo much excited his rage and ſuſpicion, that he cauſed another natural brother, Frederic, to be murdered in his preſence, and ſhewed his ſavage diſpoſition by dining in the ſame apartment before the dead body was removed. He afterwards put to death his couſin, Juan of Arragon, and poiſoned his widow, and his own aunt the queen-dowager of Arragon. His cruelties having driven many of the diſaffected nobles to take

take refuge in Portugal, he entered into a negociation with the king of that country, alfo called Peter the Cruel, to deliver them up, upon condition that, on his part, he fhould deliver up thofe Portuguefe who had been concerned in the death of Agnes de Caftro. This was punctually performed on both fides, and was the caufe of many bloody executions. In 1361 he completed the meafure of his domeftic cruelties by the murder of his firft queen, Donna Blanca, then confined in the fortrefs of Xeres. A fhort time after this he perfidioufly put to death the Moorifh prince of Grenada, Mahomet Barbaroffa, with all his fuite, who had attended on him at Seville, on the fecurity of a fafe conduct. His enormities at laft produced a confederacy againft him between the kings of Arragon and Navarre, and Henry de Traftamare, at the head of the emigrant Caftilian nobility. Peter had, by no means, been deficient in vigour or fuccefs in carrying on the war againft the king of Arragon, and his depofition was therefore much defired by that monarch, who, in fact, was nearly as perfidious and fanguinary as himfelf. A band of mercenaries, ready to fight in any caufe, was brought out of France, under the command of Bertrand de Guefclin, and others; and Henry entering Caftile was admitted into Calahorra, and proclaimed king. Advancing to Burgos, he received the homage of the nobles of Caftile, and was folemnly inaugurated; while Peter retired to Portugal, and thence to Guienne, to the court of Edward the Black Prince. The treafures which he carried with him made him welcome to the prince and his barons, and the offer of Bifcay, together, probably, with the notion of the duty of affifting the rightful fovereign, induced the gallant Edward to undertake his reftoration. This he effected by an entire defeat which he gave to Henry and his party at the battle of Najara, in 1367. Peter would gladly have put to death his natural brother Sancho, and all his prifoners on this occafion, but was reftrained by the humanity of the prince of Wales. He now paid no fort of regard to his promife of recompence to his victorious allies, and after refuming his crown, he indulged the feverity of his nature by numerous favage executions.

Henry was not, however, difheartened by his misfortunes, but, after the departure of the Englifh, collected his forces and engaged again the affiftance of du Guefclin, and his men at arms. He entered Spain, and advanced to the plains of Monteil, where he met Peter at the head of a more numerous army, but compofed of a very motly affemblage, there being among them many Jews and Moors. A battle enfued, in which Peter was completely defeated, and he was forced to take refuge in Monteil. He was, for want of provifions, foon obliged to quit this place, which he did at midnight with eleven companions, but was ftopped and carried to the tent of his captor. His brother Henry, informed of the fact, arriving, words of reproach paffed between them, and Peter caught Henry in his arms, threw him on the ground, and attempted to kill him. In the ftruggle, Henry was affifted by his attendants, and they difpatched the cruel Peter with their poniards. This happened in the year 1369, when he was only in the 36th year of his age, and in the 19th of his reign. He left a name juftly execrated, though it is not unlikely that his crimes have been exaggerated, and it is quite certain that feveral of his contemporaries deferved the opprobrious title as well, and nearly as much as himfelf. Univer. Hift.

Peter *of Sicily*, fo called from the ifland which gave him birth, was a man of noble defcent, who flourifhed at the clofe of the ninth century. He was taken into the fervice of the emperor Bafil, who, in the year 870, fent him into Armenia for the purpofe of negociating an exchange of prifoners. This bufinefs, which he performed to the fatisfaction of the emperor, having occafioned him to fpend nearly nine months at Tibrica, the capital of Armenia, he embraced feveral opportunities of holding conferences with the Paulicians, a branch of the Manichæans, who were numerous in that country, and undertook the tafk of drawing up in Greek "A Hiftory of the Rife and Progrefs, and Decline of that Sect." The work to which he gave this title was dedicated by him to an archbifhop of Bulgaria. Part of it was tranflated into Latin, and inferted by cardinal Baronius in his "Annals." It was afterwards publifhed with the original, under the title of "Hiftoria de varia et Stolida Manichæorum Hærefi." This work is an object of curiofity, as it prefents us with a view of the fentiments of the Paulicians at the time in which Peter lived.

Peter *of Blois*, a learned French ecclefiaftic in the 12th century, was a native of the city on the Loire, whence he derived his furname. Having been inftructed in the claffics and polite learning at Paris, he went to the univerfity of Bologna, where he acquired great reputation by the proficiency which he made in the ftudy of civil and canon law, and the various branches of profane literature. He then returned to France and devoted himfelf wholly to the ftudy of divinity, under the celebrated John of Salifbury, bifhop of Chartres, of whofe church it feems probable that he was made a canon. In 1167 he travelled into Sicily with Stephen, fon of the count of Perche, and coufin to the queen of that ifland, where he was appointed tutor, and afterwards fecretary to William II. king of Sicily. When Stephen, who had been made chancellor of the kingdom, and archbifhop of Palermo, was fent into banifhment, Peter was involved in his fortune, and found it neceffary to take refuge in his native country. Hence he was invited into England by king Henry II., at whofe court he continued fome time, and was nominated archdeacon of Bath. He next entered into the fervice of Richard archbifhop of Canterbury, who appointed him his chancellor, and fent him to negociate bufinefs of importance relating to the metropolitan fee with king Henry II., and popes Alexander III. and Urban III.

After the death of king Henry, he refided for a time at the court of queen Eleanor. At a late period of his life he was deprived of his archdeaconry of Bath, though he was afterwards compenfated for his lofs by obtaining that of London, the duties of which he difcharged with the utmoft fidelity. He died in England in the year 1200. He is faid to have been the firft perfon who made ufe of the word *Tranfubftantiation*, to exprefs the doctrine of the Catholic church on the fubject of the eucharift. His remains chiefly confift of "Letters," 183 in number, which he formed into a collection by order of king Henry II., and which will be found ufeful in illuftrating the civil and ecclefiaftical hiftory of the period in which he flourifhed. Moreri.

Peter, furnamed *Comeftor*, or the Eater, another French ecclefiaftic, was a native of Troyes in Champagne. Having embraced the clerical profeffion, he became canon, and afterwards dean of the cathedral in that city. Here he acquired fuch celebrity, that he was invited to Paris, where he was appointed dean of the metropolitan church. Some time after this, he refigned his benefices, renounced the world, and entered among the canons regular of St. Victor, at Paris, where he gave himfelf up entirely to ftudy and devotion. He died in 1198. He was efteemed a man of learning for the age in which he lived, and he had the fortitude publicly to condemn fome of the abufes and corruptions of the Romifh church, particularly the celibacy of the clergy.

The following epitaph upon his tomb has been thought not unworthy of prefervation.

"*Petrus* eram, quem Petra tegit, dictufque *Comeftor*
Nunc comedor. Vivus docui, nec ceffo docere
Mortuus; ut dicant, qui me vident incineratum,
Quod fumus, ifte fuit, erimus quandoque quod hic eft."

He was author of "Hiftoriæ Ecclefiafticæ, lib. xvi.," containing a fummary of facred hiftory, from the beginning of Genefis to the end of the Acts of the Apoftles. To his pen has been attributed a work entitled "Catena Temporum," &c. confifting of a compilation of univerfal hiftory, publifhed at Lubeck in 1475, in two vols. folio, of which a tranflation into French was publifhed in 1488, under the title of "Mer des Hiftoires."

Peter Nolasque, a faint of the Roman calendar, was founder of the order for the redemption of captives, commonly called *the order of* Mercy; which fee. He was of noble defcent, and born about the year 1189. Having loft his father when he was only fifteen years of age, he attached himfelf to Simon, count de Montfort, who placed him in the fervice of James, king of Arragon. By his talents and virtues, he recommended himfelf to the favour of that prince, a circumftance of confiderable importance to him when he afterwards undertook the foundation of his order. The firft defign of it was fuggefted to him by a private fociety of gentlemen at Barcelona, who made a common purfe for the exprefs purpofe of redeeming Chriftian captives, and relieving the fick. Struck with the generofity of their undertaking, he meditated a plan for converting this private fociety into a religious and military order. He laid his plan before the king, who fanctioned it with his approbation, and the order was eftablifhed in 1123, under the title of "The Confraternity of Mercy;" at firft it confifted of fix priefts and feven laymen, who, befides the cuftomary vows, bound themfelves to devote their perfonal exertions to the tafk of redeeming captives from Mahometan flavery. Peter Nolafque was appointed the firft fuperior-general; but this office did not exempt him from engaging in the common duties of the fociety. He is faid to have been fo fuccefsful in his two firft expeditions into the kingdoms of Valentia and Grenada, as to redeem upwards of four hundred captives from their moft oppreffive bondage. He afterwards paffed over into Africa, where he met with much ill treatment, while employed in zealoufly purfuing the object of his benevolent miffion. In 1249 he refigned the office of fuperior-general, and he died in 1256. Peter Nolafque was canonized by pope Urban VIII. in 1628. Several houfes of his order have been founded in France and other countries; but its principal eftablifhments have always been in Spain. Moreri.

Peter, the Hermit, a celebrated perfon, to whom we have frequently, in the courfe of our volumes, referred, was born in the 11th century at Amiens, in Picardy. He entered into the army, and ferved under the counts of Bologne, but having imbibed the holy zeal of the age, he quitted the world, and devoted himfelf to a life of religious folitude and aufterity. About the year 1095 he made a pilgrimage to Jerufalem, then in the hands of the Turks, and was deeply impreffed with the oppreffions fuftained by the Chriftian inhabitants, and the vifitors of that memorable city. In the warmth of his emotions, he promifed the Greek patriarch to ufe his endeavours to roufe the weftern nations to arms in his behalf; and, upon his return, he waited upon pope Urban II. with letters from the prelate. The appearance of Peter was mean, his ftature fmall, his body meagre, his countenance fhrivelled, but he had a keen and lively eye, and a ready eloquence. The pope received him as one who had a call from heaven, and encouraged him to proceed in his defign; and Peter immediately fet out on his travels as a miffionary through the provinces of Italy and France. He rode on an afs, his head and feet being naked, and bearing a weighty crucifix; he prayed frequently, fed on bread and water, gave away in alms all that he had received, and by his faintly demeanour, and fervid addrefs, drew innumerable crowds of all ranks to liften to his preaching. When he painted the indignities offered to the true believers at the birth-place and fepulchre of their Saviour, every heart was melted to compaffion, and animated to revenge. His fuccefs in raifing recruits for the holy war, was fuch as might have been expected from the rude enthufiafm and martial fpirit of the age. (See Croisade and Godfrey.) Collecting above 60,000 perfons of both fexes, and of the loweft ranks in life, from the borders of France and Lorraine, he proceeded with them along the banks of the Rhine and Danube. The progrefs was marked by pillage and diforders of all kinds, and by the maffacre of all the Jews that came in their way. As they approached the confines of Hungary and Bulgaria, the fierce natives of thofe countries arofe upon them, and cut them off in fuch numbers, that only a third part, with Peter himfelf, efcaped into Conftantinople. Almoft all thefe were afterwards flain by the Turks in the plain of Nice, while Peter had prudently withdrawn from the camp, and remained in the Greek capital. He was, after this, in 1097, at the fiege of Antioch, but his ardour was confiderably cooled, and he would gladly have made his efcape, but Tancred caufed him to fwear that he would never defert an expedition of which he had been the prime mover. He afterwards diftinguifhed himfelf at the fiege of Jerufalem, and has been celebrated in the verfe of Taffo. After the capture of that city, he was appointed by the patriarch, during his abfence in Godfrey's army, to act as his vicar-general. Peter died at the abbey of Neumoutier, near Huy, of which place he was the founder. Gibbon, vol. xi.

Peter I. ftyled the Great, emperor of Ruffia, was the third fon of the czar Alexis Michaelovitch. He was born at Mofcow in the year 1672, and on the death of his eldeft brother, in 1682, he was nominated to the fucceffion, in exclufion of his other brother Iwan, who was fet afide on account of incapacity. Shortly after, a terrible mutiny of the guards, fomented fecretly by the princefs Sophia, the adult fifter of Iwan and Peter, effected a revolution at court, and the two princes were nominated joint czars, under the tutelage of Sophia. Iwan was a mere cypher, but Peter early difplayed a fpirit which fhewed that he was not formed to be under controul. His education was much neglected, and early habits of intemperance inflamed the violence of his temper, and augmented a difpofition to convulfive or epileptic fits. It was not long before he attempted to put himfelf beyond the influence of Sophia; he married againft her will, in his 18th year, and claimed a feat at the council board, from which fhe procured his exclufion, and an open rupture was the confequence. Peter took the bold refolution of arrefting and imprifoning his fifter, who, on her part, is faid to have formed a confpiracy againft her brother's life, or, at leaft, againft his liberty. Peter prevailed, confined his fifter to a nunnery for life, and affumed the reins of government in 1689. Although he had given way to the fenfuality natural to a young prince in a rude and diffolute court, yet he appears early to have had juft ideas of thofe ftate reforms, of which former fovereigns in Ruffia, and efpecially his father, had given fome examples. He had been employed in training a fmall body of troops in the German or foreign discipline, and he now began to display that attachment to maritime affairs which afterwards so much distinguished his reign. His great fondness for navigation is dated from the year 1691, when accidentally taking notice of a decayed sloop near Moscow, and being informed that it was of foreign construction, and built to go against the wind, he caused it to be repaired by a Dutch shipwright, whom his father had invited into Russia, and was highly pleased by observing its manœuvres. He soon learnt to manage it himself, and afterwards had several small vessels built, with which he made excursions on the lake of Perislaf. The passion for sailing gained so much upon him, that in 1693 he went to Archangel, and took a short voyage on the White sea, attended by all the merchant-ships in that harbour, and in the following year he spent several months in similar expeditions.

A quarrel with the Turks, in 1694, opened to the czar views of aggrandizement on the Black sea, and in the following year an army was marched to lay siege to Azof. He was with it in person, but only in the capacity of a volunteer, for he was fully sensible of the necessity of instruction as a preliminary to command. The failure of the first attempt to reduce the place, through want of ships to block up the harbour, coincided with his passion for navigation in stimulating him to create a fleet. He immediately gave orders for the equipment of a flotilla; which was effected with so much celerity, that during the next summer his squadron appeared before Azof, defeated the Turkish gallies stationed there, and the town surrendered. Of this conquest he was very proud, and caused his army to make a triumphal entry into Moscow, in which his generals and admiral took the precedence over himself, as well as over his principal nobility. In the mean time he had left orders for a large addition to his fleet on the Black sea, in which were included several sixty-gun ships. His brother Iwan dying about this time, he became in title, as well as in effect, sole sovereign of Russia. But as his mind expanded, he was rendered more sensible of the barbarism of this vast empire, and of his own deficiency in knowledge to improve and civilize it. The first plan that suggested itself was to send abroad a number of the young nobility, in order that they might learn, in various countries, the arts which he thought essential to the state, especially naval and military tactics. His own improvement was what he had most at heart, and he was resolved to pursue it by foreign travel, and a continued residence in those countries which he thought likely to afford that kind of knowledge of which he chiefly stood in need. He was not at present sufficiently enlightened to make a proper estimate of the relative value to a sovereign of different branches of knowledge, and his passion for maritime affairs took too great a lead in marking out his objects. It was, however, an interesting and extraordinary circumstance in the history of the world, that the despotic monarch of a mighty dominion should descend from his throne, and travel in the train of his own ambassadors as a private person, rejecting all the pageantry of state, and disdaining no means which appeared necessary to perfect himself in those arts which he thought of essential importance to his country. He set out on his travels in 1697, and the first country in which he made any stay was Holland. At Amsterdam he took up his quarters in the admiralty yard, in order that he might have a constant eye upon all that was passing. In the disguise of a Dutch skipper he went to the famous shipbuilding village of Sardam, where he actually laboured as a common carpenter and blacksmith, clad and fed like his fellow workmen. He did not, however, confine himself to the mechanic arts. He frequently went to Amsterdam to attend the anatomical lectures of the celebrated Ruysch. He studied natural philosophy, astronomy, and geography, and he sought out able men in various professions, whom he sent to Russia. At the same time he was exceedingly attentive to what was passing in the world, with respect to war and politics. He engaged to support the election of Augustus of Saxony to the throne of Poland, and issued orders to his armies on the Turkish frontier. In 1698 he came over to England, where he was treated with great attention by king William. He took lodgings at the King's-yard, Deptford, and continued to devote his time principally to obtaining instruction in naval affairs, but without neglecting other objects of useful curiosity. It is said that the variety of religious sects attracted his notice both here and in Holland, and probably gave him those ideas of religious toleration upon which he always acted in his intercourse with foreigners. At his departure the British monarch made him a present of a fine yacht completely equipped. He returned in it to Holland, carrying with him a number of naval officers, and other persons illustrious in various arts and professions. Thence he proceeded with his ambassadors to Vienna, for the purpose of viewing the military discipline of the Austrians, and strengthening his alliance with that court against the Turks. The return of the czar to his own country was hastened by the news of a formidable rebellion, excited with the view of placing on the throne the princess Sophia. Peter passing through Poland, had an interview with Augustus, in which they laid the plan of cooperation against the king of Sweden, and he then unexpectedly appeared at Moscow. He instantly enquired into the causes and effects of the revolt, and was prompt in punishing the aggressors with the most unrelenting severity. Many of the leaders in the conspiracy he caused to be tortured and hung before the windows of the apartments of Sophia. And her he obliged to take the veil, and to pass the remainder of her life in strict confinement. He now formed new regiments after the German model, and the dress and discipline of the rest of Europe were introduced into the Russian army. Peter proceeded with his characteristic rigour in his other meditated reforms. The established church in Russia had almost obtained an independence of the civil power, and the patriarchs had often been formidable to the czars. Peter, who had seen in England that the king was head of the church, though he did not follow his example, yet on the death of the patriarch in 1699, he suffered that office to remain vacant till its final abolition in 1721; and he obliged the ecclesiastical synod to take a strict oath of allegiance to himself and his successors. He introduced likewise many salutary reforms into the church. The Russian year had hitherto begun in September; Peter removed it to the first of January; but the new style, which is of much more importance to the commercial interests of the world, has not even yet been introduced into Russia. In all the minor particulars of manners and customs he introduced alterations, the object of which was to assimilate the Russians with the more polished nations of Europe. In some points he exhibited too great a precipitancy, a common fault with despotic monarchs, but in general his ideas were liberal, and his reforms tended to the real advantage of the people whom he governed. In the year 1700, a confederacy was formed against the young king of Sweden, Charles XII. Peter joined in it with the view of recovering the provinces of Ingria and Carelia, which had formerly belonged to Russia. For this purpose, he marched a large army, with which he laid siege to Narva. Charles hastened to its relief with a very inferior force, but

having

having well difciplined troops he foon obtained a complete victory over the Ruffians, who fought without judgment or fkill. Peter was not difpirited; he melted down the great bells of his churches to repair his lofs in artillery, and exerted all his powers to recruit and difcipline his troops. After various actions with different fuccefs, the Ruffians gained a footing in Ingria and Livonia, and became mafters of the river Neva. The place where that river enters the gulf of Finland appeared to him a proper fpot for a port, by means of which he might obtain a fhare of the navigation of the Baltic; and having formed the plan, no obftacles could prevent him from the accomplifhment of his purpofe. A morafs furrounded with forefts, in the 60th degree of north latitude, was the uninviting fcite which he chofe for a new capital of his empire. The firft erection was a fortrefs on an ifland, the foundation of which was laid in May 1703. A hut, for his own refidence on a neighbouring ifland, a larger wooden houfe for his favourite Mentfckikof, and an inn, were the firft buildings of St. Peterfburg. Such was the eagernefs with which he purfued his defign, with all the refources of defpotic power, that in lefs than nine years from thefe rude commencements, the feat of empire was transferred from Mofcow to Peterfburg. A vaft number of lives was facrificed in carrying on thefe labours, but human life never enters into the calculations of defpots. Every thing muft be fubfervient to their will. Nor could any thing be more arbitrary than the means he took to fill it with inhabitants; one of which was to oblige all the nobility and principal merchants to have houfes in the new capital. But it was chiefly inhabited by foreigners, whom he encouraged to fettle in his dominions, and even to the prefent time foreigners and their defcendants make a great part of its population. The removal of the metropolis to a corner of this vaft empire, at fuch a diftance from its moft defirable diftricts, and from the neighbouring courts, was thought to be highly impolitic, but it proved to be very inftrumental in civilizing the great body of the people, by breaking thofe national habits of life which were foftered in the barbaric grandeur of Mofcow. In the year 1704, the czar, in perfon, took Narva by affault. On this occafion, his foldiers committing the ufual exceffes in a captured town, he was, though at much perfonal rifk, extremely active in reftoring order and tranquillity. Entering the town-houfe, whither many of the citizens had retired for refuge, he laid his bloody fword on the table, and exclaimed, "It is not ftained with the blood of the people of Narva, but with that of my own foldiers, which I have fhed to preferve your lives." Cruelty to a vanquifhed foe was not among the characteriftics of Peter. He continued faithfully to adhere to the interefts of the king of Poland, after he had been dethroned by Charles, and the king of Denmark had been compelled to remain neuter. After the humiliating peace made by Auguftus, Ruffia remained the fole object of hoftility to the hero of Sweden: the dethronement of the czar was his avowed aim; "but," faid Peter, "though my brother Charles affects to act the Alexander, I truft he will not find me a Darius." In 1708, Charles advanced to Grodno, where he narrowly miffed taking the czar prifoner. He pufhed forwards towards the Dnieper, and gave the Ruffians, who oppofed him, a total defeat, though fo much were they improved by practice and difcipline that they ftood feven charges before they gave way. Charles now croffed the Dnieper, and marched to meet the coffack Mazeppa in the Ukraine. In the mean time his general, Lewenhaupt, was leading an army in Livonia to reinforce him. Peter, in perfon, attacked Lewenhaupt at Lefnau, with a force not much fuperior in number, and after a defperate conflict of three days, took or deftroyed half his army. This fuccefs was the prelude of the great victory at Pultowa, in June 1709, which entirely defeated all the plans of the Swedifh monarch, and made him an exile among the Turks. Auguftus was replaced on the throne of Poland; Pruffia made an alliance with Ruffia; Elbing, Wiburg, and Riga yielded to Peter's arms; and Carelia and Livonia acknowledged him as their fovereign. In 1711 the Turks declared war againft Ruffia, in the courfe of which the grand vizier would infallibly have captured Peter and his whole army, had he not found means to induce him to enter into a negociation. The principal inftrument which he ufed on this occafion, and which freed him from fo perplexing a fituation, was a woman, whom, from the loweft origin, he had raifed to be the partner of his bed, and to whom he had been privately married. This was the emprefs Catharine I., originally a parifh foundling, and who had paffed through various hands to thofe of her fovereign. By the fweetnefs of her voice, and the mildnefs of her manners, fhe was able to foothe her fovereign and lord, in all the paroxyfms of rage and gloom to which he was occafionally fubject; and fhe retained her influence over him to the very laft moment of his life. He rewarded her fervices in this important inftance, by a public declaration of marriage in the following year, and by the inftitution of the order of St. Catharine, of which fhe was the head and patronefs.

Peter being at peace was left to purfue his defigns, and in the years 1713 and 1714 he effected a total reduction of Finland, and a victory of the Ruffian fleet over the Swedifh rendered him mafter of the ifle of Oeland. The czar foon after vifited Copenhagen, and a grand plan was formed for the invafion of Sweden by the Danes and Ruffians, in conjunction with an Englifh and Dutch fleet: it was, however, rendered abortive, probably, by means of a fecret negociation entered into between the czar and the Swedifh minifter baron Goertz, in which very advantageous terms were granted to Ruffia, in order to obtain a peace. Some great revolutions in the north of Europe entered into the projects of this daring minifter, one of which was placing the pretender on the throne of England. About this time he was making another tour, in which he combined the purpofe of introducing improvements in his dominions, with that of carrying on political intrigue. He went from Denmark to Hamburgh, and thence to the Hague, and in 1717 he vifited France, where he opened to the regent, duke of Orleans, a plan calculated for the advantage of France and Ruffia, in which were comprized peace with Sweden, the humiliation of Denmark, and the difturbance of England; but that prince's clofe connection with George I. prevented him from liftening to it. Soon after his return a domeftic event took place, which was one of the calamities of Peter's reign, and has left a ftain on his memory that can never be obliterated. His fon Alexis, born in 1690, was the fole offspring of his firft marriage with Eudocia Lapookin; his education had been much neglected, and he had imbibed deep prejudices, and a rooted averfion from his father's improvements. As he grew up, he contracted habits of intemperance and grofs debauchery, with a fondnefs for the loweft company. His father probably never entertained for him a fpark of the paternal affection, and treated him with a harfhnefs that rendered him always uneafy in his prefence. Alexis married a very amiable woman, whom he made wretched by his brutality, and fhe died very foon after fhe had brought him a fon, in the year 1715. In the following year, renouncing his right of fucceffion in favour of Peter's fon by Catharine, he requefted permiffion permiſſion to retire into a convent. But during the czar's abſence he ſecretly left Ruſſia, and put himſelf under the protection of the emperor Charles at Vienna. By him the prince was ſent firſt to Inſpruck, and then to the caſtle of St. Elmo in Naples. He was diſcovered in this retreat, and having had the moſt ſolemn aſſurances of forgiveneſs he was induced to return to Moſcow. The promiſes of the tyrant were no bar to his revenge; and having him again in his power, he determined to proceed againſt him for high treaſon, a crime in that country, as in many others, which is made to ſuit the wiſhes of deſpotic princes and ſanguinary miniſters. There was no difficulty in Ruſſia in obtaining a conviction: the will of Peter was a rule to all his ſubjects, from which they did not dare to deviate. The ſentence was read to the young prince on the ſixth day of July 1718, and on the next day it was reported that his agitation of mind had thrown him into violent convulſions, and that his life was in danger. The czar, with ſome of his courtiers, repaired to the chamber in which he was confined, where, it is ſaid, the prince implored forgiveneſs, which he received, but that on the ſame day he died. Many myſterious circumſtances, however, attended his death, and it was generally believed he was taken off by poiſon. The death of the king of Sweden in the year 1718, and the arreſt of his miniſter Goertz, entirely deranged the czar's plans, and he was obliged to continue the war againſt that country without allies. A rupture enſued between Ruſſia and England, but a peace was concluded with Sweden, under the mediation of France, in the year 1721. On this occaſion the ſenate of Ruſſia requeſted the czar to aſſume the title of "Peter the Great, father of his country, and emperor of all the Ruſſias," and his imperial title was very ſoon after recognized by all the European ſtates excepting Denmark. He now removed the principal mart of trade from Archangel to Peterſburg, which was already become a large and handſome city. After a triumphal entry into Moſcow, his ſecond ſon Peter being dead, he obliged all his people to ſwear that they would acknowledge as ſucceſſor to the crown any perſon whom he ſhould pleaſe to nominate.

As he had opened the Baltic ſea to his ſubjects at one extremity of his dominions, he now reſolved to attempt the ſame with reſpect to the Caſpian at the other extremity. Making uſe of the pretext of ſome violence that had been offered to his people by certain tribes of Perſians and Tartars, he fitted out a fleet at Aſtrachan, and on the Volga, and marched with a conſiderable body of troops in May 1722, to embark for an expedition into the provinces bordering on the Caſpian ſea. Peter having carried the point at which he aimed, ſeveral Perſian provinces were ceded to him in perpetuity, and a treaty of peace was concluded. His empire being now entirely at peace, and ſome of his great ſchemes brought to maturity, he thought proper to give a public demonſtration of his affection and gratitude to Catharine, by the ceremonial of placing upon her head the imperial crown, with his own hands. This coronation took place at Moſcow, in May 1724, and was conſidered as preparing the nation to receive her for its ſovereign in caſe of his death. He had undergone a ſevere attack of illneſs ſome time before that period, the effects of which ſeem never entirely to have left him. His activity was, however, ſtill unremitted, and he was particularly aſſiduous in forming uſeful and ornamental eſtabliſhments for his new capital, one of which was an academy of ſciences. A cold, which he took at the ceremony of bleſſing the waters, brought on a painful diſorder, which put an end to his life in January 28, O.S. 1725, being in the 53d year of his age. He left no will, nor made any diſtinct nomination of a ſucceſſor. The meaſures by which the ſucceſſion of Catharine was ſecured have been mentioned in her article. Peter the Great left three daughters by Catharine, and one grandſon by the unfortunate Alexis.

"This great prince," ſays his biographer, "was of a lofty ſtature, and of a commanding but rude and ferocious countenance. His geſtures were quick and impatient, his ſpeech fluent and animated. His manners were groſs and uncultivated, and in the midſt of his attempts to civilize the nation, he himſelf remained a ſemi-barbarian. He was, however, eaſy and familiar with his intimates, and with thoſe from whom he expected to derive inſtruction; and, like all truly great men, loved to lay aſide pomp, and bring himſelf to the level of his company. He was furious and ungovernable in his fits of anger, and cruel and inexorable in his puniſhments, in which he occaſionally officiated as executioner; he was, however, capable of ſentiments of juſtice and humanity when brought to cool reflection. His talents were certainly conſiderable, and although he did not always take the beſt road to inſtruction, his perſonal acquiſitions were various and reſpectable. If he is eſtimated by what he performed, very few princes in any age can be compared to him. Ruſſia at his acceſſion to the throne did not poſſeſs a ſingle ſhip of war, and he left it with forty ſhips of the line and four hundred galleys. It was excluded from the Baltic, and he founded a maritime capital on a branch of that ſea. He converted a ſeditious and half-diſciplined militia into a regular army, capable of meeting the beſt troops in Europe. He introduced a police into the great towns, which rendered them ſecure and comfortable abodes. He planned, and partly executed, a grand ſyſtem of inland navigation, by which a junction is formed between the remoteſt parts of that extenſive country, and the ſeas ſurrounding it. (See CANAL.) He was the creator of a great number of inſtitutions for the promotion of learning and the uſeful arts and ſciences, among which may be enumerated colleges, at the principal cities, for the languages and mathematics, an academy of marine and navigation, a college of medicine, with anatomical lectures, and a botanical garden, an aſtronomical obſervatory, an imperial library and printing-offices, the academy of ſciences at Peterſburg, which he inſtituted, though death prevented him from putting it into activity. He reformed the architecture of the country, and introduced many improvements in the commerce of private life. He did not, indeed, civilize a nation which long after retained many traces of barbariſm, but he rouſed it from its torpor, gave it the means of future improvement, and was the principal author of that political importance which it has ſince attained. The epithet *Great* belongs to him by ſo many titles, that it is probably a permanent appendage to his name." Mod. Univer. Hiſt. Coxe's Travels, vol. ii. Tooke's Ruſſia.

PETER II. the ſon of the unfortunate Alexis, and grandſon to Peter the Great, was born in the year 1715, and ſucceeded in 1727 Catharine I. He died in 1730 of the ſmall-pox, in Moſcow, on the very day which had been appointed for his marriage. His death was occaſioned by the ignorance of the phyſicians, who treated his diſorder as a malignant fever. Peter II. acquired a conſiderable degree of popularity, by fixing, during the latter part of his ſhort reign, his imperial reſidence at Moſcow. He was regretted as the grandſon of Peter the Great, and as the perſon in whom the male line of the houſe of Romanof became extinct. Coxe's Travels, vol. ii.

PETER III. emperor of Ruſſia, born in 1728, was the ſon of Anne, eldeſt daughter of Peter the Great, and Charles Frederic, duke of Holſtein-Gottorp. He was nominated

minated grand-duke of Ruffia, and fucceffor to the crown, by his aunt the emprefs Elizabeth, in 1742, after having conformed to the Greek church, and in 1745 he efpoufed Sophia Augufta, princefs of Anhalt-Zerbft, who took the name of Catharine. Peter had received a bad education, and was eftranged by Elizabeth from public affairs. Being, therefore, a prey to idlenefs, he gave himfelf up to trifling purfuits, and indulged in low fenfualities. One of his principal amufements was the training of his fervants, and a fmall body of foldiers, which he was allowed to keep at his palace, in the German difcipline. He conftructed a petty fortrefs, in which he acted as governor, and affiduoufly practifed all the minutiæ of military fervice. At the fame time, he bore with impatience the conftraint in which he was held by the emprefs, and often broke out into invectives, which, by the fpies placed about him, were carried in an exaggerated ftate to her ears. Nor did he conceal his hatred and contempt of the Ruffian nation, nor his partiality to foreigners, in whom he feemed to place the moft unbounded confidence. Elizabeth, therefore, urged by the chancellor Beftuchef, was nearly perfuaded to fet him afide from the fucceffion. She did not, however, perfift in this intention, and on her death, in December 1761, Peter afcended the throne without oppofition, and with all the joy of a perfon enlarged from a long imprifonment into a ftate of perfect liberty. He immediately releafed the principal ftate prifoners, who had been confined by Elizabeth; among thefe were Biren, duke of Courland, marfhal Munich, and Leftof; and in all ftate affairs he conducted himfelf upon political principles, diametrically oppofite to thofe of the late emprefs. He recalled alfo from exile the victims of the defpotifm of the former reign, who are faid to have amounted to feventeen thoufand perfons. He abolifhed the dreadful fecret ftate inquifition, and formed a plan for correcting abufes in the courts of judicature. He freed the nobles from the obligation of ferving in the army, and permitted them to vifit foreign countries without particular licence. An extravagant admiration of the great Frederic of Pruffia was one of his paffions, and he became an ally to that monarch. At the fame time he formed a defign of conquering the duchy of Slefwick from Denmark, which he conceived belonged to him as duke of Holftein. Although, as has been obferved, he introduced important changes in the government, yet the falutary part of them was accompanied with projects of innovation, fome of them trifling, and others at leaft dangerous and imprudent. He offended the Greek clergy, by fecularizing their monafteries, and feizing their eftates, and by fhewing a contempt for the rites and ceremonies of that church, and a preference to the Lutheran, in which he had been educated. He gave umbrage to the army by his partiality for his Holftein troops, and his rigour in introducing the Pruffian difcipline; and he affronted the nobility by the appointment of his uncle, prince George of Holftein, to the poft of generaliffimo, and by the exclufive confidence which he placed in foreigners. But his conduct to the emprefs Catharine was that which efpecially haftened his ruin. He had frequently treated her with great indignity, and at length did not fcruple to avow an intention of arrefting and repudiating her, fetting afide her fon, the grand duke Paul, from the fucceffion, as not being his, and marrying his favourite miftrefs, the countefs of Woronzof. Catharine was, however, beforehand with him, and a revolution was effected completely in her favour. Peter was forced to fign his own abdication in the moft humiliating terms. After this he was fent a prifoner to Robfcha, a fmall palace at fome diftance from Peterfburg, where he was in a very few days murdered, at the age of thirty-four, after he had reigned only half a year. Coxe's Travels, vol. iii.

PETER, commonly called the Wild Boy, was found in the woods near Hamelyn, in Hanover, in the year 1725. He was, from his appearance, fuppofed to be about twelve years of age, and had fubfifted in thofe woods upon the bark of trees, berries, &c. for a confiderable time. How long he had been in that ftate could never be afcertained, but when found, the remains of a fhirt collar were about his neck. He was brought to England in the following year, by order of queen Caroline, but though every attention was paid to him, he could never be brought to fpeak. It was pretty well afcertained that he was an ideot. He was placed under the care of a farmer at North Church in Hertfordfhire, where he lived on a ftipend of 35*l.* *per ann.* allowed him by the government.

PETER-*Pence*, an ancient levy, or tax, of a penny on each houfe throughout England, paid to the pope.

It was called *Peter-pence*, becaufe collected on the day of *St. Peter ad vincula*; by the Saxons it was called *Rome-feoh*, *i. e.* the fee of Rome, and alfo *Rome-fcot*, and *Rome-pennying*, becaufe collected and fent to Rome: and laftly, it was called *hearth-money*, becaufe every dwelling houfe was liable to it, provided there were thirty pence *vivæ pecuniæ* belonging to it, nay, and every religious houfe; the abbey of St. Alban's alone excepted.

This Peter-pence was at firft given as a penfion or alms, by Ina, king of the Weft Saxons, in the year 727, being then in pilgrimage at Rome: and the like was done by Offa, king of the Mercians, throughout his dominions, in 794: and afterwards by Ethelwulph, through the whole kingdom, in the year 855.

It was not intended as a tribute to the pope, but chiefly for the fupport of the Englifh fchool or college at Rome; the popes, however, fhared it with the college; and at length found means to appropriate it to themfelves.

At firft it was only an occafional contribution; but it became at laft a ftanding tax; being eftablifhed by three laws of king Canute, Edward the Confeffor, the Conqueror, &c.

The bifhops who were charged with the collecting it, employed the rural deans and archdeacons in the bufinefs.

Edward III. firft forbade the payment, but it foon after returned, and continued till the time of king Henry VIII. when Polydore Virgil refided here as the pope's receiver-general.

It was abolifhed under that prince, and reftored again under Philip and Mary; but it was finally prohibited under queen Elizabeth.

PETER, *St.*, in *Geography*, a town of the duchy of Stiria; four miles S.E. of Landfperg.—Alfo, a town of the fame duchy; three miles W.N.W. of Windifch Weiftritz.—Alfo, a town in the fame duchy; fix miles W. of Cilley.—Alfo, a town of Auftria; 12 miles W.S.W. of Freuftadt.—Alfo, an ifland on the river Rhine, ftrongly fortified, near Mentz.—Alfo, a town on the S.W. coaft of the ifland of Cape Breton, in a bay to which it gives name, and which is a very commodious place for carrying on the fifhery.—Alfo, a fmall ifland in the Weft Indies, among thofe which form the clufter called "Virgin iflands," dependent on Virgin Gorda.

PETER'S, *St.*, a town of the ifland of Antigua.—Alfo, a town of the ifland of Stronfa. N. lat. 59°. W. long. 2° 31'.—Alfo, a river on the coaft of Labrador, about four leagues from the ifland of Belle-ifle, in the ftraits of that name.—Alfo, a river of Louifiana, being one of the north-weftern branches of the Miffifipi river, which it joins in about 45° 6' N. lat. W. long. 94° 22'.

PETER'S, *St.*, *Bank*, a large fifhing ground off the S. end of of Newfoundland island, extending from Cape Race to St. Peter's island, opposite Placentia, St. Mary, and Trepassy bays. It has on it from 45 to 30 fathoms of water.

PETER'S, *St.*, *Bay*, a bay on the S. coast of Cape Breton island. See *St.* PETER, *supra.*

PETER'S, *St.*, *Fort*, a fort on the island of Martinico, in the West Indies. N. lat. 14° 44'.

PETER'S, *St.*, *Harbour*, on the N. coast of the island of St. John, in the gulf of St. Lawrence, about eight leagues W. of E. point. N. lat. 46° 25'. W. long. 62° 20'.

PETER'S, *St. Haven*, a harbour on the E. coast of Labrador. N. lat. 56° 31'. W. long. 60° 42'.

PETER'S, *St.*, *Island*, a small island on the W. coast of St. John's island, near to, and N. by W. of, Governor island, in the narrowest part of the strait between New Brunswick and St. John's island.

PETER'S, *St.*, or *St. Pierre's Island*, an island on the coast of that of Newfoundland, S.S.W. of the S.E. point of Fortune bay, and near to, and S.E. of the S. point of Miquelon island. This island is chiefly used for curing and drying fish. N. lat. 46° 46'. W. long. 56° 17'.

PETER'S, *St.*, *Lake*, an expansion of the river St. Lawrence, into which are discharged from the S. and E. Sorel river from lake Champlain, the river St. Francis, and some smaller rivers from the N.W. The Masquinonge, Omachis, &c. enter the lake. The centre of it is 68 miles above Quebec, and 205 N.E. of Kingston, at the mouth of lake Ontario.

PETER'S, *St.*, *Mount.* See KEENEEBALOO.

PETER'S, *St.*, *Wort*, in *Botany.* See ASCYRUM.

PETER'S, *St.*, and *St. Paul*, in *Geography.* See AVATSCHA. Captain King, in the third volume of captain Cook's "Third Voyage," has given a plan of this harbour, which he places in N. lat. 53° 0' 38". E. long. 198° 43': the variation in 1779 being 6° 19' E.

PETER, *St.*, and *St. Paul*, a river at the bottom of the gulf of Campeachy. Its branches form an island, called "Tabasco."

PETER, *St.*, *le Port*, or *Port St. Pierre*, a town situated on the S.E. part of the island of Guernsey, defended by two castles, *viz.* the old castle and Gornat castle. N. lat. 49° 10'. W. long. 2° 34'. See GUERNSEY.

PETER'S *Point*, a cape of England, on the coast of Lincolnshire; four miles S. E. from the mouth of the Witham.

PETERBOROUGH, or PETERBURGH, a city having separate jurisdiction, is situated at the eastern extremity of the county of Northampton, bordering on the great fens of Lincolnshire, at the distance of 81 miles N. by W. from London. It is built on the north bank of the river Nen, and the country adjacent has been termed, from its fertility, the "Nile of England." This spot was originally called Medeshamstede, and here was at least a village, if not a considerable town, early in the 6th century. Though not made a city till the reign of Henry VIII., yet at a very remote period this place was distinguished in the Anglo-Saxon annals for its monastery, which was large in its establishments, and extensive in its jurisdiction. So closely is the interest which Peterborough possesses interwoven with the history of this conventual foundation, that in describing the one, it is requisite to enter into a short account of the other. The foundation of this abbey was laid by Peada, eldest son of Penda, king of the Mercians, in 655 or 656; but dying in the fourth year of his reign, it was completed, in 664, by Wolfere, his brother, who succeeded him, assisted by Ethelred, the remaining son, Kynesburga and Kyneswitha, the two daughters of Penda, and Saxulf, a pious and prudent earl, who was made the first abbot. It was dedicated to St. Peter at an assembly of nobles and bishops, and endowed with large immunities and possessions, which were confirmed by the charter of Wolfere in the 7th year of his reign. Pope Agatha ratified these endowments, and constituted it a vice-papal see, where persons might "pay their vows, be absolved from their sins, and receive the apostolical benediction." The monastery flourished for nearly 200 years, under a succession of seven abbots, when the Danes, commanded by Hubba, in 870, after desolating the abbies of Croyland and Thorney, almost annihilated Medeshamstede, plundered its dependencies, destroyed the library, and slaughtered the venerable abbot, Hedda, together with the friars and the country people, who had fled to its altars for protection. The monastery is reported to have remained in ruins 96 years, till Athelwold, bishop of Winchester, in 970, assisted by king Edgar, and the archbishops Dunstan and Oswald, rebuilt it on an enlarged scale, and confirmed its former privileges and possessions. At this period the name of the town was changed to Burgh, and from the splendour and privileges of the monastery, it was generally called Gilden-burgh. In reference to the saint to whom the dedication was made, this name was afterwards changed to Peter-burgh. Under several succeeding abbots the fortunes of the establishment were variously chequered, but nothing remarkable happened until the abbacy of Thoroldus, when the Danes, under Sweyn, destroyed the town, but were unsuccessful in their repeated attacks against the monastery. In the year 1116, it was consumed again, by an accidental conflagration, which left only the chapter-house, dormitory, and refectory standing. By the same fire the greater part of the town was likewise destroyed. In 1118, John de Salisbury, the reigning abbot, commenced a new church, which was finished under Martin de Vecti in 1144. Under William de Waterville various architectural improvements and additions were made in the church, &c. The abbots were called to the house of peers in the time of Henry III. and were mitred in 1400. Queen Catharine, the first wife of Henry VIII., was interred here in 1535. In 1541 the monastery was converted into an episcopal see, and the conventual church into a cathedral. The government of it was entrusted to a bishop, a dean, and six prebendaries, whose jurisdiction extended over the city of Peterborough, and nearly the whole of the counties of Northampton and Rutland. In the reign of queen Mary this church was again submitted to the authority of the see of Rome, but under Elizabeth, Protestantism revived to the exclusion of Popery. In 1587, the funeral of the hapless Mary, queen of Scots, was here solemnized, unattended by splendour or ceremony: her remains were translated to Westminster in the reign of James I. 1612. During the rebellion of 1643, the cathedral experienced various acts of violence from the parliamentary forces; the stalls, organ, books, monuments, and every ornamental decoration, shared an equal destruction. After remaining eight years in a state of ruin and desolation, its damages were in some measure repaired, and the whole edifice restored for the performance of divine service.

The style of architecture prevalent in this building is that denominated Norman, of which the circular arch and large column, with analogous mouldings, form the leading characteristics. It has been erroneously termed Saxon in the present instance, although no part of the existing cathedral was erected antecedent to the year 1118, when the monastery was destroyed by fire. The plan, like that of most other cathedrals, consists of a nave with side aisles, a transept, a choir terminating at the east end, semicircularly, with a continuation of the side aisles of the nave. The whole is finished at the east, by what is called the new building,

building, or St. Mary's chapel. In the centre is a tower rising from four large arches, at the interſection of the nave, choir, and tranſept. The weſt front is formed by a receſſed portico of three lofty arches, ſurmounted by pediments, pinnacles, and ſpires. In the centre arch is a ſmall chapel. The dimenſions of the cathedral, with its ſeveral parts, are; length externally, including the buttreſſes, 471 feet; of the nave, from the weſt door to the entrance into the choir, 267; of the choir, 117; and from the altar of the choir, to the eaſt window, 38; making, in the whole, from the weſt door to the eaſt window, 422 feet. The length of the tranſept, from north to ſouth, is 180 feet. The height of the nave, from the floor to the ceiling, is 81 feet; of the central tower, from the floor to the ſummit, 135; whilſt its whole height externally is 150 feet. The breadth of the nave and aiſles, from the north wall to the ſouth, is 78 feet, and the breadth of the weſt front 156. The periods of erecting the various parts of the cathedral may be aſſigned thus: the choir, with its aiſles, from the circular extremity at the eaſt, to the commencement of the tranſept on the weſt, was begun in the year 1118, and finiſhed in 1144. Between the years 1155 and 1177, the tranſept was erected, and between 1177 and 1193, the nave, with the aiſles, were completed to the termination of the pillars. A farther addition was made about 1288, when the ſpace between the extreme weſtern pillar and the door of entrance was finiſhed, forming a projection on each ſide of the weſtern extremity, and terminated by two towers. The Lady's chapel, ſaid to have been on the eaſt ſide of the north tranſept, was built by William Parys, the prior, in the 14th century. At what period the weſt portico, with its three arches, was erected, is not preciſely known, but we preſume before the year 1274, as abbot Richard de London raiſed one of the weſtern towers before that year. The chapel in the centre arch, is in the ſtyle of architecture of a much later date than the weſtern front. The new building, at the eaſtern extremity of the choir, was erected by Richard Aſhton in the middle of the 15th century, and probably completed by abbot Kirton about 1518. This building formed the laſt addition made to the church before the diſſolution of the monaſtery by Henry VIII., making a period of 400 years, from the foundation of the preſent church to its final completion. On the ſouth ſide were the cloiſters, which are nearly deſtroyed.

The Cloſe, to the weſt of the cathedral, is nearly ſurrounded by ancient monaſtic buildings, the ſouth ſide of which preſents ſeveral fine and intereſting parts of ancient architecture. On this ſide is alſo the biſhop's palace: north of the cathedral is the deanery, the entrance gateway to which was built by abbot Kirton, as the ſculpture and arms plainly indicate.

Nearly in the centre of the city is a parochial church, dedicated to St. John, which is ſaid to have been originally erected about the year 1400, by abbot Genge, aſſiſted by the citizens. The church is ſpacious, and contains ſeveral monumental ſlabs. Over the altar table is a large picture, painted by ſir Robert Ker Porter.

Symon Gunton, author of the Hiſtory of the Cathedral, was a native of this place, in which he reſided the greater part of his life, and where he died in 1676.

It is remarkable that Peterborough is the only city in England without mayor and aldermen. The civil government of the city is veſted in ſeven magiſtrates, and in the bailiffs to the lords of the manor. There are two members ſent to parliament, elected by the inhabitants, who pay ſcot and lot. A quarter ſeſſion is holden here for the city and liberty, by a commiſſion of oyer and terminer and gaol delivery, for criminal actions of all kinds. The chief of the commiſſion is the cuſtos-rotulorum, who is appointed by the crown at pleaſure. There are two gaols, one belonging to the earl of Exeter, for perſons taken within the liberty by his bailiff, the other belonging to the dean and chapter, for perſons arreſted by their bailiff in the city.

The trade of Peterborough is very inconſiderable. The benevolent inſtitutions are a charity-ſchool, a workhouſe, and Sunday-ſchools for the children of the poor. Various kinds of fiſh are caught in the river, over which is a bridge, erected by abbot Godfrey, in the fourth year of Edward II. From being half in the county of Huntingdon, and half in Northamptonſhire, a queſtion aroſe once, by which it ſhould be repaired; a jury was impannelled, ſix from each county, to determine it; and they returned, upon examination, "there was none of right bound to repair, or ſuſtain the ſame." But the king and queen coming to Peterborough, the bridge was repaired by abbot Adam, for their paſſage into the city. At preſent it is kept up by the feoffees, who, in 1790, thoroughly repaired it. The market is on Saturday, and there are two annual fairs. By the cenſus of 1811, Peterborough was ſtated to contain 900 houſes, and 3674 inhabitants.

At Milton, about three miles weſt of Peterborough, is a ſeat of earl Fitzwilliam. At another ſeat of the ſame nobleman, not far diſtant, was found, in 1720, a Moſaic pavement, and it is ſuppoſed by antiquaries, that near it was a Roman villa of ſome diſtinction. Beauties of England and Wales, vol. xi. Carliſle's Topographical Dictionary, vol. ii. Hiſtory of the Church of Peterburgh, by Symon Gunton, folio.

Peterborough, a poſt-town of America, in Hillſborough county, New Hampſhire; incorporated in 1760, and containing 1333 inhabitants. In this town are the moſt valuable griſt, ſaw, oil, paper, and clothier's mills in the ſtate.

PETERDORF, a town of the duchy of Stiria; four miles N.N.E. of Muckrau.

PETERERO. See Pedrero. See Guernsey.

PETERHEAD, in *Geography*, a market-town and ſeaport in the diſtrict of Deer, and county of Aberdeen, Scotland, is ſeated upon a peninſula projecting into the German ocean, and connected with the mainland by an iſthmus about 800 yards in breadth. It is built in the form of a croſs, and is divided into four wards. The town-houſe, placed at the head of the principal ſtreet, is a fine building of hewn ſtone, ſurmounted by a ſpire upwards of an hundred feet in height. Many of the private houſes are alſo handſome in their exterior appearance. Peterhead is a borough of barony, under the ſuperiority of the Merchants' Maiden hoſpital, and is governed by a ballie and eight counſellors: the baillie is in the nomination of the ſuperiors, and has his commiſſion from them, but the counſellors are choſen by the feuars, at a general meeting called for that purpoſe. The revenue of the burgh, which is conſiderable, is expended in various improvements. The market day is Friday, and there are beſides two annual fairs.

Peterhead occupies the moſt weſterly point of Scotland; and lies within three hundred miles of the Naze of Norway. It is much frequented in ſummer as a bathing and watering place, by perſons from all the principal towns in North Britain. The mineral well, called the *wine-well*, from its water ſparkling like Champagne, has been long and juſtly held in high eſtimation for its medicinal qualities. The harbour is in want of improvement, and is ſuſceptible of being rendered one of the largeſt and moſt commodious on the eaſtern coaſt. It is divided into two diſtinct parts, called the north and ſouth harbour, and is defended by a ſmall fort mounted

mounted with eight guns. The north harbour, which is the oldeſt, is chiefly appropriated for the reception of the numerous fiſhing veſſels which annually frequent the Moray Frith. Peterhead has long been a place of conſiderable trade, and has an extenſive manufacture of thread, woollen cloth, and cotton, beſides a large ſalt-work. Here is a reſpectable parochial ſchool; alſo a ſchool for writing and arithmetic, endowed by Dr. Anderſon's truſtees, with a ſalary of 20*l.* ſterling. The town, with the lands in the vicinity, were formerly the property of the abbey of Deer, which was erected into a temporal lordſhip in 1589, in favour of Robert Keith, then commendator of Deer, by the title of lord Altree. This peerage becoming extinct in 1593, the ſuperiority of the town became the property of earl Mariſchal, by whom it was conſtituted a burgh of barony, under the name of Keith Inch. In 1715 it was ſold to an Engliſh fiſhing company, whoſe truſtees transferred it to the preſent proprietors.

The pariſh of Peterhead, anciently called Peter Ugie, extends about four miles along the coaſt, and compriſes nearly ſeven thouſand acres of land, of which five thouſand are arable, and the remainder conſiſts of moor and moſs ground. In this pariſh are the ruins of Old-Craig, or Raven's-Craig caſtle. According to the parliamentary returns of 1811, it contains 919 houſes, and 4707 inhabitants. Topographical Dictionary of Scotland and the Britiſh Iſles; by Nicholas Carliſle, F. S. A. 1813. Beauties of Scotland, vol. iv.

PETERKINGEN, a town of Switzerland, in the canton of Berne; nine miles N. of Berne.

PETERS, a townſhip of America, in Franklin county, Pennſylvania; containing 1749 inhabitants.

PETERSBACH, a town of Bavaria, in the principality of Aichſtatt; five miles N. of Aichſtatt.

PETERSBERG, a town of the duchy of Magdeburg; 48 miles S.S.E. of Magdeburg.

PETERSBURG, properly St. Peterſburg, in Ruſs *Sanctpeterbourg*, is the imperial reſidence of the Ruſſian monarchs (Moſcow being the ancient capital). It is ſituated on the ſhores and the iſlands of the Neva, ſtanding partly on the continent in Ingria and Finland, and partly on ſeveral iſlands formed by the branches of that river, in N. lat. 59° 57′, and E. long. 47° 49′. Its ſituation is pleaſant, and the air ſalubrious. Straight, broad, and generally long ſtreets, frequently interſecting each other at right angles, ſpacious open ſquares, variety in the elegant architecture of the houſes; in ſhort, the numerous canals, and the ſuperb river Neva, with their ſubſtantial and ſumptuous embankments, render the general view brilliant and enchanting. With regard to regularity and embelliſhment, no metropolis in Europe can come in competition with Peterſburg. Paris, notwithſtanding the multitude of its palaces, and the perpetual attention that is paid to the correction of its defective conſtruction, can never become an elegant city; and London can only appropriate that epithet as applicable to ſome of its modern annexations. Berlin may vie with any other capital with regard to its handſome ſymmetry, but Peterſburg is altogether grand and reſplendent. The diameter of the city, from eaſt to weſt, from the Voſkreſenſkoi monaſtery, is nine verſts; and from ſouth to north, from the town foſſe acroſs Kamennoi-oſtrof to the Nevka, eight verſts; the circumference, taking the Vyborg ſide by the right bank of the Neva, meaſures twenty-four verſts, or ſomewhat more than twenty Engliſh miles. Of this ſpace, however, much muſt be ſubtracted for the water, and the land is not yet completely built upon.

Peter the Great is ſuppoſed to have had ſeveral views in building his new city. His fondneſs for maritime affairs, a deſire of perpetuating his name, and his diſlike of Moſcow, where in his younger years he had met with ſuch a ſeries of ill treatment, were the chief motives that induced him to lay the foundation of this ſeat of empire; to which ſome add another inducement, namely, the pleaſure of mortifying the Ruſſians, who were ſo obſtinately attached to the city of Moſcow. However that be, the beginning and increaſe of this great city were very extraordinary; for till the year 1703, the only buildings on the ſpot where this flouriſhing metropolis now ſtands were two ſmall fiſhing-huts. But Peter having in that year taken the town of Nyenſhants, ſeated on the river Neva, and made himſelf maſter of this country, its commodious ſituation for the Baltic trade determined him to build a town and fortreſs here. He immediately began to put his project in execution, calling the town after the name of his patron ſaint.

By the police ordinance of the year 1782, Peterſburg is divided into ten precincts, each containing ſeveral quarters. The ſcite of theſe primary diviſions is generally determined by the natural boundaries formed by the river and its ſubordinate channels. The ſpace between the left bank of the Neva and the river Moika, is called the firſt admiralty quarter; between the Moika and the Katarina canal, the ſecond; and between the Katarina canal and the Fontanka, the third admiralty quarter. The part lying beyond the Fontanka, along the Neva, is denominated the Styckhof; below the Styckhof, along the Fontanka, lies the Moſkofſkoi; and along the Ligova canal, the Rojeſtvenſkoi, to which the Yæmſkoi quarter adjoins. Then follow the Vaſſilieoſtroi, the Peterſburgſkoi, and the Vyborgſkoi.

What the quartier du palais-royal is to Paris, the firſt admiralty quarter is to St. Peterſburg; the heart of the city, in which luxury and opulence have eſtabliſhed their ſeat, diffuſing themſelves around with increaſing energy to the remoteſt borders of the town; the centre of amuſement and buſineſs, the brilliant reſort of pleaſure and faſhion. Within its circuit are between twenty and thirty ſtructures of the firſt magnitude, of which the imperial winter palace is the moſt conſpicuous.

The coloſſal dimenſions of this edifice, being five hundred Engliſh feet in length, and three hundred and fifty in breadth, the magnificence which reigns within and around it, the treaſures of coſtly works of art and curioſities of every kind that are here collected, render it the moſt ſtriking object of the city.

The exterior of this palace, which, including the hermitage, occupies the ſpace of a ſmall town, is impoſing by its huge and ponderous maſs, though not remarkable for elegance of architecture. The ſtyle and the exuberance of decoration ſufficiently betray the period when it came into being. The whole height, amounting to ſeventy feet, compriſes only a baſement floor, with one grand ſtory and an entreſol. The ſituation of this palace is truly majeſtic. In front of it ſtands a magnificent creſcent of lofty and ſuperb edifices, forming a larger ſpan than is to be ſeen in any other capital, and behind it flows the beautiful Neva within its granite banks. The left wing, to which the hermitage adjoins, has, by means of a projection, the proſpect up the great Millione, one of the fineſt ſtreets of the city, and on the right ſtands the admiralty. It was in this vaſt palace, raiſed by the empreſs Elizabeth, though firſt inhabited by Catharine II., that the latter monarch diſplayed through her long reign, that magnificence and liberality which made her court the admiration of foreigners, and obtained for her the juſt eulogiums of all literary travellers.

It was here likewife that fhe ended her days on the fourth of November 1796.

The fummer gardens likewife, or the principal public promenade, lie within the bounds of this admiralty quarter. By their original deftination they belonged to the imperial fummer palace, a fpacious wooden edifice, fince demolifhed; but are now entirely devoted to the public. They are well laid out and ornamented with fountains and ftatues. The baluftrade by which they are entered is a truly furprifing work of art; it runs in a line with the houfes on the bank of the Neva, and confifts of thirty-fix maffy columns of granite, connected together by an iron palifade of exquifite workmanfhip, defigned and executed by a Swede. The columns are two fathoms in height, and their diameter exceeds three feet: the fhafts, refting on granite pedeftals of fix cubic feet, and the pillars are decorated at top by a regular interchange of urns and vafes. The huge maffes of ftone, the wonderful ingenuity difplayed in the iron work, the ornaments of which are highly gilt, the connection of the whole with the fuperb edifices ranging at either extremity, and the view of the Neva with its noble granite quay, fill the beholder with aftonifhment and delight.

This quarter contains four public fquares. In one of them ftands the juftly famous monument of Peter the Great. This ftatue is truly a mafter-piece. Falconet has fucceeded in the refemblance to admiration; the features of the czar's countenance are admirably expreffed. The artift reprefents the hero on horfeback, as in the act of afcending a fteep rock, the fummit of which he propofes to attain. Peter is in an Afiatic drefs, and crowned with laurels; he extends his right arm with graceful dignity, while with the left he holds the bridle of his horfe, whofe beauty of form, and elegant attitude, captivate the admiration of all fpectators. The fiery courfer rifes on his hinder feet, and is in the attitude of ftretching to attain the fummit of the rock. To combine folidity with excellence was therefore a difficult tafk; but this the ingenious artift found a way to accomplifh. The brazen ferpent, which is trampled on by the horfe, is emblematical, doubtlefs, of oppofition to the views of the monarch; but it artfully ferves likewife to give the proper equipoife to the ftatue; the point of bearing being by this means not perceived, which is the full and flowing tail of the horfe gently falling on the ferpent writhing with pain. The hewn rock on which it ftands is a flightly mingled granite, formed of white and variegated quartz, white and red feldfpath, white and black glimmer, having here and there likewife grains of iron and fchorl cryftals. On one fide of it is this fimple infcription, in letters of caft brafs.

PETRU PERVOMU
EKATERINA VTORAIA.
LIETA 1782.

And on the fide towards the fenate the fame in Latin:

PETRO PRIMO
CATARINA SECUNDA.
MDCCLXXXII.

The figure of the monarch is eleven feet in height, and that of the horfe feventeen. The expence of this grand monument was truly imperial. The tranfport of the rock from Lachta in Finland, coft 70,000 rubles; Stephen Falconet, the ftatuary, received, during his nine years' ftay, about 48,000 rubles; for his maintenance, 26,800 rubles; apart for the fount, 17,500 rubles; his three fubordinate artificers, 27,284; the founder Chailof, 2500 rubles, befides incidental charges: the whole amounting, according to the report of the board of works, to 424,610 rubles. It was caft in a ftrong building, conftructed over the rock for that purpofe in Auguft 1775. It is a bell-metal of copper, with a fmall mixture of tin and zinc, and weighed 44,041 Ruffian pounds. The head of the hero was modelled by Mad. Collot, who was afterwards married to Peter Falconet, fon of the ftatuary.

In this quarter of the town, too, is the marble palace. This fuperb edifice, built originally by Catharine for the manfion of Gregory Orlof, at his death reverted to the emprefs, and during her life-time it remained uninhabited; but her fon and fucceffor Paul, having invited Staniflaus Poniatoffky, king of Poland, to St. Peterfburg, affigned him this palace for his refidence; and here, by a fingular turn of fortune, he terminated his troublefome and inglorious life.

The college of foreign affairs, the poft-offices, the fenate, and the loan bank, are among the public ftructures; which, either from their magnificence, or ftyle of architecture, deferve to be reckoned remarkable objects in this quarter of the town, and the number of which is augmented by fixteen palaces of noblemen, and a multiplicity of other beautiful and fpacious buildings.

A very important rank in the topography of the fame diftrict is alfo maintained by the admiralty, with its lofty tower, from which it affords a view up the ftreets diverging from it as radii from their centre, and efpecially that called the Great Perfpective, extending at leaft five miles in length. The body of the building is an oblong fquare, and, as is juftly obferved by M. Storch, remarkable for nothing fo much as its ugly appearance. The fide of the admiralty to the Neva occafionally prefents the public with a magnificent fpectacle; here being the wharf and dock-yard from whence fhips of war of fixty to a hundred guns are built, and every launch is a great holiday.

The grand church dedicated to St. Ifaac, which was intended by the emprefs Catharine II. to be the moft fumptuous of all the city, was not completed in her reign. Like the marble palace, it is erected on a bafement of granite, the fuperftructure, both within and without, being of marble, jafper, and porphyry. This church, which at the deceafe of Catharine had been building upwards of twenty-fix years, was raifed to the top of the walls, and a beginning had been made with the dome. Her fucceffor, impatient to fee the edifice completed, to the amazement of all who were not acquainted with his imperial tafte, caufed it to be finifhed of brick.

The fquare, contiguous to the fummer-gardens, is remarkable for nothing, except the ponderous monument erected to the memory of field marfhal Romanzof. The Ifaac place, on which the church of that name is built, is in the form of an obtufe triangle, and is enclofed by handfome houfes. The Peter's place, in which the famous ftatue of that monarch ftands, is the grandeft of all, whether we confider it in itfelf, or in the picture viewed from it compofed of the noble river, the paffing fhips and boats, the thronged bridge, and the oppofite fhore of Vaffily-oftrof, bordered by palaces, the imperial academies and fumptuous houfes. In this quarter of the town originate three ftraight, long, and elegant ftreets, denominated perfpectives, becaufe from their feveral points of view they afford a profpect of the admiralty's gilded fpire. It proceeds in a direct line, one little curvature excepted, from the admiralty to the monaftery of St. Alexander Nevfky, and in breadth it may vie with the fineft ftreets in Europe; being, according to the above-mentioned author, by one-half broader than Oxford-ftreet, in London. Rents in this part of the town are confiderably higher than in every other, and even the price of provifions and other neceffaries is here much enhanced by the readinefs wherewith the luxury of the inhabitants complies with the moft exorbitant demands.

The principal public edifices of the fecond admiralty quarter are the court ftables, the college of medicine, and the opera houfe. This laft is a fpacious maffy ftructure in a noble fimplicity of ftyle, in the conftruction of which, due regard was had to the feveral requifites of its deftination. Within the purlieus of this quarter of the town ftand two of the principal Greek churches. In that dedicated to God's mother, of Kazan, containing her portrait, which is held in the higheft veneration, the folemn thankfgivings for the fuccefs of public affairs are ufually celebrated, at which the fovereign is occafionally prefent in perfon. The church of Nicolai, or the failors' church, confifts of two ftories, whereof the lower may be heated in winter. Its five cupolas are richly gilded. The greateft curiofity of the third admiralty quarter is the bank, perhaps the moft elegant building in all Peterfburg. Of the churches in this quarter, only the Catholic and the Armenian are deferving of fpecification; both of them are rather confpicuous for the tafte difplayed in their ftructure, than for their grandeur and magnificence. The inhabitants of the two laft-mentioned quarters belong chiefly to the trading claffes.

Among the public buildings of the Styckhof, the arfenal is the moft remarkable. It forms an open quadrangle of three ftories, is built in a grand ftyle, and wears an afpect of dignity, correfpondent to its defign. Facing the Styckhof road it has a magnificent portico, and the roof is ornamented with trophies and allegorical figures of excellent fculpture. Oppofite the principal front, on the other fide of the ftreet, is a large fquare court filled with piles of cannon balls and bombs. Remarkable of itfelf, and from the viciffitudes it has undergone, is the edifice that was formerly the pantheon of prince Potemkin, which the emprefs Catharine II. afterwards purchafed, and deftined for her autumnal refidence, denominating it the Tauridan palace. At that time, this fuperb edifice confifted properly of only one floor; but the body of the building, having wings extending along the ftreet, had over the grand portal, fupported upon columns, two ftories furmounted with a large cupola. The left wing was greatly lengthened by the emprefs, by a feries of additional erections, taking in one entire ftreet, fitted up as dwellings for her retinue, orangeries, and neceffary offices. She likewife changed the whole interior of the principal ftructure, and augmented it by the addition of a theatre. Above fifteen hundred labourers were employed in this work, which was even profecuted during the night by the light of torches, as the emprefs had refolved to pafs the enfuing autumn there. Dying a few years after its completion, this gorgeous palace was by her fon and fucceffor converted into barracks.

In this compartment are the imperial Italian gardens, the imperial tapeftry manufactory, the foundery of cannon, the imperial brewery, and the flobode of the horfe guards. Here are likewife the churches of St. Sergius and of the Preobajenfkoi guards, dedicated to the transfiguration of Chrift, with the church of St. Pantaleon and Simeon on the Fontanka, and the fubaltern Yæger church on the Ligova canal, which is the only one of timber. The Lutheran church of St. Anne, belonging to the Germans, ftands here in the third Artillery ftreet. The Styckhof contains likewife the palaces of the princes of Wurtemburg, and on the Fontanka that of prince Sheremetof, with its fpacious court ornamented with ftatues and a pleafure garden in the Dutch tafte.

The Rojeftvenfkoi quarter, though comparatively fmall and inconfiderable, yet contains the only monaftery and the only convent within the city. The Vofkrefenfkoi nunnery, or convent, was originally built and inhabited by the emprefs Elizabeth, while grand-duchefs, and on her acceffion to the throne it was, in 1744, converted into a convent for twenty nuns. The building and walls inclofe a large quadrangle, in the centre of which ftands the church. Catharine II. fuffered the nunnery to remain, but enlarged the ftructure, and founded in it a feminary for young ladies of noble families. The monaftery of Alexander Nevfki is built in the fhape of a fpread eagle, and contains in its ample bounds the palace of the metropolitan, the cells of fixty monks, five churches, a fchool, &c. The famous fhrine of St. Alexander, compofed entirely of wrought folid filver, occupies a confiderable fpace in the elegant church erected exprefsly for that purpofe. Beneath the pavement is the vault conftructed by Catharine II. for her relics, and thofe of her imperial fucceffors.

Among the public edifices of the Mofkoffkoi quarter, is the imperial Yægerhof for the *corps de chaffeurs*. This fpacious and noble edifice was juft finifhed at the demife of Catharine II. and her fon Paul converted it into barracks. The town-hofpital is likewife fituated here, and deferves notice from the grandeur of its architecture.

Vaffili-oftrof is the feat of commerce and of literature. The Exchange and Academy of Sciences ftand on this ifland. The Academy of Arts alfo here raifes its majeftic front on the fhore of the Neva, over-againft the Galerenhof. Afcending the river, the coaft is lined with the fpacious edifices of the land cadet corps; and the eaftern promontory of the ifland is decorated with the three large ftructures which form the Academy of Sciences, at the extremity of which appears the fuperb Exchange. Among the numerous churches fituate on the Vaffili-oftrof, the Lutheran church of St. Catharine is principally confpicuous for the neatnefs and fimplicity of its architecture, the portico of which is from the model of the temple of Concord.

The Peterfburg quarter of the town confifts of feveral iflands; and though it has no fumptuous edifices to boaft of, yet contains the parent of all that exift in the imperial refidence, namely, the original wooden palace or cottage of Peter the Great, over which is erected a brick building, on arches to preferve it from the inclemencies of the weather, as a facred relic of that creative genius. Thefe iflands are Petroffki-oftrof, which, befides a fmall wooden fummerhoufe belonging to the grand duke Conftantine, has nothing worth mentioning, and is partly covered with foreft trees. Of the fame defcription is the Apothecary ifland, which has its name from the garden upon it belonging to the medical college. Another petty ifland is occupied by the hemp magazines, on which account, during the fummer, a numerous fleet of barks and galleots are conftantly collected about it. Kammenoi-oftrof, belonging to one of the imperial family, has upon it an elegant villa, an hofpital for invalids, and a number of beautiful pleafure houfes. The ifland Yelagin, fo defignated from the name of its proprietor, is highly embellifhed by art, and laid out in walks, parterres and avenues, with plantations and fhrubberies, fo as to refemble the pleafure-grounds of an Englifh nobleman. Kreftofki-oftrof, the largeft of thefe iflands, belongs to count Razumofki, and though lefs transformed by art, is however, by reafon of its delightful profpects, arifing from the noble viftas and walks, and the fhores of the furrounding ifles, very much frequented by the inhabitants of the city. The laft and greateft curiofity of this quarter is the citadel, which ftands on the ifland in the Neva, four hundred fathoms long and half as much in breadth, near the

Peterſburg iſle, a little above Vaſſili-oſtrof, and therefore nearly oppoſite to the marble palace. The date of its conſtruction is memorable in the annals of the empire, as marking at the ſame time the era of this city. In the year 1703, while Peter the Great was cauſing an earthen rampart to be thrown up on this ſpot, little could he foreſee that the hamlet, conſiſting entirely of a few fiſhermen's huts, would within the courſe of a century be garniſhed with marble temples and gorgeous palaces. Even his rampart of mud has met with a brilliant lot, being faced on the Neva ſide with a magnificent quay of granite. This was the work of the empreſs Catharine II.

The fortreſs has two gates; one looking towards the Peterſburg iſland, with which it has communication by a drawbridge, the other fronting the admiralty-ſide, to which the only acceſs is by water. The moſt ſtriking edifice within the walls is the church of St. Peter and St. Paul, which owes its origin likewiſe to the ductile genius of the famous czar. It ſtands in an open place nearly in the centre of the whole encloſure; having, contrary to the uſual cuſtom, no more than one cupola, with a tower fifty fathoms in height, furniſhed with a chiming clock, for which no leſs a ſum than forty-five thouſand rubles were paid by Peter the Great. From this tower the ſpire riſes twelve fathoms, is gilt with ducat gold, and the whole preſents a beautiful object from various points of view. This church contains the bones of its heroic founder, and ſeveral of his ſucceſſors. Among the other curioſities of the caſtle are to be noted the imperial gold and ſilver aſſay offices and the mint.

Laſtly, the Vyborg quarter has the moſt rural appearance of all; ſince, excepting the ſtreet along the bank of the Neva, it is entirely occupied by cottages of the peaſantry, and its ſmall population is chiefly employed in ruſtic labours. Notwithſtanding this characteriſtic it however numbers amongſt its buildings two noble manſions: that belonging to the late count Beſborodko, ſtanding on the Neva, has wings of colonnades, which form an amphitheatre, and has an elegant garden in the Engliſh taſte. The other of theſe villas, remarkable for its curious ſtyle of architecture, is the property of count Stroganof, and has likewiſe extenſive gardens. The wharf for merchantſhips of all deſcriptions, in this quarter of the town, is the laſt particular we ſhall mention.

The population of St. Peterſburg is computed at 250,000 perſons, conſiſting of Ruſſians, Germans, Finns, French, Swedes, Engliſh, Dutch, Poles, Italians, Spaniards, Portugueſe, &c. St. Peterſburg is therefore a colonial city, of the motley mixture of which the Ruſſians form by far the major part of the people, though they are not the aborigenes of the region, which the ſovereigns of the Ruſſian empire have fixed upon as their imperial reſidence.

The revenue which the ſtate draws from the traffic of the city, may at preſent be eſtimated at about five millions of rubles. If to this be added the tax on the ſale of houſes, the contracts, &c., on the loweſt probable calculation, the total will perhaps be increaſed by one-half.

Bread corn is brought to St. Peterſburg from the countries bordering upon the Volga. Both rye and wheaten bread are eaten here; the latter is the common food of even the loweſt and pooreſt claſſes. The rye-bread is well taſted and yields more nouriſhment. It is univerſally eaten, and even in families of good condition, where they have the chooſing between this and the other. The poorer ſort uſe what is called black bread, prepared of rye-meal unbolled, and is extremely nutritious.

No capital, except London, is better ſupplied with water than this city. The Neva, with its numerous branches and canals, conveys it through every part of the town, ſo that no family can have far to fetch it. Salt is cheap; a pound being ſold at a copeek, which is ſomewhat leſs than a halfpenny. Good beef is bought for four copeeks the pound. Sheep, hogs, tame and wild fowl, and all ſorts of game, are uſually brought frozen in winter, and the price of them is generally regulated by the weather and the hardneſs or ſoftneſs of the ſledge-roads. Fiſh is here a very common article of conſumption. The ſterlet is one of the moſt eſteemed kinds of fiſh, and is conſequently the deareſt. Of theſe about twenty-five thouſand are every year brought alive to St. Peterſburg from the Volga; which river moreover ſends upwards of a million of ſizeable fiſh of various other kinds. The town is ſupplied with the ordinary ſorts of live fiſh from the Ladoga lake. Frozen, ſalted, and dried fiſh are moſtly the food of the lower claſſes. The Neva abounds with ſalmon, which, however, are inferior in point of flavour to thoſe of Riga. Cray-fiſh are alſo caught in the Neva; beſides which the Volga furniſhes annually about a million. Vegetables are the ſole article of conſumption, which the city obtains for the moſt part from its environs. The culture of the kitchen-garden is here brought to ſuch perfection, that the moſt delicate exotics of this kind are to be had at every ſeaſon of the year, and of uncommon excellence. Several of theſe, ſuch as cauliflowers, aſparagus, &c. are very common, and not dear. Sour cabbage, which the Ruſſians call *ſchtſchi*, the ſalutary antiſcorbutic virtues of which have procured it a welcome reception alſo in other countries, is a daily diſh of the common people; it is even ſerved up at great tables as a national delicacy. Salted cucumbers are eaten in equal abundance, and are extremely cheap. The fruit reared in the orchards and forcing-houſes in and about St. Peterſburg, is not nearly adequate to the demands of taſte and luxury. Fruit of the country comes from the Ukraine, and from the regions of the Volga and the Occa; foreign fruit, eſpecially apples, from Roſtock and Stettin, to the amount of about a hundred thouſand rubles annually. The firſt ſhips that arrive here in the ſpring, import oranges of both kinds, and lemons in ſuch abundance, that the ſale of theſe goods often ſcarcely pays the freight. A cheſt, containing four hundred lemons, is uſually to be had, at that ſeaſon, for two or three rubles. Of the ordinary liquors, *quas* is an acidulous, cooling, and wholeſome beverage, peculiarly national, and is offered for ſale at the corners of all the ſtreets. (See Quas.) In ſummer it is cuſtomary to cool it with ice. The juice of the cranberry yields an excellent and refreſhing liquor, in very frequent uſe under the appellation of *klukva*. By a mixture of klukva, it is by no means uncommon not only to improve the quas and other drinks, but it is uſed, even in good houſes, for making punch, when lemons are at a high price, or not to be had. *Sbiten* is prepared of honey and pepper boiled in water, and hawked about the town by people who make it their trade, and are therefore called *ſbitenſhiks*. In the public houſes may be had beer, mead, and brandy. Among the more delicious ſorts of national liquors, the *viſhneſca* and *malinoſca* muſt not be forgot, a ſort of wine made from cherry-juice put into fermentation by ſugar and brandy; *kiſliſhtſhi*, a ſpecies of quas of a ſuperior quality, and ſeveral others. Their conſumption, however, falls very ſhort, when compared with that of foreign liquors. Wine, porter, and ale, are in general uſe. Of the firſt, upwards of two hundred and fifty thouſand hogſheads are imported every year, and of the two laſt to an amount exceeding two hundred and ſixty thouſand rubles, the greater part of which is here conſumed. The wood for firing

firing produced in the circumjacent diſtrict is not ſufficient for the prodigious demand of this city; about a hundred and fifty thouſand fathoms, moſtly of birch, being annually brought in from other parts of the country.

Mr. Tooke, in his View of the Ruſſian Empire, vol. iii. p. 543, has given us the ſeveral items of expence incurred by travellers viſiting Peterſburg, which are as follow: ſervant, *per* month 15 rubles, clothes, food. Coachman, 10 rubles *per* month, without food, but clothes provided. Cook, from 10 to 15 rubles *per* month; but a foreigner 30 or 40 rubles. Maid ſervant, from 3 to 5 rubles *per* month. Keep of a ſaddle horſe, 18 rubles *per* month. A pair of coach horſes, to hire, from 50 to 60 rubles *per* month, coachman included. Waſhing ſhirt, 10 copeeks; ſtockings, ſilk, 15 cop.; cotton, 5 cop.; cravat, 4 cop.; waiſtcoat, 10 cop.; trowſers, 15 cop.; handkerchief, 3 cop. Phyſician 10 rubles. Carriage to hire, 100 rubles *per* month. Lacquay, *per diem* 1 ruble; *per* month 25 rubles. Wines; the beſt old port 350 rubles the pipe; table port 250 rubles; chateau margot 250 rubles the hogſhead; Madeira 300 rubles the hogſhead; Champagne, the caſe 50 bottles, 200 rubles; Rheniſh wine from 1 ruble 50 cop. to 3 rub. 50 cop. *per* bottle; Hungary wine from 2 rub. 50 cop. to 6 rub. the bottle. It muſt be underſtood, however, that this ſtatement was made in the year 1800. Since that period every thing is greatly enhanced in price.

The inhabitants of this large city, beſides Ruſſians, conſiſt of all nations; ſo that a perſon hears a great variety of languages, and ſees an infinite diverſity of faſhions and cuſtoms at St. Peterſburg. The ſplendour of the court is imitated by the inhabitants in general; though every thing belonging to apparel, and eſpecially if made by foreign artizans, is very dear; and likewiſe furniture, and houſes in an eligible ſituation, bear ſometimes an extravagant price. The police is well regulated; and liberty of conſcience is enjoyed in its utmoſt extent.

When a perſon intends to ſet out from hence in order to quit the country, it is neceſſary for him to be furniſhed with a paſs, for obtaining which he muſt previouſly advertiſe his name, and intention of travelling, three times in the gazette. No ſooner is the winter ſet in, than upwards of 3000 Ruſſians repair with their ſledges to Peterſburg, where they ſtand in every ſtreet, and are ſo cheap and convenient, that few go on foot even about the town. A ſledge and horſe may be hired for ten copeeks an hour; and within that time this carriage will go about ſeven or eight Engliſh miles, the horſe continually galloping. Every *iſvoſhik*, or driver, is marked with a number on his back. It is ſufficient for a ſtranger to know the place or the houſe whither he would go, and three or four Ruſſian words, as, *ſtupai*, drive on; *ſtoi*, ſtop; *pramo*, ſtraight on; *na prava*, to the right; *na leva*, to the left; and the driver will convey him ſafe. Moſt houſekeepers have their own ſledges and horſes, and perſons of diſtinction keep alſo their poſtilion. In ſummer time thoſe who are not inclined to go on foot in this extenſive city, either make uſe of their own carriage, which is almoſt of abſolute neceſſity here, or elſe hire either curricles or boats.

Petersburg, a townſhip of America, in New York, in Renſſelaer county, E. of the village of Troy, incorporated in 1793, and containing 4322 inhabitants.—Alſo, a poſt-town of Pennſylvania, in York county, two miles N. of the Maryland line; containing a Roman Catholic church, and about 80 houſes; 25 miles N.W. of Yorktown.—Alſo, a ſmall town of Kentucky, ſituated in Woodford county, on the E. ſide of Kentucky river; 19 miles W.S.W. of Lexington. It has a few dwelling houſes, and a tobacco warehouſe.—Alſo, a poſt-town of Virginia, of conſiderable trade, in Dinwiddie county, on the S.E. bank of Appamatox river, about 25 miles S. of Richmond. It contains about 400 houſes, irregularly built, an epiſcopal church, a court houſe, and a gaol. The Freemaſons' hall is a handſome building. It has ſeveral tobacco warehouſes, ſtores of dry goods, and ſome few neat and commodious dwelling-houſes. The town is a corporation; and in 1790 contained 2828 inhabitants, including 1265 ſlaves. Its ſituation is rather low and unhealthy. The whole exports of this town, valued at the uſual peace prices, amount to 1,389,300 dollars, beſides the value of peach and apple brandy, whiſkey, &c.; 80 miles W. by N. from Norfolk. N. lat. 37° 14'. W. long. 78 8'.—Alſo, a very flouriſhing poſt-town of Georgia, in Albert county, in a pleaſant and ſalubrious ſituation, on the point of land formed by the confluence of Broad river with the Savannah. Several reſpectable merchants are ſettled in this town; 20 miles N. by E. from Waſhington. N. lat. 33° 46'. W. long. 81° 32'.

PETERSDORF, a town of Perſia, in the province of Samland; 24 miles E. of Königſberg.

PETERSFIELD, a town having ſeparate juriſdiction, in the hundred of Finchdean, is ſituated in the county of Southampton, or Hampſhire; 55 miles S.W. from London. Though but a chapelry to the pariſh of Buriton, Petersfield is a market and borough town of conſiderable antiquity. Its firſt charter of incorporation was granted by queen Elizabeth, who veſted its government in a mayor and commonalty, and empowered them to return two members to parliament; but two returns had been previouſly made, one in the thirty-fifth of Edward I., the other in the time of Edward VI. The right of election, as determined by the houſe of commons in 1727, is "in the freeholders of lands, or ancient dwelling houſes or ſhambles, or dwelling houſes or ſhambles built upon ancient foundations, within the ſaid borough." The number of votes is about 180, and the mayor is the returning officer. The regular place of worſhip is a chapel of eaſe, and near it ſtands an equeſtrian ſtatue of William III. erected by William Jeliffe, eſq. with an inſcription on the pedeſtal.

The paſſage of travellers from London to Portſmouth, forms the principal ſupport of Petersfield. It has a market on Saturday, and two annual fairs. The petty ſeſſions are holden here. Mapledurham, about two miles ſouth of Petersfield, was ſome time the ſeat and reſidence of the hiſtorian Edward Gibbon, eſq. At Butſer hill, a ſhort diſtance from Mapledurham, Aubrey places a conſiderable encampment. A few miles to the weſt from Petersfield are the villages of Eaſt and Weſt Meon, mentioned in the Domeſday book as the property of the biſhop of Wincheſter, and then known by the general name of Menes. In the church at Eaſt Meon is a very ancient font, bearing an exact reſemblance to that in Wincheſter cathedral, and moſt probably the work of the ſame artiſt, and given by the ſame biſhop. The upper part, or baſin, is placed on a circular ſhaft of three large ſingle ſtones, and its corners are ſupported on circular pillars without baſes, and having capitals of plain upright leaves. Beauties of England, vol. vi.

PETERSHAGEN, formerly *Hockleve*, a town of Weſtphalia, in the county of Minden, and once the reſidence of the biſhop of Minden.

PETERSHAM, a pleaſant poſt-town of America, in Worceſter county, Maſſachuſetts, formerly called by the Indians "Nichewang;" 28 miles N.W. of Worceſter. It is traverſed by Swift river, a branch of Chickapee river. The ſoil is rich, and here are large and excellent orchards; it contains 1794 inhabitants.

PETERSHAUSEN, a princely Benedictine abbey, near Constance, on a branch of the lake; given in 1802, with the diocese of Constance, as an indemnity to the margrave of Baden.

PETERSKIRCHEN, a town of Austria; five miles N. of Sonneberg.

PETERSTHAL, St., a town of Germany, in the circle of the Upper Rhine; six miles S. of Oppenau.

PETERSWALD, a town of Bohemia, in the circle of Leitmeritz; 18 miles N.N.W. of Leitmeritz.

PETERSWALDAU, a town of Silesia, in the principality of Schweidnitz; nine miles S. of Schweidnitz.

PETER-WARDEIN, a town of Sclavonia, on the Danube, strongly fortified; famous for the victory obtained near it over the Turks, in 1716, by prince Eugene; 38 miles N.W. of Belgrade. N. lat. 45° 26′. E. long. 19° 37′.

PETESIA, in *Botany*, a name of whose origin neither Browne nor Linnæus has vouchsafed to give any account, nor has any other writer, that we can find, hazarded a conjecture concerning it. We are obliged to leave it in the dark, as we find it. Browne Jam. 143. Linn. Gen. 54. Schreb. 72. Willd. Sp. Pl. v. 1. 612. Mart. Mill. Dict. v. 3. Juss. 199.—Class and order, *Tetrandria Monogynia*, Nat. Ord. *Rubiaceæ*, Juss.

Gen. Ch. *Cal.* Perianth superior, in four or five deep, acute, permanent segments. *Cor.* of one petal, funnel-shaped; its limb in four deep segments. *Stam.* Filaments four, short, inserted into the base of the corolla; anthers oblong, equal to the tube. *Pist.* Germen inferior, roundish, with a furrow at each side; style simple, erect; stigma acute. *Peric.* Berry globose, of two cells, crowned with the calyx, and finally splitting longitudinally. *Seeds* solitary in each cell, large, convex on the outside, flat on the inner.

Eff. Ch. Corolla of one petal, funnel-shaped, four-cleft. Stigma simple, acute. Berry with two seeds.

Obs. The character of this genus is involved in the greatest possible confusion. We have endeavoured to make it accord with *P. stipularis*, the only authentic species that remains, and to avoid absurd contradictions. Probably *Ixora americana* ought to be restored to *Petesia*, where Browne first placed it, and with which it agrees far better in habit and character than with other *Ixoræ*; but who can decide this point without examining all the plants in question in a perfect state? Whether *P. stipularis* be tetrandrous or pentandrous is not clear, nor does Browne, whose specimens are before us, appear to have seen the flowers. For *P. Lygistum* of Linnæus, see Manettia.

1. P. *stipularis*. Linn. Sp. Pl. 160. Willd. n. 1. (P. fruticosa, foliis ovatis oppositis, stipulis rigidis interpositis, racemis minoribus alaribus, calyce quinquefido; Browne Jam. 143. t. 2. f. 2.)—Leaves elliptic-lanceolate, most downy beneath. Panicles axillary, dense, forked.—Native of Jamaica, on the hills above Bull Bay, and on those between Sixteen-mile-Walk and St. Mary's. *Browne.* The *stem* is shrubby. Young *branches* square, leafy, clothed with soft down, as are the *footstalks*, backs of the *leaves*, and whole *inflorescence*. The *leaves* are two inches long, elliptical, acute, entire, with one rib, and many transverse curved veins; their upper surface at length smooth and naked. *Stipulas* between the bases of the *footstalks*, broad at the bottom, pointed, bristly. *Panicles* much shorter than the leaves, each of twelve or fifteen small *flowers*. *Berry* downy, about the size of hemp-seed. Swartz guesses this plant to be akin to *Rondeletia*, but he had never seen it. See his Obs. Bot. 47.

2. P. *carnea*. Forst. Prodr. 10. Willd. n. 2.—"Leaves oblong-lanceolate, smooth. Cymes terminal, three-cleft."—Native of the island of Namoka. *Forst.* We must rely on Forster for the genus of this plant.

3. P. *tomentosa*. Jacq. Amer. 18. Linn. Sp. Pl. 161. Willd. n. 3.—"Leaves oblong, downy on both sides."—Observed by Jacquin, in woods at Carthagena. A *shrub*, with weak trailing *branches*; the young ones obscurely quadrangular, and slightly downy. *Leaves* oblong, tapering at each end, three inches long, soft with scarcely visible down. *Corymbs* lateral and terminal. *Flowers* small, inodorous, yellowish-white. *Fruit* unobserved, so that Jacquin was in doubt as to the genus. We should not be surprized if this proved the very same plant as *P. stipularis*.

4. P. *villosa*. (P. fruticosa, foliis subvillosis ovatis oppositis, stipulis setâ terminatis, racemis alaribus; Browne Jam. 144.)—"Leaves ovate, somewhat villous. Stipulas tipped with a bristle."—Gathered by Browne along with the first species. He gives no figure of it, nor have we seen a specimen. We merely insert it for further enquiry.

P. spicata, Swartz Ind. Occ. 1945, having numerous *seeds* and a cloven *stigma*, cannot belong to this genus, nor dare we adopt Loureiro's *simplicissima* and *trifida*.

PETHERTON, North, in *Geography*, a town in the hundred of North Petherton, in Somersetshire, 144 miles W. by S. from London. The town consists chiefly of one street, which is built along the road from Bridgewater to Taunton, and contains many good houses. It derives its name from its situation on the river Parret, which was anciently written Peder. It was formerly in the possession of the Saxon kings, and of such consequence, that it never was assessed to the Danegeld, nor rated to any other subsidy. The parish is extensive, and contains several hamlets. The church is dedicated to St. Mary, and is a large handsome structure, consisting of a nave, chancel, and side aisles. At the west end is an embattled tower, richly embellished with sculpture, and open ornaments towards the summit. The pinnacles are particularly light and elegant. The market is on Saturday, and there was formerly a large market-place for corn. Here is one annual fair. By the census of 1811, the number of houses was 546, and of inhabitants 2615. Within the parish are several places, of little note now, but which at former periods have been the residence of great and eminent families. Mansel, or Maunsel, is the seat of John Slade, esq., the possessor of the manor and hundred of North Petherton. This estate had been the inheritance of the family of the Maunsels for many generations. Collinson's History of Somersetshire, vol. iii.

Petherton, *South*, a town in the hundred of South Petherton, Somersetshire, 137 miles from London, and six from Ilminster. It was formerly called Pedredan, or Pedredstown, from its situation on the Parret. It is the first considerable parish which that stream traverses in its way to the sea. It passes here under a stone bridge of three arches, a mile southward of the parish church, at the intersection of the Roman fosse-road, coming from Ilchester. The bridge was formerly of wood, which having become ruinous, two children were drowned in the river near it; the parents of the children rebuilt it of stone, and caused their infant effigies to be placed thereon, to commemorate the circumstance. In a field near this bridge a large quantity of Roman coins, to the amount of six pecks, was dug up about the year 1720; and near Jailer's-mill, in the tithing of Southarp, a little below the surface of the ground, are the remains of Roman buildings, which the common people, from the name, suppose to be the foundation of an old prison. In this spot, also, coins, fragments of urns, pateræ, and pieces of terras, have been discovered. It is undisputed that South Petherton and its vicinity were known to, and occupied by, the Roman people, as it lies so near to one of their principal roads, and as their reliques have here been so frequently discovered. At Watergore, a small hamlet southward of the town, a Roman pavement was discovered in 1673; and Wigborough, not far distant, is supposed to have been a Roman town, not only from its name, but from the extensive foundations of buildings which have been traced there.

When that people relinquished this country, South Petherton became the possession and the seat of the Saxon kings of Wessex. King Ina had a palace here, which was long ago destroyed; there is, however, an old house near the church, with ancient windows, and armorial shields, which bear that prince's name, but it is unquestionably the erection of more modern times. King Athelstan is reported to have occupied this place, which was thought an object of importance by all his successors, till after the Norman conquest. The parish church stands on a little eminence near the centre of the town, and is dedicated to St. Peter and St. Paul. It is a large structure, built in the form of a cross, having two side aisles, and a north and south transept, with an octangular tower at their intersection, crowned with a spire. Behind the altar is a vestry-room, which was formerly a confessional: many of the monuments, with the organ, were spoiled in the civil wars. The parish is divided into four tithings. A market is held here on Thursday, and there was formerly a large market-hall and cross, both which, with several houses, were destroyed in the last century. The annual fair is on the fifth day of July. At this place is a considerable manufactory of dowlas. By the census of 1811, the parish contained 352 houses, and a population of 1867 inhabitants. At Hinton St. George, about three miles distant, is a seat of earl Poulet. Collinson's History of Somersetshire, vol. iii.

PETIA, a word used by medical writers in different senses. It is commonly understood to mean a piece of rag, used to tie medicinal ingredients in, to be used by infusion in liquors; but petia oculi signifies an hæmorrhage of the eye.

PETICULÆ, the same as *petechiæ*, purple spots appearing on the flesh in malignant fevers.

PETIGLIANO, in *Geography*, a town of Etruria; 50 miles S.E. of Sienna.

PETIGO, a word used by some authors for *impetigo*.

PETILIUM, in *Botany*, a name given by Linnæus, in the first edition of his Genera Plantarum, p. 91, to the Crown Imperial, which he at that time considered as a distinct genus from FRITILLARIA; see that article.

PETILIUS FLOS, a name used by some botanical authors for the African marygold.

PETIMBUABA, in *Ichthyology*, the name of a fish caught in the American seas, and called by some, in English, the *tobacco-pipe fish*. See FISTULARIA.

PETIN, in *Geography*, a small island in the East Indian sea. S. lat. 2° 20'. E. long. 99° 27'.

PETINA, LA, a town of Naples, in Principato Citra; 6 miles S.W of Cagiano.

PETIOLATE LEAF, in *Botany*. See LEAF.

PETIOLUS, the Footstalk, or Leafstalk, is what supports the leaf when the latter is not sessile, or close to the stem or root. In all simple leaves, and in some compound ones, whose leaflets are sessile, the footstalk is necessarily simple: in compound leaves in general it is branched. The footstalk is usually channelled on the upper side; convex, angular, or keeled underneath. Sometimes it is dilated, and concave, or sheathing at the base. It occasionally ends in tendrils, as in some Vetches, and now and then bears the flower-stalk, as in *Turnera* and *Menyanthes*. See LEAF.

PETIS DE LA CROIX, FRANCIS, in *Biography*, a learned French orientalist, born in 1654, was the son of the king's interpreter for the oriental languages, and received an education to qualify him for the same employment. At the early age of sixteen, he was sent by the minister Colbert to reside in the East. He passed several years at Aleppo, visited Ispahan and Constantinople, and employed himself in the most diligent study of oriental literature. He returned to Paris in 1680, and in two years afterwards he was sent to Morocco, as secretary under M. de Saint-Amand, to Muley Ishmael, king of that country. He pronounced before that sovereign the ambassador's harangue in Arabic, with an elegance and purity which excited the admiration of the whole court. In the two following years he accompanied the French armament against Algiers, in quality of secretary-interpreter of the marine, and was employed to translate into the Turkish language the treaty of peace in 1684. He performed the same office with respect to the negociations with Tunis and Tripoli. When the latter power was engaged to pay the king of France the sum of 600,000 livres, by way of reimbursement, a considerable bribe was offered to Petis de la Croix, to put in the treaty crowns of Tripoli instead of French crowns, which would have made the difference of 100,000 livres, but his fidelity to his sovereign was incorruptible. In 1687 he was employed at Morocco under the duke de Mortemar: and, in short, it was through his intervention that all the affairs between the French ministry and the eastern courts were transacted, from the year 1680 to the time of his death. In 1692 he was appointed to the professorship of Arabic in the college royal, and the survivorship of his father's office of Oriental interpreter was conferred upon him. From this period he never left the kingdom, but employed himself in translations from the eastern languages, of which he was acquainted with the Arabic, Turkish, Persian, Tartarian, Ethiopic, and Armenian. He died at Paris in 1713. His principal publications are "The Oriental Library of Hadji Calfa;" "The History of all the Mahometan Monarchies," from the Turkish; "General State of the Ottoman Empire, from the Foundation to the present Time, with abridged Lives of the Emperors;" from the Turkish; "The History of Gengiscan;" "The History of Timur-Bec," from the Persian: "The Thousand and One Days," tales from the Persian; besides other tracts, geographical and descriptive, and some grammars, dictionaries, &c. Moreri.

PETISTAGUIT, in *Geography*, a river of Canada, which runs into the river St. Lawrence, N. lat 50 . W. long. 66 26'.

PETIT, SAMUEL, in *Biography*, a French Protestant divine, was born in the year 1594. He was the son of a respectable minister at Nismes, in Languedoc, from whom he received the elements of an excellent education. While a child, he discovered a powerful inclination for learning, and astonished the masters under whose tuition he was placed, by the rapidity with which he became a proficient in the Greek and Latin languages. Having laid a good foundation of grammar learning, he continued to extend his acquaintance with the ancient languages, and afterward to apply his attention to rhetoric and philosophy. Being intended for the ministry, he spent three years at Geneva in attending the divinity lectures of Diodati, and those of the other learned professors of that celebrated school. At the same time

time he applied himſelf to the ſtudy of the oriental tongues. The zeal with which he applied to learning is almoſt incredible: for a whole year he allowed himſelf reſt only on each alternate night, the others were devoted to ſtudy. Such was his progreſs, that at the age of ſeventeen he was admitted to the miniſtry. Almoſt immediately after this he was choſen to fill the chair of profeſſor of divinity in the academy of Niſmes, to which was added the profeſſorſhip of the Greek and Hebrew languages. Theſe poſts he retained with very high reputation during the remainder of his life; while he purſued his various learned ſtudies with uncommon diligence. He was likewiſe eminent as a preacher, and devoted much of his time to the charitable duties of viſiting the ſick. To the deep regret of all who knew him, and to the loſs of the learned world, he died in 1643, when he was only in the 49th year of his age. He was a man of vaſt and profound erudition, but his learning was accompanied with modeſty and humility, and through life he is ſaid to have exhibited a bright pattern of unaffected piety, and of all the moral virtues. His works are very numerous, and he left behind him in MS. two large volumes of notes upon Joſephus, which were purchaſed by lord Clarendon for 150 louis-d'ors, and preſented to the univerſity of Oxford, where they were depoſited in the Bodleian library. Here they were conſulted by Hudſon, when he was preparing his edition of the Jewiſh hiſtorian. Moreri.

Petit, Peter, a celebrated French mathematician and natural philoſopher, was born in the year 1598. He cultivated from a very early period the ſtudy of the mathematics and phyſics, in which he made conſiderable progreſs, and which recommended him to the acquaintance of M. Paſcal. His father was comptroller of the elections in the diſtrict in which he lived, an office to which he ſucceeded, but which, in 1633, he ſold, and removed to Paris. Here he diſtinguiſhed himſelf by his writings, and became intimate with the moſt eminent men of his time. On ſeveral occaſions he was employed by cardinal Richelieu, who gave him a commiſſion to viſit the ſea-ports, with the title of engineer and geographer to the king. He was afterwards ſent into Italy by his majeſty, on ſpecial affairs. After his return, he became a convert to the principles of Des Cartes. About the year 1640, he received the appointment of intendant of the fortifications of France. During a part of the year 1646 and 7, he was ſtationed at Rouen, where, in conjunction with M. Paſcal, he went through the ſame experiments on the ſubject of a vacuum, which Torricelli had made before in Italy. (See Pascal.) From this time there are no farther particulars relating to the life of M. Petit, though he lived to the year 1677, when he was about 79 years of age. He is deſcribed as having excelled particularly in aſtronomy, and as having had a ſingular paſſion for experimental philoſophy. He was author of many treatiſes on mathematical, phyſical, and aſtronomical ſubjects, of which a long liſt is given in the Gen. Biog. Moreri.

Petit, Peter, a learned phyſician, was born at Paris in the year 1617, and obtained the degree of doctor in the univerſity of Montpellier, and of bachelor of medicine in that of Paris. He was alſo elected a member of the academy of Padua. Although he had acquired an extenſive acquaintance with the medical ſcience, in the courſe of the ſtudies by which thoſe degrees were obtained, yet the bias of his mind was not directed to the practice of the profeſſion which he had cultivated, but led him to philoſophical and literary purſuits, and eſpecially to the ſtudy of hiſtory, and to the cultivation of Latin poetry. It was by the excellence of his poems that he obtained the honour of admiſſion into the Paduan academy; and the ſame merit occaſioned him to be ranked as one of the Pleiades of Paris, an appellation given to a party of ſeven of the moſt accompliſhed Latin poets of that capital. A collection of his poems was publiſhed in 1683, dedicated to M. Nicolai, preſident of the chamber of accounts, and prefaced by a curious diſſertation on the mania of poetry. His poem of "Codrus," and that entitled "Cynomagie," are much praiſed for the elevated ſentiments, the elegance of expreſſion, and the ſtrength and harmony of the verſe, which they exhibit. One of his poems was on the ſubject of "Tea," and was printed at Leipſic, in 1685, with the title of "Thée, ſive de Sinenſi Herba Thée," with an epigraph of Nicholas Pechlin reſpecting this herb, and the deſcriptions of ſeveral other authors. The writings of Petit, however, were not limited to poetical eſſays; he was the author of ſeveral curious tracts, of which the following are the titles. "De Motu Animalium Spontaneo," Par. 1660, in which he defended Ariſtotle againſt Deſcartes: "De Lacrymis, Libri tres," 1661, 12mo.: "Exercitationum de Ignis et Lucis Natura Defenſio," 1664, 4to.: "Diſſertatio de novâ Renati Carleſii Philoſophia," 1670, 8vo: "Miſcellanearum Obſervationum, Libri quatuor," 1682, 8vo.: "De Amazonibus Diſſertatio," 1685, 12mo.: "De Sybilla, Libri tres," Lipſ. 1686, 8vo.: "De Natura et Moribus Anthropophagorum," Traj. 1688, 8vo.: "Homeri Nepenthes, ſive, de Helenæ Medicamento luctum avolente Diſſertatio," ibid. 1689, 8vo.: "Commentarii in tres priores Aretæi Cappadocis Libros," Lond. 1726: "Traité de la Nourriture qui peut ſe tirer de l'Eau." Eloy Dict. Hiſt. de la Med.

Petit, Francis, a diſtinguiſhed phyſician, who is better known by this name than by that of *Pourfour du Petit*, was born at Paris on the 24th of June, 1664, and loſt his parents, who were engaged in trade, during his childhood. He is ſaid to have been ſlow of apprehenſion, and weak in memory, when a boy; ſo that, though he laboured much at ſchool, his progreſs was extremely ſlow, until his mind was intereſted, and his faculties called forth, by the philoſophy of Deſcartes, which his tutor put into his hands. The ſubject became the leading object of his purſuits, and he began his travels early, with the view of increaſing his knowledge. At Rochelle he became intimate with M. Blondin, who had a valuable library, a garden of medicinal plants, and a muſeum of natural curioſities, and who inſtructed him in anatomy, and recommended him to ſtudy medicine. He adopted this counſel, and in 1687 repaired to Montpellier, where he graduated, and returned to Paris in 1690. Here he ſtudied anatomy under Du Verney, botany with Tournefort, and chemiſtry with Lemery, and obtained the friendſhip of theſe celebrated men. After three years of ſtudy, and attendance on the hoſpital of La Charité, he became attached to the army, and in his ſuperintendance of the hoſpitals at Mons, Namur, and Dinant, he obtained conſiderable diſtinction, and eſtabliſhed in them diſſecting-rooms, and chemical laboratories, and directed the ſtudies of the pupils in botany. After the peace of Ryſwick, in 1697, he returned to Paris: but the war of the Spaniſh ſucceſſion called him again to the military hoſpitals, and it was not till the peace of Utrecht took place, in 1713, that he ſettled in Paris. In 1722 he was elected a member of the Academy of Sciences, and three years afterwards he was appointed penſionary anatomiſt, on the ſuperannuation of M. du Verney. His reputation obtained for him this honourable appointment, and he was now extenſively employed in the practice of his profeſſion. He was particularly ſucceſsful in the treatment of diſeaſes of the eye, which he illuſtrated by various models, and remedied

died by improving the inftruments and operations of his predeceffors, in relation to this delicate organ.

This ingenious man died at Paris on the 18th of June, 1741, aged 77. He left feveral works behind, befides the papers which he communicated to the academy. They were written in a negligent, and not always correct ftyle; for the conftant occupation of his time in obfervation and experiment prevented him from exercifing the *limæ labor* on his writings, and rendered him carelefs about the turn of his phrafes. His works are; " Trois Lettres d'un Medecin des Hofpitaux du Roi à un autre Medecin de fes Amis, fur un Nouveau Syfteme du Cerveau," Namur, 1710, 4to. " Differtation fur une Nouvelle Methode de faire l'Operation de la Cataracte," Par. 1727, 12mo. " Lettre dans laquelle il eft démontré que la Cryftallin eft fort près de l'Uvée, et ou l'on rapporte de nouvelles preuves de l'Operation de la Cataracte," 1729, 4to. " Lettres contenant des Reflexions fur ce que M. Hecquet, M.D. a fait imprimer touchant les Maladies des Yeux," 1729, 4to. " Lettres contenant des Reflexions fur les Decouvertes faites fur les Yeux," 1732, 4to. Eloy Dict. Hift.

PETIT, JOHN LEWIS, a celebrated furgeon, was born of a refpectable family at Paris, on the 13th of March, 1674. From his childhood he difplayed an acutenefs and penetration beyond his years, which gained him the attachment of M. de Littre, a celebrated anatomift, who refided in his father's houfe. This kindnefs of M. de Littre, and his own curiofity, fometimes attracted the boy to the diffecting room of the former, where he foon evinced an intereft in anatomical purfuits. Diffection, fo far from alarming him, became his play: he was found one day, in a garret, where he had fecreted himfelf, diffecting a rabbit, which he had caught, in imitation of what he had feen M. de Littre perform. This able anatomift did not fail to cultivate this inclination; and from the age of feven years, his young pupil regularly attended at his demonftrations, and made fuch rapid progrefs, that he had fcarcely attained the age of twelve, when M. de Littre confided to him the fuperintendance of his anatomical theatre. He afterwards ftudied furgery under Caftel and Marefchal, and was admitted Mafter at Paris in 1700. He was born, it has been faid, for the art which he practifed, and would have created furgery, if it had been previoufly unknown. He became the firft practitioner, and, as it were, the oracle of furgery in Paris; he was confulted in all cafes of importance; and there were few operations of difficulty and delicacy, which he did not fuperintend, or actually perform; and his hand and his counfels were alike fuccefsful. Such a reputation was of courfe not limited to his native city, but extended throughout Europe. In 1726 he was fent for by the king of Poland, and again in 1734 by Don Ferdinand, afterwards king of Spain: he re-eftablifhed the health of both thefe princes, who endeavoured to retain him near their perfons with the offer of great rewards. But he preferred his native capital to the moft brilliant fituations, and found there a fufficient number of perfons who properly eftimated his merits. He became a member of the Academy of Sciences in 1715, and was appointed director of the academy of furgery, and cenfor and royal profeffor at the fchools. He was likewife chofen fellow of the Royal Society of London. He died at Paris on the 20th of April, 1750, aged 76. He was equally beloved for the qualities of his heart, as he was admired for thofe of his underftanding; for his difpofition was naturally lively and hofpitable, and his manners were indicative of opennefs and warmth of heart, rather than the refult of a ftudied politenefs. He was extremely animated in every thing that concerned his profeffion; and an overfight irritated him more than an infult. But his anger was ever of fhort duration, and he entertained no enmities. His benevolence towards the fuffering poor was unbounded, and he fpared no labour or exertions for their relief.

He communicated many memoirs to the Academy of Sciences, and feveral to the Academy of Surgery, which were printed in their firft volume. His only feparate publication was, his " Traité des Maladies des Os," printed at Paris in 1705, in 12mo., and frequently reprinted, with additions. An edition, in 1758, in two volumes, 12mo., was publifhed by M. Ant. Louis, with an hiftorical and critical effay refpecting it fubjoined: and his pupil, M. Lefne, publifhed his pofthumous works in 1774, with the title of " Traité des Maladies Chirurgicales et des Operations qui leur conviennent," in three volumes, 8vo., with many plates of chirurgical inftruments. His treatife on the bones involved him in feveral controverfies; but the only chagrin which he felt, arofe from finding Winflow, who, as cenfor royal, had approved the work, retract his approbation, in a letter inferted in the Journal des Savans for May, 1725. Eloy Dict. Hift.

PETIT, ANTHONY, a diftinguifhed anatomift, was born at Orleans, and received the degree of doctor of phyfic at Paris, in November 1746. He was elected a member of the Royal Academy of Sciences in 1760. His talents in the practice of his profeffion procured for him the appointment of infpector of military hofpitals in 1768, and, in the following year, the chair of anatomy and furgery at the king's garden, where his fcience and eloquence attracted a crowd of auditors. In 1775 he was fucceeded by M. Vicq d'Azyr in the duties of this chair, while he remained titular profeffor. He was author of the following works; *viz.* " Lettre d'un Medecin de Montpellier, au Sujet de l'examen public que le Sieur Louis a fubi à faint Côme, en 1749, pour fervir d'Eclairciffement a ce qu'en dit M. Fréron," 4to. 1749. " Difcours fur la Chirurgie," an introductory lecture delivered at the fchools of medicine, 1757. " Confultation en faveur des Naiffances tardives," 1764, 8vo. " Premier et feconde Rapport en faveur de l'Inoculation," 1766, 8vo. " Deux Confultations Medico-legales," relative to a cafe of fuppofed felf-murder, and to a fuppofed infanticide, 1767. He alfo edited, " Anatomie Chirurgicale publicé cidevant par Jean Palfin," 2 tom. 8vo. 1753. Eloy Dict. Hift. de la Med.

PETIT, *Cape*, *Jury*, *Larceny*, *Serjeanty*, *Seffion*, *Treafon*. See the fubftantives.

PETIT *Goave*, in *Geography*. See GOAVE.

PETIT *Port*, a harbour on the coaft of Peru, near the equator.

PETITA TERRA. See SUMMONS.

PETITCODIAK, in *Geography*, a river of America, which falls into an arm of the bay of Fundy, called Chegnecto channel. The Indians have a communication from the head of it with St. John's river, by a portage acrofs to the head of Kennebecfius.

PETITE GUERRE, Fr., in *Military Language*, is carried on by a light party, commanded by an expert partifan, confifting of between one and two thoufand men, feparated from the main army, in order to fecure the camp on a march, to reconnoitre the enemy or the country, to feize their pofts, convoys, or efcorts, to plant ambufcades, and to practife every ftratagem for furprifing or difturbing the enemy.

PETITE-PIERRE, LA, or LUTZELSTEIN, in *Geography*, a town of France, in the department of the Lower Rhine, and chief place of a canton, in the diftrict of Savarne.

varre. The place contains 1019, and the canton 9323 inhabitants, on a territory of $292\frac{1}{2}$ kiliometres, in 22 communes.

PETITE-RIVIERE, a town of Hispaniola; 15 miles E.N.E. of St. Marco.—Also, a town of Canada, on the St. Lawrence; 65 miles N.E. of Quebec.

PETITES-CHIELLES, a town of France, in the department of the Jura, and chief place of a canton, in the district of Saint Claude. The place contains 578, and the canton 11,923 inhabitants, on a territory of 255 kiliometres, in 28 communes.

PETITE-TERRE, a small island in the West Indies, near Deseada.

PETITE-TROU, a town of the island of Hispaniola; 19 miles E. of Jeremie.

PETITIA, in *Botany*, was named by Jacquin, in honour of Francis Pourfour du Petit, a celebrated physician and anatomist of Paris, who died in 1741. He published some botanical observations, in the form of letters, in 1710. Jacq. Amer. 14. Schreb. 72. Willd. Sp. Pl. v. 1. 614. Mart. Mill. Dict. v. 3. Juss 107.—Class and order, *Tetrandria Monogynia.* Nat. Ord. *Personatæ*, Linn. *Vitices*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, small, erect, with four teeth, permanent. *Cor.* of one petal; tube cylindrical, erect, long; limb in four ovate, acute, flat, reflexed segments, half the length of the tube. *Stam.* Filaments four, awl-shaped, very short, in the upper part of the tube; anthers erect. *Pist.* Germen roundish, small, superior; style awl-shaped, erect, the length of the stamens; stigma simple. *Peric.* Drupa roundish. *Seed.* Nut ovate, obtuse, of two cells, with solitary, oblong kernels.

Eff. Ch. Calyx four-toothed, inferior. Limb of the corolla four-cleft, reflexed. Drupa with a nut of two cells.

Obs. Jacquin says the flowers are often three-cleft and triandrous.

1. P. *domingensis.* Jacq. Amer. t. 182. f. 6, a leaf only.—Native of woods in Hispaniola. An upright *shrub*, whose young *branches* are square and furrowed. *Leaves* opposite, ovate-oblong, pointed, smooth, entire, veiny underneath, six inches long, on slender *footstalks*. *Panicles* axillary, three inches long, with awl-shaped *bracteas* at their subdivisions. *Flowers* numerous, white.

Dr. Mærter, whose discoveries, though not acknowledged, have so greatly enriched the Vienna gardens, has observed to us that this plant is truly a species of *Citharexylum*; nor do we see any reason to doubt the accuracy of this opinion, though, having never seen a specimen, we cannot form any positive conclusion.

PETITIO Induciarum, in the *Civil Law*, the same as imparlance in common law.

Petitio *Principii*, in *Logic*, a begging the question, or precarious supposing a thing to be true, or taking it for granted, when it really remains either dubious, or else expressly denied.

PETITION, Petitio, a supplication in form, made by an inferior to his superior; especially to one having some jurisdiction.

To subscribe a petition to the king to frighten him into change of his measures, intimating, that if he denied, many thousands of his subjects will be discontented, &c. is included among the contempts against the king's person and government, tending to weaken the same, and is punishable by fine and imprisonment. 1 Hawk. P. C. 60.

The right of petition is, however, unquestionable; provided care be taken, that, under the pretence of petitioning, the subject be not guilty of any riots or tumults, for preventing which, it is provided by the stat. 13 Car. II. stat. 1. cap. 5, that no petition to the king, or either house of parliament, for any alterations in church or state, shall be signed by above twenty persons, unless the matter thereof be approved by three justices of the peace, or the major part of the grand jury, in the country; and in London, by the lord mayor, aldermen, and common council: nor shall any petition be presented by more than ten persons at a time, on pain, in either case, of incurring a penalty not exceeding 100*l.* and three months imprisonment. But, under these regulations, it is declared by the statute 1 W. & M. stat. 2. cap. 2, that the subject hath a right to petition; and that all commitments and prosecutions for such petitioning are illegal.

Petition *of Appeal* to the house of lords is the dernier resort of any subject, who thinks himself aggrieved by any interlocutory order or final determination in the court of chancery. This jurisdiction of the house of peers is said to have begun in 18 Jac. I., and the first petition, which appears in the records of parliament, was presented in that year; and the first that was heard and determined, was presented in a few months after; both levelled against the lord keeper Bacon, for corruption and other misbehaviour. It was afterwards warmly controverted by the house of commons, in the reign of Charles II. But the dispute has long since terminated. We may observe, that no new evidence is admitted in the house of lords, upon any account, for this is a distinct jurisdiction.

Petition *of Bankruptcy*, is a petition presented to the lord chancellor by one creditor to the amount of 100*l.*, by two to the amount of 150*l.*, or by three or more to the amount of 200*l.*; upon which he grants a commission to certain persons, who are then styled commissioners of bankrupts. See Commission.

Petition *of Right*, was a parliamentary declaration of the liberties of the people, assented to by king Charles I., in the beginning of his reign: in which it is enacted, that none should be compelled to make or yield any gift, loan, benevolence, tax, and such like charge, without consent by act of parliament; nor upon refusal so to do, be called to make answer, take any oath not warranted by law, give attendance, or be confined, or otherwise molested concerning the same, &c. And that the subject should not be burthened by the quartering of soldiers or mariners; and all commissions for proceeding by martial law to be annulled, and none of like nature issued thereafter, lest the subject (by colour thereof) be destroyed or put to death, contrary to the laws of the land, &c. See stat. 3 Car. I. cap. 1.

PETITOT, John, in *Biography*, was an enamel painter of very considerable renown, born at Geneva in 1607, who practised for a considerable length of time in England, being assisted, it is said, in the manufactory of his colours, by sir Theodore Mayerne, a physician and renowned chemist.

Petitot copied many of Vandyke's pictures with great neatness and care; but though his colours were specifically pure and bright, he possessed not the art of breaking and uniting them; and consequently his pictures lack richness, truth, and harmony. He was nevertheless the first man of his time, in that branch of the art. From England, after the execution of Charles, he went to France, and succeeded at the court there, so as to acquire an ample fortune. Being a Protestant, he with some difficulty, after the passing of the edict of Nantes, procured permission to retire to Geneva; and afterwards settled at Vevay, in the canton of Berne, in ease and affluence; and there he died at the advanced age of 84, in 1691.

The ufual price of Petitot for a portrait was 30 piftoles; but for fome years before his death, it was advanced to 40. But he only painted the heads and hands of his figures; the hair, ground, and draperies, being executed by his brother-in-law, Bordier; and it appears to their credit, that they affociated and lived together for 50 years, without the fmalleft conteft or mifunderftanding.

He left a fon of his own name, who practifed the fame profeffion with his father; and though he was not by any means equal to him, yet he obtained very confiderable employment and repute. His age and the period of his death are alike unknown.

PETIVARS, in *Geography*, a tribe, inhabiting towards the north-eaft of Brafil, who are faid to be benevolent and hofpitable. They bore their lips, and adorn them with a green ftone, of which they are fo vain as to defpife all other nations. When the wife has brought forth a child, the hufband confines himfelf to his bed for a month, and receives vifits of congratulation. Eftalla obferves, that this cuftom is not only common in many parts of America, but was alfo known to the ancient Spaniards, as mentioned by Strabo. The reafon of this cuftom is, that if any accident were to befal the father, the new-born babe muft fuffer.

PETIVER, James, in *Biography*, an Englifh naturalift and indefatigable collector, who flourifhed at the end of the 17th and beginning of the 18th centuries, paffed the chief part of his life as an apothecary, at the White Crofs in Alderfgate-ftreet, London. Of his origin nothing is known, and the only indication we can find of his family connections, occurs in the octavo edition of his *Gazophylacium*, p. 15, where he fays, "this ferpent, with feveral other animals, I find amongft fome Cape paintings, which our worthy kinfman Dr. Sherard hath lately given me to figure," &c. It were unjuft to defraud him of even the fhadow of fo illuftrious a relationfhip. Dr. Pulteney has afcertained that Petiver was apprenticed to Mr. Feltham, apothecary to St. Bartholomew's hofpital, and that after he was eftablifhed for himfelf in Alderfgate-ftreet, he became apothecary to the Charter-houfe, and obtained a confiderable fhare of practice in his profeffion. He had an early propenfity to collect natural curiofities, and engaged various captains and furgeons of fhips to bring home any thing they could find to enrich his growing mufeum. He fupplied fuch perfons with printed lifts, and indications, of what was beft worth their notice, as well as with inftructions for preferving what they might collect. Nor was he lefs induftrious in procuring the productions of his own country. He travelled in 1692 into the midland counties of England, nor did he confine his inquiries to the beaten tracks, but extended them to the cryptogamic walks of Botany, hitherto fcarcely explored. His fubfequent publications fhew that he was in the daily habit of obferving the minuteft productions of the animal as well as vegetable kingdoms, in the neighbourhood of London. His mufeum and his reputation gradually increafed, infomuch that Sir Hans Sloane, fome time before Petiver's death, offered him four thoufand pounds for the former, and afterwards purchafed it; while the latter is evinced by his being elected a Fellow of the Royal Society, and ftill more by his being acknowledged as the liberal and intelligent correfpondent and affiftant of the great Mr. Ray. He proved no idle member of the learned body which adopted him. Above twenty of his papers appear in the Philofophical Tranfactions, between the years 1697 and 1717. Thefe are moftly accounts of various productions of the three kingdoms of nature, fent to the author from diftant countries. One of his treatifes however has a higher aim, and entitles him to rank as a philofophical naturalift. This occurs in vol. xxi. N° 255, under the denomination of "Some attempts made to prove, that herbs of the fame make, or clafs, for the generality, have the like vertue, and tendency to work the fame effects." The idea had indeed been fuggefted by Cæfalpinus, but it was firft exemplified by Petiver. Linnæus afterwards carried it further, nor can any reflecting perfon doubt of the foundnefs of the doctrine.

The firft publication of our author was a fmall octavo of 96 pages, with two plates, entitled *Mufei Petiveriani Centuriæ decem*; 1695—1703. This is more than a bare catalogue of his collection, as many of the articles are fcientifically defined, and accompanied with brief but intelligent remarks. Copious accounts of his correfpondents and benefactors are interfperfed. An invidious mention of his contemporary, and rival collector, Plukenet, occurs in p. 78, where that botanift is accufed of "rafh conjectures" and "falfe references," and of refufing to compare fome of Petiver's fpecimens with his own, for the purpofe of afcertaining fynonyms. Thefe authors were always at variance; for though they now and then fpeak of each other with civility, they much more frequently lay afide all decorum in their criticifms. Plukenet in his *Mantiffa* (fee Plukenet) handles Petiver very roughly; nor was the latter at all behind-hand in abufe. This does not indeed appear by the generality of his publications; but we have feen in the collections of Tournefort and Vaillant at Paris, various tickets, whether manufcript or printed we cannot pofitively fay, attached to a number of dried fpecimens, in which the fubject of our prefent article difplays a malignity and coarfenefs of criticifm, directly calculated to defeat its own defign, and of which we have fcarcely ever met with another inftance.

Petiver publifhed, in 1702, the 1ft and 2d Decades of his *Gazophylacium Naturæ et Artis*, the plates of which are in folio, the letter-prefs 32 pages in 8vo. Thefe were followed by three more Decades in 1704, with 48 pages of letter-prefs; and "A Claffical and Topical Catalogue" of the whole work was fubjoined, in 14 pages more. The 50 plates, which compofe thefe five Decades, contain a great number of objects of natural hiftory, difperfed without any order, many of them very imperfect, efpecially the fpecimens of plants. In turning over thefe engravings, it is impoffible not to recollect Shakfpear's defcription of the Mantuan apothecary:

> " —— in his needy fhop a tortoife hung,
> An alligator ftuff'd, and other fkins
> Of ill-fhap'd fifhes;" &c.

The infects are better than the reft, but of thefe the moft famous is an impofture. The *Papilio*, figured in t. 10. f. 6, which Linnæus has named *Ecclipfis*, and defcribed from this figure alone, was found, on the infpection of the original fpecimen by Mr. Jones, to be no other than *P. Rhamni*, which, being artificially painted, impofed on our author. The late Dr. Grey indignantly ftamped the fpecimen to pieces.

In 1709—1711 five more Decades of the fame work came forth, with folio letter-prefs, and a folio edition of the "Catalogus Claffìcus et Topicus."

It would be impoffible as well as ufelefs to particularize the publication of every one of Petiver's lifts and catalogues. They were all, as far as could be collected, republifhed in two vols. folio, under the title of *Jacobi Petiveri Opera*, by John Millan in 1767, price plain fix guineas; or with the infects coloured, which is the beft, feven guineas; and with the whole coloured, which muft chiefly have been done from imagination, twenty guineas.

The firft volume confifts of the *Gazophylacium* extended to 156 plates, with explanations of all but the laft, which contains 37 fhells copied from Bonanni. A great part of the laft fifty of thefe plates, at leaft, are compilations from printed works, fuch as thofe of Plumier, Pona, Merian, and others, whofe figures certainly gain nothing in being copied and diminifhed by Petiver. Some of the plates, however, are taken from original drawings. The moft extraordinary circumftance is his defcending to copy his rival Plukenet, as in t. 106, f. 10 and 11, and elfewhere. The reft of this volume is made up of 22 plates of Amboyna fhells and marine animals, copied from Rumphius; and two plates intended to teach the rudiments of Botany. The paper of our author on the virtues of plants, Phil. Tranf. n. 255, is judicioufly introduced into the letter-prefs of this volume; as well as an illuftration of Ray's fyftem, as far as regards Englifh plants.

The fecond volume, defigned to have commenced with the above-mentioned rudiments of Botany, is particularly eftimable, as containing 72 plates of Englifh Plants, with 12 plants in each plate, arranged and named according to the 1ft and 2d editions of Ray's *Synopfis*. This performance, though incomplete, as it ends with the *Cufcuta*, R. Syn. ed. 2. 282, the laft of the herbaceous plants, is of great importance in many cafes. The figures fhew, with tolerable accuracy, what was known of Ray's plants by his contemporaries, and have proved of ufe in fome difficult queftions, as appears by the *Flora Britannica;* though indeed few of them are done from original drawings, and fome are copied from books erroneoufly cited by Ray himfelf, as the *Hieracium*, t. 13. f. 6, and the *Scilla*, t. 67. f. 5. Next follow four plates of ufeful Peruvian plants, not ill copied from Feuillée; and two of rare medicinal ones, chiefly from Pomet. Haller, who had no complete fet of Petiver's works, fays he remembers to have feen with difguft his very faulty reprefentation of the plant yielding the Peruvian bark. Nothing certainly can be much worfe than this figure, which occurs twice; yet we can perceive that it was taken from one of the large downy-leaved fpecies of *Cinchona*, and not from what Haller had elfewhere feen reprefented; fo that it throws fome light on the obfcure hiftory of the valuable drug in queftion. It muft alfo be recollected, that Petiver publifhed thefe plates folely for the purpofe of obtaining better information. They were intended to be fent abroad, to affift travellers in their enquiries, nor had he any thing better within his reach. Next to thefe plates follow five of marine plants or animals, and Italian graffes, copied from Boccone, Barrelier, &c.; and two of Egyptian plants from Profper Alpinus. Copies of Plumier's *Filices*, with fome *Fungi*, occupy 17 plates more, which are what Linnæus cites in his *Species Plantarum*, along with the original work. Three plates more of marine productions are fubjoined. Six very ufeful ones of Englifh *Papiliones* conclude the engravings of this volume. They are accompanied by printed catalogues of explanations, and various other papers, all, for the moft part, the original impreffions, which appear to have lain dormant on the bookfeller's hands, till this republication of the whole was contrived. The purchafer fhould, by collating his copy with fome authentic one, take care that it is complete. The *Concordia Graminum, Mufcorum*, &c., a work often cited by Englifh writers, is one of the moft valuable things in this collection. Our copy has but 12 pages, and ends with n. 375, being evidently imperfect; yet we have never feen more. The *Botanicum Anglicum; Hortus Siccus Chirurgicus* and *Pharmaceuticus*, confift of tickets, intended to be feparately applied to dried fpecimens, for fale, like fome publications of Ehrhart and Dickfon. To them are annexed labels for fix different noftrums, fold, as we prefume, by our author; thefe are the Indian Purge, Ambretta, Purging Marmalade, Golden Aqua Mirabilis, Purl Royal or Elixir Regale, and Syrup of Manna, or the Cordial Purge. Thefe favour of quackery, and account for the flourifhing ftate of Petiver's finances; while they perhaps may partly explain the caufe of Plukenet's difdainful enmity, as the latter was a learned and regular, but unfuccefsful, phyfician.

It does not appear that Petiver had any family, or that he was ever married. He died at his houfe in Alderfgate ftreet, on the 20th of April 1718, but of his age we find no mention. His body lay in ftate at Cooke Hall, and was probably interred at his parifh church, to the charity-fchool attached to which he left 50 pounds, and five guineas to Dr. Brady for preaching his funeral fermon. His pall was fupported by fir Hans Sloane, Dr. Levit, phyfician to the Charter-houfe, and four other phyficians. We know not that any portrait of him is extant.

The collections of dried plants, and other natural productions, which belonged to Petiver, and, after his death, were bought by fir Hans Sloane, now make a part of the Britifh Mufeum. They are frequently reforted to for the fake of afcertaining obfcure fynonyms, his plates being fo generally cited by Linnæus, and in many inftances fo infufficient to exprefs the precife object intended. Pulteney's Sketches of Botany. Haller Bibl. Bot. and Petiver's Works. S.

PETIVERIA, in *Botany*, a genus dedicated, with many compliments, by Plumier, to James Petiver, the Englifh naturalift; fee the laft article. Plum. Gen. 50. t. 39. Swartz. Obf. 137. t. 10. f. 3. Linn. Gen. 181. Schreb. 241. Willd. Sp. Pl. v. 2. 284. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 334. Juff. 84. Lamarck Illuftr. t. 272. Gærtn. t. 75. Clafs and order, *Heptandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Atriplices*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of four linear, obtufe, equal, erect, permanent leaves. *Cor.* none, "except the calyx, being coloured, fhould be fo denominated." *Linn.* *Stam.* Filaments fix to eight, awl-fhaped, erect, unequal, moftly fhorter than the calyx; anthers linear, cloven. *Pift.* Germen oblong, compreffed, emarginate; ftyle very fhort, lateral, received into a longitudinal furrow of the germen; ftigma pencil-fhaped. *Peric.* none. *Seed* oblong, compreffed, dilated upwards, emarginate, furnifhed at each fide with two rigid, acute, reflexed briftles.

Eff. Ch. Calyx of four leaves, inferior. Corolla none. Style lateral. Stigma pencil-fhaped. Seed one, with four reflexed briftles.

Obf. Dr. Swartz has materially corrected the Linnæan character, in which the briftles of the feed were taken for ftyles; and finding the number of ftamens, though variable from fix to eight, very commonly feven, he has transferred this genus from *Hexandria Tetragynia* to *Heptandria Monogynia*.

1. P. *alliacea*. Guinea-hen Weed. Linn. Sp. Pl. 486. Stockh. Tranf. for 1744. 287. t. 7. Trew Ehret. 33. t. 67. (P. folani foliis, loculis fpinofis; Plum. Ic. 213. t. 219.)—Common about hedges and dry bufhy places in the Weft Indies. *Swartz*. The *root* is perennial. *Stem* fomewhat fhrubby, erect, alternately branched, about two feet high, roundifh, ftriated, downy, leafy. *Leaves* alternate, on fhort ftalks, elliptic-oblong, three inches in length, generally fmooth, with one rib and feveral tranfverfe veins; their margin either quite entire, or with a few fhallow blunt ferratures. *Stipulas* a pair of obtufe, fometimes ftalked, glands, at the bafe of the footftalks. *Spikes* terminal, very long

long and ſlender, of numerous, alternate, rather diſtant, erect, ſmall, whitiſh or reddiſh *flowers*, of no beauty. We readily concur with Swartz, in uniting the *P. octandra* of Linnæus with his *alliacea*, nor do we find grounds to diſtinguiſh it, even as a variety; the ſtamens being in ſome flowers ſix, in others ſeven or eight, on one and the ſame plant.

The whole herb is ſaid to have a very ſtrong and volatile ſcent of garlick, ſo that ſome perſons in Hiſpaniola uſe it as a remedy for the headache. When cattle, in diſtreſs for more grateful food, in the dry ſeaſon, feed upon the *Petiveria*, it is ſaid to give, not only their milk, but their fleſh, and eſpecially the kidnies, a powerful and diſagreeable flavour of garlick. Sloane ſays that this inconvenience is cured, by removing the cattle to freſh paſtures, where this plant does not grow, for about a week before they are killed. Guinea-hens are reported to be very fond of it.

Petiveria, in *Gardening*, contains plants of the woody, exotic, perennial, evergreen kind, for the ſtove, of which the ſpecies cultivated are, the common guinea-hen weed (P. alliacea); and the dwarf guinea-hen weed (P. octandra). See the preceding article.

Method of Culture.—Theſe plants may be increaſed by ſlips or cuttings planted out in the ſummer, as well as by ſeeds; which muſt be ſown on a hot-bed early in the ſpring. When the plants are come up, they ſhould be removed into ſeparate pots, and plunged into a moderate hot-bed. When the plants have obtained a good ſhare of ſtrength, they ſhould be inured by degrees to the open air, into which they may be removed towards the end of June, placing them in a warm ſituation, where they may remain till autumn, when they muſt be placed in the ſtove, and during winter have a moderate degree of warmth.

They afford variety, and produce a good effect among other potted plants.

PETKAM, in *Geography*, a town of Eaſt Frieſland; three miles S.E. of Emden.

PETNBOFEN, a town of Bavaria, in the municipality of Aichſtatt; ſeven miles S.S.E. of Aichſtatt.

PETOLA, in *Botany*, &c. See Momordica.

Petola, in *Zoology*, a ſpecies of coluber, the ſcuta of whoſe abdomen are two hundred and nine; and the ſquamæ of the tail ninety. See Coluber.

PETOLIN, in *Natural Hiſtory*, the French name for a ſhrub of the piſtachia kind, famous for affording bladders or tubercles on its leaves and tender branches, in the manner of the common turpentine tree; which are found full of inſects. Theſe inſects are always found to be of the puceron kind, and ſome of them are winged, others not, as is known to be the caſe in that genus of animals. Theſe bladders, and thoſe of the turpentine tree, called its *horns*, have been by ſome ſuppoſed to be the natural production of the trees, but they are, in reality, only a peculiar ſpecies of bladder-galls, formed by theſe animals, one female of which making her way into the leaf, while the young raiſes its covering membrane into a bladder, in which ſhe produces her young ones; which by ſucking its ſides, derive the juices to it, and occaſion its increaſe. See Puceron.

PETOUNE' Hotun, in *Geography*, a town of Chineſe Tartary, in the government of Kerin-Oube; 485 miles N.E. of Pekin. N. lat. 45° 15'. E. long. 124° 34'.

Petoune' *Kianen*, a port of Chineſe Tartary; nine miles N.W. of Petouné Hotun.

PETRA, a river of Naples, which runs into the ſea, 13 miles N.E. of Bova.—Alſo, a town of Sicily, in the valley of Mazara; two miles N.N.W. of Girgenti.—Alſo, a ſea-port town, in the iſland of Metelin, ſituated on a rock almoſt inacceſſible. N. lat. 39° 27'. E. long. 26° 14'.

PETRAHAR, a town of Hindooſtan, in Bahar; 20 miles E. of Ramgur.

PETRALIA, a town of Sicily, in the valley of Demona; 17 miles S. of Miſtrella.

PETRALTA, a town of Naples, in Calabria Citra; five miles E.S.E. of Coſenza.

PETRANTA, a town of Etruria, near the ſea-coaſt; 15 miles N.W. of Lucca. N. lat. 43° 58'. E. long. 10° 21'.

PETRARCHA, Francesco, in *Biography*, one of the moſt celebrated names in the literature of the middle ages, was born at Arezzo, in Tuſcany. His father was a notary in Florence, who, with his wife, was exiled in 1302, and took up his reſidence at Arezzo. After ſome changes in their abode, his parents, having loſt all hope of being reſtored, carried him to Avignon, being then only eight years old. In that city, and in Carpentras, he paſſed his youth, receiving inſtructions, according to the mode of the age, in grammar, dialectics, and rhetoric. He then ſtudied the civil law at Montpellier and Bologna, ſpending four years in the former city, and two in the latter. He however deſerted the legal profeſſion, though his father had ſet his heart upon ſeeing him in the doctorial robes. In his own juſtification he ſays, that he found it impoſſible, at that period, to practiſe the law in an honourable manner, and conſiſtently with a juſt ſenſe of integrity. At the age of 22 he returned to Avignon, and about that time he loſt both his parents. Finding himſelf left in indifferent circumſtances, he, together with a younger brother, enrolled himſelf in the clerical order, but only received the tonſure. At Avignon he contracted an intimacy with Jacopo Colonna, afterwards biſhop of Lombes, which was the foundation of the attachment that he preſerved during his whole life to the houſe of Colonna. With ſuch a patron he might unqueſtionably have obtained high eccleſiaſtical preferment, but his habits of life were little conformable to the clerical character. He was particularly unfitted for this profeſſion by that amorous paſſion which is ſo conſpicuous a circumſtance in his life and writings, and which commenced when he was about 23 years of age. Who was that Laura whom he has rendered ſo celebrated by his poems, became a ſubject of controverſy even in his lifetime, and has ever ſince exerciſed the inquiſitive talents of critics and biographers. The Italians acquieſce in the proofs adduced by the Abbè de Sade, that ſhe was the daughter of Audebert de Noves, ſyndic of Avignon, and the wife of Hugh, ſon of Paul de Sade. The nature of his love has alſo been a matter of diſpute; ſome have regarded it as a mere Platonic attachment, others have conſidered it as an ordinary ſenſual affection. If Petrarch is himſelf to be truſted, it was a real and a violent paſſion, which, for a long courſe of years, kept his mind in agitation, and influenced the whole tenor of his life. It appears to have been void of criminality, and no ſuſpicion reſts upon the virtue of Laura. It may not be amiſs in this place to take notice of the theory of De Sade, and of its examination by Alexander Fraſer Tytler, eſq. This gentleman has written a very elaborate paper in the fifth volume of the Tranſactions of the Edinburgh Royal Society on the ſubject, and in defence of the purity of Petrarch's love, in oppoſition to the hypotheſis of De Sade.

"The works of Petrarch," ſays Mr. Tytler, "bear evidence of his abilities as a politician, theologian, and philoſopher, and it is in theſe characters that he appears to have been chiefly diſtinguiſhed by his contemporaries, but it is not on theſe foundations that the laſting ſtructure of his fame has been reared. It is to thoſe incomparable verſes, in in which he has celebrated the accomplishments and bewailed the fate of the beautiful Laura, that Petrarch has been indebted for his permanent reputation. The history of the poet's passion for his lovely mistress, must ever be regarded as forming the most interesting portion of his annals. His character, in fact, took its tone from that predominant affection, which influenced his studies, his habits of life, and all his pursuits and occupations. A love so pure, so ardent, and so lasting, is difficult to be paralleled in the history of human nature. Petrarch was the passionate admirer of Laura for 21 years, while she was in life, and with unabated ardour of affection, he is said to have bewailed her loss for 26 years after her death." The works of the poet bear the strongest testimony that this passion was an honourable and virtuous flame. Petrarch aspired to the happiness of being united to Laura in marriage, and from the same kind of evidence it is clear that Laura was not insensible to his passion. At length De Sade attempts, in his ponderous work, to blast the fair fame of the lady; maintaining, as we have seen, "that Laura was a married woman, the mother of a numerous family; that Petrarch had no other end in his pursuit, than what every libertine proposes to himself in the possession of a mistress; and that the lovely Laura, though never unfaithful to her husband's bed, was sensible to Petrarch's passion, gratified by his attentions, and continued to give him every mark of regard which, without a direct breach of her matrimonial vow, she could bestow upon him." Such is the hypothesis of De Sade, which has been fully examined by Mr. Tytler: into his reasoning we cannot enter, without transgressing the limits allotted to a biographical article in this work. He carries with him all the best feelings of the reader, and if his arguments do not amount to what may be denominated historic demonstration, yet they are strong, and deserving the regard of those who would be satisfied on the point under discussion. In the conclusion he says, "I have now, as I trust, impartially canvassed the whole of these arguments drawn by the author of the *Memoires* from the works of Petrarch himself, or what may be termed the intrinsic evidence in support of the material part of his hypothesis, namely, that Laura was a married woman; nor do I think I presume too much when I say, that I have shewn their absolute insufficiency to prove that proposition." He then proceeds farther, and asserts, that in the whole of Petrarch's works, consisting of more than 300 sonnets and other poetical pieces, there is not to be found a single passage which intimates that Laura was a married woman. He then produces a variety of direct arguments on the subject, and he concludes; "if, while on the one hand we have shewn that there is not the smallest solidity in all that elaborate argument, which has been brought to prove that Laura was a married woman, we have proved on the other, from the whole tenour of the writings of Petrarch, the only evidence that applies to the matter, that his affection for Laura was an honourable and virtuous flame."

One of the methods taken by Petrarch to combat his unfortunate passion was frequent travelling, and in 1330 he accompanied Jacopo Colonna to his new bishopric of Lombes, where he passed the summer, and then returned with him to Avignon. That prelate introduced him to his brother, cardinal Giovanni Colonna, who was thenceforth one of his principal patrons, and in whose palace he became acquainted with the most learned men of the age. He made a more extensive tour in 1333, taking his course through Paris into Flanders, and thence to Aix-la-Chapelle and Cologne, and returning by Lyons to Avignon. By these and his other journies he increased his acquaintance with men, and his knowledge of the manners and customs of the world. In 1334, a new pope having succeeded to the pontifical chair, under the name of Benedict XII., Petrarch began that course of remonstrance on the desertion of Rome, and the removal of the holy see to Avignon, which was ever after one of the favourite topics of eloquence in prose and verse. In 1336 he visited, with filial and classical reverence, all the monuments of antiquity which render Rome so interesting. The love of Petrarch was not of a kind to exclude transitory amours, and the manners of the age were little restraint to such indulgence; and it appears that in the year 1337 he had a natural son, who died while he was a young man. For the education of this son he shewed an anxious solicitude. It was about this time that he resolved upon that retreat which has made the name of Vaucluse so famous in the annals of love and poetry. This place, situated in the county of Provence, where the river Sorgue springs from a rocky cavern, is a romantic solitude, well suited both to the lover and the student, and Petrarch seems to have enjoyed it in both capacities. He purchased a small house and farm in this sequestered spot, which was his favourite residence for many years. Here he composed not only the greatest part of his vernacular poetry, but many of his epistles in Latin prose and verse, and of his eclogues. Here likewise he wrote his books on a "Solitary Life," and on "Religious Tranquillity," and made a commencement, in 1339, of the poem on which he most valued himself, his "Africa." He did not entirely bury himself here, but made occasional visits to Avignon, and other places. The literary reputation consequent upon his writings, now began to make him extensively known. One of its most flattering effects was a letter addressed to him by Robert, king of Naples, the greatest protector of letters and learned men of the age. This connection was a prelude to the highest honour which could be conferred upon him as a poet, and which makes an era in his life. The ancient custom of solemnly crowning eminent poets in the capital of Rome had for some ages fallen into disuse. From the revival of letters in the 13th century, the honour of the laurel had indeed occasionally been conferred upon poets, but not in that place, nor with the former ceremonials. Petrarch had for some time indulged the hope of attaining this distinction, when in the month of August, 1340, he unexpectedly received a letter from the Roman senate, urging him to come and take the laurel in that city; and a few hours after, he was greeted with a letter from the chancellor of the university of Paris, containing a similar application in favour of that capital. He wavered for some time in his choice, but at length his own inclination, and the advice of cardinal Colonna, determined him for Rome. As he thought it a necessary form previously to submit to an examination of his learning and talents, he gave king Robert the honour of being his examinant, and accordingly repaired to Naples in March 1341. His reception from that monarch was of the most flattering kind, and they conversed together on equal terms of literary equality. During three days, Petrarch, in presence of the king and his whole court, sustained his trials, which related not only to poetry, but to all the sciences then cultivated; and, in short, he was declared worthy of the crown. Robert likewise decorated him with the honorary title of his chaplain, and appointed one of his courtiers to assist in his name at the ceremony in the Capitol. At Rome he was received by his friend count d'Anguillara, who fixed upon Easter-day for the time of conferring the destined honour. On that day, in the midst of the applause of the whole Roman people,

ple, and with a numerous attendance of perſons of rank and diſtinction, the laurel was placed upon Petrarch's head by the count.

From Rome the poet went to Parma, where he paſſed ſome time with his protectors the lords of Corregio, and employed himſelf in finiſhing his "Africa," and it was probably from that family that he obtained the dignity of archdeacon in the church of Parma. At the acceſſion of pope Clement VI., in 1342, Petrarch was one of the ambaſſadors ſent to compliment him in the name of the ſenate and people of Rome, ſoon after which a priory in the dioceſe of Piſa was conferred upon him through the favour of the ſame pope. In the following year he compoſed his curious "Dialogue with St. Auguſtine," in which he confeſſes the paſſion for Laura, which ſtill held dominion over his ſoul. That this confeſſion was rather ſentimental and rhetorical than penitentiary, is evident, as he makes no mention in it of a connection which about this time made him the father of a ſecond natural child.

In the year 1348 Petrarch viſited Padua for the firſt time, where he became acquainted with Jacopo da Carrara, who was one of his great friends and admirers, and it was this year that was remarkable for the univerſal peſtilence which ravaged all Europe, and one of the victims to it was the celebrated Laura. The ſame peſtilence deprived him of his great friend and patron cardinal Colonna, but he was now in ſuch general eſteem, that he was ſure of an honourable reception from perſons of the firſt rank wherever he went. He paſſed a year or two at Parma, Carpi, and Mantua, and in 1350 he again viſited Padua, where Jacopo de Carrara, in order to detain him, procured him a canonry. From that city he wrote a very eloquent letter to the emperor Charles IV., exhorting him to come into Italy for the purpoſe of remedying the many evils with which that country was oppreſſed. Sentiments of piety induced him to take a journey to Rome, in this jubilee year, and in the way he ſaw Florence, for the firſt time, the place whence he derived his origin, and where he had ſeveral perſonal friends. Returning, he went to Padua and Venice; at the latter place he contracted a friendſhip with the celebrated doge Andrew Dandolo, and employed himſelf, though unſucceſsfully, in mediating a peace between that republic and Genoa. After this he was invited to return to Florence, and take a part in their newly founded univerſity, which he declined. He next went to Milan, with an intention of proceeding further, but he was received with ſo much kindneſs, and with ſuch preſſing ſolicitation to ſtay by Giovanni Viſconti, its archbiſhop and ſovereign, that he was conſtrained to take up his abode there. He was admitted into the council of ſtate, and in 1354 was ſent to Venice to make another effort for pacifying the two hoſtile republics, but his eloquence again proved fruitleſs. Upon the death of Giovanni, Petrarch attached himſelf to his nephew Galeazzo, by whom he was always highly honoured. In the ſame year he went to Mantua to meet the emperor, who having at length come to Italy, ſent an equerry to Milan, to conduct into his preſence the perſon of whoſe fame he had heard ſo much. Petrarch met with a moſt gracious reception; but the hopes he had conceived of great advantages to his dear country, from the viſit of this monarch, all vaniſhed upon his diſhonourable retreat a few months afterwards. Petrarch, on this occaſion, wrote a letter of cenſure to the emperor, but it is probable it never got into his hands, as he not only never loſt the imperial friendſhip, but afterwards received a diploma conferring the title of count palatine. His fondneſs for ſolitude induced him to take a villa three miles off Milan, where he paſſed his ſummers, but he ſays in a letter deſcriptive of his manner of life, that even here he found the greateſt difficulty in ſubduing certain inclinations which appear always to have put his virtue to the greateſt trial. Devotional practices were his chief reſources againſt temptation, to which he joined very aſſiduous occupation by reading and writing by night and by day. In 1360 Petrarch was ſent by Galeazzo to Paris, to congratulate king John on his liberation from Engliſh captivity, and his reception in that capital was anſwerable to the celebrity of his name.

By pope Innocent VI. Petrarch was treated at firſt with much neglect or even contempt, but in the year 1361 he had ſo far overcome his prejudices, as to offer the poet the place of apoſtolical ſecretary, which he declined, as he did alſo a very preſſing invitation from John, king of France, to reſide at his court. When pope Urban V. had ſucceeded to the pontifical chair, he preſented Petrarch with a canonry of Carpentras, for the purpoſe of attracting him to his court, but it did not anſwer the purpoſe. The pope condeſcended to ſend him ſeveral invitations to viſit him, but advanced years, and infirmities to which he was ſubject, retarded Petrarch's reſolution to pay his homage to the father of Chriſtendom in his proper reſidence; nevertheleſs, in 1370, he undertook the journey, but owing to ill health he was unable to accompliſh it. He returned to his villa, where, in a very ſhort time, he had the mortification to hear of Urban's death. His ſucceſſor, Gregory XI., was very deſirous of ſerving the poet, but he had reached that period of life when a quiet retreat was the moſt deſirable. He was, however, conſtrained, in 1373, to undertake a journey to Venice, on account of his patron Franceſco da Carrara, who, having had a difference with the republic, was obliged to ſubmit to the condition of ſending his ſon to aſk pardon and ſwear fidelity, and was very deſirous that Petrarch ſhould accompany him. It was alſo to be his office to harangue the Venetian ſenate; but on making the attempt he was ſo overcome by the dignity of the aſſembly, and his own fatigue, that he ſtood ſilent. The diſcourſe was accordingly deferred till the next day, on which he happily ſucceeded. On his return to his villa near Padua he fell into a ſtate of languor, in which he paſſed the concluding months of his life. At length, in the night of July 18th, 1374, he was attacked with an apoplectic fit, and was found dead the next morning in his library, with his head reſting on a book. His remains, attended by the prince of Padua, Franceſco da Carrara, the biſhop, all the clergy, and the principal perſons of the city, were depoſited in the church of Arqua.

Petrarch was unqueſtionably one of the moſt memorable characters of his age and nation: his fame is, however, founded chiefly on his Italian poetry. He had paid great attention to moral philoſophy, and publiſhed ſeveral works upon it. His treatiſes "De Republica optime adminiſtranda," and "De officio et Virtutibus Imperatoris," prove that he had paid attention to political and military ſubjects. He left works alſo on theology, which ſhew that he was perfectly orthodox: on hiſtory and geography. But it is not only as an author that literature is indebted to Petrarch; no one had a greater ſhare in bringing to light thoſe writers of antiquity, the revived ſtudy of whoſe works was the great inſtrument of diſpelling the barbariſm of the dark ages. He was actuated by an enthuſiaſm in this matter, and was indefatigable, both in his own reſearches, and in ſolicitations to his friends in different parts, for the ſame purpoſe. The works of Cicero were eſpecially the object of his aſſiduous

enquiry,

enquiry, and to him is owing the difcovery of the valuable Familiar Epiftles of that great man. Although his reading was chiefly confined to Latin authors, yet he extended his fearch to the Greek, and his literary reputation procured him from Conftantinople the prefent of a copy of Homer's poems. He had collected, with great care and expence, a large library, which in 1362 he prefented to the republic of Venice. After this he probably collected another; and Petrarch himfelf alludes to a collection which he had made of imperial medals in gold and filver, and which he offered to the emperor Charles IV. This is the earlieft mention of a treafure of that kind. The efteem in which this great man was held by his countrymen, was fhewn by the vaft number of commentators on his works, efpecially his Italian poems, which appeared from his death to modern times. The editions of his poems have been almoft innumerable. The earlieft was that of Venice in 1470, and the beft is faid to be that alfo of Venice, in two volumes 4to. 1756.

PETRARIA, in *Ancient Writers*, is fometimes taken for a quarry of ftone.

In other places petraria is ufed for a fort of engine of war, with which ftones were caft on the enemy; chiefly ufed in fieges, &c.

PETRASTRUMIA, in *Geography*, a town of Naples, in Principato Ultra; 9 miles S. of Benevento.

PETRATSCHAN, a town of Pruffian Lithuania; 4 miles W.S.W. of Regnitz.

PETRE OIL, Πετρέλαιον, the fame as petroleum. See PETROL.

PETRE, *Sir* WILLIAM, in *Biography*, an eminent ftatefman, was born at Exeter, and educated at the college of that name, at Oxford; but in 1523 he was elected fellow of All-Souls. He took his doctor's degree in civil law. His talents recommended him to Thomas Cromwell, by whofe means he was employed in ftate affairs, and was in the commiffion for vifiting the monafteries. He obtained a large fhare of the church lands in the reign of Mary, to whom he had been counfellor, as he had been to her father and brother. He found means to ingratiate himfelf with queen Elizabeth, who appointed him one of her fecretaries of ftate, and member of the privy council. He was a great benefactor to Exeter and All-Souls' colleges, and founded feveral charitable inftitutions. He died in 1571; leaving very large eftates in Effex, which are now in the poffeffion of his defcendant, the prefent lord Petre.

PETREA, in *Botany*, was fo called by Houftoun, in honour of Robert James, lord Petre, who was born in 1710, and died of the fmall-pox in 1742. Peter Collinfon, in a letter to Linnæus, fpeaks of this nobleman as "the worthieft of men, whofe death was the greateft lofs that botany or gardening ever felt in this ifland." After defcribing his lordfhip's fpacious ftoves, and many of their valuable contents, amongft which numerous tropical trees had attained a degree of growth not to be feen in any other garden; as well as the nurferies for more hardy kinds, in which, at the time of lord Petre's death, were 219,925 individuals, moftly exotic; the writer concludes thus. "As this young nobleman was the greateft man in our tafte that this age produced, I thought it might not be unacceptable to give you fome account of the greatnefs of his genius. But his fkill in all liberal arts, particularly architecture, ftatuary, planning and defigning, planting and embellifhing his large park and gardens, exceeds my talent to fet forth." Mr. Collinfon was feized with his laft illnefs when on a vifit to the fon and worthy fucceffor of this nobleman in 1768. (See COLLINSON.)—Reliq. Houft. 5. t. 11. Linn. Gen. 315. Schreb. 413. Willd. Sp. Pl. v. 3. 313. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 38. Juff. 108. Lamarck Illuftr. t. 539. Gærtn. t. 177.—Clafs and order, *Didynamia Angiofpermia*. Nat. Ord. *Perfonatæ*, Linn. *Vitices*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, bell-fhaped; its limb very large, in five deep, fpreading, oblong, obtufe, coloured, veiny, permanent fegments; the mouth clofed with five double abrupt fcales. *Cor.* of one petal, wheel-fhaped, unequal, fmaller than the calyx; tube very fhort; limb flat, in five rounded, fpreading fegments, the middle one largeft, and differently coloured. *Linn. MSS. Stam.* Filaments four, concealed within the tube, afcending, two of them fhorteft; anthers oval, erect. *Pift.* Germen obovate; ftyle fimple, the length of the ftamens; ftigma obtufe. *Peric.* Capfule obovate, flat at the top, concealed in the hollow of the calyx, of two cells. *Seeds* folitary, obovate, convex at the outfide, flat at the inner, attached to the bafe of each cell.

Eff. Ch. Calyx five-cleft, very large, coloured. Corolla wheel-fhaped, much fmaller. Capfule of two cells, in the bottom of the calyx. Seeds folitary.

1. P. *volubilis*. Climbing Blue Petrea. Linn. Sp. Pl. 873. Jacq. Amer. 180. t. 114. Curt. Mag. t. 628.—Leaves and clufters fimple.—Native of Vera Cruz, the Caracaos, and Martinique, where it blooms in November. Houftoun is faid to have fent it to Chelfea garden before the year 1733; but we agree with Dr. Sims, that the flowers were probably never feen in England, till they appeared in Mr. Woodford's late collection at Vauxhall, in Auguft 1802. It is obferved to thrive beft in rich loam, and a warm moift air, being advantageoufly trained over a trellis, where, if luxuriant, it muft make a beautiful appearance, being one of the moft elegant plants that can be imagined. The *ftem* is fhrubby, twining round every thing in its way, and afcending, without tendrils, to the tops of trees twenty feet high; its *branches* round, roughifh, flender, and leafy. *Leaves* oppofite, on fhort, thick, rather filky *ftalks*, elliptic-oblong, entire, varying in length from two to five inches, and in breadth from an inch to an inch and a half, furnifhed with one rib and many tranfverfe veins producing innumerable reticulations; rough on both fides to the touch, but not to the fight; fhining above; opaque and paler beneath. *Clufters* about the ends of the branches, a foot or more in length, elegantly pendulous, fimple, of many *flowers* turned one way. The *ftalks*, minute *bracteas*, and tube of the *calyx*, are rough with filky brown hairs. Limb of the *calyx* fmooth, light violet; its fegments an inch long when fully grown. *Corolla* of the fame colour, variegated with dark violet and white; fometimes it is faid to be wholly white, the *calyx* remaining of its proper hue. The *piftil* is thought to be occafionally imperfect.—A fpecimen with lanceolate *leaves*, five or fix inches long, gathered at the Caracaos along with the common kind, by Dr. Mærter, feems to us a mere variety, but the following is certainly a new and very diftinct fpecies.

2. P. *multiflora*. Panicled Petrea. (Funis quadrifidus; Rumph. Amboin. v. 5. 4. t. 3.)—Leaves and clufters twice compound.—Gathered in the ifland of Honimoa, or Honimao, by the late Mr. Chriftopher Smith, from whom we have an unnamed fpecimen. The *ftem* is woody, climbing, branched, quadrangular, with four furrows; downy when young. *Leaves* oppofite, on longifh fmooth *ftalks*, twice ternate; *leaflets* on fhortifh ftalks, ovate, undulated, entire, fmooth on both fides; fhining above; rather opaque and fomewhat paler beneath, with a rib and veins like the former fpecies; the terminal ones one and a half inch long, the reft much fmaller. *Clufters* axillary, twelve or eighteen inches

inches long, twice compound, downy, compofed of innumerable, fomewhat whorled, *flowers*, of whofe colour we can determine nothing from the dried fpecimen, but they appear to agree in that refpect with the foregoing. Their fize is rather fmaller. The fegments of the *calyx* are more contracted at the bafe, and its tube has ten ftrong ribs; whereas the other fpecies has five principal ribs, far lefs confpicuous, and a number of minute crowded intermediate ones.

Such is our plant, which accords precifely with the figure of Rumphius; but his defcription is lefs applicable. What he afferts, of the main ftems fplitting into four parts, and difcharging a bitter limpid water, we have no means of verifying. He fays the *flowers* are yellow, or whitifh, with fix minute *petals* and as many *ftamens*, having in the middle a cloven *piftil*, like a lizard's tongue. The *germen* is faid to turn black as it ripens; but of the nature of the *fruit* he gives no account.—Notwithftanding this defcription, his plate exhibits the *calyx* in five deep fegments, with others in an early ftate, exactly as in our fpecimen. There is no reprefentation of the *ftamens* or *piftil*. He defcribes the *leaflets* twice as large as we find them, and remarks that their ftalks, when old, become *clafpers*. The *ftems* are very tough and pliant, ferving for ropes. On the whole there feems little doubt of the plant of Rumphius being the fame with our's, nor, though we have often had his plate and defcription in contemplation, do we find any thing fo applicable to them as this *Petrea*.

Petrea, in *Gardening*, contains a plant of the climbing, exotic, fhrubby kind for the ftove, of which the fpecies cultivated is, the twining petrea (P. volubilis).

It has a variety with bright blue petals.

Method of Culture.—This is increafed by feeds, which muft be obtained from the places where the trees grow naturally, and be fown in pots plunged into a good hot-bed; and when the plants come up, they fhould be each planted in a feparate fmall pot filled with light loamy earth, and replunged into a hot-bed of tanners' bark, and be afterwards placed in the bark-bed in the ftove, where they muft conftantly remain, and be treated like other plants of the fame country.

They afford ornament in ftove collections.

PETREL, in *Ornithology*, the name of a very remarkable bird, called *procellaria* by authors. See Fulmer, and Procellaria *glacialis*.

Petrel *Ifland*, in *Geography*, a fmall ifland in Dufky bay, near the coaft of New Zealand, N. of the harbour in Anchor ifland.

PETRELLA, a town of Naples, in the county of Molife; 11 miles E. of Molife.—Alfo, a town of European Turkey, in Albania; 26 miles S.E. of Durazzo.—Alfo, a town of the duchy of Urbino; 20 miles N.W. of Urbino.

PETRI, Christiern, in *Biography*, was a learned Danifh divine, who flourifhed in the 16th century. It is not certain when he was born; but it appears he purfued his ftudies during feveral years at Paris, where he was admitted to his degree of M.A. Upon his return to his native country, he was made canon of Lunden, and alfo chancellor of that fee. After this he took a fecond journey to Paris, where he was entrufted with the care of editing "Danica Hiftoria, lib. xvi. Autore Saxone Grammatico," which made its appearance in the year 1514. He was in Denmark at the time Chriftiern II. was compelled to fly from that country, and he followed him into exile. Soon after that event, and until the time when that prince was imprifoned, and his affairs became defperate, Petri took up his refidence in Flanders, where he renounced the communion of the church of Rome, and embraced the principles of the Reformation. He became now exceedingly zealous in propagating the doctrines which he had adopted; and with this view wrote and publifhed various works at Antwerp, in the Danifh language, from 1528 to 1531. Among others he publifhed, in 1529, "The New Teftament tranflated into Danifh." Nor was he lefs zealous in making converts from Popery, after his return to his native country in 1532. Little more is known of him, but that he died at an advanced age, under the reign of Chriftiern III., who, notwithftanding the change in his religious faith, permitted him to enjoy to the laft the emoluments of his canonry. He left behind him a number of works, chiefly on theological fubjects, and on the education of youth. Moreri.

Petri, or *Petieri*, in *Geography*, a town of Africa, on the Ivory coaft.

PETRICOW, a town of Bohemia, in the circle of Chrudim; 9 miles S. of Chrudim.

PETRIDIA, in *Natural Hiftory*, the name of a genus of foffils of the fcrupi kind, of a plain uniform ftructure, of no great variety of colours, and emulating the external form of pebbles.

Of this genus there are twelve known fpecies. Hill.

PETRIFACTIONS, are animals and vegetables, or their parts, changed into a foffile fubftance. In the Linnæan fyftem, by Gmelin, petrifactions make the fifth clafs of minerals, which is divided into eight genera, *viz.*

Anthropolithus,	Man, or the parts of man.
Zoolithus,	Mammalia, or their parts.
Ornitholithus,	Birds, or their parts.
Amphibiolithus,	Amphibia, or their parts.
Ichthyolithus,	Fifhes, or their parts.
Entomolithus,	Infects, or their parts.
Helmintholithus,	Worms, or their parts.
Phytolithus,	Vegetables, or their parts.

Before we treat of thefe genera, in the order in which they ftand, we fhall give a general outline of the fubject, as it is defcribed in Mr. William Martin's "Attempt to eftablifh a Knowledge of extraneous Foffils on fcientific Principles;" referring our readers to the work itfelf for the details, and alfo to his other work, entitled "Figures and Defcriptions of Petrifactions collected in Derbyfhire," &c.

Mr. Martin fays, that the natural bodies which conftitute our globe are either organized or unorganized: the firft includes animals and vegetables, the latter foffils.

Foffils are ufually diftinguifhed into *native* and *extraneous*. Native foffils, or minerals, are foffils deftitute of an organic form, exhibiting fuch a ftructure only as arifes from the appofition or continual addition of the particles of which they are compofed. Extraneous foffils, or *reliquiæ*, *relics*, are foffils that have the form or ftructure of animal or vegetable bodies. If it be objected, that thefe bodies poffefs an organic form; it may be replied, that they may neverthelefs be regarded as unorganized, fince that form is no longer inftrumental to growth, motion, or the propagation of the fpecies.

Extraneous foffils comprehend two forts of animal and vegetable relics, *viz.* the *confervata* and *petrifacta*: the *former* are the remains of animals or vegetables, preferved by various operations of nature among minerals; the *latter* are mineral bodies, which have received their form from animals or vegetables.

The phenomena attendant on extraneous foffils are *general* or *peculiar*. The general phenomena are fuch as are common

mon to both kinds of organic remains: thefe are the following.

Extraneous foffils have been found in every quarter of the known world: they are met with embodied in the hard rocks and ftones; but they are not equally common to all rocks and mineral fubftances, inafmuch as granite, fienite, gneifs, micaceous fchiftus, and fome fpecies of limeftone, never contain organic remains; and thofe rocks, in which extraneous foffils are never found, conftitute the higheft mountains. The parts of organized bodies moft common in a foffil ftate, are thofe which are known longeft to refift putrefaction and decay: thefe are wood, and the leaves and ftems of certain plants; fhells, bones, corals, and other hard parts of animals. Very tender and fucculent bodies, whether animal or vegetable, are rarely found in a foffilized ftate. Shells, and various exuviæ of the vermes clafs, are moft commonly found in the ftrata immediately repofing on, or following tracts of granite, gneifs, and the other rocks, in which extraneous foffils are never imbedded. Strata containing the remains of fifh and marine fhells, &c. mixed fometimes with the parts of amphibious animals and plants; or thofe in which vegetables only occur, generally fucceed, or reft on the tracts, in which the exuviæ of vermes alone are found. The remains of land-animals, particularly of the clafs mammalia, rarely occur in regular ftrata. Animal reliquiæ, particularly the marine, are moft common in calcareous ftrata; whereas vegetable reliquiæ frequently occupy argillaceous beds, efpecially thofe productive of coal.

The phenomena *peculiar* to petrifactions are as follow: petrifactions are generally confined to mountains, or other elevated fituations, where the more ancient of the fecondary ftrata are prefented to our view; they are ufually incorporated in the earths and ftones, of which thefe ftrata confift, forming, as it were, a part in the original fabric of the globe; no particular petrifaction is confined wholly to one kind, or fpecies of ftones; the fubftance, which forms the petrifaction, is frequently of the fame nature as the furrounding rock; when it differs, it is found to confift of mineral matter, with a finer texture or grain than that of the matrix. A petrifaction often confifts of feveral diftinct minerals: thus chalk and flint often form feparate parts of an *echinite;* and in Derbyfhire, chert, calcareous fpar, bitumen, and quartz, are frequently incorporated together in the fame fhell.

The common conftituent fubftances of petrifactions are earths and ftones of the calcareous, argillaceous, or filiceous clafs. Animal petrifactions are lefs common, in proportion to the degree of locomotive power which the originals poffeffed.

Shells and zoophytes abound in petrifactions: fifh and infects without wings are more rare. The petrified remains of mammalia are ftill lefs frequent; and winged infects and birds have perhaps never been found in this ftate.

The vegetable petrifactions moft common are fuch as bear the form of plants, growing in moift and boggy grounds. The petrifactions hitherto recognized, however, as bearing the forms of plants or animals, known to exift at prefent, are very few, compared with thofe, the living fpecies of which have not been difcovered.

A petrifaction feldom, if ever, exhibits a complete change, or fubftitution of mineral for organic matter; more or lefs of the original animal or vegetable fubftance being generally prefent, and difcoverable either in the external or internal parts of the foffil. In petrified fhells and corals, the original calcareous matter is frequently feen covering the furface, or remaining in fmall portions in the internal parts, and is readily diftinguifhed, although the fubftituted mineral, forming the principal portion of the foffil, be alfo calcareous.

The petrifying procefs is carried on, in fome waters, at this day, of which we have a ftriking inftance at Matlock; but it appears to be confined to the formation of petrified wood, or woodftone. Petrifactions rarely exift in veins.

The phenomena peculiar to the Confervata are as follow: they are for the moft part found in low or flat tracts, where the ftrata are evidently of modern formation. They are alfo found in the caves and fiffures which pervade the more ancient mountain ftrata, but are rarely incorporated in the ftone, or other fubftance of which fuch ftrata confift: they occur alfo in the beds of rivers, and in moft fituations where mineral or other matter is daily accumulating: they are found in all ftates, between that in which actual decay takes place, and that in which farther decay is prevented, either by a new combination in the remaining principles, by an impregnation with mineral particles, or by fome other natural procefs incident to thefe bodies. The animal confervata moft common are fuch remains as are moft rare in the petrified ftate, fuch as the bones of mammalia and fifh, and fhells of the fame genera as thofe found in the neighbouring feas. The moft common vegetable confervata are wood, and other parts of trees: they are more frequently referrible to plants and animals now exifting than the petrificata, and they are not uncommon in mineral veins.

The origin of extraneous foffils is fhewn by the attendant phenomena. The confervata cannot be faid to originate from, fince they really are the remains of, plants and animals, introduced, by different proceffes of nature, into the mineral kingdom: but petrifacta owe their form to organized bodies; they derive their fubftance generally from minerals.

It is inferred by Mr. Martin, that the introduction of extraneous bodies into the mineral kingdom has been effected in various modes, and at various periods, during a fucceffion of ages; but with refpect to thofe from which the petrifacta derive their form, chiefly while the fuperficial parts of the globe were in their primeval liquid ftate, and the ocean far above its prefent level. He therefore confiders the *periods at which*, and the *agency by which*, the depofition of organic bodies has been effected in the mineral regions.

The periods of introduction, he fays, may be reduced to *three:* the *firft* commencing with the exiftence of marine animals, and ending with the formation of plants. During this period, the moft ancient of the fecondary tracts were formed, and the remains of the zoophytes and fhell-fifh, the only animals apparently then exifting, enveloped in the fubftance of the ftrata.

The *fecond,* commencing with the formation of plants, and an increafe of thofe animals which are peculiar to the ocean; ending with the time at which the ocean, after a gradual fubfidence through feveral ages, firft attained its prefent level. During this period our author fuppofed the lefs ancient and fome modern tracts were formed, and the remains of plants and fifh, as well as fhells, and other relics of the vermes, added to the foffil world; and he adds, "Towards the middle of this period, it is probable the mammalia and other land animals were either created, or confiderably increafed in number, as their remains are found, though very fparingly, in fome modern ftrata, fuppofed to have been depofited juft before the fea had finally retired to its prefent limits."

The *third* period commences with the reduction of the ocean to its now actual level, and continues to the preſent time. Throughout this period, modern and very recent tracts of alluvial and other ſtrata have been depoſited, and various extraneous foſſils, particularly the remains of mammalia, introduced into the mineral kingdom.

The *agent*, according to Mr. Martin, by which the introduction of extraneous foſſils into mineral ſtrata has been chiefly brought about, is water; that is, of the ocean, of ancient lakes and inland ſeas, of rivers, local inundations, and perhaps the general deluge.

To the agency of the ocean, in a primary ſtate, is to be referred all depoſits of ſea-ſhells, and other marine bodies found in ſtrata, which do not alternate with ſtrata, holding the remains of fiſh or plants. To the ſame agent, during the ſecond period, are to be aſcribed all other accumulations of organic bodies, in which marine remains make a conſiderable part, and which are depoſited in regular determinate beds of ſtone, &c. "Sea-ſhells and other marine bodies," ſays Mr. Martin, "poſſeſſing but a ſmall degree of locomotive power, evidently have been generated, have lived and died, in the ſame accumulated heaps which their remains now exhibit. Theſe, apparently, in ſome inſtances, have been gradually entombed in matter, precipitated from an immenſe body of water, ſlowly without alteration, through an unknown length of time, and hence forming ſtrata of great thickneſs. In other tracts, marine bodies of the vermes claſs have been more quickly enveloped. The matter of the depoſition, having been repeatedly changed, forms, in ſuch caſes, only thin, ſucceſſive ſtrata of various kinds of earths and ſtones, alternating with each other. Fiſh, &c. endued with a great degree of locomotive power, have probably been arreſted in their courſe, and inſtantly killed, by ſome ſudden diffuſion of matter inimical to animal life." Some perſons have thought this to have been effected by ſub-marine volcanic eruptions.

"Where vegetable foſſils, whoſe originals grew on dry land, are found mixed with marine ſhells, in deep and regularly diſpoſed beds, it is obvious that a tranſportation of vegetable bodies from the land to the ſea muſt have taken place. In ſuch inſtances, it appears probable that plants and wood, ſpecifically lighter than water, would remain floating for a certain length of time, before their depoſition at the bottom of the ſea could be accompliſhed; and that this, at laſt, muſt have been effected by a gradual attachment of mineral particles, ſuch as the ſea then abounded with, to the ſurface of theſe floating leaves, ſtems, &c.; thus inducing in each individual that degree of ſpecific gravity neceſſary for its ſubſidence, and final depoſition, in the depths of the ocean."

The depoſition of vegetable matter, &c. in inland ſeas, would be carried on, for a certain length of time, under the ſame proceſſes as thoſe ſuppoſed to have taken place in the ocean. The influence of rivers, currents, &c. in the immediate depoſition of organic remains among mineral matter, is only to be traced in thoſe accumulations of ſand, gravel, clay, &c. To local inundations are to be referred moſt ſuperficial accumulations of organic foſſils, not depoſited in regular ſtrata, and which are not immediately connected with the courſe of ſtill exiſting rivers. Partial inundations of freſh waters appear, in many inſtances, to have occaſioned the depoſits of animal bones, ſo frequent in the looſe earth or ſoil of thoſe alluvial tracts, which have not originated from the deeper, but more contracted influence of rivers and currents. To ſudden inundations may be perhaps aſcribed the deſtruction, at leaſt, of thoſe animals, whoſe bones are found in clefts and chaſms of ancient ſtrata. To the agency of the general deluge are to be referred the ſuperficial depoſitions of marine and other remains mixed with each other, and lodged in cavities, &c. at heights to which no partial inundation of the ſea could reach.

Mr. Martin, in a note, p. 36, ſays, "it perhaps may be doubted, if any depoſition of organic bodies has ever yet occurred, unequivocally demonſtrative of a general flood. The ſhells found in Peru, on a mountain conſiderably higher than any affording ſimilar remains in Europe, appear to have been perfect petrifactions, included in the ſubſtance of the ſtone of which the mountain conſiſts: of courſe, they prove the ſubmarine formation of the rock in queſtion, but not that its contents have been elevated to their preſent ſituation by the deluge. Even looſe or unconſolidated depoſits of marine remains, ſometimes found, according to Pallas, in the more external fiſſures and veins of lofty primary rocks, in which extraneous foſſils do not occur as integrant parts, are no certain proof of this event. It is highly probable, that ſecondary ſtrata have originally covered many elevated tracts, where there is at preſent no appearance of ſuch formation: and that extraneous foſſils, formerly imbedded in theſe ſecondary ſtrata, will remain in a very complete ſtate of preſervation, long after their original matrix has been deſtroyed, is indeed a fact ſufficiently illuſtrated by the looſe reliquia ſo abundant in the common ſoil of ſome countries, and which have been liberated undoubtedly by the waſte and decay of their native rock. When, however, the remains of marine and of land animals occur together, in ſuperficial accumulations, they certainly exhibit a leſs ambiguous evidence of the deluge; yet not altogether a deciſive one, except both kinds of reliquia are found in a ſimilar ſtate of preſervation. If, on the contrary, the ſhells are petrified, and the bones are in nearly a recent or unmineralized condition, it is obvious that they were not originally introduced into the foſſil kingdom at the ſame period; and hence the ſupport which the preſence of marine objects gives to the concluſion, that ſuch depoſits are truly diluvian, is done away with." Mr. Martin adds, "It muſt not be inferred, that we wiſh to eſtabliſh a diſbelief of the general deluge. The exiſtence of that event is confirmed by authority far above the evidence of geological facts. But in the preſent ſtudy, it is neceſſary to guard againſt the too common error of aſcribing effects to cauſes, inadequate to their production."

Before we come to treat of the genera included under this claſs of mineralogy, we may obſerve that Mr. Parkinſon, and ſome other modern writers, have diſcuſſed the ſubject under the general term oryctology. We have, in the article FOSSILS, given our reaſons for maintaining the older term; and we may add, that as the more modern one comes from the Greek ὀρύσσω, *to dig*, and λόγος, *a diſcourſe*, or *treatiſe*, it does not neceſſarily lead the reader to *petrifactions*, but to any other ſubſtances dug out of the bowels of the earth. We, however, take pleaſure in referring to Mr. Parkinſon's work, entitled "Organic Remains of a former World," in which our readers will find abundance of important and intereſting matter. His concluſions are, that it appears obvious, from what has actually been diſcovered, that a conſiderable number of ſpecies, kinds, and perhaps orders of animal, vegetable, and mineral materials, have been loſt for ages, and conſequently that the general ſtate and inhabitants of the earth have undergone ſome very remote and very conſiderable change; and it muſt be equally obvious, that ſuch change muſt have been produced by ſome ſuch event as the deluge deſcribed in the Old Teſtament; the book of nature thus bearing ample evidence to the truth of the book of revelation. Nothing, he adds, is clearer than judging from the general nature of the foſſil materials of the antediluvian world which have reached us, or at leaſt are known to have reached us, that the poſt-diluvian world has a very high comparative advantage, is actually richer, and to a conſiderable extent, in valuable productions, and is much more fitted for the neceſſaries, and even comforts and luxuries of civilized life. Hence, independently of the accompliſhment of any other important purpoſe, by the revolution of a former world, one grand object appears to have been attained, *viz.* ſuch an arrangement of the ſeeming ruin, as produced the regeneration of a world ſtored, in its deepeſt receſſes, with ſubſtances calculated to promote the comfort of man; to tempt him to the exerciſe of his innate powers, to furniſh him with the means of maintaining his dominion over the animals around him, and even to urge him to a change from the ſavage to the civilized ſtate. Another world riſes from the overwhelming flood, compoſed of the fragments of the former, which appear to be blended together in an apparently diſordered and incongruous maſs. But after the lapſe of a ſmall period of time, the conſtituent parts of the newly-formed world are diſcovered to be arranged according to thoſe wiſe laws which the great Creator had decreed from the beginning. The ſurface again teems with animal and vegetable life; and the freſh creation, enriched by a melioration of its materials, obtains an increaſe both in its ſtock of utility and beauty.

Genera.

ANTHROPOLITHUS. The human body, or ſome of its parts, changed into a foſſil ſubſtance.

Species.

TOTALIS; the whole human ſkeleton. This, according to Gmelin, was found, in 1785, at Fahlun, in Sweden, imbedded in a maſs of ſulphuret of iron or pyrites, and converted into a hard ſtone. Other ſpecimens are ſaid to have been found in ſome mineral waters in France, and near Freyburg and Saxony. Mr. Parkinſon, however, maintains that no well-atteſted inſtance of the mineralized remains of man is known.

PARTIALIS; the cranium, or other bones. Theſe are ſaid to have been found in France, at no great diſtance from Rheims. In a cavern, in the Mendip-hills of our own country, ſome human bones have been found inveſted with ſtalactite; but they ſeem to be but of modern exiſtence.

ZOOLITHUS. The body of ſome animal of the order mammalia, or its parts, changed into a foſſil ſubſtance. Of this genera there are enumerated eight

Species.

TURCOSA; the teeth; hardiſh, and of a blueiſh-green colour. Theſe have been found in the copper mines of Cumberland, in Perſia, Siberia, Bohemia, France, Germany, &c.; and are held in great eſtimation by the inhabitants of the Eaſt. Their colour is greeniſh, with a tinge of blue, which, after long expoſure to the air, becomes a dirty yellow brown or blackiſh, opaque, hard, adhering a little to the tongue, and admitting ſome degree of poliſh and luſtre; their colour ſeems to be acquired by the oxides of iron or copper.

OSTEOLITHUS; the bones becoming a calcareous ſubſtance. Theſe have been found in Great Britain, and many parts of the continent, converted into limeſtone.

SIMIÆ; the entire ſkeleton of an ape, found in the year 1733, at Henneburg, near Gluckſbrun in Germany, imbedded in bituminous marle, impregnated with copper.

ELEPHANTIS; the tuſks, grinders, and bones of the elephant, found in various bogs of England and Ireland. According to Mr. Parkinſon, much remains to be aſcertained with reſpect to the foſſil bones of the elephant, of which conſiderable numbers have been found in various parts of France, Germany, and Italy, as well as in this country; but no where are they ſo abundant as in Siberia. In America the remains of an unknown ſpecies of this animal are alſo very abundant. For the exiſting ſpecies, see ELEPHAS. The elephantine remains which have been found in Siberia, have been ſuppoſed to belong to no ſpecies now known, for though the teeth are formed of plates diſpoſed parallel to each other, as in the Aſiatic elephant, theſe plates are ſaid to be thinner, and conſequently more numerous. The remains of elephants diſcovered in this country ſeem to be referrible, in moſt inſtances, to the Aſiatic. With regard to the elephant, whoſe remains have been found in America, the tooth of which differs eſſentially from all known foſſil or recent ſpecies, in having its crown cuſpidated and covered with enamel, there exiſts at preſent every reaſon for ſuppoſing it to be a ſpecies now extinct. The general opinion was, that this animal was carnivorous, which is contradicted by the aſſertion, that the ſtomach of one of theſe animals has been found filled with vegetable matter. An animal of this kind, with its fleſh, ſkin, and hair, has been lately found in Siberia.

CERVI; the ſkeleton, horns, or ſeparate bones of the ſtag. Theſe are found frequently buried in the ground in ſome mountains in England and Ireland, eſpecially the horns of the mooſe deer; and alſo in the mountains near Baruth in Sileſia, ſometimes the whole ſkeleton, and ſometimes parts only. In Ireland there have been found the remains of deer, of a ſize far exceeding any now known; and in Scotland the remains of an elk, as well as thoſe of an enormous animal of the ox kind, but larger than even the urus.

ROSMARI; the head of the morſe (ſee TRICHECUS); found in the neighbourhood of Bononia in Italy.

BOVIS; the ſkeleton of the ox, found about a century and a half ago between Querfurt and Gutterſtadt in Saxony. See CERVI, above.

SORICIS; the ſkeleton of the ſhrew; found in Bohemia, buried in ſchiſtus. See SOREX.

Before we quit this genus, we may obſerve, that in moſt parts of Europe remains of large animals have been found; and in both North and South America, the reliquiæ of enormous unknown animals have been diſcovered. According to Pallas, from the Tanais to the continental angle neareſt to America, there is hardly a river in this immenſe ſpace, eſpecially in the plains, upon the ſhores, or in the bed of which, have not been found the bones of elephants, and of other animals not of that climate. From the mountains by which Aſia is bounded, to the frozen ſhores of the ocean, all Siberia is filled with prodigious bones. The beſt foſſil ivory is found in countries neareſt to the arctic circle, as well as in the eaſtern countries, which are much colder than Europe, under the ſame latitude; countries in which only the ſurface of the ground becomes thawed during the ſummer.

The number of bones which have been diſcovered of the rhinoceros is very conſiderable, not only in Siberia, but in Germany, and other parts of Europe, and in the opinion of St. Fond and others, they are all of a double-horned ſpecies, ſimilar to the rhinoceros of Africa. It is, however, ſup-

poſed

posed that the rhinoceros, which corresponded with all the fossil remains, was the rhinoceros of Sumatra.

Ornitholithus. The body, or parts of a bird changed into a fossil substance. Of this genus there are three

Species.

Rostri; the beak; found in the neighbourhood of Jena; and in the mountains on the confines of Switzerland, sometimes perfect, sometimes only impressed on a schistose swinestone.

Ossium; the bones of birds found in Silesia.

Plumarum; the feathers of birds, which are found principally at Oeningen, on the confines of Switzerland, impressed on a schistose swinestone. Notwithstanding this enumeration, the fossil remains of birds are very rarely met with, although, as Mr. Parkinson says, they are frequently mentioned, and even described, by different authors. Fossils, much resembling the beaks of birds, are sometimes found, but these are supposed to be parts of fishes. Several of those specimens which have been spoken of, as petrifactions of whole birds, and of their nests, have been merely calcareous incrustations of very modern formation. Bones very much resembling the bones of birds have been found in the calcareous stone of Oxfordshire, and in some parts of France and of Germany.

Amphibiolithus. The body, or some part of an amphibious animal changed into a fossil substance. Of this three species are mentioned.

Species.

Testudinis; the Tortoise. This has been found entire, or in parts, sometimes in the stone quarries of Oxfordshire; in a bed of schist in Switzerland; on St. Peter's mountain near Maestricht in Brabant; in Malta; in Leipsic, and other parts of Saxony.

Ranæ; the toad or frog. The head of a frog found in a bed of schist in Switzerland, and an entire petrified toad in a slaty swinestone at Oeningen.

Crocodili; the entire skeleton of a crocodile. A specimen of this was found near Elston in Gloucestershire, in indurated clay; and others near Drax in Aquitain, at the depth of nearly fifty yards under the surface of the earth; near Suhl in Henneburg, and near Boll in Wirtemburg in a slaty stone.

The fossil remains of amphibia, says Mr. Parkinson, are very numerous, and supply us with ample exercise for enquiry and admiration. In different parts of England, particularly in Somersetshire and Devonshire, the remains of animals apparently of the Lacerta genus are frequently found; but are, as far as we are able to judge, really different from any animal which is known to us. A most beautiful specimen of part of the jaw of the fossil animal of St. Peter's mountain, already referred to, was presented to the Royal society by professor Camper, and is now deposited in the British museum. A specimen of the head of this animal has been also obtained from the same mountain by Faujas St. Fond, and is delineated in the work which he has given the world descriptive of the fossil riches of that mountain. The plates of St. Fond, as well as the specimen of professor Camper, shew that these are the remains of an enormous animal, different from any at present known. It must, however, be observed, that the remains of crocodiles, apparently of the same species which now exist, have also been discovered; part of the head of the Asiatic crocodile was found in very good preservation in the quarries of Altdorf.

6

Ichthyolithus. The body or parts of a fish changed into a fossile substance. Of this genus Gmelin has enumerated four species, besides varieties, but instead of particularizing them we refer the reader to our article Ichthyolite.

Entomolithus. The body, or some part of an insect, changed into a fossil substance. See Entomolithus.

Species.

Cancri; the crab or some of its parts. Found in various parts of Great Britain, and in most parts of the globe, in slate or foliated limestone, either entire or in parts, as the shell, legs, claws, &c. of various species.

Monoculi. The Monoculus polyphemus, found near Solenhofen, in foliated limestone.

Paradoxus. The Oniscus paradoxus, found in various parts of Great Britain and the continent, in various kinds of limestone, and indurated clay or slate, loose or affixed, solitary or in numbers, entire or in parts, straight, incurved, expanded or contracted; the head covered with a very convex, roughish, often three-parted shell, semilunar on the fore part, grooved its whole length, with two hemispherical or cylindrical, three-lobed, covered with a laminar shell, consisting of versatile triarcuated rings; the tail is thin, three-parted by three tubercles.

Insects of the smaller kinds are seldom found in a fossil state, the smallness of their size, and the delicacy of their structure, preventing their preservation. The one which is generally found in the most perfect condition is that which is commonly denominated the Dudley fossil, from its being found in the neighbourhood of Dudley in Worcestershire. Other species of this have been found in Wales and Germany. From the imperfect state in which these insects have been found, little more, perhaps, can be said of them, except that the remains which have been examined shew that the covering of the body was formed by three series of thick crustaceous shells, transversely disposed in rows, the length of the body, while one plate served to give a covering to the head of the animal. Other remains of the smaller insects have been mentioned by different authors, but few or none appear to have been described as agreeing with any insect now known in existence. The remains of lobsters and crabs are frequently found in the isles of Sheppey and Malta, and some very good and perfect specimens were discovered in digging the archway at Highgate in the years 1812 and 13, one of which is in the possession of the compiler of this article. The remains of different species of these animals are also found in a compressed state in the schistous masses of Pappenheim and Oppenheim.

Helminthólithus. The body, or parts of a crustaceous worm, or shell-fish changed into a fossil substance.

Species.

Asteriæ; the star-fish, or its parts. The varieties of this, found in a fossil state, are as follows.

1. Asterias papposa, found in slaty limestone at Pappenheim.

2. A. rubens, found in St. Peter's mountain near Maestricht.

3. A. minuta, found in chalk-pits in various parts of England; it is small, of a reddish-white colour; in form of a star, or wheel with four or five radii; it is somewhat convex at the centre.

4. A. glacialis, found in France.

5. A. reticulata, found in France near Chassois.

6. A. aurantiaca.

7. A.

7. A. equeftris, in the fandftones in Saxony.

8. A. ophiara, in Italy and Germany, in marble, and with folitary rays in a yellow fhining fandftone.

9. A. pectinata, at Pappenheim, in flaty limeftone.

10. A. multiradiata, near Stutgard, with the rays aggregate.

11. A. Caput Medufæ, found generally in mountains of chalk, limeftone or fandftone, fometimes the mere impreffions are what are left.

Echini; the Echinus or Sea Hedgehog. Divided into two fections, *viz.* A, including the entire animal; and B, its parts.

Section A.

1. Echinus efculentus, found in England, Saxony, Germany, &c. in chalk, lime, marle, flint or agate.

2. E. excavatus, in marble at Verona, of a yellow-grey colour.

3. E. globulus, in England, and divers parts of Germany, generally calcareous, rarely in flint.

4. E. faxatilis, in limeftone near the falt-pits in Upper Auftria.

5. E. ovarius, in England, France, and Switzerland, in chalk and lime-ftone hills.

6. E. diadema, in the mountain Raudberg in Switzerland, and at Rottenburg in Weftphalia.

7. E. circinatus.

8. E. cidaris, found in England, Saxony, Franconia, and various parts of Europe, in flint, chalk, or marble.

9. E. mamillatus, in Malta, Switzerland, on the limeftone mountain Legerburg, and near Baffeville in iron ore.

10. E lucunter, in the chalk-hills of England.

11 E. coronalis, in the flint and chalk-hills of England.

12. E. afterizans, found filled with cretaceous matter, the fhell itfelf being converted into fpar.

13. E. teffellatus, in the chalk-hills of Bafil.

14. E. botryoides.

15. E. finuatus, in the chalk and limeftone hills of England.

16. E. femiglobofus, in the calcareous mountains of Silefia and Switzerland.

17. E. quinquelabiatus, in the calcareous mountains of Switzerland.

18. E. conoideus.

19. E. albo-galerus, and the next, are found in the chalk-hills of England, and in marble in Lower Saxony.

20. E. depreffus.

21. E. vulgaris, found abundantly in calcareous hills, in England, Germany, and Silefia.

22. E. quadrifafciatus.

23. E. fexfafciatus.

24. E. fubuculus.

25. E. fcutatus, in the chalk-hills of England and Denmark.

26. E. ovatus.

27. E. puftulofus, in the chalk-hills of England, and in the marble rocks of Germany.

28. E. quadriradiatus, in the coarfe marble of Holftein.

29. E. minor.

30. E. dubius.

31. E. rofaceus, found in the mountains of Languedoc.

32. E. altus.

33. E. orbiculatus, in the calcareous mountains of Switzerland.

34. E. fubrotundus.

35. E. corollatus.

36. E. orbiculus, in Venice; near Brandenburg in Weftphalia, and in Languedoc.

37. E. placentæ, in Malta.

38. E. cor-anguinum, in the chalk-hills of England, and coarfe marble rocks of Germany.

39. E. lacunofus.

40. E. radiatus.

41. E. complanatus, in the limeftone mountains of Switzerland.

42. E. fubglobulus, in the chalk-hills of England, and the marble of Switzerland.

43. E. oananchytis.

44. E. bicordatus, in the mountains of Switzerland.

45. E. carinatus, found in Norway.

46. E. fpatagus, found in great abundance in the chalk-hills of England, near Maeftricht, and in various parts of Germany and Switzerland.

47. E. briffoides.

48. E. ovalis, found in the mountains of Switzerland.

49. E. pyriformis.

50. E. lapis cancri.

51. E. patellaris.

Section B. The Parts.

This fection includes fpecimens, 1. Of the fpines, denominated Jew's-ftone, of which there are nine varieties that do not require particular notice; 2. Of the knobs; 3. Of the feparate compartments of the fhell; and 4. Of the teeth of the fhell, which laft are found abundantly in Great Britain, and various other parts of the globe; the fpines are fhorter or longer, fmooth, ftriated or ftudded.

Chiton, found near Creazzo, in the Venetian territories.

Lepadis, or Acorn-fhell. 1. L. balanus is found in Piedmont, in fandftone; in Malta, Languedoc, and near Drefden in Saxony. 2. L. balanoides. 3. L. tintinnabulum. 4. L. mitella: thefe three laft are all found in Piedmont, either in fandftone or marble. Mr. Parkinfon fays, although feveral fpecies of the Lepas have been found in a mineralized ftate, they are by no means frequent foffils. The L. anferifera is faid to have been found foffil, and fo has the L. diadema; thefe muft, however, be exceedingly rare foffils.

Pholadis. The Pholas in a foffil ftate is by no means common; but the P. crifpata has been found among the Harwich foffils; others have been difcovered in Piedmont, generally imbedded in filica or limeftone.

Mya. This is found in a foffil ftate in England, Arabia, Belgium, Switzerland, Germany, France, and other parts of the continent. The Mya *pictorum* (which fee) is defcribed by Solander as exifting among our Hampfhire foffils; a foffil mya of three or four inches in length is found in the rocks near Bognor.

Solenites. The Solen in a foffil ftate is found in Arabia, Belgium, Switzerland, Germany, France, and other parts of the European continent. Remains of the S. filiqua, and of the S. enfis, have been found at Harwich; and a fmall foffil fhell, named by Solander S. ficus, has been found between Lymington and Chriftchurch.

Tellinites. The Tellina is found foffil in Glocefterfhire, Italy, Switzerland, Bohemia, Auftria, &c. in clay or limeftone. The varieties are, 1. T. lingua felis, in the limeftone mountains of Switzerland and Wirtemberg. 2. T. roftrata, at or near Ball in Wirtemberg, in calcareous earth. 3. T. donacina, near Herbipolis, in limeftone.

Bucardites. The Cardium, or cockle, found in a foffil ftate ſtate in the clay-pits at Richmond in Surry; at Sherborne in Glocelterſhire; in the cliffs at Harwich; on Shooter's Hill, and in vaſt maſſes of grey limeſtone in the county of Cork; in Germany, Italy, Bohemia, Auſtria, and other parts of the continent.

MACTRÆ. This is found in the foſſil ſtate in Piedmont, about Verona in Italy, in England and Germany, generally calcareous.

DONACITES. The Donax ſcortum and D. irus are found in Germany and Switzerland.

VENERIS. Different ſpecies of the Venus are found in this and other countries of Europe, and the V. paphia is met with on the continent of America.

SPONDYLI. The Spondylus gædaropus is found in America, Switzerland, and Germany, and the S. regius in marble, near the ſalt ſprings in Upper Auſtria.

CHAMITES. Of the Chama eight ſpecies are found in a foſſil ſtate in the ſouthern parts of Europe.

ARCÆ. The Arca is found in the cliffs at Harwich, and various parts of Glocelterſhire and Oxfordſhire, and likewiſe in many parts of Germany and Switzerland.

OSTREÆ. The Oyſter, or ſcallop-ſhell, is found foſſil in different counties of England, as Glocelterſhire, Berkſhire, Oxfordſhire; alſo in Italy, Germany, and moſt countries of Europe, in chalk, flint, marble, clay, ſandſtone, &c.

Section A. Scallops.

1. Oſtrea radiata, is found near Witney and Graveſend, and in Germany.
2. O. maxima, in the Venetian territories, Malta, Hungary, and divers parts of Germany.
3. O. jacobæa, in Piedmont and Germany.
4. O. ziczac, in the Netherlands and Germany.
5. O. minuta, in Auſtria, near Brunn, and near Libochowitz in Bohemia.
6. O. ſtriata, near Querfurt in Saxony, and in Hungary.
7. O. pleuronectes, found in various parts of Germany.
8. O. pallium, in Bohemia, Saxony, Switzerland, and Germany.
9. O. nodoſa, in Alſace.
10. O. puſio, in Belgium, Germany, and Bohemia.
11. O. glabra, in Germany and Bavaria.
12. O. faſciata, found near Odolca, in Bohemia
13. O. lima, found near Ariſtorf, in Switzerland.

Section B. Oyſters.

The O. diluviana, O folium, and O. edulis, are found in moſt parts of the globe.

ANOMITES. No bivalve exiſts as a foſſil in ſuch prodigious number as the Anomia. Theſe ſhells are characteriſed by the beak of the larger or under valve, which is perforated, being greatly produced, riſing or curving over the beak of the ſmaller or upper valve. Twenty-one of theſe ſpecies of ſhells are mentioned by Gmelin, of which the following ſeem moſt worthy of notice.

1. A. gryphus, found in England, France, Germany, Switzerland, &c. in gravel or clay-pits, ſometimes with both ſhells joined.

2. A. lacunoſa is one of the moſt abundant of theſe ſpecies. They are found in conſiderable numbers in different parts of England, but particularly in Lincolnſhire, Warwickſhire, and Glouceſterſhire.

3. A. terrebratula, found fixed or detached, in lime or flint, and ſometimes filled with ſpar, near Witney in Oxfordſhire, and alſo at Graveſend; likewiſe in Germany, Saxony, Bohemia, Auſtria, and moſt parts of the continent.

MYTILITES; the Mytilus or Muſcle-ſhell. Several ſpecies of this are known foſſils, ſome of which approach very nearly to thoſe which are recent, and one in particular appears to differ very little from the M. modiolus, which is found in various parts of Germany, fixed and marmoreous. The other principal ones are;

1. Mytilus criſti-galli, found in Malta, Normandy, Switzerland, Germany. It is ſometimes very large, and generally marmoreous.

2. M. frons; found in Chriſtianſtadt in Sweden, in Belgium, Normandy, and Malta, in marble, ſand, or flint.

3. M. margaritiferus; this is found near Ariſtorf, in Switzerland; admitting a beautiful poliſh, and exhibiting the moſt ſplendid irideſcent colours, according to its poſition in the light.

4. M. edulis; found in Piedmont, and very many parts of Germany, generally fixed and calcareous, ſometimes ferruginous, or in ſand-ſtone.

PINNITES; the Pinna. This alſo is found in a foſſil ſtate in Piedmont, near Ariſtorf in Switzerland, in Franconia, and near Dreſden in Saxony.

NAUTILITES; the Nautilus. Specimens of this, in the foſſil ſtate, are very frequent. They have been found in ſeveral parts of our own iſland: ſome fine ſpecimens have been met with at Lime in Dorſetſhire, in different parts of Wiltſhire, and at Whitby in Yorkſhire. The fineſt ſpecimens are thought to be found in the neighbourhood of Bath, and in the iſle of Sheppey in Kent. In digging for the Highgate archway, a number of very beautiful ſpecimens were diſcovered, ſome exceedingly large, and ſtill retaining a reſplendent pearly ſhell, highly decorated with pyrites; of which one is in poſſeſſion of the compiler of the preſent article.

The ſhell with the outer whorl much larger than the others is common in Northamptonſhire, Kent, Sheppey, and other parts of England; alſo in many countries on the continent. It is generally marmoreous, ſometimes pyritaceous, or ſiliceous.

That with the circumference rounded and knotty, and the grooves tranſverſe and flexuous, is met with in almoſt every part of the globe, in marble, limeſtone, clay, marle, ſwineſtone, hornſtone, agate, flint, &c. from the ſize of a ſixpence to more than two feet in diameter. The chambers are often filled with cryſtals of various kinds.

The N. belemnita is found abundantly in many parts of England, particularly in Glouceſterſhire and Oxfordſhire, and in moſt mountainous parts of Europe. They are more or leſs opaque or tranſparent, ſtraight or a little bowed, cylindrical, conic, more or leſs clavate, fuſiform, a little compreſſed, pointed or rather obtuſe, with a groove or two towards the tip; internally hollow or filled up, from a quarter of an inch to eight inches long; the colour is whitiſh, amber, grey, browniſh, or blackiſh. They are often incloſed in, or adhere to other ſtones, and are compoſed of ſeveral cruſts encircling each other, and are moſt frequent in chalk, gravel, or clay. When burnt, or ſcraped with a knife, they give out an odour like raſped horn. Common people have a notion that they are to be found after a thunder-ſtorm.

CONI. The Conus is to be met with in Piedmont, Switzerland, and Tranſylvania; and commonly it has a marble nucleus.

PORCELLANITES. The Cypræa, or cowrie, found marmoreous in Piedmont and Auſtria.

BULLITES.

BULLITES. The Bulla, near Northberg in Germany.

CYLINDRITES. The Voluta has generally a marble nucleus, in Switzerland, Piedmont, near Verona, in Auſtria, Saxony, and Germany.

BUCCINI; the Buccinum or Whelk. Of the ſeveral ſpecies of this, the angular or B. bezoar is found on the hills near Hampton in this country, in Switzerland, the Netherlands, and Germany.

STROMBI. The Strombus chiragra is found near Oedenburg in Hungary. S. lucifer with a long ſpire, near the warm bath in Wirtemburg.

MURICIS. Several ſpecies of the Murex or whelk is found foſſil; the M. granulatus is met with in Italy and Auſtria. It is marmoreous, or filled with ſandſtone.

TROCHILITES. The Turbo is found in various ſpecies, in divers parts of Europe.

The Turbo littoreus in Switzerland, and many parts of Germany, ſometimes filled with ſpar, or covered with arboreſcent figures.

Of the *Cancellate* tribe, the T. ſtriatulus with an elongated ſpire is met with in England, France, Switzerland, and various parts of Germany, aggregate and fixed, generally in marble, flint, calcedon or ſandſtone, and ſometimes filled with ſpar.

HELICIS. The Helix or ſnail-ſhell is met with in the foſſil ſtate, either *flattened*, in various parts of England, Belgium, Switzerland, Hungary, &c. detached or fixed, ſolitary or gregarious, or mixed, in marble, flint, or ſandſtone; or *rounded*, near Verona, in the Venetian territories, in Piedmont, Switzerland, and Germany; or *ovate*, in England, France, Switzerland, and Germany, in marble or ſandſtone.

NERITITES. The Nerita is found in Piedmont, Switzerland, Carinthia, Auſtria, Germany, &c. and generally in limeſtone.

AURICULARIS. The Haliotus, or ſea-ear, found in Belgium.

PATELLARIÆ. The Limpet is found in various parts of England, Switzerland, and Italy. The P. ſaccharina is common in various parts of Sweden.

DENTALIS. The Dentalium, or tooth-ſhell, found in various parts of Italy, Switzerland, Germany, Bohemia, Sileſia, and Saxony, in marble, jaſper, or calcedony.

TUBULITES. The Serpula is to be met with in many of the countries of Europe. The flexuous or contorted, called *vermiculites*, is found in Malta, Italy, Switzerland, Germany, Franconia, and Belgium, in marble, ſandſtone, generally ſeated on other petrified ſhells.

TEREDINIS. The Teredo is found in Sheppey iſland, and Piedmont, in ſubterraneous wood.

SABELLÆ. The Sabella is found every where among impreſſions.

TUBIPORITES. The Tubipore is met with in Sweden, Belgium, Franconia, and Sileſia.

T. muſica is found in England, Belgium, Germany, Gothland, in marble, quartz, or ſandſtone.

MADREPORITES. The Madrepore is found foſſil in Gothland, Belgium, Piedmont, and the Venetian territories, in beds of marle. Of the forty-two ſpecies characteriſed by Gmelin, we ſhall only notice the following.

M. turbinata, found in Derbyſhire, Gothland, Switzerland, Auſtria, and various parts of Germany and the Netherlands, in marble.

M. porpita, or ſhirt-button madrepore, in Switzerland, Auſtria, Saxony, and Weſtphalia, generally detached, in marble, jaſper, and flint.

M. aſtroites, in Oxfordſhire, near Heddington and Witney, in the Netherlands, Germany, Auſtria, and Saxony, in chalk, calcedony, or ſandſtone.

M. cæſpitoſa, in Derbyſhire, Switzerland, and various parts of Germany, in marble and flint.

MILLEPORITES. The petrified Millepores are found chiefly in Switzerland, Germany, and Sweden. Milleporæ do not appear to be nearly ſo frequently found in a mineral as in a recent ſtate. Several foſſils have been placed among the millepores, which Mr. Parkinſon thinks ſhould unqueſtionably rank with the madrepores: ſuch are the M. ſimplex turbinata, and the M. ſimplex diſcoides of Waller and Geſner.

CELLEPORITES. The Cellepore is found in Gothland, in marble or ſandſtone. C. antipathes and C. gorgonia, as foſſils, are rather uncommon.

ISIDIS; the Iſis or coral. Of this we may obſerve, that the ſimple joints of the I. hippuris are often found in England, Switzerland, and Sicily.

I. entrocha is found in England, and on almoſt every part of the continent, ſometimes in ſingle ſeparate joints, ſometimes connected together in a column, from the ſize of a pin's head to a finger's length, and of about the thickneſs of the middle finger; they are more or leſs tranſparent, in proportion as they contain more or leſs ſilica, are ſtriated from the centre to the circumference, and have a cavity in the middle. When reduced to powder, they are eſteemed very powerful diuretics, and are exhibited in nephritic caſes; the doſe being as much as will lie on a ſhilling.

I. aſteria, or ſtar-ſtone. Of this there are ſeveral varieties: the one denominated by Gmelin *b*, is orbicular at one end, and angular at the other, and is found in England, Switzerland, Germany, Auſtria, &c. ſingle or gregarious, detached or fixed, with the joints ſolitary, or forming a column, which is rarely curved or branched, ſmooth or warty, rarely three or ſix-ſided, very rarely ſquare; the joints, when ſeparated, reſemble a radiated ſtar: when thrown into ſtrong vinegar, or acetous acid, they have the property of moving, which, however, is probably occaſioned by the efferveſcence cauſed by the acid acting upon the calcareous matter of which they are compoſed.

GORGONIÆ. The Gorgonia is found in Switzerland, Italy, and Saxony, in the foſſil ſtate.

ALCYONII. The different ſpecimens of the Alcyonium, in the foſſil ſtate, are found chiefly in Switzerland and Germany; but the A. arboreum is met with in England.

SPONGIÆ. Petrified ſponge is found near Paffrath in Switzerland, and in Franconia.

ESCHARITES. The Fluſtra is found foſſil in the Netherlands, Franconia, and Switzerland, in ſandſtone and calcareous ſoil.

TUBULARIÆ. The Tubularia is met with in Gothland and Switzerland.

CORALLINÆ. The Coralline is found in Bohemia and Venice.

SERTULARIÆ. The Sertularia is met with in France and the Netherlands.

PENNATULÆ. The Pennatula (or ſea-pen) phoſphorea is found in the Netherlands, and on mount Baldo in Verona.

P. encrinus, in its *expanded* ſtate, is found in England and Germany, in marle or flint, ſometimes the impreſſion only: in the *contracted* ſtate, called the *ſtone-lily*, it is found entire, or in parts, in England, Switzerland, Saxony, Germany, &c.

PHYTOLITHUS, the laſt genus of the claſs Petrifactions, includes

includes vegetables, or ſome of their parts, changed into a foſſil ſubſtance. Of this there are ſix

Species.

TOTALIS; the whole plant. Found in various parts of Great Britain, moſt commonly in the ſhale lying over ſtrata of coals or in ſandſtone, and in various parts of Europe: it is always in the form of an impreſſion; of the thirty-one varieties the following only claim notice.

The Hippuris, or mare's-tail, is found in the coal-mines of Sileſia and Germany.

Various graſſes are found in Switzerland, Bohemia, Sileſia, and divers parts of Germany, in ſchiſtoſe ſwineſtone and alumina lying over beds of coal, rarely in flint.

Stellate plants, as Gallium, Aſperula, &c. in the coal-pits of England, France, and Germany.

The Cactus, in England, Weſtphalia, and Germany, in coal-mines.

The Ornithopodium, or bird's-foot, in the Veroneſe mountains of Venice.

The Pinus, or pine, in Switzerland and various parts of Weſtphalia.

Many genera and ſpecies of ferns are found in ſchiſtoſe and bituminous marle and alumina covering veins of coal, in ſandſtone and other foſſils, in numerous varieties, in many parts of Great Britain, France, Germany, Italy, Bohemia, Saxony, and moſt parts of Europe, generally in impreſſions.

Various moſſes and ſea-weeds are met with in Venice, Saxony, and Sileſia.

RHIZOLITHUS; the roots of vegetables, moſt commonly found underground in a ſtate of decay, ſometimes hollow, or filled with other foſſil ſubſtances; ſometimes covered with a ſtony cruſt; though ſometimes they occur petrified in France, Italy, Germany, Sweden, and Siberia.

TRUNCI. The trunk or ſtalk of vegetables. The trunks of trees are found in almoſt every part of the globe, and in various ſtates of decay and appearance; ſometimes forming ſubterraneous woods, the pieces of which are found or carious, or perforated by the Teredo. Numerous ſpecimens of theſe were dug up in forming the Highgate archway. Some are in a complete foſſil ſtate, and will admit of a high poliſh: others are converted into charcoal, with or without the bark, and often ſo perfect as to diſtinguiſh the kind, as oak, aſh, fir, &c. Some of them are marmoreous and often filled with ſpar: of theſe, ſpecimens are met with in Ireland and many parts of Germany: ſome in gypſum; ſome in ſilica; ſome in agate: theſe laſt are found in Siberia, Hungary, and Saxony, more or leſs opaque, breaking into coarſe ſplinters or indeterminate fragments, a little ſhining, taking a fine poliſh, fibrous internally, of a conchoidal texture, variegated, ſpotted or ſtriate, blackiſh or of a ſmoke colour, ſometimes red, ochraceous or green: ſome are found in opal, in Upper Hungary, hardiſh, opaque or nearly ſo, breaking into indeterminate fragments or long ſplinters, ſeparating into cruſts, generally a little ſhining, moſtly variegated with white, greyiſh-brown, or ochraceous and hyacinthine alternate ſtreaks: ſome of theſe ſpecimens are bituminous, which are found frequently forming entire ſubterraneous woods in various parts of England and Ireland, particularly in Lincolnſhire: alſo in almoſt all the countries on the continent of Europe: in Pruſſia they are found in ſtrata that are ſuperincumbent on amber.

LITHOPHYLUM; the leaves of plants. Impreſſions of the leaves of various herbs and trees are very frequent in marble, ſchiſt, marle, clay, and ſandſtone, rarely in flint or indurated oxyd of iron.

ANTHOLITHUS; the flowers of plants. Thus the ſpikes of graſſes are found in Sileſia, Franconia, and Germany, in copper ores, frequently with a ſmall admixture of ſilver: the flowers of herbs, as the galium, heliotropium, ranunculus, and various ferns, are to be met with in England, Sileſia, and Switzerland; impreſſions are found between ſlaty ſtones.

CARPOLITHUS; the naked ſeeds, ſeed-veſſels, cones, nuts, drupas, and legumes of plants, are found in a foſſil ſtate in the coal-mines of England, in ſandſtone in Piedmont, in Bohemia in marle, in Switzerland in turf, in Hungary, Auſtria, &c. always in impreſſions.

The parts of vegetables confined in ſubterranean ſituations ſuffer, according to circumſtances, either a complete revolution of compoſition, the lighter parts becoming volatilized, while the more fixed remain and form the ſubſtance which is termed *humus*; or, as it is ſuppoſed by Mr. Parkinſon, it paſſes through another proceſs which he conſiders as fermentative, and becomes bituminous. Wood thus changed is called *lignum foſſile bituminoſum*, and *Bovey-coal*. By the extenſion of this proceſs, the ſame author ſuppoſes that the ſubſtances denominated bitumens (naphtha, petroleum, and aſphaltum) are formed. To the ſame proceſs he attributes the formation of amber. That jet, cannel coal, and common coal employed in domeſtic purpoſes, have had a vegetable origin, is rendered extremely probable, from the frequency with which they manifeſt the impreſſions of various vegetable bodies.

Thus the formation of the bituminous foſſils may be ſatisfactorily explained, but by far the greater number of vegetable foſſils, are of a lapideous nature, and neceſſarily owe their formation to very different proceſſes, which may be preceded by the proceſs by which bitumen is formed. Many bodies which are evidently of vegetable origin, may be now found exiſting in a lapideous, either calcareous, or ſilicious ſtate; and many others are found poſſeſſing certain marks of the preſence of ſome metallic ſubſtance. To explain theſe formations ſome perſons have ſuppoſed the injection of the impregnating matter in a ſtate of fluidity, by ignition, while others have imagined the gradual abſtraction of the original particles of the body, and the regular depoſition of the impregnating particles in the ſpaces which have been juſt left by the original matter. Mr. Parkinſon attributes the formation of this deſcription of foſſils to the impregnation of vegetable ſubſtances, which have undergone different degrees of bituminization with water, holding the earths or the metals in ſolution. Thus with *lime* is formed calcareous wood, or the wood-marble of Oxfordſhire and Dorſetſhire, of Piedmont and Bohemia: with *ſilex* is formed the calcedoniſied, agatiſied, and jaſperized wood; and with the addition of alumine, &c. the foſſil woods which now partake of the nature of pitch-ſtone, &c. In other ſituations, metallic impregnations occur, as in ſuch woods as are impregnated with pyrites of iron, ſo frequent in this country, and the beautiful woods of Siberia, containing the hydrate and carbonate of copper. For other particulars, and an account of the diſcovery lately made in the iſland of Guadaloupe, ſee the article RELIQUIÆ.

PETRIFYING WATERS. Alonſo Barba gives an account of ſome petrifying waters of Peru, which greatly exceed all thoſe we have in Europe in the quantity of ſtony matter they contain. He tells us that they ſoon choak up their own paſſage by the ſtony matter they depoſit there; and that all the cattle that drink of them die. He adds another

another ſtory, which he probably took a little too haſtily upon credit, which is, that they have moulds of the ſhape of our brick, which they fill with this water, and that on being expoſed to the ſun a few days, the water is wholly converted into a ſtone of the ſame ſhape; and that they build their houſes and other buildings with theſe ſtones.

PETRIKOW, Peterkau, or *Petrkow*, in *Geography*, a commercial, but not large, town of the duchy of Warſaw, in which the kings of Poland were formerly elected, and diets held. It has been twice conſumed by fire; 48 miles E.S.E. of Siradia.—Alſo, a town of Lithuania; 130 miles S.E. of Novogrodek.

PETRILITE, or *Cubic Felſpar of Karſten*, in *Mineralogy*, is the 40th ſpecies of the ſiliceous genus in the arrangement of Kirwan; its colour is reddiſh-brown or red; amorphous; its luſtre 2; its tranſparency partly 2, partly 1; its fracture participates of the ſplintery and foliated, but inclines more to the former; its fragments 2; cubic, or inclining to that form, and without poliſhed faces; it ſeems to conſiſt of thick, indiſtinctly ſeparate, ſtraight, lamellar concretions; its hardneſs 9; brittle. The ſpecific gravity of Kirwan's ſpecimen was 3.081. At 160° it whitened, and barely concreted without any farther ſign of fuſion. As it is ſpecifically different from the other ſtones hitherto called felſpars, Kirwan, to prevent confuſion, calls it petrilite.

PETRINAL, or Poitrinal, in *Artillery*, a kind of medium between the harquebuſs and piſtol, deſcribed by the preſident Fauchet, who lived under Francis I. and died under Henry IV. It had a very ſtrong and quick wheel, and is ſuppoſed to have been invented by the bandouliers of the Pyrenean mountains. Nicot, in his Dictionary, deſcribes it thus: "It is," ſays he, "a ſpecies of harquebuſs, ſhorter than the muſket, but of a greater calibre, and on account of its weight, is carried in a broad baudrick worn over the ſhoulder, and reſted on the breaſt of the perſon who carries it, when he fires it, whence its name. The poitrinalier is the perſon who carries and uſes the poitrinal." This arm is mentioned in the ſiege of Rouen by Henry IV. in 1592.

PETRINIA, in *Geography*, a ſtrong town of Croatia, on the S. ſide of the Kulpa, built by Aſſan Pacha in 1592; 37 miles E. of Carlſtadt. N. lat. 45° 32′. E. long. 16° 35′.—Alſo, a river of Croatia, which riſes near Puſta Petrinia, and runs into the Kulpa near Petrinia.

Petrinia, *Puſta*, a town of Croatia, near the ſource of the Petrinia; 10 miles S. of Petrinia.

PETRISKI, a lake of European Turkey, in Macedonia; 3 miles N.E. of Jenitza.

PETRIZZI, a town of Naples, in Calabria Ultra; 5 miles from Squillace.

PETROBRUSSIANS, in *Eccleſiaſtical Hiſtory*, a religious ſect, which aroſe in France, and the Netherlands, about the year 1110; ſo called from their leader, Peter de Bruys, a Provençal, who made the moſt laudable attempt to reform the abuſes and remove the ſuperſtitions that diſgraced the beautiful ſimplicity of the goſpel; and after having engaged in his cauſe a great number of followers, during a laborious miniſtry of twenty years' continuance, was burnt in 1130, by an enraged populace, ſet on by the clergy. The chief of Bruys' adherents was a monk, one Henry; from whom the Petrobruſſians were alſo called Henricians.

Peter the Venerable, abbot of Clugny, has an expreſs treatiſe againſt the Petrobruſſians; in the preface to which, he reduces their opinions to five heads.

1. They denied that children before the age of reaſon can be juſtified by baptiſm; in regard it is our own faith that ſaves by baptiſm. 2. They held, that no churches ſhould be built, but that thoſe that already are ſhould be pulled down; an inn being as proper for prayers as a temple, and a ſtable as an altar. 3. That the croſs ought to be pulled down, and burned, becauſe we ought to abhor the inſtrument of our Saviour's paſſion. 4. That the real body and blood of Chriſt are not exhibited in the Euchariſt but merely repreſented by their figures and ſymbols. 5. That ſacrifices, alms, prayers, &c. do not avail the dead.

F. Langlois objects Manicheiſm to the Petrobruſſians; and ſays, they maintained two gods, the one good, the other evil: but this we rather eſteem an effect of his zeal for the Catholic cauſe, which determined him to blacken the adverſaries of it, than any real ſentiment of the Petrobruſſians.

PETROCALLIS, in *Botany*, from πέτρος, *a ſtone*, or *rock*, and κάλλος, *beauty*, a new genus, founded by Mr. R. Brown upon the *Draba pyrenaica* of authors, which owes the above appellation to its place of growth, and the decoration it affords to many an alpine precipice, of which a garden ſpecimen can give but an inadequate idea. Brown in Ait. Hort. Kew. v. 4. 93.—Claſs and order, *Tetradynamia Siliculoſa*. Nat. Ord. *Siliquoſæ*, Linn. *Cruciferæ*, Juſſ.

Gen. Ch. *Cal.* Perianth of four elliptical, concave, ſlightly ſpreading, keeled, deciduous leaves, with a dilated, coloured margin. *Cor.* cruciform, of four obovate, ſpreading, ſlightly emarginate petals, twice the length of the calyx. *Stam.* Filaments ſix, awl-ſhaped, ſimple, about the length of the calyx, two oppoſite ones rather ſhorter; anthers ſimple, elliptical, incumbent. *Piſt.* Germen ſuperior, ſeſſile, elliptical, compreſſed; ſtyle very ſhort, angular; ſtigma ſmall, capitate, flat. *Peric.* Pouch oval, compreſſed, entire, veiny, ſomewhat oblique, crowned with the permanent ſtyle, of two cells; the partition parallel to the valves, which are nearly flat. *Seeds* two in each cell, almoſt orbicular, flat, without a border, pendulous, their ſtalks capillary, attached to the partition.

Eſſ. Ch. Pouch oval, entire; its valves flattiſh. Seeds two in each cell, without a border, their capillary ſtalks attached to the parallel partition. Stamens without teeth.

1. P. *pyrenaica*. Pyrenean Rock-bloſſom. Ait. n. 1. (Draba pyrenaica; Linn. Sp. Pl. 896. Willd. Sp. Pl. v. 3. 428. Jacq. Auſtr. t. 228. Curt. Mag. t. 713.)—Native of the Pyrenees, as well as of the mountains of Dauphiny, always in the moſt elevated ſituations, flowering about the middle of ſummer. We have gathered it in ſeed upon Mount Cenis in Auguſt. In gardens it flowers in May, and may ſerve to adorn rock-work, but we doubt whether it will not require the ſhelter of a frame in winter. The *ſtems* form denſe perennial tufts, and are much branched and leafy. *Leaves* crowded into a roſe-like form, wedge-ſhaped, three-cleft half way down, obtuſe, light green, ſhining, ribbed, fringed, not half an inch long, permanent though finally faded, and partly bleached. *Flowers* but few together, on ſolitary, corymboſe, erect, hairy ſtalks; their *petals* at firſt white, but ſoon turning, like the edges of the *calyx*, to a roſe-colour.

Though, in compliance with the ideas of our learned friend, we have adopted this genus, there ſeems but little pretence to ſeparate it from *Draba*, with which the whole habit and appearance of the plant accord.

PETROCARYA, a name given by Schreber to the *Parinari* of Aublet, derived from πετρος, *a ſtone*, and καρυον, *a nut*, in alluſion to the remarkable hardneſs and ſolidity of the large ſtony ſeed. Schreb. 245. Willd. Sp. Pl. v. 2. 287. Mart. Mill. Dict. v. 3. (Parinarium; Juſſ. 342. Lamarck Illuſtr. t. 429. Parinari; Aubl. Guian. v. 1. 514.)

514.)—Clafs and order, *Heptandria Monogynia*. Nat. Ord. *Hefperideæ*, Linn. *Rofaceæ*, Juff.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, turbinate, five-cleft; its fegments ovate, acute, rigid, fpreading. *Cor.* Petals five, ovate, acute, unequal, fmaller than the teeth of the calyx, and alternate with them. *Stam.* Filaments fourteen, capillary, longer than the teeth of the calyx, and inferted into its rim within the petals, feven of them, all on one fide of the calyx barren; anthers feven only, roundifh, burfting at the inner fide. *Pift.* Germen in the bottom of the calyx, ovate, villous; ftyle cylindrical, incurved, villous, longer than the ftamens; ftigma capitate. *Peric.* Drupa large, ovate, compreffed, its flefh fibrous, of one cell. *Seed.* Nut ovate, compreffed, longitudinally furrowed, with unequal wrinkles and tubercles, of two cells, its fhell very hard and almoft ftony, not burfting; kernels folitary, oblong.

Eff. Ch. Calyx five-cleft. Petals five, inferted into the calyx. Seven of the ftamens abortive. Drupa fibrous. Nut rugged, of two cells.

1. P. *montana*. Willd. n. 1. (Parinari montana; Aubl. Guian. v. 1. 514. t. 204, 205.)—Leaves ovate, on hairy ftalks.—Gathered by Aublet in the woods of Guiana, forty miles from the fea-coaft, flowering in May, and bearing ripe fruit in Auguft, the nuts of which are fweet, and excellent eating. The *trunk* of the tree is twenty-four feet high, and two or three in diameter, crowned with many fpreading branches, which are clothed when young with rufty down. *Leaves* alternate, on thick downy *ftalks* about half an inch long, oval, pointed, entire, coriaceous, four or five inches in length, and nearly one and a half in breadth, with one rib, and numerous, parallel, tranfverfe veins; their upper furface fmooth and fhining; the under white and finely cottony, with reticulated prominent veins. *Stipulas* in pairs, fheathing, lanceolate, concave, externally downy, above an inch long, deciduous. *Flowers* rather fmall, whitifh, numerous, in denfe, terminal, forked, downy and hairy *panicles*, with two or three large ovate *bracteas* at each fubdivifion. *Drupa* green, acid, four inches long, and three in its greateft diameter.

2. P. *campeftris*. Willd. n. 2. (Parinari campeftris; Aubl. Guian. v. 1. 517. t. 206.)—Leaves heart-fhaped, nearly feffile.—Native of the forefts of Guiana, in the quarter of Timoutou; as well as of the ifland of Mauritius, in the quarter of Moka. *Aubl.* Differs from the laft in the broader and heart-fhaped figure of the *leaves*, as well as in the very fhort *footftalks*, and much fmaller fize of the *fruit*, which is fcarcely an inch and half long, with very acute points and angles to the fhell of its nut, which is as hard as the former, and its kernels are likewife eatable. This fruit is known among the Creoles by the name of *Nefle*, or Medlar. Its flefh is pulpy and acid. Its feafon, as well as that of the flowers, is June. By Aublet's fpecimens of thefe plants, one would almoft fufpect them to be varieties, fo exactly do all their parts accord in texture and appearance. Their *fruits* indeed are very different in fize, and their *footftalks* in length.

Juffieu mentions two other fpecies, obferved by him amongft Adanfon's fpecimens from Senegal, called *Mampata* and *Neou*, whofe nuts however are ovate, and lefs furrowed or wreathed, their *ftamens* apparently fifteen, three oppofite to each fegment of the *calyx*. See MAMPATA.

PETROCOSSYPHUS, in *Ornithology*, a name given by fome authors to the bird more ufually called from its colour the *cæruleus*.

It lives among the rocks, in woody mountains, and fings very fweetly. It is a variety of the Lanius infauftus.

PETROJOANNITES, in *Ecclefiaftical Hiftory*, the followers of Peter John, or Peter Joannis, *i. e.* Peter the fon of John, who lived in the twelfth century; whofe doctrine was not known till after his death; when his body was taken out of his grave, and burnt. His opinions were, that he alone had the knowledge of the true fenfe wherein the apoftles preached the gofpel; that the reafonable foul is not the form of man; that there is no grace infufed by baptifm; and that Jefus Chrift was pierced with a lance on the crofs before he expired.

PETROL, or PETROLEUM, in *Chemiftry*, a fluid fubftance, refembling in a high degree the effential oils from vegetables. It is of a brownifh-yellow colour, of a peculiar odour. Its fpecific gravity varies from .73 to .878. When expofed to a gentle heat for diftillation, the fluid which comes over has lefs colour, is much thinner, and has more fmell. In this ftate it is called naphtha. It burns with a white flame, and is employed in the vicinity of the Cafpian fea for lamps. The earths in thefe parts are fometimes fo faturated with it as to be rendered inflammable.

When it is expofed to the air, even that obtained by diftillation, it becomes thick and highly coloured, and puts on the form of bitumen. This no doubt is occafioned by the gradual diminution of its hydrogen, by the oxygen of the atmofphere.

It is foluble in alcohol and ether, and combines with the fixed and volatile oils. It is hence ufed to diffolve refinous bodies and bitumen, and might, in many cafes, anfwer the purpofes of oil of turpentine.

It is found in different ftates. According as it has had accefs to the air, it will thicken and become of a darker colour. See NAPHTHA and BITUMEN.

The more fluid petrolea, fays Dr. Lewis, have been diftinguifhed by the name of *naphtha;* and the thicker by thofe of *piffafphalthum* and *piffelæum*.

Thefe, according to all appearance, muft be the work of fubterraneous fires, which raife or fublime the more fubtile parts of certain bituminous matters that lie in their way.

Thefe parts, being condenfed into a liquor by the cold of the vaults of rocks, are there collected, and ooze thence through clefts and apertures, with which the difpofition of the ground furnifhes them.

Petrol, then, is a liquid bitumen, only differing by its liquidity from other bitumens, as afphaltum, jet, amber, and the like fubftances.

The naphtha, which is either a liquid, or at leaft a very foft bitumen, is nearly allied to petrol.

Hitherto there has been little petrol found, except in hot countries. Olearius fays, he faw above thirty fprings of it near Scamachia, in Perfia. (See PERSIA.) There are alfo petrols in the fouthern provinces of France; but the beft are thofe in the duchy of Modena, firft difcovered by Ariofto, a phyfician, in 1640, in a very barren valley, twelve leagues from the city of Modena.

Three canals are there dug with great expence in the rock; by which three different kinds of petrol are difcharged into little bafons or refervoirs: the firft, as white, clear, and fluid as water, of a brifk penetrating fmell, and not difagreeable; the fecond of a bright yellow, lefs fluid, and of a lefs brifk fmell than the white; the third of a blackifh red, of thicker confiftence, and a fmell more approaching that of bitumen.

There are many varieties of thefe oils in regard to colour, fluidity, fubtility, and the pungency of their fmell, and tafte; the moft fluid are, in general, the moft fubtile and pungent. With us they are commonly fophifticated.

Mr.

Mr. Boulduc made ſeveral experiments with the petroleum of Modena, an account of which he gave to the Paris Academy.

It eaſily took fire on being brought near a candle, and that without immediately touching the flame; and when heated in any veſſel, it will attract the flame of a candle, though placed at a great height above the veſſel, and the vapour it ſends up taking fire, the flame will be communicated to the veſſel of heated liquor, and the whole will be conſumed. It burns in the water, and when mixed with any liquor, ſwims on the ſurface of it, even of the higheſt rectified ſpirit of wine, which is one-ſeventh heavier than pure petroleum. It readily mixes with all the eſſential oils of vegetables, as oil of lavender, turpentine, and the reſt, and ſeems very much of their nature: nor is this very ſtrange, ſince the alliance between theſe bodies is probably nearer than is imagined, as the eſſential oils of vegetables may have been originally mineral ones, and drawn up out of the earth into the veſſels of the plant.

Petroleum, when ſhaken, yields a few bubbles; but they ſooner ſubſide than in almoſt any other liquor, and the liquor reſumes its clear ſtate again almoſt immediately. This ſeems owing to the air in this fluid being very equally diſtributed in all its parts, and the liquor being compoſed of particles very evenly and nicely arranged.

The extenſibility of this oil is alſo amazing. A drop of it will ſpread over ſeveral feet of water, and in this condition it gives a great variety of colours, that is, the ſeveral parts of which this thin film is compoſed, act as ſo many priſms.

The moſt ſevere froſt never congeals petroleum into ice, and paper wetted with it becomes tranſparent, as when wetted with oil; but it does not continue ſo, the paper becoming opaque again in a few minutes, as the oil dries away.

Spirit of wine, which is the great diſſolvent of ſulphur, has no effect upon petroleum, not even with ever ſo long a digeſtion. It will not take fire with the dephlegmated acid ſpirits, as oil of cloves and other of the vegetable eſſential oils do: and in diſtillation, either by balneum Mariæ, or in ſand, it will neither yield phlegm nor acid ſpirit; but the oil itſelf riſes in its own form, leaving in the retort only a little matter, thick as honey, and of a browniſh colour. Whoever, therefore, would uſe this oil in medicine, muſt take it as nature has prepared it, art having no power to make any alteration in it. Mem. Acad. Paris, 1715.

It is remarkable, that all the petroleum got from the lake of mount Ciaro in Italy is white, whereas that of Modena is yellow, and that of Parma brown. Theſe wells or holes continue to furniſh the oil in different quantities for a conſiderable time, and, when they will yield no more, they pierce the ſlates in ſome other place. Mem. Acad. Scienc. Par. 1736.

The petroleum wells of the Birman empire, ſituated about five miles E. of Yaynangheoum, or Petroleum creek, on the Irrawaddy, ſupply the whole empire, and many parts of India, with this uſeful product. The mouth of the creek, when captain Symes viſited it, was crowded with large boats, waiting to receive a lading of oil; and immenſe pyramids of earthen jars were raiſed within and round the village, diſpoſed in the ſame manner as ſhot and ſhells are piled in an arſenal. This place is inhabited only by potters, who carry on an extenſive manufactory: the ſmell of the oil is ſaid to have been extremely offenſive. (Symes's Embaſſy to Ava, vol. ii.) Of the wells in this diſtrict there are ſaid to be 520, which yield, annually, more than 400,000 hogſheads of petroleum.

PETROLEUM *Barbadenſe*, *Barbadoes tar*, a ſpecies of *bitumen*, for an account of which, ſee BITUMEN. Petroleum is a ſtimulating antiſpaſmodic and ſudorific; and as ſuch it has been given in aſthma and coughs, unattended with inflammation, but it is chiefly uſed for external purpoſes, as a ſtimulant in diſeaſes of the hip-joint, rheumatic, and other chronic pains, chilblains, and to paralytic limbs, applied by friction. It is, however, ſcarcely ever employed in either way, and on this account is not often to be procured in the ſhops. The doſe of petroleum may be from ♏x to f℥ſs, in any convenient vehicle. In the Weſt Indies the Barbadoes tar is uſed both as an internal remedy and an external application, in the ſame caſes.

PETROLEUM *Creek*, in *Geography*, a river of America, which runs into the Ohio, N. lat. 40° 24′. W. long. 80° 40′.

PETROMARULA, in *Botany*, a name given by ſeveral authors to the pyramidal rapunculus of the iſland of Crete, called by Mr. Tournefort, *rapunculus Creticus ſeu pyramidalis alter*.

PETROMYZON, *the Lamprey*, in *Ichthyology*, a genus of fiſhes of the order Chondropterigious, according to the Linnæan ſyſtem, but in the arrangement of Shaw and others, it belongs to the Cartilaginous order. The name is originally Greek, and is derived from the words πετρον, *a ſtone*, and μυζαν, *to ſuck*; this fiſh being uſually found in rivers, adhering to the ſtones by ſucking, and ſo keeping its place. The generic character is as follows. The head is ſlenderer than the body; the mouth longer above than beneath; the teeth are orange-coloured, hollow within, and ſurrounded with a fleſhy margin; above it is a little curved, broad beneath; it has ſeven ſpiracles on each ſide the neck; on the nape a fiſtulous opening; it has neither pectoral nor ventral fins. According to the laſt edition of Gmelin, there are only four ſpecies, but Dr. Shaw enumerates nine: we ſhall notice them all, taking firſt thoſe referred to by Gmelin. They all adhere to rocks, and other bodies by the mouth, the edges of which are jagged; the body is eel-ſhaped, ſlippery, and mucous; they live a long time out of the water, and feed on worms, inſects, leſſer fiſh, and dead bodies; the belly is long, and narrow; the vent is near the pinnate tail. They have two dorſal fins; round the eyes are numerous perforations; the tongue is ſemilunar and hard; the teeth ſerrate.

Species.

* MARINUS; True Lamprey. Mouth papillous within; ſecond dorſal fin is diſtinct from the tail. In its general appearance this fiſh makes a near approach to the eel tribe, and particularly to the MURÆNA genus; which ſee. It arrives at a conſiderable ſize, and to the length of more than three feet: the generality of the Britiſh ſpecimens, however, are not ſo large. The uſual colour of the lamprey is a dull-browniſh olive, clouded with yellowiſh-white variegations; the back, as in moſt fiſhes, is darker than the other parts, and the abdomen paler; the fins are tinged with dull orange, and the tail with blue; the eyes are rather ſmall; the mouth large, oval, ſituated beneath, deeply concave, and lined or paved, as it were, with ſeveral circular rows of ſharp, triangular, orange-coloured teeth; the tongue, which is ſhort and creſcent-ſhaped, is alſo furniſhed with a row of very ſmall teeth round its edge; on the top of the head is a ſmall orifice or ſpout-hole, through which is diſcharged the ſuperfluous water taken in at the mouth and gills; near each eye are two rows of much

ſmaller foramina, one row conſiſting of five, and the other of ſix; theſe are ſuppoſed to be the orifices of the glands which ſecrete the viſcid moiſture neceſſary for lubricating the ſkin; on each ſide the neck, commencing at a ſmall diſtance beyond the eyes, is a row of ſeven pretty large, equidiſtant, round ſpiracles or breathing-holes, each leading to a deep ſacculus, lying in an oblique direction towards the head: theſe ſeven ſacculi on each ſide are lined with a red plaited membrane, and have no communication with each other, but paſs by their reſpective double ducts to the inſide of the mouth: towards the lower part of the back commences the firſt dorſal fin, which is rather ſhallow, with a rounded outline; the ſecond, which commences at a very ſmall diſtance from it, is nearly of the ſame extent, but with a ſubtriangular outline; the tail is ſhort and ſlightly rounded.

The lamprey is an inhabitant of the ocean, aſcending rivers chiefly during the latter end of winter and the early months of ſpring; and after a reſidence of a few months in freſh water, again returns to the ſea: it is viviparous, and the young are obſerved to be of ſlow growth; contrary to the aſſertions of ſome writers, who have ſuppoſed the lamprey to be a ſhort-lived fiſh. When in motion this fiſh is obſerved to ſwim with conſiderable vigour and rapidity, but it is more commonly ſeen attached by the mouth to ſome large ſtone or other ſubſtance, the body hanging at reſt, or obeying the motion of the current: ſo ſtrong is the power of adheſion exerted by this animal, that a ſtone of the weight of more than twelve pounds may be raiſed without forcing the fiſh to forego its hold. The general habits of the lamprey ſeem pretty much to reſemble thoſe of the eel, and it is ſuppoſed to live principally on worms and young fiſh. Like the eel it is remarkably tenacious of life; the ſeveral parts, when cut in pieces, will long continue to move; and the head will ſtrongly attach itſelf, for ſeveral hours, to a ſtone, though by far the greater part of the body be cut away from it.

Among the cartilaginous fiſhes none is ſo deſtitute of all appearance of real bone as the lamprey, in which the ſpine itſelf is no other than a mere ſoft cartilage, without any proceſſes or protuberances whatſoever. Among other particulars in its anatomy, it is remarkable that the heart, inſtead of being incloſed in a ſoft pericardium, as in other animals, is guarded by a ſtrong cartilaginous one: the liver, which is of an oblong form, is of a fine graſs-green colour, ſomewhat deeper in the female fiſh, and may be uſed for the purpoſe of a pigment.

A vulgar error, ariſing from inattentive inſpection, and total ignorance of the nature of the animal, is ſaid ſometimes to prevail; *viz.* that the lamprey is furniſhed with nine eyes on each ſide: as an article of food, the lamprey has, for many ages, maintained its credit as an exquiſite dainty; and has uniformly made its appearance at the moſt ſplendid of our ancient entertainments. The death of king Henry I., it is well known, is attributed to a too luxurious indulgence in this his favourite diſh. It ſtill continues to be in high eſteem, and we are told by Mr. Pennant, that the city of Glouceſter continues to ſend yearly, at Chriſtmas, a preſent of a rich lamprey pye to the king. It ſometimes happens that the lampries at that ſeaſon are ſo rare, that a guinea is demanded for the price of a ſingle fiſh. They are moſt in ſeaſon during March, April, and May, and are obſerved to be much more firm when juſt arrived from ſea than when they have been a conſiderable time in freſh water. They are found in ſeveral of the Britiſh rivers, but that which is moſt celebrated for them is the Severn. In the mouths of ſome of the larger European rivers they are ſometimes taken in ſuch quantities, that it is impoſſible to uſe them in their freſh ſtate; they are therefore grilled and moderately ſalted, and afterwards barrelled up for ſale, with the addition of vinegar and ſpices.

* Fluviatilis; Leſſer Lamprey. Second dorſal fin angulate. The head is greeniſh; behind the row of leſſer teeth there are larger ones; above there are ſeven connected together, and beneath two diſtant; the eyes are ſmall, the iris golden; towards the head is the appearance of a lateral line; the fins are of a violet colour. This ſpecies is, according to Dr. Bloch, an inhabitant of the ſea, and aſcends, in ſpring time, moſt of the European rivers, in which it is found more frequently and plentifully than the great lamprey. With us it is found in conſiderable quantities in the Thames, the Severn, and the Dee. Vaſt numbers are taken and ſold to the Dutch as baits for their cod and turbot fiſheries. In the river Bauſter, in Courland, great quantities are taken from beneath the ice with nets; they are much larger than thoſe found elſewhere, and are packed in ſnow, and ſent to any diſtance; and when put into cold water they will recover. This ſpecies ſpawns in March and April, and it is a very prolific fiſh.

Branchialis; Pale Lamprey, or Lampern: by Pennant it is named Pride. The ſpecific character is, ſecond dorſal fin linear; mouth lobate. The mouth is without teeth; the fins are ſcarcely a line broad; the tail is lanceolate, ſharp at the end. It inhabits the freſh-water rivers of Europe, particularly the Iſis, near Oxford; it is ſix or ſeven inches long; conceals itſelf under ſtones or in the mud, and does not adhere to ſtones like the others; the body is round, tapering to each end, annulate, above greeniſh, yellowiſh at the ſides, beneath white. This was firſt diſtinctly deſcribed as an Engliſh ſpecies by Dr. Plot in his Hiſtory of Oxfordſhire.

Planeri. Body annulate; mouth papillous; the length of this fiſh is from five to ten inches; it has a general reſemblance to that of the lampern-colour olive, pale or white beneath; the ſecond dorſal fin has an angular outline; the tail is ſhaped like that of the lamprey or lampern; the mouth is furniſhed with ſmall teeth; native of the rivers of Thuringia, and other parts of the German empire; like moſt of the genus it is tenacious of life, living for the ſpace of a quarter of an hour when incloſed in ſpirits of wine. This was firſt obſerved and deſcribed by profeſſor Planer, of Erford. Hence it is called Planer's lamprey.

Ruber; Red Lamprey, ſpecifically deſcribed as having a browniſh back. Its general appearance is that of the minute lamprey; the colour is red, deepeſt about the gills or reſpiratory foramina; the upper parts are tinged with a duſky hue. It is found in the Seine, where it was obſerved by M. Noel, who ſent it to the count de Cepede.

Sanguisuga; Leech Lamprey. Characteriſed by its large mouth, very ſmall orange-coloured teeth, and ſhallow fins; the body is cylindric; the mouth very wide; teeth very numerous, orange-coloured, and a ſemi-circular range of nine double teeth near the throat. It has been found in the Seine, and in many points it ſo nearly reſembles the common lamprey as to leave a ſuſpicion that it was the young of that ſpecies, but M. Noel was convinced of its being ſpecifically different: it is ſaid to be found only at thoſe times in which the ſhad, Clupea *Aloſa*, (which ſee,) is in the river: theſe fiſhes it perſecutes, by faſtening beneath their bellies, and ſucking their blood with the avidity of a leech; its body being conſtantly found full of that fluid: they ſometimes attack ſalmon in a ſimilar manner.

Argenteus; Silvery Lamprey. This has a bright ſilvery

very body, and a slightly yellowish back; the mouth is large; the teeth orange-coloured, and situated in the fore part of the mouth; the eyes are very large, with silvery irides; both the dorsal fins are very shallow, and without any angular outline; the lateral line is very distinct; the tail is lanceolate. It is a native of the Indian seas.

Plumbeus; Lead-coloured Lamprey. Yellowish-white beneath, with spatule-shaped tail. The body of this fish decreases from head to tail in a conical manner, the mouth is large, the dorsal fins rounded. It has been seen in the Seine, where it is rather plentiful.

Bicolor; Brilliant Lamprey. This species is easily distinguished by its colours, the upper part being of a fine black, and the under of a brilliant silver colour; the mouth is very small; both the dorsal fins are rounded, and each nearly as short as the caudal, which is spatule-shaped: it is found in the Seine, in considerable quantities.

PETRONA, in *Geography*, a town of Croatia; 14 miles N. of Carlstadt.

PETRONEL, a sort of harquebuss, or hand-gun.

Petronel, or *Poitrinal.* See Petrinal.

PETRONELL, in *Geography*, a town of Austria; 7 miles N.E. of Brugg.

PETRONELLUS, in *Ornithology*, a name under which some have described the bunting, or Emberiza *Miliaria;* which see.

PETRONIA, a species of *Fringilla;* which see.

Petronia *Marina*, the name of a small bird of the œnanthe kind, or nearly allied to that genus. Its beak is strong and sharp, like that of the chaffinch; its head is a brownish-grey, but has usually a long whitish streak running along it; its neck is ash-coloured, and at the bottom is variegated with black; the rump is of a brownish-green; the long wing-feathers are blackish; with edges and tips of green, and are white underneath; the breast is of a dusky white, and the tail brownish, variegated with yellow. It is, however, distinguished from all other birds by a fine large yellow spot, which it has on the middle of its throat.

PETRONIUS, Arbiter, in *Biography*, the author of a Latin work entitled "Satiricon," which has come down to modern times in a very imperfect state, is commonly supposed to be the same person as A. Petronius, mentioned by Tacitus in the 16th book of his Annals, under the reign of Nero, as a favourite of that tyrant, and at length a victim to his suspicion: "He was one," says that historian, "who passed his days in sleep, and his nights in business and pleasure: and as others acquire celebrity by active exertions, he obtained it by his indolence. He was regarded not as a common debauchee and spendthrift, but as a proficient in studied luxury; and his words and actions, the more they were marked with an air of carelessness and negligence, the more they pleased, as denoting a simplicity of character. In the station of proconsul of Bithynia, and afterwards of consul, he displayed vigour and talents for public business, but relapsing into vicious habits, or, at least, affecting it, he was received among the few intimates of Nero as the director of his pleasures; and the emperor considered nothing as peculiarly delicate and refined, which had not the approbation of Petronius." This degree of favour proved fatal to him: it excited the envy of Tigellinus, who accused him to Nero, as being the friend of one of the persons condemned for a conspiracy. He was detained in custody at Cumæ, where, impatient of the suspence between hope and fear, he opened his veins, and died. This was in the year 66: he sent as a last legacy to the emperor a sealed paper, reproaching him with his infamous and unnatural debaucheries.

It is a matter of considerable doubt, whether it was this Petronius who was author of the "Satiricon;" for while its contents are not at all unsuitable to a man of such a character, the style and circumstances have been more appropriate to a later period of Roman literature. "The work itself," says an able critic, "is a farrago of verse and prose, of topics and stories, serious and ludicrous, intermixed with the most detestable obscenity, and so mutilated, that no connection can be made out." It has been thought that some of the scenes in it were intended as a satire against Nero, written by Petronius in his last moments. A new fragment was discovered at Traw, in Dalmatia, and published in 1664: its genuineness was warmly discussed among critics, but it has generally obtained an admission among the rest. The difficulties of this author, and, it is probable, the nature of his subjects, have caused him to be much studied by the curious literati, and have produced numerous editors and commentators, chiefly French, German, and Dutch; but says the critic already referred to, "it is to the credit of England that none of her scholars have contaminated themselves with the attempt to elucidate him." The most elaborate edition is that of Burmann, in 1709, 2 vols. 4to. Moreri. Gen. Biog.

PETROPAVLOVSKAIA, in *Geography*, a fort of Russia, in the government of Irkutsk; 16 miles W.S.W. of Selenginsk.—Also, a fort of Russia, in the government of Upha; 52 miles E.N.E. of Verchouralsk. See also *St.* Paul and *St. Peter.*

PETROPAVLOVSKOI, a town of Russia, in the government of Tobolsk, on the Ischim; 40 miles E. of Ischim.

PETRO-PHARYNGEUS, in *Anatomy*, a name given by Winslow to some fibres of the constrictor pharyngis superior.

PETROPHILA, in *Botany*, so named by Mr. R. Brown, from πέτρος, *a stone*, and φιλεω, *to love*, because the shrubs of this genus are always found in rocky exposed situations. Brown Tr. of Linn. Soc. v. 10. 67. Prodr. Nov. Holl. v. 1. 363. Ait. Hort. Kew. v. 1. 186.—Class and order, *Tetrandria Monogynia.* Nat. Ord. *Aggregatæ*, Linn. *Proteaceæ*, Juss.

Gen. Ch. *Cal.* none. *Cor.* of four petals, linear, cohering at their base, somewhat dilated and concave at the summit, and falling off together. *Stam.* Filaments four, short, inserted towards the summit of each petal; anthers erect, oblong, two-celled, lodged in the cavities of the petals. *Pist.* Germen superior, small, compressed, without scales at the base; style cylindrical, rigid, permanent at the base; stigma spindle-shaped, taper-pointed. *Peric.* none. *Seed.* Nut lenticular, crowned with the base of the style, sessile, hairy, either on one side or at the base only.

Eff. Ch. Petals four, cohering below, falling off entire. Anthers in the hollows of the petals. No scales under the germen. Stigma spindle-shaped, pointed. Nut compressed, crowned with the permanent base of the style, and partly hairy.

The habit is rigid and shrubby. *Leaves* smooth, various, either thread-shaped or flat, undivided, lobed or pinnatifid, sometimes differing on the same individual. *Flowers* in dense spikes, with a scale-like *bractea* to each, which is permanent and finally hardened, so that the inflorescence assumes the nature of a *strobilus* or cone; yet analogy, and the presence of a corolla, forbid us to consider these spikes as catkins. Mr. Brown defines ten species in his *Prodromus*, chiefly the produce of dry heathy and stony ground, on the southern coast of New Holland. The two following are known in our gardens.

P. *pulchella.*

P. *pulchella.* Fennel-leaved Petrophila. Brown n. 5. (Protea pulchella; Willd. Sp. Pl. v. 1. 507. Schrad. Sert. Hannov. t. 7. Curt. Mag. t. 796. Cavan. Ic. v. 6. 33. t. 550.)—Leaves doubly pinnatifid, cylindrical, erect. Petals silky; downy at the point.—Native of New South Wales, from whence it is said by Mr. Aiton to have been introduced by sir Joseph Banks, about the year 1790. It is a green-house shrub, flowering in July and August. The *leaves* are glaucous, resembling those of fennel, but shorter, thicker, and more rigid. *Spikes* terminal, sometimes aggregate, cylindrical, of numerous, crowded, inodorous, white *flowers*, with yellow *anthers*.

P. *diversifolia.* Various-leaved Petrophila. Brown n. 8.—Leaves doubly or triply pinnate, flat; their segments pointed. Petals bearded. Spikes axillary, stalked. Bracteas woolly, combined.—Native of Lewin's land, from whence it was sent to Kew in 1803, by Mr. Peter Good, but has not yet flowered. The *nut* is said to be thin, leafy and dilated.

We still feel much disposed to unite Isopogon, see that article, with *Petrophila*, as forming one natural genus, for which we would retain the latter name; yet Mr. Brown hints an inclination even to subdivide both genera. There are two ways of viewing every subject. Very acute and laborious observers naturally incline to make nice and multiplied distinctions. It requires a peculiar talent to combine without confounding; and to judge, by taking enlarged views of the matter, what genera are founded in nature, which is perhaps the most difficult part of the philosophy of natural history.

PETROPSKOI, in *Geography*, a town of Russia, in the government of Perm; 56 miles E.S.E. of Krasnouphunik.

PETRO-SALPINGO-STAPHYLINUS, in *Anatomy*, the name given by Winslow to the levator palati mollis muscle.

PETROSELINUM, in *Botany*, from πέτρος, *a stone*, and σέλινον, *parsley*, appears, by the description in Dioscorides, to be a plant of the umbelliferous order, which, according to him, was originally found on rocky precipices in Macedonia. The early commentators have differed concerning it, from the usual cause, of seeking the plants of ancient Greece, in the narrow limits of their own neighbourhood. Thus Fuchsius supposed our *Sison Amomum* to be the πετροσέλινον, whilst Lobel and others, conversant with gardens, have, with more probability, fixed upon *Bubon macedonicum.* Linnæus retains the above word as the specific name of the common Garden Parsley, *Apium Petroselinum*; which is unquestionably the σέλινον of Dioscorides, spoken of by him as a garden plant. Dr. Sibthorp thought the same plant in a wild state, growing on rocky mountains and precipices, might be the ὀρεοσέλινον of that ancient author; but we find little to countenance such an opinion. The decision of Linnæus is supported merely by that of various preceding writers, cited under *Apium hortense*, in Bauhin's Pinax, 153. These were chiefly early German botanists, to whom *Bubon macedonicum* was probably unknown, and who merely fixed on any plant that, in the narrow range of their acquaintance, answered best to the description of Dioscorides. It is thus that many ancient synonyms have become misapplied, which, by long use, are now but too firmly established in their erroneous acceptation.

Petroselinum *Macedonicum*, in the *Materia Medica*, the name of a seed used in medicine.

PETROSILEX, Hornstone, in *Mineralogy*, a species of the siliceous genus. Its colour is commonly dark blue, yellowish, or pearl-grey, sometimes yellowish-white, flesh, or brownish red, or mountain blue, or blackish-brown, or greenish-brown, or dark green, or olive-green, often variegated. Amorphous for the most part, but lately found crystallized by Mr. Beyer in Schneeberg, either in hexahedral prisms, or in double triangular pyramids, or cubic or hexahedral plates; the surface of these crystals being mostly rough and uneven, some hollow, some solid, sometimes as thin as paper. Its lustre, 0: transparency, 1.2: the crystallized sometimes 0. Its fracture generally splintery, more rarely conchoidal, sometimes from the fine splintery passing into the even, but of a coarser grain than flint: fragments, 2.3: hardness, from 7 to 9: specific gravity, from 2.532 to 2.653. Mr. Bergman counts this stone among those that are fusible *per se*, even by a blowpipe: but Mr. Kirwan, after many trials, found only one that gave any sign of fusion: but they most frequently decrepitate and whiten. M. Saussure found the hornstones of Switzerland generally infusible; and only those lying in calcareous strata to be fusible in a high degree of heat. Of the hornstone there are many varieties. The hornstones are frequently found in a state of decomposition. Its transitions are into flint, calcedony, chrysoprasium, jasper, quartz, opal, siliceous schistus, argillite, toadstone, and even into granular limestone, and indurated clay.

Hornstone differs from jasper, often by its splintery fracture; always by its transparency, though imperfect, and want of lustre:—from flints, by its fracture, dulness, and hardness; but when its fracture happens to be conchoidal, by its dulness, less transparency, and hardness:—from quartz, by its dulness and inferior hardness:—from serpentine, generally in hardness, specific gravity, and fusibility:—from heliotropium, by the aggregate of its properties. The hornstone, being a greenish-white, with reddish spots, from Lorraine, whose specific gravity was 2.532, fracture conchoidal, lustre 0, hardness 10, whitening and becoming brittle at 127°, and melting at 144° into a semitransparent compact enamel, was analysed by Mr. Kirwan; and found to contain 72 *per cent.* silex, about 22 argill, and about six, or rather more, of mild calcareous earth. The infusible hornstones probably contain no calx, or less. The schistose hornstone has three varieties, *viz.* siliceous schistus, Lydian stone, and hornslate. Kirwan's Mineralogy.

PETROSUM Sal, in *Natural History*, a name given by some of the old writers to the nitre of Ægypt, used in the ancient times: and by others to the common nitre, which we use at present, and call by a similar name, *saltpetre.*

PETROVATZ, in *Geography*, a town of Croatia; 22 miles S.S.E. of Carlstadt.

PETROUS Portion, in *Anatomy*, a part of the temporal bone, so called from its irregular surface. See Cranium.

PETROVSK, in *Geography*, a town of Russia, in the government of Jaroslavl; 52 miles S. of Jaroslavl. N. lat. 56° 45'. E. long. 40° 14'.—Also, a town of Russia, in the government of Saratov, on the Medveditza; 40 miles N.W. of Saratov. N. lat. 52° 40'. E. long. 44° 54'.

PETROVSKAIA, a town and fort of Russia, situated on a bay of the sea of Azof, or Azoph, with a harbour, 24 miles S.W. of Mariupol.—Also, a bay on the N. coast of Russia, in the Frozen ocean. N. lat. 76° 10'. E. long. 106° 14'.

PETROWITZ, a town of Bohemia, in the circle of Konigingratz; 8 miles E.N.E. of Konigingratz.—Also, a town of Bohemia, in the circle of Moldau; 6 miles S. of Seltschan.

PETROWNAH, a town of Hindooſtan, in Bahar; 28 miles S.S.W. of Patna.

PETROZAVODSK, a town of Ruſſia, in the government of Olonetz, on the W. coaſt of the Onezſkoe lake; 132 miles N.E. of Peterſburg. N. lat. 61° 40′. E. long. 34° 14′.

PETSCHAKEN, a town of Bohemia, in the circle of Bechin; 8 miles S. of Pilgram.

PETSCHANOI, a fort of Ruſſia, in the government of Kolivan; 188 miles W.S.W. of Kolivan. N. lat. 53°. E. long. 76° 34′.—Alſo, a cape on the north coaſt of Ruſſia, in the Frozen ſea. N. lat. 75° 25′. E. long. 165° 14′.

PETSCHNECZA, a town of the duchy of Carinthia; 12 miles S.W. of Clagenfurt.

PETSKA, a town of Bohemia, in the circle of Koningingratz; 11 miles E.N.E. of Getſchin.

PETSKAU, a town of Bohemia, in the circle of Saatz; 22 miles E. of Eger. N. lat. 50° 4′. E. long. 12° 55′.

PETSMO, a ſmall iſland on the E. ſide of the gulf of Bothnia. N. lat. 63° 14′. E. long. 21° 33′.

PETTAL, a town of Hindooſtan, in Madura; 10 miles E. of Coilpetta.

PETTAPOLLY, a town of Hindooſtan, in the circar of Guntoor, ſituated on the coaſt of Bengal; 42 miles S.W. of Maſulipatam.

PETTAPOUR, a town of Hindooſtan, in the circar of Rajamundry; 30 miles N.N.E. of Rajamundry.—Alſo, a town of Hindooſtan, in Guzerat; 12 miles N.W. of Amedabad.

PETTAW, a town of the duchy of Stiria, on the Drave, containing one pariſh church, and three cloiſters. This is an ancient place, as it is frequently mentioned both by Roman as well as other authors of antiquity. Its manufactories are conſiderable; 13 miles E.S.E. of Marpurg. N. lat. 46° 34′. E. long. 15° 53′.

PETTEIA, Πεττεια, in the *Ancient Muſic*, a Greek term to which we have no correſponding one in our language.

The melopœia, *i. e.* the art of arranging ſounds in ſucceſſion, ſo as to make melody, is divided into three parts, which the Greeks call *lepſis*, *mixis*, and *chreſis*; the Latins *ſumptio*, *mixtio*, and *uſus*; and the Italians *preſa*, *meſcolamento*, and *uſo*. The laſt of theſe is called by the Greeks πεττεια, *petteia*, and by the Italians *pettia*.

Petteia or *pettia*, then, is the art of making a juſt diſcernment of all the manners of ranging or combining ſounds among themſelves, ſo as they may produce their effect, *i. e.* may expreſs the ſeveral paſſions intended to be raiſed, thus: *e. gr.* it ſhews what ſounds are to be uſed, and what not; how often any of them are to be repeated; with which to begin, and with which to end; whether with a grave ſound to riſe, or an acute one to fall, &c.

It is the petteia that conſtitutes the manners of the muſic; it being this that chooſes out this or that paſſion, this or that motion of the ſoul, to be awakened; and whether it be proper to excite it on this or that occaſion. The petteia, therefore, is in muſic much what the manners are in poetry.

We do not ſee whence the denomination ſhould have been taken by the Greeks, unleſs from πεττεια, their game of cheſs; the muſical petteia being a ſort of combination and arrangement of ſounds, as cheſs is of pieces called πεττοι, calculi, or cheſs-men.

PETTENAW, in *Geography*, a town of Tyrol, near the Inn; 12 miles W.S.W. of Inſpruck.

PETTENDORF, a town of Germany, in the principality of Culmbach; ſix miles S.W. of Bayreuth.

PETTERKAW, a town of Pruſſia, in Oberland; 24 miles E.S.E. of Marienwerder.

PETTERSDORF, a town of Pruſſia, in the province of Natangen; 28 miles E. of Königſberg.

PETTERSWALDT, a town of Pruſſia, in the province of Natangen; 24 miles S.S.W. of Brandenburg.—Alſo, a town of Pruſſia, in the province of Ermeland; 10 miles W. of Heilſberg.

PETTERWITZ, a town of Pruſſia; in the province of Oberland, four miles S.S.E. of Neidenberg.

PETTICOTTA, a town of Hindooſtan, in the Carnatic; 27 miles S. of Tanjore.

PETTINCO, a river of Sicily, in the valley of Mazara, which runs into the ſea; ſix miles N.W. of Miſtrella.

PETTINI, a ſmall iſland in the gulf of Venice. N. lat. 24° 37′. E. long. 44° 49′.

PETTORANO, a town of Naples, in Abruzzo Citra; five miles S. of Salmona.

PETTSTATT, a town of Bavaria, in the biſhopric of Bamberg; three miles S. Bamberg.

PETTUS, *Sir* JOHN, in *Biography*, a native of Suffolk, was member of parliament for Dunwich in the reign of Charles II., and one of the deputy governors of the royal mines. He died about the year 1690. He was author of the "Hiſtory, Laws, and Places of the chief Mines and Mineral Works in England and Wales;" "England's Independency of the Papal Power;" "Fleta Minor, or the Laws of Art and Nature in knowing, judging, aſſaying, &c. of Metals," tranſlated from the German, which he executed while he was in the Fleet priſon.

PETTY, *Sir* WILLIAM, was the eldeſt ſon of a clothier at Rumſey, in Hampſhire, where he was born in 1623. At a very early period he ſhewed a diſpoſition for the mechanical arts, and was eager in attending to the performances of artificers, ſuch as ſmiths, carpenters, &c. and copying them. He received the elements of his education at the grammar ſchool of his native place, and from thence, at the age of 15, he was ſent to Caen, in Normandy, for farther improvement in modern languages, and the mathematics. On his return he entered into the ſervice of the royal navy, but it does not appear in what particular capacity, and his ſervice in it muſt have been very ſhort, ſince, on the commencement of the civil wars in 1643, he went again on the continent, and paſſed three years in France and the Low Countries. It was at this period that he directed his ſtudies chiefly to anatomy, and the profeſſion of medicine, and at Paris he diſſected in company with the celebrated Hobbes. As in his former viſit to France he is ſaid to have maintained himſelf by means of a ſmall ſtock of merchandize, ſo in the preſent he muſt have followed ſome gainful traffic, ſince he has recorded, that he returned ten pounds richer than when he went out. In 1647 he gave the firſt public proof of his inventive talents, by ſoliciting and obtaining a patent from parliament for an invention of the art of double writing, which appears to have been by means of a copying inſtrument. In the following year he publiſhed a piece entitled "Advice to Mr. Samuel Hartlib, for the Advancement of particular Parts of Learning," the general ſcope of which was to extend education to a variety of objects of utility in common life. About this time he went to Oxford, whence the parliamentary viſitors had ejected the royaliſts, and gave inſtructions in anatomy and chemiſtry to the younger ſtudents. Here he was appointed deputy to the profeſſors of anatomy, and in 1649 he was created doctor of phyſic by diſpenſation from the delegates of the univerſity. About the ſame time he was elected a fellow of Brazen-noſe college, and became a member of that Oxford

Oxford society for cultivating natural knowledge, out of which the Royal Society took its rise. In 1650 he succeeded to the anatomical professorship in Oxford; and soon after employed his interest so effectually as to be chosen professor of music at Gresham college, which was probably then, as it is now, almost a sinecure place. The chief source of his fortune was his appointment, in 1652, to be physician to the army in Ireland, and in 1654 he entered into a contract for regulating the admeasurement of lands forfeited by the rebellion, and intended by way of recompence to the soldiery. By his peculiar skill in practical, as well as theoretical mathematics, he performed this work with great exactness, and at the same time he obtained such a knowledge of the state and value of property in that country, as enabled him to lay out to great advantage, in purchases of land, the savings of his economy. After this he was appointed one of the commissioners for dividing the lands which he had surveyed among the army; clerk of the council; and secretary to Henry Cromwell, when lord-lieutenant of Ireland. In Richard's parliament of 1658, he served for West-Looe, in Cornwall; and in the next year he was impeached by sir Heisome Sankey, for certain mal-practices in his distribution of the Irish lands. He was, it appears, at the time in Ireland, but returned to answer the charge in his place, but parliament being adjourned, the matter was not brought to issue. He was, after this, removed from his public employments, though the lord-lieutenant continued his friend, and spoke handsomely of him. When the restoration took place he was in Ireland, but upon his return he was graciously received by Charles II., and made one of the commissioners of the court of claims. In 1661 he received the honour of knighthood, and also a patent, constituting him surveyor-general of Ireland; and, what was probably of much more importance to him, all the forfeited lands which had been allotted to him, were confirmed by new grants to himself and his wife. Such is a brief sketch of the political character of sir William Petty. We come now more particularly to his claims on public notice as a man of science. He had been made a fellow of the College of Physicians, and when the Royal Society was first incorporated he was in the list of the council. In 1663 he engaged the public attention by his invention of a double bottomed ship, to sail against wind and tide. His trial-vessel went very well in a voyage from Dublin to Holyhead, and back; but on a second voyage it was lost in a great storm, and no further experiment was made. He presented a model of this ship to the Royal Society, to which body he, in 1665, communicated a paper on ship-building, which was kept by the president, lord Brownlow, as an important state secret. It seems not to be well ascertained whether it was this or another work that was printed after his death, under the title of "A Treatise on Naval Philosophy." The principal and most valuable of the writings of this author, were on the subject of political arithmetic. Of these he published a number of separate tracts, which were reprinted collectively in 1699. Some of them relate to the growth and population of London, and comparisons between that city and Paris, and other capitals. In one of them, entitled "Political Arithmetic," he discusses all the topics connected with national wealth and improvement, with the particular view of pointing out the means of augmenting the power and prosperity of England. The state of Ireland is considered in some of his other pieces, particularly in a treatise on taxes and contributions, which passed through several editions. Some of his papers inserted in the Philosophical Transactions are on mathematical subjects, and some on chemistry, as it was then known. The uncommon activity and vigour of his mind are strikingly displayed by the great variety of the productions of his pen, while at the same time he was indefatigable in business, and in the improvement of his fortune. With this view he established upon his Irish estates iron-works and fisheries, opened lead mines, and carried on a large timber trade. He was of great service to the poor, by providing them with employment, in which he justly thought the most useful charity towards them consisted. He died in the month of December 1687, at his house in Westminster, and his remains were interred at Rumsey. He was regarded as a person of great worth, as well as of extraordinary talents and acquirements. He left a widow, the daughter of sir Hardress Waller, who was created baroness of Shelburne in 1688, which title, as we shall see, became hereditary in the family. Sir William Petty thus speaks of his religious opinions in has last will: "I die in the profession of that faith, and in the practice of such worship, as I find established by the laws of my country; not being able to believe what I myself please, nor to worship God better than by doing as I would be done unto, and observing the laws of my country, and expressing my love and honour of Almighty God, by such signs and tokens as are understood to be such by the people with whom I live, God knowing my heart, even without any at all. Grant me, O Lord, an easy passage to thyself, that as I have lived in thy fear, I may be known to die in thy favour."

Three children survived sir William, viz. Charles, who succeeded to his mother in the barony of Shelburne, and dying without issue the title became extinct. But in June 1699, it was revived in Henry, the second son; and in 1718-19, king George I. advanced him to the further titles of viscount Dunkeron and earl of Shelburne. He died in 1751, immensely rich. The present family is from Anne, the only daughter of sir William Petty, who married Thomas Fitzmaurice, baron Kerry, created in 1722 earl of Kerry.

Under the articles ARUNDELIAN *Marbles*, and PARIAN *Chronicle*, we have mentioned a gentleman under the name of W. Petty, who was employed by the earl of Arundel, in the year 1624, for the purpose of collecting marbles, books, statues, and other curiosities in Italy, Greece, and Asia Minor. We have been anxious to ascertain some authentic particulars relating to a person of so distinguished a character, as to warrant this employment, and who was so laudably engaged. But though we have been aided in our researches by the ingenious and learned Mr. Hewlett, ever anxious to promote the cause of literature, we have not succeeded in our wishes. The Bibliotheca Manuscripta Lansdowniana, deposited in the British Museum, has been examined; and we find in vol. ii. p. 104. the following notices. Art. 806. A Collection of Theological and other Papers of the Rev. Mr. William Petty of Thorley, in the Isle of Wight, with the dates of 1613, 17. Also, The Commentary of George Aeropolita, comprising the state of the oriental church and empire for about three-score years, translated out of an original Greek MS. by that late industrious and learned man, William Pettie, dated 6th February, 1644. From A. D. 1183 to 1262, an interval of 79 years. This Mr. William Pettie is supposed to be the same with the Rev. Mr. William Petty of the preceding article; and to have been an uncle of sir William Petty, of whom we have already given an account. He was also, not improbably, the same Mr. Petty who is mentioned in sir Thomas Roe's letters from Constantinople, as having been sent to the Levant by Villiers, duke of Buckingham, to collect Grecian antiquities for Charles I. This Mr. Petty appears to been shipwrecked, and to have lost all he had collected at Samos in his way to Ephesus. He was lodged in prison as a spy, but released

on

on the testimony of some Turks, who knew him, and that he had lost his credentials in the sea. With great industry he recovered his statues and 22 Greek MSS., and raked together 200 pieces.

PETTY, WILLIAM, marquis of Landsdown, descended from the two noble families of Fitzgerald, duke of Leinster, and Fitzmaurice, earl of Kerry. The adopted name of Petty is derived from his maternal great uncle, Henry, earl of Shelburne, son of the celebrated sir William Petty, the subject of the preceding article. The marquis of Landsdown was born in May 1737, and succeeded to the Irish honours of his father in the month of May 1761, but in the preceding year his majesty had created the late marquis, then viscount Fitzmaurice, an English peer, by the title of baron Wycombe. In February 1765, he was married to lady Sophia Carteret, daughter of the late earl Granville, by whom he became possessed of large estates, particularly that beautiful spot Landsdown Hill, Bath, from which he took his last title. By this lady, who died in 1771, he had a son, John Henry, who succeeded him in his titles, and who is since dead, leaving no male heir. The marquis married, secondly, lady Louisa Fitzpatrick, by whom, who died in 1789, he had another son, lord Henry, the present marquis of Landsdown. His lordship being intended for the army, he, at a fit age, obtained a commission in the guards, and served with the British troops in Germany under prince Ferdinand, and gave signal proofs of great personal courage at the battles of Campen and Minden. In December 1760, he was appointed aid-de-camp to the king, George III., with the rank of colonel. As a political man, he joined the party of the earl of Bute; and in 1762, he eagerly defended the court on the question respecting the preliminaries of peace. In the following year he was appointed first lord of the board of trade, which he soon quitted, and with it, his connection with the court and ministry, and attached himself, in a short time, to lords Chatham and Camden. When the Rockingham administration was displaced in 1766, and lord Chatham was called upon to form a new administration, he appointed lord Shelburne secretary of state of the southern department, to which was annexed the department of the colonies. But finding a train of measures was secretly pursuing, hostile to the liberties of America, he resigned. The American war succeeded, during which he acted with firmness and energy against the ministry. Among other projects to support this war, was the appointment of a Mr. Fullarton, secretary to lord Stormont, when abroad, to the rank of lieutenant-colonel in the army, and to the command of an intended new regiment. When this matter came before the house of lords, lord Shelburne spoke of it in terms of contempt, denominating the new made commander a *commis*, *a clerk* taken from the desk. Mr. Fullarton, judging these epithets derogatory to his rank, sent a challenge to lord Shelburne, a duel was fought, and the noble lord wounded. This affair happening very soon after a similar one between Mr. Fox and Mr. Adam, and being attributed to the same causes and motives, occasioned a great sensation throughout the kingdom. Addresses of congratulation from the cities of London and Westminster, and from several of the counties, were sent to earl Shelburne on his recovery, all of which held out the idea, that his life had been endangered by the faithful discharge of his duty as a peer of parliament. The death of lord Chatham placed him at the head of his political connection, and he continued in opposition to the measures of the court till the termination of lord North's ministry, in the spring of 1782. He was then appointed secretary of state in the Rockingham administration, and upon the death of that nobleman he succeeded to the office of minister. This measure gave great offence to Mr. Fox and his friends, but his lordship did not quit his post. His first object was to make peace; but when the treaty was brought before the parliament, lord North and Mr. Fox had united in a most disgraceful coalition, and the treaty meeting with the disapprobation of the representatives of the people, lord Shelburne resigned, and Mr. Pitt was appointed his successor. His lordship now received the title of marquis of Landsdown, with the honours of the Garter.

When the French revolution took place he earnestly deprecated our interference, but his eloquence and sound reasoning had no weight, and we were in 1793 involved in a war, which, with a very short interval, has continued to this present time (Dec. 1813). His lordship died on the 7th of May 1805.

Through life he resisted the increasing influence of the crown, and he suggested at various times enquiries into the public expenditure: he proposed the abolition of useless places, and brought forward plans which tended to establish a rigid system of public economy. With foreign politics, and foreign courts, no statesman in Europe was better acquainted. He had deeply studied the history and laws of his country, and they had taught him that the constitution of England is not the grant of princes, but an inheritance obtained by the virtue and wisdom of Englishmen. Monthly Mag. 1805.

PETTY *Bag*, an office in chancery; the three clerks of which record the return of all inquisitions out of every shire, and make all patents of customers, guagers, comptrollers, &c. See CLERK.

PETTY *Orders*. See ORDERS.

PETTY *Patees*, among *Confectioners*, a sort of small pies, made of a rich crust, and filled with sweet meats.

PETTY-*Singles*, among *Falconers*, are the toes of a hawk.

PETTY *Tally*, in the *Sea Language*, a competent allowance of victuals, according to the number of the ship's company.

PETTY, or *Petit Treason*, in *Law*. See TREASON.

PETTY *Whin*. See FURZE and GENISTA.

PETTYCUR, in *Geography*, a harbour and landing-place from Leith, on the coast of Fife, in Scotland, west of Kinghorn.

PETULANTIUM FESTUM, in *Antiquity*, a festival celebrated by the Athenians and Lacedæmonians in honour of the moon, under the name of Venus: at which the men assisted, dressed in women's clothes; and the women in the habits of men.

PE-TUNG, in *Metallurgy*, a name given by the Chinese to their white copper, which has a beautiful silver-like appearance, and a very close grain. It takes a fine polish; and many articles of neat workmanship, in imitation of silver, are made from it. An accurate analysis has determined it to consist of copper, zinc, a little silver, and in some specimens, a few particles of iron and of nickel have been found. The artists at Canton, in making their pe-tung, reduce the copper into as thin sheets or laminæ as possible, which they make red-hot, increasing the fire to such a pitch, as to

 soften,

foften, in fome degree, the laminæ, and to make them almoft ready to flow. In this ftate they are fufpended over the vapour of their pureft tutenag, or zinc, placed in a fubliming veffel over a brifk fire. The vapour thus penetrates the heated laminæ of the copper, fo as to remain fixed with it, and not to be eafily diffipated or calcined by the fucceeding fufion it has to undergo. The whole is fuffered to cool gradually, and is then found to be of a brighter colour, and of a clofer grain than when prepared in the European way. Lord Macartney's Embaffy, &c. by Sir G. Staunton, vol. ii.

PETUNTSE, or, as it is ufually called, *petunfe*, one of the two fubftances of which the porcelain ware of China is made. The other is named *kaolin*.

The petuntfe is fprinkled all over with bright glittering particles; it is beaten to powder, and afterwards made up into a fort of bricks, and in that form it is fent to the places where it is to be wrought; it is of a hard texture, and of a fomewhat greenifh colour. M. Reaumur, of the Academy of Sciences of Paris, who was extremely induftrious in fearching into the nature of porcelain, obtained fome fpecimens of the petuntfe, both in its native ftate, and in form of the brick, which is given it after it is powdered and reduced to a pafte.

M. Reaumur found that the petuntfe was fo far from being an earth, as ufually fuppofed, that it was truly of the nature of the European flint or pebble, as he eftablifhes the character of that body: but to underftand this rightly, it is to be obferved, that this author makes the flints and pebbles a very large clafs of bodies, fome of which are more, fome lefs tranfparent; and that this petuntfe is of the nature of the coarfer, or lefs tranfparent kind, the furface of which, when broken, is not fo fmooth and polifhed as that of the ordinary flint. Some have fuppofed that this fubftance is a fpecies of gypfum, rather than of flint or talc. By fome experiments of Mr. Scheffer, in the Swedifh Tranfactions, for the year 1753, it appears to be a glittering, flaky, femitranfparent mafs, like the *lapis fpecularis*, of a light greenifh-grey colour, and remarkably heavy. It was not acted upon by acids, and in the fire it burft and fell in pieces, and calcined into a white powder, interfperfed with a red ferruginous matter. Calcined in contact with the fuel, it emitted ftrong fulphureous vapours, like the other gypfa, and became quite white, confiderably firm and coherent, and femitranfparent.

The great character of thefe ftones for the porcelain manufactures is, however, that they are very eafily vitrified without the affiftance of any falt, and without the immediate contact of the fire, the operation fucceeding in a crucible, which is not at all the cafe in regard to the European flints, they very difficultly melting alone in a crucible, and then only into a whitifh opaque glafs.

It being certain from hence, that one of the two ingredients of the china-ware is eafily vitrifiable, it follows, from the experiment of the whole mixture, or china-ware, not being reducible into a glafs in a large fire, that it is a compofition of a vitrifiable and a not vitrifiable (or at leaft not eafily vitrifiable) fubftance; and, confequently, that the kaolin is a fcarcely vitrifiable body, and that the refult of the action of fire on a mixture of thefe two is a femivitrification; which is what we call the china-ware.

If we, therefore, could, in Europe, provide the materials of China, or fuch as were like them, we might reafonably hope to fucceed; and this appears far from improbable. The petuntfe is eafily fupplied by many of our own earths, ftones, and fands, as nothing is required in it more than a property of running eafily into a white glafs. The kaolin feems moft to be refembled by our European tales. Mem. Acad. Par. 1727.

The petuntfe, according to Chaptal, is that fpecies of filex, known by the names of feldfpar, rhomboidal quartz, and fpathum fcintillans. It very frequently forms one of the principles of granite, and the cryftals which are found feparate, arife from the decompofition of this primitive rock. The texture of feldfpar is clofe, lamellated, and it is lefs hard than quartz. It fufes without addition into a whitifh glafs. The fpecific gravity of white feldfpar is 25.946: 100 parts of white feldfpar contain, according to Chaptal, about 67 filex, 14 alumine, 11 barytes, and 8 magnefia. See FELSPAR, KAOLIN, and PORCELAIN.

PETWORTH, in *Geography*, a market-town, in the hundred of Rotherbridge, rape of Arundel, and county of Suffex, is fituated on a fmall branch of the river Arun, 49 miles S.W. by S. from London. Its fcite is confidered very falubrious, and the houfes are well built, though the ftreets are irregular. The living is one of the richeft in the county, and in the gift of the earl of Egremont. The church, in which are interred the remains of many of the Percies, earls of Northumberland, is built of ftone, and has a fquare tower; but there are no monuments worthy of notice, except two very ancient tombs, the one completely defaced, the other in a very dilapidated ftate. In the centre of the town is a handfome market-houfe of ftone, adorned at one end with a buft of William III. The lower part confifts of piazzas, with an open fpace for the market, over which is the room where the quarter-feffions are held. Clofe to the church-yard is a charity-fchool, for the education of twenty boys, and the fame number of girls, founded by the Rev. Mr. Taylor, who alfo left donations of twelve pounds a-year each to two clergymen's widows of the neighbourhood, and fix pounds each to two poor tradefmen, to affift them in bufinefs. The alms-houfes, founded by the duchefs of Somerfet, are built of brick, and adapted for the accommodation of twenty widows, each of whom has an allowance of twenty pounds a-year. Thompfon's hofpital, another benevolent inftitution of the fame kind, affords lodging for fix poor men, and as many women, who annually receive ten pounds each. At a fmall diftance fouth-eaft of the town is the bridewell for the county, a brick edifice, on Howard's plan.

Petworth was the refidence of Jofceline of Louvaine, the progenitor of the renowned Percies of Northumberland; and it was their family-feat till the extinction of the title, when it devolved by marriage to Charles, duke of Somerfet; from whom, alfo by marriage, the manor and manfion-houfe have been tranfmitted to the family of Egremont, the prefent poffeffors.

Petworth-houfe, the magnificent family-manfion of the earl of Egremont, is clofe to the town, the back front opening into the church-yard. It was erected on the fcite of the ancient houfe belonging to the duke of Somerfet. The front of freeftone, adorned with ftatues on the top, forms one unbroken range, having twenty-one windows in each ftory. The interior is elegant, and all the principal apartments are decorated with paintings, antique ftatues, and bufts, fome of which are of the firft excellence. Some of the rooms are noble, well contrived, and richly furnifhed, and the difpofitions of the fpecimens of art tafteful and judicious. The park is very extenfive, the wall being about twelve miles in circumference. In front of the manfion is a fheet of water, which has been formed at a vaft expence. It is fupplied by the fprings collected from the neighbouring hills. This park, which commands delightful views of the Downs of Surrey and Suffex, is well ftocked with deer and game.

game. There are alfo various breeds of cattle and fheep fattened in the park: befides the native breeds of the latter, the prefent earl has imported the Calmuck and Aftracan race, and likewife the fhawl goat of Thibet, from the fleece of which fome of the moft valuable manufactures of the Eaft Indies are produced.

The petty feffions are holden at Petworth. The market is on Wednefday, and there is an annual fair. By the cenfus of 1811, the houfes amounted in number to 453, and the inhabitants to 2459. Beauties of England, vol. xiv. Carlifle's Topographical Dictionary, vol. ii.

PETZENKIRCHEN, a town of Auftria; 8 miles E. of Ips.

PETZENSTEIN, a town of Germany, in the territory of Nuremberg; 35 miles N.N.E. of Nuremberg.

PEUCEDANUM, in *Botany*, πευκεδανος of the ancient Greeks, is evidently, by the account in Diofcorides, and the plants with which he ranges it, fomething of the umbelliferous order; but what precife fpecies, we find little to affift us in determining; neither has Dr. Sibthorp formed any decided opinion refpecting this point. The *Peucedanum officinale*, which this learned traveller gathered on the fea-coaft of Laconia, is full as likely as any thing elfe to be the ancient πευκεδανος, or, as fome have it, πευκεδανον. Concerning the derivation of the name, etymologifts are not agreed; but the moft probable feems to be from πευκη, *a Fir*, or *Pitch-tree*, which its leaves refemble, and δανος, *dry*, or *burning*, in allufion to the very pungent qualities of the root and gum, for which this plant is celebrated. Gen. Ch. *General umbel* of numerous, very long and flender rays; *partial* fpreading. *General involucrum* of many, fmall, linear, reflexed leaves; *partial* fmaller. *Perianth* of five minute teeth. *Cor. Univerfal* uniform; flowers of the difk abortive; *partial* of five equal, oblong, incurved, entire petals. *Stam.* Filaments five, capillary; anthers fimple. *Pift.* Germen inferior, oblong; ftyles two, fmall; ftigmas obtufe. *Peric.* Fruit ovate, furrounded with a wing, ftriated at each fide, feparable into two parts. *Seeds* two, ovate-oblong, compreffed, moft convex outwardly, marked with three elevated lines; furrounded by a broad, membranous, undivided border; emarginate at the fummit.

Eff. Ch. Fruit ovate, ftriated at each fide, encompaffed with a wing. Calyx of five teeth. Involucrum very fhort. Flowers of the difk abortive.

1. P. *officinale*. Sea Sulphur-wort, or Hog's Fennel. Linn. Sp. Pl. 353. Engl. Bot. t. 1767. (Peucedanum majus; Ger. Em. 1054.)—Leaves five times deeply three-cleft; fegments linear, undivided.—Native of falt marfhes and ditches on the fea-coaft of the fouth of Europe; very rare in England, and chiefly found below Feverfham and Whitftable in Kent, flowering from July to September. The whole plant is fmooth, and when bruifed emits a ftrong fulphureous fmell, efpecially the *root*, which is perennial, tap-fhaped, very refinous and fœtid, reported to be ufeful in coughs, obftructions of the vifcera, and nervous diforders. Thefe virtues feem to have been handed down from Diofcorides. *Stem* nearly a yard high, erect, round, ftriated, branched, leafy, tough. *Leaves* narrow and rigid, forming a copious *coma*, or tuft, at the root, as Diofcorides fays of his πευκεδανος; each is divided five or fix times fucceffively, into three deep divifions, the ultimate fegments flattifh, linear, acute, entire. *Umbels* large, rather concave, pale yellow, of innumerable flowers. *Fruit* tawny, broadly elliptical, flat.

2. P. *alpeftre*. Alpine Sulphur-wort. Linn. Sp. Pl. 353. (Peucedanum; Riv. Pentap. Irr. t. 11. Ger. Em. 1054?)—Leaves twice or thrice deeply three-cleft; fegments linear, pinnatifid.—Native of Germany. The authentic Linnæan fpecimen is marked *P. germanicum*, and feems to have been obtained from fome Dutch herbarium or garden. On revifing the fynonyms of the firft fpecies, we have no fcruple in removing fome of them to this; efpecially that of Rivinus, whofe plate accords with this fpecies, and not with the former, in the divifions of its *leaves*, as well as in the fize and whole afpect of the plant. This fynonym therefore ought to be ftruck out of Prodr. Fl. Græc., and a reference to Engl. Bot. t. 1767, fubftituted in its ftead. A correction of Linn. Sp. Pl. as well as of Willdenow and Aiton, is alfo neceffary; *P. germanicum* being no other than *P. alpeftre*; and the large fuppofed variety called *italicum*, is the very identical *officinale* itfelf, above defcribed, anfwering to the Linnæan character and authentic fpecimen. *P. alpeftre* is a much fmaller plant than *officinale*, and effentially characterized by the ultimate divifions of its *leaves* being pinnatifid, and fomewhat decurrent, while the general divifions are fewer. The *umbel* is very much fmaller, of fewer but ftouter rays. *Seed* with a broader and pale border.

We have fome fcruple refpecting Gerarde's fynonym. His firft figure may probably be only a fmaller reprefentation of the *officinale*, with which the ftructure of its leaves agrees.

3. P. *capillaceum*. Capillary Cape Sulphur-wort. Thunb. Prodr. 50. Willd. n. 3. — "Leaves doubly pinnatifid; fegments capillary, furrowed."—Native of the Cape of Good Hope. *Thunberg*.

4. P. *tenuifolium*. Slender-leaved Cape Sulphur-wort. Thunb. Prodr. 50. Willd. n. 4—"Leaves doubly pinnatifid; fegments lanceolate, bordered, oppofite or alternate."—From the fame country.

5. P. *fibiricum*. Siberian Sulphur-wort. Willd. n. 5.—"Leaves more than twice compound; leaflets linear, acute. Firft umbels feffile."—Native of Siberia.—*Leaves* fupradecompofite; their leaflets long, linear, acute, running down into the partial footftalk; the lower ftem-leaves furnifhed at the bafe with an ample fheath. Firft *umbel* feffile in the fork of the ftem; the reft ftalked. General *involucrum* wanting; partial ones fetaceous and very fhort. *Petals* inflexed. *Styles* permanent, divaricated. Ripe *feeds* not feen by Willdenow, who referred this plant to *Peucedanum* by its habit. We have a fpecimen of a plant from Pallas, who found it in dry fituations about the Wolga frequent, which may poffibly be the fame with what Willdenow defcribed. In ours indeed there is no feffile *umbel*, but the inflorefcence is fo irregular, fome *umbels* being proliferous juft below their bafe, that, as the other characters agree with tolerable exactnefs, we feel little uncertainty on the fubject. Pallas fays Cuffon meant to call his plant *P. anagymnodes*. Its radical *leaves* are defcribed as four times ternate. There is a minute roughnefs on the foliage of the fpecimen.

6. P. *japonicum*. Japanefe Sulphur-wort. Thunb. Jap. 117. Willd. n. 6. (San bofu; Kæmpf. Amoen. Exot. 825.)—"Leaves five times deeply three-cleft; fegments three-cleft, wedge-fhaped."—Native of the fea-coafts of Japan, flowering in September and October. Whole *plant* fmooth. *Stem* fcarcely a foot high, as thick as a goofe-quill, erect, branched, zigzag. *Leaves* with a broad, ftriated, fheathing bafe to the footftalk. *Seeds* ovate, furrowed, with a flight border. *Thunb.*

7. P.

7. P. *Silaus*. Meadow Sulphur-wort. Linn. Sp. Pl. 354. Engl. Bot. t. 2142. Mart. Ruft. t. 128. Jacq. Auftr. t. 15.—Leaflets pinnatifid; their fegments oppofite, decurrent. General involucrum of barely two leaves.—Not unfrequent in rather moift paftures, throughout Europe, flowering in Auguft and September. A dark-green, rigid, nearly fmooth plant, varying very much in the breadth and decompofition of its *leaves*, fœtid when bruifed, and fuppofed to give a bad flavour to butter in fome parts of Norfolk; but there is a doubt whether cattle will eat it. The *ftem* is from one to two feet high, very ftraight. *Flowers* greenifh-white. *Fruit* but obfcurely bordered.

8. P. *alfaticum*. Alfatian Sulphur-wort. Linn. Sp. Pl. 354. Jacq. Auftr. t. 70. (Daucus alfaticus; Bauh. Prodr. 77.)—Leaflets pinnatifid; their fegments three-cleft, bluntifh, palmate.—Native of various parts of Auftria, Alfatia, and the Palatinate, in moift ground. The *leaflets* are much fhorter and broader than the laft, with more apparent roughnefs at the edges. *Umbels* very copious, fmaller, yellowifh.

9. P. *aureum*. Golden Sulphur-wort. Ait. n. 5. Willd. n. 9.—Leaves triply pinnate; thofe on the ftem with linear-lanceolate, thofe from the root with oblong, many-cleft, leaflets.—Native of the Canaries, from whence Mr. Maffon brought it to Kew in 1779. It is a greenhoufe biennial plant, flowering in June. We have feen no fpecimen.

10. P. *obtufifolium*. Blunt-leaved Sulphur-wort. Sm. Prodr. Fl. Græc. n. 659. Fl. Græc. t. 277, unpublifhed. —Leaflets pinnatifid, coriaceous; their fegments oppofite, obovate, obtufe.—Gathered by Dr. Sibthorp in Bœotia, and on the fhores of the Euxine. *Root* perennial, with a fibrous crown. *Stems* a foot high, bowed, round, leafy. *Leaves* fmooth, a foot long, firft three-cleft, then pinnatifid, of a thick leathery texture. *Footftalks* with a hollow fheathing bafe. *Umbels* yellowifh-white, of ftout, not numerous, rays. General and partial *involucrum* of feveral fhort, broad, acute leaves. *Corolla* a little irregular. *Seeds* with a thickifh border. This plant has much of the afpect of an *Heracleum*.

11. P. *microphyllum*. Small-leaved Sulphur-wort.—Leaves thrice pinnate; leaflets three-cleft, flefhy. General involucrum fcarcely any.—Gathered plentifully in the falt deferts about the Wolga, by Pallas, who fent it to Linnæus as a new *Peucedanum*, but we do not find that it has been any where publifhed. It is fmaller than the laft, with differently compounded *leaves*, and much fmaller *leaflets*. *Stem* glaucous. General *involucrum* fometimes of a fingle fetaceous leaf, but oftener wanting, as the partial ones alfo feem moftly to be. We have feen no *feeds*, fo that the genus muft remain doubtful.

12. P. *nodofum*. Knotty Sulphur-wort. Linn. Sp. Pl. 354. Willd. n. 10.—“Leaflets alternately many-cleft.”—Found in Crete, by Tournefort, who defines the *ftem* as knotty, and the *leaves* like fennel. We know nothing more of this fpecies.

13. P. *geniculatum*. Bent Sulphur-wort. Forft. Prodr. 22. Willd. n. 11.—“Leaves roundifh kidney-fhaped, crenate.”—Native of New Zealand. This is alfo unknown to us. Analogy would lead us to prefume that the word *leaflets*, not *leaves*, fhould be ufed in the fpecific character.

PEVENSEY, in *Geography*, a member of the town and port of Haftings, in the rape of Pevenfey, and county of Suffex, is fituated on the Englifh channel, 60 miles S.E. by S. from London. Though of little note now, Pevenfey was formerly of importance as a commercial port, but the gradual receding of the fea, from which it now ftands at fome diftance, has occafioned its decline. Boats with difficulty afcend to the village by a fmall rivulet. It is a place of great antiquity, and according to Richard of Cirencefter, was the Anderida Portus of the Romans. It is reckoned among the fea-ports ravaged by Godwin, earl of Kent, in the time of Edward the Confeffor. It is alfo celebrated in hiftory, as the place where William the Conqueror landed with his invading army. From Madox's Hiftory of the Exchequer, it appears that in the fixth year of the reign of king John, Pevenfey, among other trading towns, paid a quinxieme, or tax, for its merchandife, and that three years afterwards the barons of Pevenfey fined forty marks for licence to build a town upon a fpot between Pevenfey and Langley; which fhould enjoy the fame privileges as the cinque-ports, and have a yearly fair to laft feventeen days, commencing on the anniverfary of St. John Baptift; alfo a market every Saturday. Whether any part of this grant was ever carried into effect, we are not informed. The only relic of the ancient confequence of Pevenfey is the caftle, which ftands on the eaft fide of the town. The name of the builder, and the date of its erection, are alike unknown; but from the quantity of Roman bricks employed in the works, there is much reafon to believe that it was conftructed out of fome Roman fortrefs. The external walls, of which the towers are tolerably entire to the height of 20 or 25 feet, are circular, and inclofe an area of feven acres. The principal entrance is from the weft or land fide, between two round towers, in which are confiderable layers of Roman brick, fome fingle, others double, about twenty feet from the ground, and four or five afunder. Many fuch layers of white brick or ftone hewn into that form, lie between the ftrata of red, or in place of them, in the walls between the other towers to the north-weft, and in the north-eaft tower are fome ftones laid herring-bone fafhion towards the bottom. Within is a fmaller fortification, of a quadrangular form, moated on the north and weft. It has round towers and a drawbridge, which correfponds with the outer gate, and, like the latter, is not in the centre of the weft fide, but rather more to the fouth. The eaft wall of both is the fame, and ftands on a kind of cliff, that appears to have been once wafhed by the fea, which, however, muft have receded before the town was built. There are no Roman bricks in the inner work, and only in the north and weft fides of the outer. Several of the turrets in the latter are of folid mafonry, and feem to have been defigned, not for defence, but to deceive an enemy. In the area of the outer caftle, are two culverins without carriages; one of them meafures eleven feet in length, is hooped, has a rofe and crown, and the letters E.R. marked on it, probably for Elizabetha Regina; the other is twelve feet long, and is marked W.P. They lie within two yards of one another, funk into the earth and pointing to the fea. Sir William Burrell relates, that in 1710, a workman, engaged in conveying water from the moat of the caftle into the town, was obliged for that purpofe to make his way under the wall, the thicknefs of which he computed to be about ten feet. The foundation he difcovered to confift of piles, planked over with flabs of an extraordinary fubftance, but notwithftanding the length of time fince the erection of the caftle, there appeared to be no decay in the flabs. The colour only feemed to be changed, and the leaves of faggots found there were ftill found. William the Conqueror gave the town and caftle to his half brother Robert, earl of Mortaigne, in Normandy, and created him earl of Cornwall. Thefe honours he enjoyed during the life of that king, but having taken part under his fucceffor in an infurrection excited by his brother Odo, earl of Kent, in favour of Robert

bert Courthose, an army was sent against this castle, on which he thought proper to surrender, and make his peace. He was succeeded in his possessions by William, earl of Mortaigne and Cornwall, who, on being refused the earldom of Kent by Henry I., joined in a rebellion with Robert de Belesme, earl of Shrewsbury. The king in consequence seized all his estates, demolished most of his castles, and exiled him from the realm. He gave to Gilbert de Aquila the town and castle of Pevensey, which thence was called the "Honour of the Eagle," with all their dependencies, in whose descendants it remained vested for some time, but being again forfeited to the throne, Henry III. granted it to his son prince Edward, and his heirs, kings of England, that it should never more be separated from the crown. It, however, came into the family of Lancaster, and from them to that of Pelham, till about the middle of the last century, when it came to earl Wilmington, on being created baron of Pevensey, from whom, by an intermarriage, it has devolved to lord Cavendish. The eccentric and celebrated Andrew Borde was a native of this place. (See Borde, Andrew.) The church is dedicated to St. Nicholas. By the census of 1811, the number of houses was 149, and the inhabitants amounted to 838. The Hasting's Guide, 2d edit. 1797.

PEVEREL Point, a cape or point of land on the coast of Dorsetshire, in the English channel, S. of Pool harbour, having at its end a ledge of rocks, which extends far into the sea. On this point is a battery; 12 miles W.S.W. from the Needles. N. lat. 50° 34'. W. long. 3° 3'.

PEVET. See Pivot.

PEVETS, in a *Watch*, the ends of the spindle of a wheel in a watch. The holes into which they run are called *pevet-holes*.

PEUMUS, in *Botany*, *Peumo* of the inhabitants of Chili, a tree belonging to the *Hexandria Monogynia*, for which Molina has retained this name. Jussieu supposes it to be allied to his *Rubentia*, the *Elæodendrum* of Jacquin, Murray, Schreber, &c.

PEUTINGER, Conrad, in *Biography*, a learned German, was born at Augsburg in 1465. He pursued his studies in the principal universities of Italy, and returned a graduate in civil and canon law. In the year 1493 the senate of Augsburg appointed him to the secretaryship of the city, and he was its deputy at the diets held during the reign of the emperor Maximilian. After the death of the emperor in 1519, he was sent to Bourges to compliment Charles V. on his accession to the empire. He employed all his credit with these sovereigns for the benefit of his native city, and procured for it the privilege of coining money. He was through almost the whole of a long life an active and useful member of the state to which he belonged, and died in the year 1547, at the age of 82, having passed his latter years in a state of second childhood. He left a large and well chosen library, which remained many years in the family, but which finally came to the Jesuits of Augsburg. The name of this author is best known from the ancient Peutingerian table, of which the following is the history. It is a rude chart drawn by an unknown hand during the reign of Theodosius the Great, and marking the Roman military roads through the greatest part of the western empire; it was found in a German monastery by Conrad Celtes, who presented it to Peutinger. He intended to publish it, but did not execute his design, and after his death it disappeared for several years. At length fragments of it were found and published at Venice in 1591, under the title of "Fragmenta Tabulæ antiquæ ex Peutingerarum bibliotheca." In the eighteenth century, it was discovered entire among Peutinger's MSS., and a fine edition of it was given at Vienna in 1753 by Scheib, illustrated with notes and dissertations. Peutinger was the author of "Romanæ vetustatis Fragmenta in Augusta Vindelicorum," &c. 1508, which was reprinted under the title of "Inscriptiones vetustæ Romæ et eorum Fragmenta in Augusta Vindelicorum:" "Sermones Conviviales," which have been frequently reprinted, and many other works. Moreri.

PEWET Island, in *Geography*, a small island in the German sea, near the coast of Essex; five miles S.S.W. from the entrance into Harwich harbour.—Also, a small island in Poole harbour.

PEWIT, in *Ornithology*, the English name of a common bird of the *larus*, or sea-gull kind, called by some authors *larus cinereus*, and by others *cepphus*, and in some of the counties of England the *black-cap*, and *sea-crow*: this is the Larus *ridibundus* (not *rudibundus* as misprinted) of Linnæus.

It has its English name from its note, which seems to express the word *pewit*, and is a kind of hoarse laugh. It is affirmed by many, that the head of this bird is only black at a certain season of the year.

Pewits are birds of passage, resorting to pools and fens in some of the inland counties, particularly Staffordshire, in the spring, and after the breeding season dispersing to the sea-coasts. The young were formerly much esteemed and fattened for the table. Plot relates, that at the death of the lord of the soil, they shift their quarters for a certain time. There was a piece of ground near Portsmouth, which formerly produced 40*l.* a-year to the owner, by the sale of pewits. Ray and Pennant.

Pewit is also a name given to the bastard plover, or *lapwing*; which see. See also Tringa *Vanellus*.

PEWSUM, in *Geography*, a town of East Foresland, the principal place of a bailiwick; six miles N.N.W. of Emden.

PEWTER, a factitious metal used in domestic utensils. It is very uncertain in its composition. The common utensils of the lowest price are made from an alloy composed of about 20 of tin, 3 of lead, and 1 of brass. The lead is of no use, but to make it cheaper, and doubtless on this account is often used in larger proportion. The brass is intended to give stiffness and hardness, the tin being of itself much too soft.

Another alloy of this kind is made without lead, consisting of tin combined with antimony, and copper in small proportion, to give it hardness. This is manufactured into almost all the articles which are usually made of plated copper, and is known by the name of Britannia metal.

The practice of putting lead into these alloys is extremely dangerous. Malt liquor, and particularly porter, always contains more or less acetic acid, which cannot fail to dissolve some of that deleterious metal.

The basis of this metal is, as we have already said, tin, and it consists of three different standards: *viz.* that which is called plate-metal, of which plates and dishes are made, which is formed of tin and regulus of antimony, in the proportion of one hundred and twelve pounds of the former to six or seven pounds of the latter. Wallerius gives for this finest kind of pewter, the proportions of 12 parts of tin, 1 of antimony, and about $\frac{1}{16}$ of copper. A very fine metal is made of 100 parts of tin, 8 of antimony, 1 of bismuth, and 4 of copper. The use of these additions to the tin is to harden it, and preserve its whiteness, and this fine kind of pewter takes a very high polish, has a beautiful silvery lustre, and is not readily tarnished. Tin, with a little zinc or brass, brafs, makes a very fine hard alloy. The antimony is fo intimately united to the tin, that it is not volatilized when ftrongly heated, or only in a very fmall degree, and it is not eafily diffolved by any weak acid, fo that in the ufe of this kind of pewter there is no danger of incurring the common effects of this metal.

The next metal inferior to this is called trifling metal, and is lowered one half-penny *per* pound in worth, by alloying it with lead; of this metal ale-houfe pots are made; the lower fort of metal is ftill farther alloyed by lead, fo as to reduce the value two-pence in a pound lower than plate-metal; of this, which is called lay-metal, wine-pots are made.

Lead may be mixed with tin in any proportion, without deftroying the malleability of the compound metal, whereas the brittle metals, and copper, impart a brittlenefs to the alloy, when they exceed certain proportions. Hence lead and tin, with or without other fmaller additions, form the pewter in ordinary ufe. Lead being the cheapeft of the two metals, the manufacturer finds it his intereft to employ it in as large a proportion as poffible; but danger having been apprehended from this noxious metal, the French government appointed a commiffion of fome very able chemifts to examine the fubject; and they found, that when wine or vinegar is allowed to ftand in veffels compofed of an alloy of tin and lead in different proportions, the tin is firft diffolved; whilft the lead is not fenfibly oxydated by thefe liquors, except at the line of contact of the air and the liquor; and no fenfible quantity of lead is diffolved even by vinegar, after ftanding for fome days in veffels that contained no more than about 18 *per cent.* of lead. Hence it was concluded, that as no noxious effect is produced by the very minute quantity of tin which is diffolved, a pewter may be confidered as perfectly fafe, which contains about 80 or 82 *per cent.* of tin; and where the veffels are employed merely for meafures, a much lefs proportion of tin may be allowed. But the common pewter of Paris was found to contain no more than about 25 or 30 *per cent.* of tin, and the remainder was lead. For the refults of the proceffes of Meffrs. Bayen and Charlard for afcertaining the nature and proportions of the feveral alloys ufed by the pewterers of Paris, we refer to Chaptal's "Elements of Chemiftry," vol. ii. See TIN.

Pewter has occafionally ferved for money. In the Philofophical Tranfactions, M. Putland informs us that king James II. turned all the pewter veffels, &c. of the Proteftants in Ireland he could feize, into money; half-crowns were fomewhat bigger than halfpence, and other pieces in proportion.

He ordered it to be current in all payments: whence, our author obferves, people abfconded for fear of being paid their debts: he alfo mentions crown pieces of this metal, with this legend on the rim, *melioris teffera fati.*

PEYAUNNY, in *Geography*, a town of Hindooftan, in Oude; 18 miles S. of Mahomdy.

PEYERBACH, a town of Auftria; 7 miles W. of Efferding.

PEYERI GLANDULÆ, in *Anatomy*, the mucous glands of the fmall inteftine, fo named from Peyer of Schaffaufen, who defcribed them in a work entitled "Exercitatio Anatomico-Medica de glandulis inteftinorum," 1677. Reprinted in the Bibliotheca of Mangetus.

PEYERSON'S POINT, in *Geography*, a cape on the N. coaft of Antigua. N. lat. 17° 18′. W. long. 61° 32′.

PEYJUREE, a town of Hindooftan, in the circar of Kitchwara; 14 miles S.S.W. of Ragoogur.

PEYRAC, a town of France, in the department of the Aude; and chief place of a canton, in the diftrict of Carcaffonne. The place contains 1370, and the canton 13,109 inhabitants, on a territory of 307½ kiliometres, in 18 communes.

PEYREHORADE, a town of France, in the department of the Landes, and chief place of a canton, in the diftrict of Dax; 10 miles S. of Dax. The place contains 1986, and the canton 9949 inhabitants, on a territory of 172½ kiliometres, in 13 communes.

PEYRELAU, a town of France, in the department of the Aveyron, and chief place of a canton, in the diftrict of Milhau; 9 miles N.E. of Milhau. The place contains 261, and the canton 3921 inhabitants, on a territory of 255 kiliometres, in 9 communes.

PEYRERE, ISAAC LA, in *Biography*, a French writer, was born at Bourdeaux about the year 1594. He was educated a Proteftant, and at one time had an employment under M. de la Thuillerie, ambaffador from France to the court of Denmark. After this he obtained a poft in the eftablifhment of the prince of Conde. He was a hard ftudent, but thought to be very deficient in enquiry. He publifhed a work in 1655, with the title of "Præadamitæ, five Exercitatio fuper verfibus 12, 13, 14, cap. xv. Epift. Pauli ad Romanos," in which he attempted to prove that it is the origin of the Jewifh nation, and not of the human race, which we find recorded in the book of Mofes, and that our globe was inhabited by many nations before Adam, whom he confidered as the father of the Jews. The book was, almoft as foon as it made its appearance, condemned to be burnt by the common executioner. Though the author had not fubfcribed his name to it, the fact was well known, and he was arrefted at Bruffels, and thrown into prifon. Through the interpofition of the prince of Conde he was fet at liberty. Smarting under this profecution he determined to run no more rifks on account of his herefy, and with this view he went to Rome to avow a change in his principles: here, in 1656, he abjured the Proteftant religion, and alfo his treatife on the præadamites, and was, of courfe, favourably received by pope Alexander VII. His motives were always fufpected, as well by Catholics, whom he joined, as by the Proteftants whom he left. After his return to Paris he was patronized by the prince of Conde, who made him his librarian, which poft he kept till he entered the feminary of our Lady of the Virtues, where he died at the age of 82. He was author of another fingular treatife "Concerning the Recall of the Jews," in which he endeavoured to maintain, that after their reftoration to the land of Canaan, they would be fubject not only to the fpiritual authority of Jefus, but to the government of a temporal king, the grand inftrument of bringing about that event; and he concluded that king to be the king of France. M. Peyrere was author alfo of two works entitled "An Account of Greenland;" and "An Account of Iceland." Bayle. Moreri.

PEYROLLES, in *Geography*, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton, in the diftrict of Aix; 9 miles N.E. of Aix. The place contains 1750, and the canton 6164 inhabitants, on a territory of 210 kiliometres, in 5 communes. This town is celebrated for its medicinal waters.

PEYRUIS, a town of France, in the department of the Higher Alps; 15 miles S.W. of Digne.

PEYSONNEL, CHARLES, in *Biography*, born at Marfeilles in 1700, was fon of a phyfician in that city: he received the elementary parts of his education under the fathers of the Oratory in Marfeilles, and was fent to Paris for its completion. He returned to his native place juft before

before the dreadful plague, fo well known in hiftory, to which calamity, his father, in fulfilling the duties of his office, fell a victim. The young man was deftined for the practice of the law, and having ftudied at Aix, he was admitted an advocate in the year 1723. He exercifed his profeffional talents with much credit at Marfeilles during fifteen years, at the fame time that he purfued, with avidity, his literary ftudies. He, together with his elder brother, was principally inftrumental in founding the Academy of Belles Lettres in that city. After this he went out a fecretary to the French embaffy at the Porte; and then accompanied the marquis de Villeneuve as plenipotentiary to negociate the peace of Belgrade. He employed himfelf, while abroad, in compofing works on the commerce of the Levant; the embaffy in which he engaged; and the remains of antiquity which he obferved in his travels. In a tour which he made to Nicomedia and Nicæa, he obtained many medals, which he placed in the rich cabinet of M. Pellerin, and likewife fome curious marbles tranfmitted to the royal cabinet of antiquities, with their explanations. He was, in the year 1747, nominated to the confulfhip of Smyrna, and, in the next year, the Academy of Infcriptions elected him a foreign affociate. He employed perfons, at his own expence, to furvey the countries of Leffer Afia, fouth of the Meander, and made fome journies thither for the fame purpofe, in order that he might throw light on thofe parts of the globe which, at that time, were little known to Europeans. Though lefs attached to natural hiftory than to antiquities, he communicated fome ufeful and interefting facts to Duhamel for his Treatife on Trees and Shrubs. He died in the year 1757. As a commercial refident he was highly efteemed for his intelligence and difintereftednefs, and fome papers, publifhed in the Memoirs of the Academy of Infcriptions, efpecially one "On the Kings of the Bofphorus," exhibit abundant proofs of his learning and diligence of refearch.

The eldeft fon of M. Peyfonnel was alfo a conful at feveral ports, and he made himfelf known by feveral hiftorical and political works: of thefe one of the moft important is entitled "Obfervations Hiftoriques et Geographiques fur les Peuples Barbares qui ont habitè les Bords du Danube, et du Pont Euxin; fuivies d'un Voyage fait a Magnefie, à Thyatire, à Sardes, &c. avec Figures." The tour in Afia Minor defcribed in this volume, is illuftrated with ancient monuments, infcriptions, and medals. Among his other literary performances are "Obfervations on Baron de Tott's Memoirs," and a "Treatife on the Commerce of the Black Sea." He died at the advanced age of 80, in the year 1790. Gen. Biog.

PEYSTORF, in *Geography*, a town of Auftria; 12 miles W.S.W. of Feldfburg.

PE-YU, a fmall ifland near the coaft of China, in the Chinefe fea. N. lat. 30° 20′. E. long. 120° 20′.

PEZ, a town of Italy, in the department of the Adda and Oglio; 20 miles N. of Breno.

PEZA, a river of Ruffia, in the government of Archangel, which rifes in lake Varzefkoi, and runs into the Mezen; 12 miles S.E. of Ofokolfkoi.

PEZENES, a town of France, in the department of the Herault, and chief place of a canton, in the diftrict of Beziers. The town, which is large and commercial, contains 8070, and the canton 11,796 inhabitanst, on a territory of 35 kiliometres, in four communes. N. lat. 43° 27′. E. long. 3° 31′.

PEZIZA, in *Botany*, fomewhat altered from the Greek πεζικη, which is derived from πεζα, *the fole of the foot*. Pliny fpeaks of *Pezicæ* as the Greek appellation of fuch *Fungi* as grow without any ftalk, or apparent root. Linnæus has adopted the above word for a genus to which that character is, for the moft part, applicable. Linn. Gen. 568. Perf. Syn. 631. Mart. Mill. Dict. v. 3. Hudf. 633. Juff. 4. Lamarck Illuftr. t. 886. (Octofpora; Hedw. Crypt. v. 2. 4. t. 3—10. Schreb. 770.)—Clafs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eff. Ch. Receptacle hemifpherical, concave, flightly tumid, lined with a fmooth coloured hymenium. Cafes imbedded, inconfpicuous to the naked eye, each containing eight volatile feeds.

The celebrated Perfoon, fo deep and fcientific in this natural order of plants, has juftly reftored the original genus of *Peziza*, only removing from it that of *Cyathus*, called by fome authors *Nidularia*, which belongs to a totally different tribe of *Fungi*, and of which *Peziza lentifera* of Linnæus, Hudfon, &c. is the moft common fpecies. *Cyathus* has been omitted in its proper place by our predeceffor, and *Nidularia* being not received by writers in general, though furely preferable as a name, we have paffed it over. Hedwig determined to retain the appellation of *Peziza* for that genus, and therefore invented the word *Octofpora*, alluding to the eight feeds in each cell, for our *Peziza*, in which Schreber has followed him; but we rather follow Perfoon, who takes the lead in this order, and who is not wanting in authorities, among preceding authors, to fupport him.

This writer defines one hundred and fifty-one fpecies of *Peziza*, difpofed in feven fections, of each of which we fhall give an example or two. The refemblance between their fructification and the fhields of a *Lichen*, is too ftriking to be overlooked; there is indeed fcarcely a difference between them; for the number of the minute feeds is too obfcure, and indeed too uncertain, a character, to be reforted to. Hedwig fays they are invariably eight in the genus before us; but they appear to be often double, and their number is fo different in different *Lichenes*, that nothing is to be depended upon concerning it in that tribe. With regard to habit, the diftinction is more abfolute. A *Lichen* has a vegetating ftem, herb, or cruft, moftly of perennial duration, extending itfelf without end; a *Peziza* has but a fhort exiftence, perifhing as foon as it has perfected the one folitary fructification, which is the end of its creation. Hedwig moreover obferves, that a fibrous texture, highly bibulous in its nature, is interwoven with the feed-cafes of a *Lichen*; while thofe of a *Peziza* are feparated, if at all, only by unconnected vertical fibres. In a word, the one plant has the flefhy evanefcent nature of a *Fungus*, the other the permanent, revivefcent, and vegetative conftitution of an *Alga*.

Section 1. *Tremella-like; more or lefs of a gelatinous fubftance.* Fourteen fpecies.

P. *inquinans*. Perf. n. 1. (P. nigra; Bulliard Fr. t. 460. f. 1. P. polymorpha; Lightf. 1055. Tremella turbinata; Hudf. 563. Elvela; Schæff. Fung. t. 158. Octofpora elaftica; Hedw. Crypt. v. 2. t. 6. f. E.)—Gregarious, vifcid, ftaining black; at length convex and obconical; externally rugged, downy, and of a lighter brown. Not uncommon on the trunks of felled oak trees, efpecially in autumn and winter, or in a wet fummer, always growing, as Perfoon remarks, in longitudinal rows. Its fubftance is leathery, but internally pulpy; hard when dry; its diameter an inch, more or lefs. When touched, its *difk* ftains the fingers with a black flimy moifture. In a dry ftate, the fine velvet-like downinefs of the outfide is moft confpicuous, and affumes a much lighter hue.

P. *farcoides*. Perf. n. 5. (P. tremelloidea; Bull. Fr. t. 410. f. 1. Helvella farcoides; Bolt. Fung. t. 101. f. 2.

Octospora carnea; Hedw. Crypt. v. 2. t. 7. f. B.)—Clustered, juicy; deep flesh-coloured externally, with elevated veins; disk purple, lobed at the margin. Frequent on rotten wood in autumn. Its shape is tolerably regular, obconical, with a dilated lobed margin, and a deep hollow *disk* of a purple or vinous hue; the outside, or stalk, pale, with branching elevated veins or plaits. Persoon confounds with this the *Tremella sarcoides* of Withering, v. 4. 78. Engl. Bot. t. 2450, to which last most of his synonyms refer. The size of the present species is usually less than half that of the foregoing; substance more tender and gelatinous.

Section 2. *Helvella-like; larger, partaking of a fleshy and membranous substance, brittle, externally rather powdery.* Thirty-five species.

P. *aurantia.* Perf. n. 21. (Peziza; Fl. Dan. t. 657. f. 2. P. coccinea; Bull. Fr. t. 474. Sowerb. Fung. t. 78. Helvella coccinea; Bolt. Fung. t. 100.)—Clustered, sessile, obliquely wavy; whitish externally; disk orange-scarlet.—Common in autumn about the roots of decayed oaks, sometimes on gravel walks in gardens, after much wet, growing in clusters of various sizes. The plants are from half an inch to two or three inches in diameter, variously cup-shaped, without any *stem*, often wavy, and oblique, or convoluted; the *disk* of an orange hue inclining to scarlet, but palest in wet weather; the outside somewhat glaucous, with a kind of bloom. Withering confounds this with *P. coccinea*, hereafter mentioned in the next section, and we believe Hudson fell into the same error.

P. *vesiculosa.* Perf. n. 31. Sowerb. Fung. t. 4.—Clustered, hemispherical, rather contracted at the margin; disk brown, separating from the slightly downy, whitish, outer coat.—Very common on exposed dunghills, according to Mr. Sowerby, who detected the essential character, consisting in a separation, and hollow space, between the *hymenium* and the *receptacle* or outer coat. In a young state the fungus is globular, white or cream-coloured, and rather downy; as it expands, the mouth still remains for some time much more contracted than the rest. The full-grown plant is two inches wide; the *disk* of an umber brown. The above intelligent author seems to have erred in citing Bulliard's t. 457. f. 1, unless that figure be very faulty and defective. Persoon omits it.

P. *Sowerbæana.* Perf. n. 34. (P. radiculata; Sowerb. Fung. t. 114.)—Clustered; externally white, downy, with a long tapering root; disk concave, yellow.—Found by Mr. Sowerby in Wanstead garden, Essex, in the autumn of 1794 and 1795. No other botanist seems to have observed this species. It grows in clusters, apparently sessile, the long tapering *root* being concealed amongst earth and dead leaves. The *cup* is above an inch wide, of a bright ochraceous yellow in the *disk*; externally white, downy, reticulated with prominent veins.

P. *Acetabulum.* Perf. n. 39. Linn. Sp. Pl. 1650. With. v. 4. 346. Sowerb. Fung. t. 59. Bull. Fr. t. 485. f. 4.—Solitary, hemispherical, brown on both sides; with elevated, branching, pale, external veins, and a pale fluted stalk. A rare species, and one of the largest; found in sandy hedge bottoms, or on very rotten wood in the shade, in winter. Its furrowed *stalk*, like that of an *Helvella*, sending up branching elevated veins over the lower half of the large thin cup, and the brittle, smooth, waxy nature of the whole fungus, well mark this species, which preserves its appearance and characters sufficiently well in drying.

Section 3. *Mostly small. The outside of the cup either bristly, hairy, downy, or woolly.* Thirty-five species.

P. *hemisphærica.* Perf. n. 51. (P. hispida; Hudf. 635. With. v. 4. 354. Sowerb. Fung. t. 147. P. Labellum; Bull. Fr. t. 204. Elvela; Schæff. t. 151.)—Clustered, sessile, hemispherical, clothed with clustered brown hairs; disk glaucous-white.—Found in autumn, after rains, growing amongst moss on the ground, but not common. This is among the larger species of the present section, being sometimes an inch or more in diameter, though occasionally not bigger than a pea. The inflexed margin gives the whole fungus nearly an orbicular shape, though somewhat depressed. The outside is brown, with a tawny cast, and clothed with clustered, short, prominent hairs; the *disk* concave, of a singular pearly or glaucous white.

P. *scutellata.* Perf. n. 58. Linn. Sp. Pl. 1651. Hudf. 637. With. v. 4. 353. Sowerb. Fung. t. 24. Bull. Fr. t. 10. (Octospora hirta; Hedw. Crypt. v. 2. 12. t. 3. f. B.)—Sessile, nearly flat, orange-red; rough externally with black spreading bristles.—This pretty species is not uncommon on wet rotten wood. It grows generally more or less dispersed, about the size of a large split pea, and is nearly hemispherical at first, fixed by a central, black, fibrous *root*. The beauty of the pale scarlet disk, which becomes gradually flattened, and the remarkable black bristles, which rise from the outside and overtop the margin, cannot fail to strike the most incurious observer. If by the manner in which Withering cites Bolton and Sowerby, the first is meant to be preferred, nothing can be more erroneous. His supposed varieties moreover include several most distinct plants.

P. *stercorea.* Perf. n. 60. (P. scutellata; Bolt. Fung. t. 108. f. 1. Octospora scutellata; Hedw. Crypt. v. 2. 10. t. 3. f. B.)—Sessile, concave, orange-coloured; rough externally with short, nearly upright, brown bristles.—Common upon the dung of horses and cows, in low wet pastures. Most authors confound this with the last, from which it differs in its place of growth, smaller size, more concave and paler *disk*, as well as in the shortness, bluntness, and lighter hue, of the external bristles.

P. *coccinea.* Perf. n. 67. Jacq. Austr. v. 2. 40. t. 163. Bolt. Fung. t. 104. (P. epidendra; Bull. Fr. t. 467. f. 2. Sowerb. Fung. t. 13. P. cupularis; Linn. Sp. Pl. 1651?)—Stalked; turbinate or funnel-shaped, white and downy; disk concave, crimson; margin somewhat crenate.—Found on rotten sticks, imbedded among dead leaves, early in the spring. This is one of the most elegant of the whole order of *Fungi*, whether we consider its delicate downy outside, whose pure white is partly tinged with a pale blush, or the vivid deep crimson of the disk, of both which Mr. Sowerby's inimitable figure alone gives any adequate idea. Jacquin's is truly miserable. If this be, as Persoon believes, the real *cupularis* of Linnæus, it is singular that neither he nor Vaillant should have noticed the colour of the disk. Hudson, Withering, and others have confounded the present plant with the very different *P. aurantia*, see our second section. The *stalk* is often an inch long, or more, and the diameter of the cup an inch and half.

P. *virginea.* Perf. n. 71. (P. nivea; Dicks. Crypt. fasc. 1. 21. Sowerb. Fung. t. 65. Fungoides, &c.; Mich. Gen. t. 86. f. 15.)—Clustered, stalked, hemispherical, white; externally downy.—Frequent on decaying plants, rotten stumps, &c. growing sometimes in a pendulous or reversed posture. The *stalk* is scarcely half a quarter of an inch in height, the *cup* about twice that diameter. Every part is white, and the outside finely downy.

Many other curious and minute species close this section.

Section 4. *Entirely smooth, or at least not manifestly downy, of a rather waxy texture. Mostly of a small size.* Forty-four

four ſpecies; twenty-four of which are ſtalked, the reſt ſeſſile.

P. *firma*. Perſ. n. 87. (P. ochroleuca; Bolt. Fung. t. 105. f. 1. Sowerb. Fung. t. 115.)—Rather ſcattered, leathery, pale brown, cup-ſhaped; at length dilated, wavy, and flattened. Stalk longer than the cup, blackiſh at the baſe.—Said to be not uncommon in the damp receſſes of moiſt woods, growing on dead ſticks; but it ſeems not to have been obſerved out of England. The full-grown *cup*, when expanded nearly flat, is almoſt an inch wide; its *diſk* of a pale reddiſh-brown; the outſide and internal ſubſtance of a light yellowiſh hue. *Stalk* an inch high, rather ſlender, ſwelling upwards. The texture is leathery and elaſtic, but by drying becomes hard, the whole plant ſhrinking much.

P. *Tuba*. Perſ. n. 94. Bolt. Fung. t. 106. f. 1.—Stalked, entirely yellow, funnel-ſhaped, deeply umbilicated, with a flat entire border. Stalk thread-ſhaped.—Found, by Mr. Bolton only, on rotten ſtems of plants, in moiſt places near rills of water, growing rather diſperſed. Each plant is about three quarters of an inch high, of a bright pale yellow, "like a trumpet in miniature," with a ſlender, ſlightly curved, *ſtalk*. The *diſk* a quarter of an inch broad.

P. *citrina*. Perſ. n. 106. Sibth. Oxon. 386. With. v. 4. 347. Sowerb. Fung. t. 151. (Octoſpora citrina; Hedw. Crypt. v. 2. 28. t. 8. f. B.)—Crowded, entirely lemon-coloured, cup-ſhaped, thick-edged. Stalk inverſely conical, the length of the cup.—Found by Hedwig, on rotten oak wood, in ſhady places, in September. Dr. Sibthorp met with the ſame in Shotover plantations, in Oxfordſhire. A pretty ſpecies, growing in conſiderable cluſters, and conſpicuous for its bright uniform lemon hue, like *Lichen vitellinus*, Engl. Bot. t. 1792, but never tinged with green or olive. Its uſual diameter is a line, more or leſs, and height about the ſame. Sometimes the *cup* is obſcurely lobed or notched. Mr. Sowerby repreſents ſeveral ſpecimens without any ſtalk, but we cannot conceive his plant to be materially different from Hedwig's.

P. *lenticularis*, Perſ. n. 110, for which Bulliard t. 300. f. AC, and Sowerby's *P. aurea*, t. 150, are quoted, the laſt indeed with doubt, appears rather an obſcure ſpecies. Though ranged among thoſe with a ſeſſile *cup*, it has actually a ſtalk; ſee *Helvella aurea*, Bolt. t. 98. f. 2, and Sowerby's figure. The colour of the *diſk* being a deeper more tawny yellow than the outſide, and the thin edge, ſeem beſt to diſtinguiſh this from the laſt.

P. *granuloſa*. Perſ. n. 119. (P. granulata; Bull. Fr. t. 438. f. 3. P. ſcabra; Fl. Dan. t. 655. f. 2.)—Seſſile, cluſtered, reddiſh-orange, flattiſh; externally paler, granulated and rugged.—Perſoon mentions this as frequent in autumn upon cow-dung. It ſeems not to have been noticed in England, but may have been confounded with ſome other. The rugged or granulated outſide is a remarkable character. The *diſk* is of a bright but pale orange-red, a line broad, with an inflexed margin, which finally diſappears, and the whole becomes nearly flat.

P. *confluens*. Perſ. n. 120. Obſ. Mycol. v. 2. 81. t. 5. f. 6, 7.—Seſſile, confluent, ſomewhat imbricated, orange-coloured, flattiſh, connected by downy whitiſh fibres.—Found on the ground, in dry burnt-up ſpots, by Perſoon, the only author who mentions this ſingular ſpecies, which is among the ſmalleſt, though from its aggregate mode of growth very conſpicuous. The *ſeeds*, flying off like ſmoke, have been obſerved by its diſcoverer.

Section 5. *More or leſs coriaceous, dry, either ſmooth or powdery, for the moſt part ſeſſile.* Fifteen ſpecies.

P. *patellaria*. Perſ. n. 131. (Lichen atratus; Hedw. Crypt. v. 2. 61. t. 21. f. A. Ach. Prod. 62.)—Cluſtered, quite ſeſſile, flat, bordered, black, ſomewhat coriaceous.—Not uncommon, according to the authors cited, upon dead branches of Lime and Oak, forming patches, more or leſs ſcattered, and entirely black. The plants appear like the ſhields of a *Lichen*, of the Acharian genus *Lecidea*, but totally deſtitute of a cruſt. Each is fixed by copious fibrous *roots*, and is about the diameter of a ſmall pin's head; the *diſk* very ſlightly elevated, the *margin* conſiderably thickened, and rather raiſed above the diſk. Hedwig, obſerving the minute oblong *ſeeds* to be diſcharged ſeparately from their fibrous *receptacle*, without any appearance of the eight-ſeeded cells of a *Peziza*, referred this diminutive production to *Lichen*; but he is generally ſuppoſed to have erred in this point. We have ſought for the plant in vain in England, nor can we decide any thing concerning it, though moſt inclined to the opinion of Perſoon, in which Acharius now concurs.

Several minute, and to us often obſcure and uncertain ſpecies, cloſe this ſection. The laſt of them is

P. *carpinea*. Perſ. n. 144. Ehrh. Crypt. n. 130. (Tubercularia faſciculata; Tode Fung. faſc. 1. 20. t. 4. f. 32.)—Cluſtered, ſtalked, paliſh, capitate, ſlightly flattened.—Found on the bark of Hornbeam, through the cuticle of which it protrudes in little denſe oblong cluſters; gelatinous, and of a fleſh-colour, with a yellow tinge, when freſh; brown and hard when dry. Each plant reſembles a minute round-headed Agaric, with a thick *ſtalk*. The ſurface of the head, or *diſk*, is ſaid to be covered with pale yellow grains, thought to be the *ſeeds*.—In Ehrhart's ſpecimen theſe ſuppoſed *fungi* evidently ſpring from the freſh internal bark, not from any decayed layer, which is ſo contrary to the nature of the whole natural order, that we greatly incline to rank this ſpecies with *Tremella*, if not, to diſcard it altogether as a mere exudation from the bark of the tree!

Section 6. *Receptacle nearly membranous, dry, cup-ſhaped, ſunk into the ſurface of wood, with a prominent border.* Three ſpecies, which Perſoon ſeems to have inclined to eſtabliſh as a genus, by the name of *Stictis*. One example will ſuffice.

P. *radiata*. Perſ. n. 146. (P. marginata; Sowerb. Fung. t. 16. With. v. 4. 351. Lycoperdon radiatum; Linn. Sp. Pl. 1654. Patellaria excavata; Hoffm. Pl. Lich. t. 23. f. 3. Sphærobolus roſaceus; Tode Fung. faſc. 1. 44. t. 7. f. 57, 58.)—Oval, immerſed, internally brown; border prominent, ſpreading, ſnow-white.—On the bark of dead branches of trees. Found by Mr. Relhan at Whitwell, Cambridgeſhire. Very conſpicuous in conſequence of its white, lobed or notched, border. If Linnæus and Tode be correct, this ſpecies diſcharges the ſeeds elaſtically, in the form of a ball; conſequently it can have no right to be eſteemed a *Peziza*, but ranks with the *Lycoperdon Carpobolus*, in a ſeparate genus. Hoffmann, Sowerby, and Perſoon, have deſcribed merely the empty receptacle.

Section 7. *Receptacle nearly membranous, elongated, bladder-like, hollow at the baſe.* This, in ſome books, forms the genus *Solenia*. Four ſpecies.

P. *ochracea*. Perſ. n. 149. (Solenia ochracea; Hoffm. Germ. v. 2. t. 8. f. 2.)—Rather crowded, ſlender-pear-ſhaped, downy, yellow.—Found on the old barks of trees, in rows or cluſters, not much crowded, the plants not quite erect, very minute; but viſible by their variegated hue of orange and yellow. Each is tubular, white within; the mouth much contracted.

 P. *candida*.

P. candida. Perf. n. 151. (Solenia candida; Hoffm. ibid. t. 8. f. 1.)—Very flender, cylindrical, fnow-white, with a revolute margin.—Found on rotten wood. It feems even more minute than the laft, from which it is very diftinct.

Albertini and Schweiniz, in their learned *Confpectus Fungorum Agri Nifkienfis*, have figured and defcribed feveral fpecies of *Peziza* not in Perfoon, and have furnifhed valuable remarks on fome of his minute or obfcure ones. They confirm the account of the fruit of *P. radiata*, n. 146, as being at firft gelatinous, then waxy, and finally intermixed with fibres. The fame acute obfervers have feen the *P. carpinea*, n. 144, twice; in April it had little convex clofed cups, and in October a flat open difk. If there be no deception in this, we muft allow it to remain here. After all, great obfcurity muft attend thefe diminutive productions; nor can fuch be put to the teft of difplaying their volatile feeds, in the form of fmoke, from an organized difk, which is the only true mark of a *Peziza*.

PEZO *de Rega*, in *Geography*, a town of Portugal, in the province of Tras los Montes, a celebrated depot of Port wine; 7 miles N.W. of Lamego.

PEZOS, a town of Spain, in Afturia; 40 miles W. of Oviedo.

PEZRON, Paul, in *Biography*, a learned French abbot, who flourifhed in the 17th and 18th centuries, was born at Hennebon, in Bretagne, in the year 1639. At the age of 22 he embraced the monaftic life, and went to purfue his ftudies at the college of the Bernardins in Paris. He foon became diftinguifhed for his ardour in the purfuit of knowledge, as well profane as facred; and his early proficiency fecured to him the refpect and efteem of the abbot, who appointed him his fecretary, and procured for him the degree of bachelor of divinity from the faculty of Paris. Honours now flowed in upon him: in 1682 he received the degree of doctor, and in 1690 he was elected vicar-general of the reformed houfes belonging to his order in the ifle of France. In 1697, Lewis XIV., in order that he might reward literary merit, beftowed on him the abbey de la Charmoye, which he retained till the year 1703, when he refigned it, that he might devote his whole time to ftudy. The intenfenefs of his application ruined his health, and he died in 1706, in the 67th year of his age. His principal works are; 1. "The Antiquity of Time, reftored and defended againft the Jews and the New Chronologifts:" in which he maintains the chronology of the Septuagint, in preference to that of the Hebrew text of the bible, which he fuppofes to have been corrupted by the Jews fince the deftruction of Jerufalem: he alfo claims for the world a much higher antiquity than is allowed by any other modern chronologer. 2. "An Attempt at a Literal and Hiftorical Commentary on the Prophets." 3. "The Evangelical Hiftory confirmed by thofe of the Jews and Romans," in 2 vols. 12mo. 4. "A Treatife concerning the Antiquity of the Nation and of the Language of the Celts, otherwife called Gauls," &c. Moreri.

PFAFF, in *Geography*, a mountain of Auftria, bordering on Stiria.

PFAFFENBERG, a town of Bavaria; 16 miles N. of Landfhut.

PFAFFENDORF, a town of Bavaria, in the bifhopric of Bamberg; five miles E. of Weifmain.—Alfo, a town of Bavaria, in the fame bifhopric; five miles S.E. of Lichtenfels.—Alfo, a town of the duchy of Wurzburg; fix miles N. of Ebern.—Alfo, a town of Pruffia, in the palatinate of Culm; 10 miles E.S.E. of Culm.

PFAFFENHAUSEN, a town of Bavaria, in the bifhopric of Augfburg, on the Mindel; 21 miles S.W. of Augfburg.—Alfo, a town of Bavaria; 13 miles N.N.W. of Landfhut.

PFAFFENHOFEN, a town of Bavaria, on the Ilm: 14 miles S.S.E. of Ingolftadt. N. lat. 48° 25′. E. long. 11° 28′.—Alfo, a town of Bavaria; 13 miles S.W. of Amberg.—Alfo, a town of France, in the department of the Lower Rhine; nine miles W. of Haguenau.

PFAFFENHOVEN, a town of Wurtemberg; eight miles W. of Heilbronn.

PFAFFENREUT, a town of Germany, in the principality of Culmbach; five miles S.S.E. of Wonfiedel.

PFAFFEYEY, a town of Switzerland, in the canton of Friburg; 10 miles S.E. of Friburg.

PFAFRODA, a town of Saxony, in the circle of Erzgebirg; 76 miles from Freyberg.

PFALDORF, a town of Bavaria, in the principality of Aichftatt; fix miles N.E. of Aichftatt.

PFALZEL, a town of France, in the department of the Sarre, and chief place of a canton, in the diftrict of Treves; three miles N.E. of Treves. The place contains 860, and the canton 8370 inhabitants, in 40 communes.

PFANBERG, a town of the duchy of Stiria; 10 miles N. of Gratz.

PFANHEIM, a town of the duchy of Wurzburg: three miles E.N.E of Aut.

PFANNER, Tobias, in *Biography*, fon of a counfellor of the count de Oetingen, was born at Augfburg in 1641. He ftudied at Altdorf, Gotha, and Jena, and acquired a profound knowledge of jurifprudence, philofophy, and other branches of learning. After having been fucceffively governor to feveral young gentlemen, the duke of Saxe-Gotha made him fecretary of his archives, and employed him to inftruct his fons in hiftory and politics. In the year 1686 he was nominated counfellor to all the Erneftine line. He was fo well verfed in public affairs, that he obtained the name of "The living archives of the houfe of Saxony:" he bore an eftimable character, but had, through exceffive ftudy, contracted a melancholy difpofition. He died in the year 1717, at the age of 76. He was author of many works written in the Latin language, of which the principal are, "A Hiftory of the Peace of Weftphalia;" "A Treatife on German Princes;" "A Treatife on the Principle of Hiftorical Faith," &c. &c. Moreri.

PFASKIRCHEN, in *Geography*, a town of Auftria; five miles N.E. of Putzeinftorf.

PFEDDERSHEIM, a town of France, in the department of Mont Tonnerre; 24 miles N.N.W. of Spire.

PFESSIKON, a town of Switzerland, in the canton of Zurich; 10 miles E. of Zurich.

PFETER, a town of Bavaria, on a fmall river of the fame name; 14 miles E. of Ratifbon.

PFIN, a town of Switzerland, in the Valais; 12 miles E. of Sion.

PFLAU, a town of Tyrol; 16 miles W. of Bolzano.

PFORING, a town of Bavaria, encompaffed with walls, on the Danube; 14 miles E. of Ingolftadt.

PFORTEN, a town of Lufatia; 12 miles S. of Guben.

PFORZHEIM, a town of Baden, on the Entz, which here receives the Nagold and Warm. It comprehends a fpecial fuperintendance, a grammar-fchool, and an orphan-houfe; 8 miles S.S.E. of Durlach. N. lat. 48° 58′. E. long. 8° 50′.

PFRAME, a town of Auftria; 6 miles S.S.W. of Marcheck.

PFREIMBDT, a town of Bavaria, in the principality of of Leuchtenberg, on the Nab; 15 miles S.W. of Leuchtenberg.

PFULLENDORF, a town of Baden, made imperial in 1204, and continued fuch till the year 1802, when it was given among the indemnities to the margrave of Baden; 14 miles W.N.W. of Ravenfpurg. N. lat. 47° 52'. E. long. 9° 18'.

PFUNT, a town of Tyrol; 15 miles W. of Bolzano.

PFYN, a town of Switzerland, in the canton of Zurich, and capital of a bailiwick; 7 miles W. of Conftance.

PHACA, in *Botany*, a name borrowed by Linnæus from Diofcorides, whofe φακος, neverthelefs, the Lentil *Ervum* (or more properly *Cicer*) *Lens*, agrees no further with the Linnæan genus, than in being a papilionaceous and leguminous plant.—Linn. Gen. 384. Schreb. 507. Willd. Sp. Pl. v. 3. 1251. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 358. Sm. Prodr. Fl. Græc. Sibth. v. 2. 84. Juff. 358. Gærtn. t. 154. (Aftragaloides; Tourn. t. 223.) —Clafs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminofæ*, Juff.

Cal. Perianth inferior, of one leaf, tubular, five-toothed. *Cor.* papilionaceous: ftandard obovate, ftraight, largeft; wings oblong, obtufe, fhorter; keel fhort, compreffed, obtufe. *Stam.* Filaments diadelphous, one fet of nine, the tenth folitary; anthers roundifh, afcending. *Pift.* Germen oblong; ftyle awl-fhaped, afcending; ftigma fimple. *Peric.* Legume oblong, inflated, half divided into two cells; the upper future depreffed towards the lower. *Seeds* feveral, kidney-fhaped.

Obf. The legume in fome is ftraight, but in others recurved, infomuch that the point fometimes touches the bafe. As the partition of the legume of fome *Aftragali* is not actually attached to the lower future, though brought very near to it, the clofe affinity between thefe two genera is evident.

Eff. Ch. Calyx with five teeth; the two upper ones moft diftant. Legume divided half way into two cells, inflated.

1. Ph. *bætica*. Hairy Baftard Vetch. Linn. Sp. Pl. 1064. (Aftragalus primus, five bœticus; Cluf. Hift. v. 2. 233, 234. A. lufitanicus Clufii; Lob. Ic. v. 2. 78. Ger. Em. 1238.)—Hairy. Stem erect. Leaflets numerous, oval. Stipulas linear-lanceolate. Legume oblong, boat-fhaped, fomewhat depreffed.—Native of Portugal, Spain, and Greece. Dr. Sibthorp found it plentifully on mountains in the ifle of Cyprus. We have a fpecimen gathered by the late Dr. Brouffonet in Barbary. Clufius faw it flowering in the end of January, in Spain. Though this noble plant ftands on the lift of our horticultural riches, it is only from having been cultivated here in Parkinfon's days. Some traveller would do well to reftore it to us. The *root* is perennial, fpindle-fhaped, very thick and ftrong. *Stems* herbaceous, erect, about two feet high, as thick as the little finger, nearly fimple, leafy, flightly angular, a little zigzag, reddifh, clothed, like every other part of the herbage, with fine, foft, hoary hairs. *Leaves* alternate, about fix inches long, pinnate, of nine pair, with an odd one, of ftalked, elliptical, uniform, entire *leaflets*, of a hoary or glaucous green. *Stipulas* not quite an inch long, linear-lanceolate, almoft awl-fhaped, erect, reddifh. *Flowers* copious, large, and handfome, pure white, pendulous, in long, folitary, axillary, ftalked, upright *clufters*, about the length of the leaves. *Legume* near two inches long, ftraight, cylindrical, flightly depreffed, channelled along the back. The modern Greeks know this plant by a name equivalent to Wild Lupine; the Portuguefe call it Dog Lupine. The tafte of the leaves, and efpecially the feeds, is faid by Clufius to be acrid and burning.

Whatever may become of *Robinia veficaria*, Jacq. Ic. Rar. t. 148, we cannot follow Willdenow in introducing it here.

2. Ph. *falfula*. Salt Baftard-Vetch. Willd. n. 3. Linn. Suppl. 336. Pallas Reife v. 3. append. n. 115. t. B, b.—Hoary. Stem erect. Leaflets numerous, obovate; fmooth above, ftipulas oblong. Legume globofe, pendulous.—Gathered by Pallas in falt ground, about the lake *Tarëi*, in Dauria.—This is, in all its dimenfions, fcarcely half the fize of the preceding, and diftinguifhed by being finely hoary in every part, (except the upper furface of the *leaves*, which is glaucous,) with fine, clofe-preffed, fhort pubefcence. The *flowers* are much fewer, not above fix or eight in each clufter, and of a fine red. *Legumes* globofe, ftalked, pendulous. It flowers in its native country about the end of June, and has never been obferved in any other fpot than the above-mentioned.

3. Ph. *alpina*. Alpine Baftard Vetch. Linn. Sp. Pl. ed. 1. 755. Willd. n. 4. Jacq. Ic. Rar. t. 151. Villars Dauph. v. 3. 472. (Ph. leguminibus pendulis, femiovatis; Gmel. Sib. v. 4. 35. t. 14. Aftragalus n. 410; Hall. Hift. v. 1. 175. Aftragaloides alpina hirfuta erecta, foliis viciæ, floribus dilutè luteis; Till. Pif. 19. t. 14. f. 2.)—Erect, branched; fomewhat hairy. Leaves of many pair of elliptic-lanceolate obtufe leaflets. Legumes half-ovate, acute. Stipulas linear-lanceolate.—Native of the mountains of Switzerland, France, Savoy, Auftria, and Siberia, from all which countries we have fpecimens. The *root* is perennial, woody, very long and ftrong, fubdivided. *Stems* erect, about two feet high, branched, leafy, more or lefs clothed with fhort, clofe-preffed, white hairs. *Leaves* alternate, two or three inches long, compofed of from ten to fourteen pair, with an odd one, of elliptic-oblong, or fomewhat lanceolate, obtufe *leaflets*, whofe medium length is half an inch, clothed, efpecially beneath, with fuch hairs as the ftem. *Stipulas* nearly linear, broad at the bafe, from a quarter to half an inch long, fmooth on both fides, but fringed at the edges. *Flowers* yellow, in fhortifh, long-ftalked, axillary *clufters*, with linear, fringed *bracteas*. *Partial footftalks* fhort, flightly drooping, clothed, as is the *calyx* in fome degree, with fhort black hairs. The *germen* is very denfely fo clothed, but the *legumes* become fmooth, and are ftalked, pendulous, fcarcely an inch long, inflated, half-ovate, the back being nearly a ftraight line. *Seeds* ufually three or four.

This being certainly the original *Ph. alpina* of Linnæus, that name is properly retained for it, though he fometimes confounded this and the following.

4. Ph. *frigida*. Northern Baftard-Vetch. Linn. Syft. Nat. ed. 10. 1173. Fl. Lapp. ed. 2. 227. Willd. n. 5. Jacq. Auftr. t. 166. (Ph. alpina; Linn. Sp. Pl. 1064. Fl. Suec. ed. 2. 256. Ait. n. 2. Fl. Dan. t. 856. Aftragalus n. 402; Hall. Hift. v. 1. 176.)—Stem erect, unbranched, fmooth. Leaves of about five pair of ovate, flightly hairy, obtufe leaflets. Legumes oblong. Stipulas broad-ovate, reflexed.—Native of the alps of Lapland and Norway, as well as of the more lofty mountains of Auftria and Switzerland. Differs from the laft in being ufually of a more humble ftature, though in its feparate parts much larger. The above characters fufficiently mark the effential diftinctions. The *leaflets* are an inch long, and nearly half as broad, fmooth above. *Stipulas* very large and broad, fringed, or hairy. *Flowers* cream-coloured, drooping. *Legumes* pendulous, fomewhat boat-fhaped, flightly hairy, narrower, and fcarcely longer than the former.

The

The *ſtem* in our two Lapland ſpecimens appears to have been two feet high, and the *flowers* are much more numerous than in thoſe from Auſtria and Switzerland, whoſe utmoſt height is ten or twelve inches. Hence the plants look very different, and that difference gave riſe to the obſervation in the *Fl. Lapponica ;* but we ſubmit to the opinion of thoſe who conſider them as one and the ſame. We agree moreover with Willdenow, that the *leaves* are incorrectly ſhaped in *Fl. Dan.* The *flowers* alſo are too yellow. Haller miſapplies Tilli's t. 14. f. 2. to this ſpecies.

5. Ph. *auſtralis*. Cloven-winged Baſtard-Vetch. Linn. Mant. 103. Willd. n. 6. Ait. n. 3. Jacq. Miſc. v. 2. 43. t. 3. (Ph. Halleri ; Villars Dauph. v. 3. 473. t. 41. Aſtragalus n. 403 ; Hall. Hiſt. v. 1. 176. Aſtragaloides alpina ſupina glabra, foliis acutioribus ; Till. Piſ. 19. t. 14. f. 1.)—Stems decumbent, branched. Leaves of about eight pair of elliptic-lanceolate leaflets, ſmooth above ; the odd one nearly ſeſſile. Wings of the corolla cloven at the extremity.—Native of the alps of Switzerland, Dauphiny, and Auſtria. The *ſtems* are ſeveral, more or leſs decumbent, branched, from three to twelve inches long, generally almoſt entirely ſmooth. *Leaflets* clothed beneath only with cloſe-preſſed minute hairs ; the terminal one uſually on the ſame kind of ſhort ſtalk as the reſt, without any elongation of the common ſtalk. *Flowers* white, with purple-tipped keel, their wings remarkable for being deeply cloven at the ſummit. *Legumes* pendulous, oblong, ſmooth, as is even the *germen*.

6. Ph. *Gerardi*. Trailing Baſtard-Vetch. Villars Dauph. v. 3. 474. (Phaca ; Ger. Gallopr. 519?)—Stems decumbent, branched. Leaves of about ten pair of elliptical leaflets, hairy on both ſides. Wings of the corolla linear, entire. Germen hairy.—Native of the alps of Dauphiny and Switzerland. This is certainly eſſentially different from the laſt, in its entire *wings*. The *ſtems*, as well as both ſides of the *leaves*, are hairy ; *leaflets* more elliptical, and rather more numerous ; the odd one attended by an elongation of the common ſtalk. *Flowers* white ; their *ſtalks*, *calyx*, and eſpecially *germen*, clothed with black hairs. *Wings* certainly entire. Villars ſays the *legume* is a little hairy.

A ſpecimen of Mr. Chamier's plant, obtained from Kew garden in 1781, has the young *leaves* very hairy on both ſides, and the *calyx* alſo black, woolly, and hairy. But its ſmooth *germen* and cloven *wings* prove it the true *Ph. auſtralis*. We cannot decide poſitively concerning Gerard's plant, as he unluckily ſays nothing about the *wings*.

7. Ph. *arenaria*. Sand Baſtard-Vetch. Willd. n. 7. Ait. n. 4. Pallas Reiſe v. 3. append. n. 116. t. C, c. f. 1, 2.—Stems aſcending, ſmooth, nearly ſimple. Leaves of about five pair of lanceolate ſmoothiſh leaflets ; the odd one nearly ſeſſile. Legumes globular, erect.—Native of ſandy ground in Siberia, about the Uda, flowering in May. The form and poſition of the *legumes* diſtinguiſh this from the two laſt, to which it ſeems otherwiſe nearly akin. We have ſeen no ſpecimen.

8. Ph. *halicacaba*. Reticulated Bladder Baſtard-Vetch. Willd. n. 8.—"Stems procumbent. Leaves of about five pair of oblong, acute, hoary leaflets ; the odd one nearly ſeſſile. Calyx inflated, ovate, reticulated, hairy."—Native of Galatia. *Stems* ſeveral, ſhort. *Leaflets* clothed on both ſides with ſhaggy hoary hairs. *Cluſters* axillary, ſtalked, of from three to five yellow *flowers*. *Calyx* ovate, inflated, as big as a gooſeberry. Like *Ph. incana* hereafter deſcribed, but cauleſcent, with ſmaller *leaflets*, and larger *calyx* and bracteas. *Willd.*

9. Ph. *denſifolia*. Crowded-leaved Baſtard-Vetch.—Stem decumbent, branched, ſmooth. Leaflets numerous, crowded, obovate, emarginate, villous beneath. Calyx woolly. Legume turgid, ovate, nearly ſmooth.—Gathered by Mr. Menzies in California. The habit and ſize of this curious nondeſcript ſpecies ſomewhat approach to the two firſt, but the decumbent mode of growth diſtinguiſhes it from them. The copious *leaves*, about three inches long including their ſtalk, and their crowded, emarginate, folded *leaflets*, conſiſting of from 16 to 20 pair, woolly underneath, are altogether peculiar. The *ſtipulas* are very broad, ovate, concave, ſmooth except the point. *Flower-ſtalks* axillary, thrice as long as the leaves, each bearing an oblong denſe *cluſter*, of reddiſh drooping *flowers*. The *legume* is not unlike that of a *Colutea*, an inch and a half long, ovate, pointed, turgid, poliſhed, with a few minute hairs near the point.

10. Ph. *veſicaria*. Smooth Bladder Baſtard-Vetch. Linn. Mant. 103. Willd. n. 10. Vahl Symb. v. 1. 57. Schreb. Dec. 5. t. 3. (Aſtragaloides orientalis veſicaria, foliis et fructibus glabris ; Tourn. Cor. 27.)—Stem none. Calyx of the fruit inflated, ſmooth. Leaflets lanceolate, nearly naked, acute.—Gathered by Tournefort in Armenia. Schreber ſent a ſpecimen to Linnæus. *Root* woody and perennial. *Stem* none. *Leaves* ſeveral, of numerous pairs of narrow acute *leaflets*, quite ſmooth above, but their under ſide bears a few cloſe-preſſed hairs. *Flower-ſtalk* ſolitary, radical, bearing an erect lax *cluſter*, or *ſpike*, three or four inches long, of large handſome *flowers*, whoſe tubular downy *calyx*, after flowering, becomes inflated, nearly globoſe, finely reticulated, quite ſmooth, and tinged with purple. The *legume* within is ſmall and oblong.

11. Ph. *incana*. Hoary Bladder Baſtard-Vetch. Vahl Symb. v. 1. 57. Willd. n. 11. (Aſtragalus anthylloides ; Lamarck Dict. v. 1. 320. Aſtragaloides orientalis veſicaria, foliis et fructibus incanis ; Tourn. Cor. 27.)—Stem none. Calyx of the fruit inflated, villous. Leaflets ovate, ſilky, obtuſe.—Gathered by Tournefort in Armenia. Habit of the laſt. *Leaves* of about 20 pair of ovate, obtuſe, ſometimes emarginate *leaflets*, hoary on both ſides with ſilky hairs. *Stalks* hoary, taller than the leaves. *Flowers* yellow. *Calyx* ovate, inflated, at length globoſe, coloured, clothed with very ſoft down. An elegant ſpecies, which we have ſeen in Tournefort's herbarium, evidently akin to the laſt, but abundantly diſtinct.

In the *Supplementum* of Linnæus we find *Ph. ſibirica*, *proſtrata*, *microphylla* and *muricata*, the three latter of which are in the Linnæan herbarium. The deſcriptions of Pallas induced the younger Linnæus to refer theſe plants to *Phaca ;* but Pallas himſelf afterwards removed them to *Aſtragalus*, where they ſtand in the early part of Willdenow's fifth ſection, with others in the ſame predicament ; Willd. Sp. Pl. v. 3. 1298—1301. Their habit certainly accords with other *Aſtragali*. As to the character of the *legume*, it muſt be confeſſed to be very obſcure and uncertain, in almoſt every caſe.

Ph. trifoliata, Linn. Mant. 270. Willd. n. 9, alone remains to be noticed. Of this a ſpecimen from China is in the Linnæan herbarium, nor could any perſon ſurely have gueſſed at the plant without ſeeing the ſpecimen. Its habit is that of a three-leaved *Hedyſarum*, but the inflated ſemiorbicular *legumes* cannot accord with that genus. Theſe *legumes* however are deſcribed on the ſpecimen as unilocular, which they truly are ; ſo that the plant has no more of the character than the habit of a *Phaca*, in which genus it can by no means remain. Having no *flowers*, we can determine nothing certain, but according to the Linnæan ideas of *Glycine*, it might be removed to that genus. In many points it accords with the new genus *Flemingia*, Ait. Hort. Kew. v. 4. 349, but the ſeeds are four or five, inſtead of being two only.

The

The *ftem* is flender, branched, partly downy. *Leaves* ternate, very unequal in fize; *leaflets* obovate, entire, an inch long at moft; minutely hairy on both fides; finely reticulated with veins beneath. *Footftalks* fhort, hairy. *Stipulas* half-ovate, ribbed, chaffy, hairy, taper-pointed, deciduous. *Clufter* terminal, of about 20 flowers, in pairs, on downy glandular ftalks. *Legumes* half an inch long, tranfverfely veiny, nearly fmooth.

PHACELIA, a genus of Juffieu's, to which he applied this name, in allufion "to the cluftered fpikes, from φακελος, *a bundle*;" the figures of both fpecies neverthelefs have racemofe flowers. Juff. Gen. 129. Michaux Boreal-Amer. v. 1. 134.—Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Afperifoliæ*, Linn. *Borragineæ*, Juff.

Juffieu gives the following character.—"Calyx in five deep fegments. Corolla nearly bell-fhaped, five-cleft, with five furrows at the bafe internally, whofe membranous margins embrace the bottom of the filaments. Stamens prominent. Style fhort. Stigmas two, long. Capfule of two cells, four feeds, and two valves each with a partition from its middle, and containing one feed in each half cell. The herb is downy; with alternate pinnate leaves. Flowers turned one way, in upright, fafciculated, terminal fpikes. From an old fpecimen."—Michaux extracts a part of the above character only, without any alteration or addition. His plate reprefents a very long capillary ftyle.

1. Ph. *pinnatifida*. Mich. n. 1. t. 16.—"Erect. Leaves pinnatifid; their fegments cut and lobed. Spikes moftly cloven, oblong, many-flowered. Corolla blue; its lobes with a nearly fimple margin."—Native of the weftern woods of the Allegany and Kentucky mountains. The *ftem* is round, alternately branched. *Leaves* alternate, ftalked, deeply pinnatifid, or pinnate, with oppofite, pinnatifid or cut, fegments, apparently fmooth. *Clufters* terminal, folitary, downy, of about feven *flowers* turned one way, on partial ftalks half an inch long. *Fruit* globofe, crowned with the permanent ftyle.

2. Ph. *fimbriata*. Mich. n. 2. (Heliotropium pumilum glabrum, nafturtii foliis, americanum; Pluk. Phyt. t. 245. f. 5.)—"Procumbent, fomewhat afcending. Leaves pinnatifid; their fegments undivided. Spike folitary, fhort. Corolla white; its lobes fringed."—Native of lofty mountains in Carolina.

Such is Michaux's account. His latter fpecies however fhould feem, by the fynonym, to be no other than *Ellifia Nyctelea*. The figure cited proves on examination to be the original from whence Morifon copied his fect. 11. t. 28. f. 3, which is certainly the ELLISIA; fee that article. Probably therefore the *Phacelia bipinnatifida* may prove a new fpecies of *Ellifia*; for moft affuredly nothing is faid of it that gives any room to fuppofe it a diftinct genus.

PHACOIDES, a word ufed by the ancient phyficians to exprefs any thing that in fize and fhape approached to a lentil. Thus the cryftalline humour of the eye was fo called.

PHACOPTISANA, a medicine often mentioned by the ancient writers as a nourifhing and ftrengthening thing: it was a ptifan with lentils.

PHACO'SIS, from φακη, *a lentil*, a black fpot in the eye, refembling a lentil.

PHÆCASIA, in *Antiquity*, a kind of fhoes.

PHÆDO, in *Biography*, a Greek philofopher, founder of the ELIAC *fchool*, to which article we refer our readers for particulars relating to him.

PHÆDRUS, well known for his fables, was a native of Thrace, and probably brought to Rome at an early age, in the condition of a flave. He came into the fervice of the emperor Auguftus, by whom he was enfranchifed, as appears from the title prefixed to his work of "Augufti Libertus." Of his life nothing more is known, except that in the reign of Tiberius he was a fufferer under the injuftice and tyranny of Sejanus, whom he furvived. It is probable he lived to an advanced age. He was author of five books of fables, compofed in Iambic verfe. They are valuable for their precifion, purity, elegance, and fimplicity. The matter of thefe fables is generally borrowed from Æfop, but Phædrus intermixes ftories or hiftory-pieces of his own. This work appears to have been little known in his own time, for no extant writer of antiquity alludes to it. This circumftance, together with the affertion of Seneca, "that the Romans had not attempted Fables and Æfopean compofitions," might throw a fufpicion on the genuinenefs of the work, did not its ftyle and manner refer it to the beft age of Roman literature. It remained unknown to the moderns till 1595 or 1596, when Francis Pithou difcovered a copy in the library of St. Remi at Rheims, and fent it to his brother Peter, who publifhed it. Two manufcripts of Phædrus are faid to exift, both of which are not only imperfect, but being tranfcribed from the fame copy very carelefsly, they are full of errors; hence few ancient works have given more trouble and room for conjecture to critics. The beft editions of Phædrus are thofe of Burmann 4to. 1727; Hoogftraten 4to. 1701; and Barbou 12mo. Paris 1754.

PHÆNIX, the name of an ancient mufical inftrument, which, according to Mufonius, was ufed by the king of Thrace in the national feftivals: its invention is attributed by fome authors to the Phœnicians, probably from the analogy between the two names.

PHÆNOGAMOUS PLANTS, in *Botany*, from φαινω, *to fhew*, or *make apparent*, and γαμος, *marriage*; a term invented, if we miftake not, by the German botanifts, for fuch vegetables as have the parts of the flower, or organs of impregnation, evident and intelligible, like the generality of plants. The term therefore is oppofed to Cryptogamous Plants. See CRYPTOGAMIA.

PHÆNOMENON, or PHENOMENON, φαινομενον, formed from φαινομαι, *I appear*, ftrictly an appearance in phyfics, an extraordinary appearance in the heavens, or on earth; either difcovered by obfervation of the celeftial bodies, or by phyfical experiments; and whofe caufe is not obvious. Such are meteors, comets, uncommon appearance of ftars and planets, earthquakes, &c. Such alfo are the effects of the magnet, phofphorus, &c.

The phenomena of comets are inconfiftent not only with the folidity of the heavens, fuppofed in the Ptolemaic hypothefis, but equally with the plenitude of the heavens, afferted by the Cartefians.

That hypothefis is beft which folves moft phenomena. Sir Ifaac Newton fhews, that all the phenomena of the heavenly bodies follow from the attraction of gravity, which intercedes thofe bodies; and almoft all the phenomena of the leffer bodies from the attraction and repulfion between their particles; fo fimple is nature.

PHÆNOMENON, *Parallax of a*. See PARALLAX.

PHÆOPUS, in *Ornithology*, a fpecies of *Scolopax*; which fee.

PHAËTHUSA, in *Botany*, fo called by Gærtner, from φαω, *to fhine*, in allufion to the great fize of the plant, its very abundant yellow flowers, and confequently ftriking appearance. The name is borrowed from heathen mythology; the nymph who bore it having been one of the fifters of Phaëton. Gærtn. v. 2. 425. t. 169. f. 3. Schreb. 571. Willd.

Willd. Sp. Pl. v. 3. 2221. Mart. Mill. Dict. v. 3. Lamarck Illustr. t. 689.—Class and order, *Polygamia superflua*. Nat. Ord. *Compositæ oppositifoliæ*, Linn. *Corymbiferæ*, Juss.

Gærtner founded this supposed new genus on the *Siegesbeckia occidentalis* of Linnæus, under the following essential character.

Calyx nearly cylindrical, of many imbricated unequal leaves, recurved at their tips. Receptacle chaffy. Perfect florets several in the disk; female one or two, ovate-oblong, cloven at the point, in the radius; all fertile. Seeds hispid, without seed-down.

Michaux, finding that the plant in question had awns to the seed, referred it to *Verbesina*, and concluded the *Phaëthusa* of Gærtner to be something else. But it appears to us, from examining original specimens of Linnæus and Gronovius, which leave no doubt of what they intended, that Gærtner's plant is precisely their's, and that either he has made a mistake, in overlooking the two very conspicuous rough bristly awns which crown the germen and seed, or that such may occasionally be wanting. In either case his *Phaëthusa* cannot be maintained; for no person surely would insist on the small number of radiant florets. Michaux seems right in referring this plant to *Verbesina*, in which he is followed by Willdenow and Aiton. The younger Linnæus judged it, by the seeds, to be a *Coreopsis*, but it wants several characters, as well as the habit, of that genus. See VERBESINA.

PHÆTON, in *Ornithology*, the Tropic bird, a genus of birds of the order Anseres. The generic character is, bill sharp-edged, straight, pointed, the gape of the mouth reaching beyond; nostrils oblong; hind toe turned forwards. Of this genus there are three species; they inhabit the South-sea, particularly between the tropics, and are often seen upon the backs of porpoises. In all of them the bill is compressed, and bent a little downwards, the lower mandible angulated. The feet have four toes, which are palmated. The tail is cuneiform, and distinguished by the great length of the two intermediate feathers.

Species.

ÆTHEREUS; common Tropic bird. White; back, rump, and lesser wing-coverts streaked with white; the two middle tail-feathers black at the base; bill red. It is about 34 inches long, and is the size of a wigeon. It flies very high, and at a great distance from land; feeds on young sharks, dolphins, and albicores. On land, where it is rarely seen, except in the breeding season, it sits on trees, and builds on the ground, in woods. It is well known to most of our navigators, to whom it generally announces their approach to the tropic, though this indication cannot be relied on as infallible, as the species will wander to the latitude of 47½°. There are two varieties; 1. White; band over the eyes, scapulars towards the extremity, band above the wings, and shafts of the tail-feathers at the origin, black; 2. Body pale and tawny.

MELANORHYNCHOS; Black-billed Tropic bird. Streaked black and white, beneath white; bill black; quill-feathers tipt with white, tail-feathers with black. It is found in Palmerston and the Turtle islands, and is nearly 20 inches long. There is a fine black streak before and behind the eyes; the front is white.

PHŒNICURUS; Red-tailed Tropic bird. Rosy flesh-colour; bill and two middle tail-feathers red. It is found in Mauritius island, is 34 inches long, of which the two middle tail-feathers measure 21 inches; it builds in hollows in the ground under trees, and lays two yellowish-white eggs with rufous spots.

PHÆUS, in *Zoology*, a species of *Mus*; which see.

PHAGEDÆNA, from φαγω, *to eat*, a term in *Surgery*, applied to an ulcer, when it presents an unhealthy appearance, and spreads, as it were, by eating the parts away, common remedies not having the power of curing the disease.

PHAGEDÆNIC MEDICINES, such as are used to eat off fungous or proud flesh.

PHAGEDÆNIC *Ulcer*. See PHAGEDÆNA, and ULCER.

The Ephemerides of the academy of the Curiosi Naturæ relate, that phagedænic ulcers have been frequently cured only with sheep's dung.

PHAGEDÆNIC *Water*, in *Chemistry*, denotes a water made from quick-lime and sublimate; so called from its efficacy in the cure of phagedænic ulcers.

To prepare this water, they put two pounds of fresh quick-lime in a large earthen pan, and pour upon it about ten pounds of rain-water; these they let stand together two days, stirring them frequently: at last leaving the lime to settle well, they pour off the water by inclination, filtrate it, and put it up in a glass bottle, adding to it an ounce of corrosive sublimate in powder; which, of white, becomes yellow, and sinks to the bottom of the vessel. The water, being settled, is fit for use, in the cleansing of wounds and ulcers, and to eat off superfluous flesh, and especially in gangrenes; in which case may be added to it a third or fourth part of spirit of wine.

PHAGESIA, φαγησια, in *Antiquity*, a festival in honour of Bacchus, celebrated during the Dionysia.

It was otherwise called *phagesiposia*, φαγησιποσια; which names come from φαγειν, *to eat*, and πινειν, *to drink*; because it was a time of good cheer.

PHAGON, φαγων, a festival of the same nature with that called Phagesia.

PHAGRUS, or PAGRUS, in *Ichthyology*. See SPARUS.

PHAGUS, in *Botany*, a name given by many authors to the esculus, or sweet and esculent oak, found in Greece and Dalmatia.

PHAIUS, so called by Loureiro, Cochinch. 529, from φαιος, *brown*, is evidently, by his description, the beautiful *Limodorum Tankervilliæ*, cultivated in the gardens of China and Cochinchina, for the sake of its flowers, the upper surface of whose petals is of a brown hue, very unusual in those parts of a flower.

PHALACRA, a word used by Hippocrates to express all the blunt instruments used in surgery; such as probes and others, with buttons at the ends.

PHALACROCEPHALUS INDICUS, in *Ichthyology*, the name of an anadromous fish of the East Indies. Its neck and head appear naked and bald, as it were; it is all over of a greyish-white in colour, and is variegated with red spots about the mouth; the eyes are large and very prominent, and their irises yellow; its usual size is about a foot and a half in length, and it lives part of its time in the sea, and part in rivers; it is an extremely delicate tasted fish, and esteemed one of the finest of that part of the world. It is called by the Dutch *kaelkop*.

PHALACROCOROX, in *Ornithology*. See PELECANUS *Carbo*.

PHALÆNA, *the Moth*, in *Entomology*, a genus of insects of the order Lepidoptera, whose generic character is: Antennæ setaceous, and gradually tapering from the base to the tip; the tongue is spiral; it has no jaws, and the wings, when at rest, are generally deflected: the flight is nocturnal. There are more than 1500 species, divided into sections, which are subdivided into still smaller assortments.

In

In our enumeration of the ſpecies, we ſhall wholly paſs over thoſe which are the leaſt intereſting to ſcientific readers. Moths fly abroad only in the evening, and during the night, and obtain their food from the nectar of flowers. The larva is active and quick in motion, moſtly ſmooth, more or leſs cylindrical, and it preys voraciouſly on the leaves of plants. The pupa is torpid or quieſcent, more or leſs cylindrical, pointed at the tip or at both ends; and is generally incloſed in a follicle. The following are the diviſions of the moth tribe, according to the Linnæan ſyſtem, which we ſhall follow.

Bombyx. Antennæ filiform; two feelers, which are compreſſed and reflected; tongue ſhort, membranaceous, obtuſe, and bifid; the larva is ſixteen-footed, often hairy; the pupa is pointed at the tip.

Subdiviſions.
- a. Wings expanded.
- b. —— reverſed.
- c —— deflected.
- d. —— incumbent.
- e. —— convolute.

It ſhould be obſerved that Dr. Shaw and others have divided the ſection Bombyx into two ſections, *viz.* Attaci; and Bombyces properly ſo called. The reader will therefore bear in mind that the Linnæan Bombyces include the Attaci of other naturaliſts.

Geometra. Antennæ filiform; feelers cylindrical; tongue projected, membranaceous, ſetaceous, bifid; the larva is from eight to ten-footed, ſix of which are pectoral, two caudal, and ſometimes two ſubcaudal; the pupa is pointed at the tip.

Subdiviſions.
- a. Antennæ pectinate.
- b. ——— ſetaceous.
- c. Wings forked.

Noctua. Antennæ ſetaceous; feelers compreſſed, hairy, the tip cylindrical and naked; tongue projecting, horny, ſetaceous, bifid; larva ſixteen-footed; pupa pointed at the tip.

Subdiviſions.
- a. Wings expanded.
- b. —— flat incumbent, thorax ſmooth.
- c. ——————, ——— creſted.
- d. —— deflected, thorax ſmooth.
- e. ——————, —— creſted.

Hyblea. Antennæ ſetaceous; feelers projecting, compreſſed, dilated in the middle; the lip is projecting and acute.

Hepialus. Antennæ moniliform; feelers two, reflected, hairy, between which is the rudiment of a bifid tongue; the larva is ſixteen-footed, feeding on the roots of plants; the pupa is folliculate, cylindrical, and pointed at the tip.

Cossus. Antennæ ſhort, filiform; two feelers, very ſhort, cylindrical, reflected.

Pyralis. Antennæ filiform; the inſects of this diviſion have likewiſe two feelers, which are equal and almoſt naked; they are cylindrical at the baſe, the middle is dilated into an oval, and ſubulate at the tip; the tongue is projected, ſetaceous, and bifid; the wings are very obtuſe, and ſlightly curved at the exterior margin; the larva is ſixteen-footed, and rolling up the leaves to which it attaches itſelf.

Tinea. Antennæ ſetaceous; four feelers, which are unequal; the larva is found in houſes among linen and woollen cloths, and furniture, in which it eats holes, and to which it is very deſtructive.

Alucita. Antennæ ſetaceous; two feelers, that are divided as far as the middle; the inner diviſion is very acute.

Pterophorus. Antennæ ſetaceous; two feelers, that are linear and naked; the tongue is exſerted, membranaceous, and bifid; the wings are fan-ſhaped, divided down to the baſe, and generally ſubdivided as far as the middle; the larva is ſixteen-footed, ovate and hairy; the pupa is naked, and ſubulate at the tip.

The foregoing diviſions, like thoſe of the genus Papilio, are not ſtrictly accurate, and therefore muſt be regarded with a proper degree of allowance.

Bombyx.

a. *Wings expanded.*

Species.

Atlas. This is the largeſt and moſt ſplendid of the Phalænæ known: the ſpecific character is; wings falcate, varied with yellow, white, and ferruginous, with a tranſparent ſpot on each; that on the upper pair with a contiguous ſmaller one. The extent of the wings of this inſect meaſures between eight and nine inches; the ground colour is a very fine deep orange-brown, and in the middle of each wing is a large ſub-triangular tranſparent ſpot or patch, reſembling the appearance of a piece of Muſcovy talc; each of theſe tranſparent parts is ſucceeded by a black border, and acroſs all the wings run lighter and darker bars, exhibiting a very fine aſſortment of varying ſhades; the upper wings are ſlightly curved downwards at their tips, in a falcated manner, and the lower wings are edged with a border of black ſpots, on a pale buff-coloured ground; the antennæ are widely pectinated, with a quadruple ſeries of fibres, exhibiting a highly elegant appearance. This inſect is found in America and the Eaſt Indies, and varies in ſize and colours. The larva is verticillate, with hairy tubercles, and it ſpins a web of ſtrong yellowiſh ſilk, that is difficult to be untwiſted.

Hesperus. Wings falcate, varied with white and yellow, and ferruginous, with an ovate tranſparent ſpot on each; the lower ones are rounded. This is an American inſect, as are the next two.

Aurotus. Wings falcate, both ſurfaces alike, yellowiſh, with a whitiſh band and tranſparent lunule on the diſk. A ſpecimen is in the muſeum of Dr. Hunter.

Cecropia. Wings grey, with a fulvous band; upper pair with a ſub-hyaline ferruginous eye.

Irius. Wings pale orange; upper pair with a tranſparent ſpot; lower ones with a black eye, the pupil is tranſparent. This and the next are Indian inſects, and with many other ſpecies of this genus, ſpecimens are preſerved in the muſeum of Mr. Francillon.

Saturnus. Wings grey, with a tranſparent ſpot; the lower ones have a black eye; the pupil being half cloſed.

Paphia. Wings falcate, both ſurfaces alike, yellow, with rufous ſtreaks and a tranſparent eye. Found in many parts of Aſia.

Polyphemus. Wings falcate, yellowiſh-grey, with a central, ocellate, tranſparent eye on each; that on the lower pair is large and blueiſh. The larva of this inſect is green, and the pupa yellowiſh-brown.

Dione. Wings yellow, with two ſtreaks, the anterior of which is interrupted and of a fleſh colour, with a tranſparent eye. It inhabits Guinea.

Cytherea. Wings grey, with cinereous ſtreaks and a tranſparent eye. Found at the Cape of Good Hope.

Mylitta. Wings falcate, yellow, with a ferruginous ſtreak

ſtreak and divided tranſparent eye. It is found in different parts of India.

PrometHEA. The wings of this ſpecies are ſlightly falcate, edged with grey, the upper pair is marked with a black eye on each ſide. The larva is of a green colour, dotted with black, with four red ſpines.

Erythrinæ. Wings browniſh, with a waved pale ſtreak. The larva is yellowiſh, with black ſpiracles, and four black ſpines on the collar, and two near the tail.

Conspicillator. The wings of this are falcate, the upper pair brown, with a paler ſigmoid ſtreak; the lower ones are black, with a large red eye. This is a native of Amboina; a ſpecimen is in the Britiſh Muſeum.

Janus. Upper wings variegated, with a black eye beneath; lower ones red, with a black eye. It is found in Surinam.

Certhia. Wings rounded, brown, the tip cinereous, with white and brown waves. Found at Chuſan.

Megæra. Upper wings blue, ſpotted with white; lower ones white in the middle, the tip blue, with yellow waves. Found in North America.

Hippodamia. Wings ſlightly falcate, brown, with a paler margin, in which is an uninterrupted white ſtreak on the upper pair. It inhabits Surinam.

Nictitans. Wings brown, fleſh-colour; lower pair with a ferruginous eye, the pupil tranſparent. It inhabits Africa, as do the three following.

Semiramis. The wings of this ſpecies have very long tails of various colours, with a tranſparent dot on each.

Boreas. Wings tailed, cinereous, varied with brown; upper pair with two, the lower ones with a ſingle tranſparent dot.

Luna. Wings tailed, both ſurfaces alike, pea-green, with a tranſparent lunule eye on each ſide. This is a large and extremely beautiful inſect; its colour is a moſt elegant pea-green, with a ſmall yellowiſh eye-ſhaped ſpot, with a tranſparent centre in the middle of each wing, and the lower wings are produced at the bottom into a long and broad tail, or continuation; the ridge of the upper wings is broad, and of a fine purple-brown colour; the head and thorax are of a yellowiſh-white, and the body milk-white.

Epimethea. Wings tailed, browniſh, with a white ſtreak; the lower ones have a fulvous eye on the diſk. This is a native of Guinea.

Argus. Wings tailed, of a pale ferruginous colour, with numerous tranſparent ocellar dots; the tail is very long. Found in Africa.

Fenestra. Both ſurfaces of the wings alike, yellow, with two tranſparent ſpots on the upper pair, and one on the lower. This and the next are natives of India.

Penelope. Wings yellowiſh, ſpeckled with brown; they have a tranſparent central eye on each.

Tyrrhea. Wings grey, with white ſtreaks, and a central black eye; the pupil is tranſparent. It inhabits the Cape of Good Hope.

Perspicua. Wings brown; upper pair with a ſhort tranſparent band. A native of India.

Armida. Wings yellow, with violet ſpecks, ſpecks and ſtreak behind Found at Cayenne.

Militaris. Both ſurfaces of the wings alike; yellow, with violet tip and ſpots; the upper pair is ſpotted outwardly with white. Found in China, and other parts of Aſia.

Castalia. Wings rounded, white; upper pair with an eye; lower ones with a brown dot. This inhabits New Holland.

* Pavonia. Wings rounded, and clouded with grey, and barred with grey beneath; each of them has a nictitant ſemitranſparent eye. In ſome books this is called the P. junonia: it is found in various parts of Europe; it meaſures nearly ſix inches in extent of wings, and is varied by a moſt beautiful aſſortment of colours, conſiſting of different ſhades of deep and light grey, black, brown, &c.; on the middle of each wing is an eye-ſhaped ſpot, having the diſk black, ſhaded on one ſide with blue; ſurrounded with red-brown, and the whole included by a circle of black: laſtly, all the wings are bordered by a deep edging of very pale brown, with a whiter line immediately adjoining to the darker part of the wing; the antennæ are finely pectinated; the larva, which feeds on the apple, pear, &c. is not much leſs beautiful than the perfect inſect; it is of a fine yellowiſh-green colour, with each ſegment of the body ornamented by a row of upright prominences of a bright blue colour, with black radiated edges, and ſurrounded by long black filaments, each of which terminates in a clavated tip. This larva, when ready for its change, envelops itſelf in an oval web, with a pointed extremity, and transforms itſelf into a large ſhort chryſalis, out of which, in due time, emerges the moth. This is finely figured in Dr. Shaw's General Zoology, vol. vi.

Achelous. Wings ferruginous; all of them with a white band, and the upper pair with a white dot. A native of America.

Arculata. Wings ſcalloped, indented; the lower ones are truncated, and very obtuſe. A native of Surinam, as is the next alſo.

Liberia. Upper wings cinereous or reddiſh, with dark ſpots and ſtreaks, lower ones fulvous, with a black eye.

* Tau. Wings of a brick colour, adorned with an eye of a violet colour, having a white ſpear-ſhaped pupil. It is found in many parts of Europe, as well as in this country. It feeds on the birch. The larva is green, marked on the ſides with oblique white ſtreaks; the back is covered with knots. The pupa is light brown and hairy.

Jo. Wings yellow; upper pair with a black eye beneath; lower ones with one above; the pupil is white. It is a native of America.

Abas. Wings brown; lower ones cinereous, with a rufous eye. This and the next are natives of Surinam.

Salmonea. Upper wings brown, with a black ſtreak; lower ones rufous, with a black eye, in which is a white lunule.

Proserpina. Wings rounded, black, with a white band, in which is a ſubocellar black ſpot. A native of America.

b. *Wings reverſed.*

Populifolia. Wings teſtaceous, indented, with numerous brown lunules. It is a native of Europe, and found on the white poplar.

* Quercifolia. Wings indented, ferruginous; mouth and ſhanks black. This is found in our own country on graſs, the ſlow, the pear, apple, and willow trees. The larva is hairy, of a ruſty colour, with a blue neck, and furniſhed with a ſlight tail. The pupa is brown, and marked with red bands.

* Ilicifolia. Wings half covered, ſerrate, grey; the hind margin is dotted with white.

Promula. Wings ſlightly indented, brown, immaculate; abdomen cheſnut-brown. It inhabits Java.

Cassandra. Wings ferruginous, with darker ſtreaks; thorax cheſnut-brown on the fore part.

Capensis. Wings pale red; upper pair with two

 flexuous

flexuous ftreaks, the pofterior of which is joined to a black one. It inhabits Africa.

ORIENTALIS. Wings teftaceous, with three ferruginous ftreaks, beneath a fingle one. This is an Eaft Indian infect.

ALUCO. Wings brown, cinereous at the tip. It inhabits the Cape of Good Hope.

AUSTRALASIÆ. Wings orange-red; lower ones beneath ferruginous at the bafe. This is a native of New Holland.

QUADRICINCTA. Wings chefnut-brown, with four pale ftreaks. It inhabits the Eaft Indies.

* FAGI. Wings reddifh-cinereous, with two linear, flexuous, yellow bands.

* TRIFOLII. Wings ferruginous; upper pair with a pale ftreak and white dot; the lower ones are immaculate.

* QUERCUS. Wings dark brown, with a yellow band; the upper pair with a central white dot. This is figured and defcribed by Mr. Donovan.

STIGMA. Wings teftaceous, fpeckled with brown, and with a central fnowy dot. Found in America.

LUSCA. Wings ferruginous; upper pair with a black fpot in the middle. A native of Coromandel.

* PRUNI. Wings indented, yellow, with two brown ftreaks, and a white dot. This is found on the plum. The larva is fmooth, and of an afh-colour; it is marked with blue lines, and furnifhed with tufts of hair on the neck, and along the fides; the hind legs are ftretched out at a diftance from one another. The pupa is black on the fore part of the body, and of a light brown behind.

AMPHIMONE. Wings entire, pale afh, with a black ftreak; the upper pair with a fulvous dot in the middle. It is a native of Terra del Fuego.

* POTATORIA. Wings flightly indented, yellow-brown, with an oblique fulvous line, and two white dots, in the upper pair. The larva is tailed, crefted, hairy, dark brown, fpeckled with white; the pupa is folliculate, dark brown; the eggs are oblong, and of a lead colour, with a green ring at each end, and a dot in the middle.

OCCULATISSIMA. Wings white, with numerous black ocellar dots. This and the next two are natives of America.

PUNCTATISSIMA. Wings and body fnowy, dotted with white; thorax with a black lunule on each fide.

PITHECIUM. Wings clouded with brown, a palmate fpot on the difk, acute-angled at the bafe.

HIBISCI. Both furfaces of the wings alike, yellow, with two brown ftreaks on the upper, and one on the lower pair. A native of India.

CYNORA. Wings yellow, with two brown ftreaks, and three connected brown rings on the upper pair. Found in Surinam.

OPERCULARIS. Wings yellow; the anterior margin and difk brown, with numerous whitifh lines. This and the next are natives of America.

PYXIDEFERA. Wings yellow; the difk with numerous brown and black flexuous patches.

* PINI. Wings grey, fpeckled with brown, with a ferruginous band and bafe, and triangular white dot. This is figured and defcribed by Mr. Donovan.

VELLEDA. Wings black, with white nerves; the margin with four white ftreaks.

* DUMETI. Wings brown; upper pair with a yellow dot, band, and hind margin.

* VERSICOLORA. Upper wings grey, varied with brown and tranfverfe black and white lines; the lower ones are ferruginous.

* RUBI. Wings fawn-coloured, marked with two whitifh ftreaks on their upper furface. It is found on the bramble and willow. The larva is hairy, black on the under fide, and of a rufty colour, marked with black rings on the upper fide. When young, it is covered with a veil of black filk. The pupa is blackifh, marked with three yellow rings, and enclofed in a covering of filk.

LANIGERA. Wings black, with two whitifh ftreaks, and a fnowy lunule in the middle.

* VINULA. Wings grey, with blackifh waves and ftreaks; thorax and abdomen grey, fpotted with brown. This is a remarkably elegant infect, without any gaiety of colour, being a middle-fized white moth, variegated with numerous fmall black ftreaks and fpecks; the thorax and abdomen are extremely downy, and the body is marked with tranfverfe black bars. The larva of this moth is far more brilliant in its appearance than the image or complete infect; it is of confiderable fize, meafuring above two inches in length, and is of a moft beautiful green, with the back of a dull purple, freckled with very numerous deeper ftreaks in a longitudinal direction; the purple part of the back is feparated from the green on the fides by a pair of milk-white ftripes, which, commencing from the head, run upwards to the top of the back, that part being elevated confiderably above the reft into a pointed procefs; and from thence are continued along the fides to the tail; the face is flat, and fubtriangular, yellowifh, furrounded, firft by a black, and then by a red border; and it is diftinguifhed by two deep black eyes or fpots on each fide the upper part: from the tail, which is extended into two long, roughened, fharp-pointed, tubular proceffes, proceed, on the leaft irritation, two long, red, flexible tentacula, the infect feeming to exert them as if for the purpofe of terrifying its difturbers; lifting up the fore-part of the body, at the fame time, in a menacing attitude, and prefenting a highly grotefque appearance. This creature poffeffes the power of fuddenly ejecting from its mouth, to a confiderable diftance, an acrimonious reddifh fluid, which it ufes as a farther defence, and which produces confiderable irritation, if it happen to be thrown into the eyes of the fpectator. It is principally feen on willows and poplars, and when the time of its change comes, it defcends to the lower part of the tree, and envelops itfelf in a glutinous cafe, prepared by moiftening with its faliva the woody fibres of the tree, and covering itfelf with them, attaching the edges very clofely to the bark, and in this ftate it remains fecure throughout the whole winter, it being too clofe to be affected by the froft, and too ftrong to be fuccefsfully attacked by birds. The chryfalis is thick, fhort, and black, and in the month of May or June, according to the warmth of the feafon, gives birth to the moth, which, immediately on emerging from the upper part of the chryfalis, difcharges a quantity of fluid fufficient to foften effectually the walls of its prifon, and effect a ready efcape.

* LANESTRIS. Wings of a rufty colour, marked with a white ftreak; the upper wings are white at the bafe, and marked with a white dot. It is a native of this and other countries of Europe, and found on the lime-tree, the floe, and the willow. It produces eggs covered with afh-coloured wool. The larva is hairy and black. It is gregarious, and lives in habitations which it forms for itfelf, compofed of many cells; going out in queft of food, it returns through parallel holes. The pupa is of a fulphur colour.

RUBICUNDA. Upper wings rofy, with a broad yellow band. It is a native of Virginia.

* POPULI. Brown, the fore part pale; wings brownifh, with a flexuous whitifh ftreak, and contiguous fmaller one.

Catax. Wings ferruginous, uniform, with a white dot. Native of Europe.

Everia. Wings yellow, with a white dot, and paler at the tip. It inhabits Germany.

* Processionea. Wings cinereous-brown, with a fingle darker ftreak on the female, and two on the male. The larva is gregarious and hairy; and the fkin, which it cafts off, is faid to produce inflammation, if touched.

Pithyocampa. Wings grey, with three darker ftreaks; the lower ones are pale, with a brown dot near the tail. It is found in Auftria, and fo is the next.

Varia. Wings brown, with waved paler ftreaks.

Mori; Silk-worm. Wings pale, with three obfolete brown ftreaks. This is by far the moft important of all the moths. It is a native of China or Perfia, and was introduced into Europe by Juftinian. It varies a little in fize and colour, the wings being fometimes yellowifh, and fometimes whitifh. The larva is furnifhed with a tail, is naked, and whitifh. The pupa is light brown, enclofed in a thick filky covering, from which filk is manufactured. The firft perfon who unravelled the cocoons of the filk-worm, and manufactured them into filk, was Pamphilia, a woman of Coos, the daughter of Latona. See Silk and Silk-*Worm*.

Tricolor. Upper wings fnowy, with a fcarlet rib, and a ftreak of black dots; the lower ones are fcarlet; thorax fnowy, with red dots. It is a native of Cayenne.

Ferruginea. Wings ferruginous, immaculate. It is a native of Italy.

* Neustria. Wings pale buff-colour, with two ferruginous ftreaks, and only one beneath.

* Castrensis. Wings dufky, with two paler bands.

Americana. Wings whitifh, with patches of brown. A native of North America.

Franconia. Wings hyaline, whitifh, with a pale ftreak and black border. It is a native of Auftria, as is the next.

Taraxaci. Wings pale, both furfaces alike; upper pair with a brown dot in the middle; the body is fulvous.

Ilicis. Wings dull grey, with a white band, in which is a waved grey ftreak. It is found in the oak, in divers parts of France.

Mali. Wings cinereous, with a finuate darker band, in which is a black dot. A native of Germany.

Hieracii. Wings entire, footy black. It is found in fome parts of Europe, on the Delphinium hieracium. The larva is hairy, black, with a red dorfal line, and fecretes itfelf within a follicle, which it makes of dry leaves and ftraws.

Apiformis. Wings footy black; body covered with ferruginous hairs. It is a fmall infect, and found in Italy.

c. *Wings deflected.*

Lagopus. Wings yellowifh, with brown fpecks and two ftreaks; the fore legs are projecting, and very hairy. It is a native of China.

Imperatoria. Wings yellow, fpotted with brown, all of them with a fubocellar ferruginous fpot. It is a native of India.

Senatoria. Wings brown, teftaceous, with a brown ftreak; the upper pair with a central fnowy dot. This and the next are natives of America.

Pellucida. Wings brown, teftaceous, with a purple outer margin; upper pair with a central fnowy dot.

Crassicornis. Wings cinereous, with brown fpecks and waved ftreaks. It is a large infect, and a native of India.

Hyphinoe. Wings blue; upper pair fpotted with yellow. This and the next are natives of Amboina.

Cyane. Wings black, with hyaline fpots; lower ones with fulvous lunules.

Regalis. Wings grey-brown, with fulvous veins and yellow fpots. It inhabits North America.

* Dispar. Upper wings of the male brown, with black flexuous bands; of the female whitifh, with tranfverfe flexuous brown lines. The larva is hairy, with white lines and blue fpots on the fore part, and red ones behind. When handled, it caufes an unpleafant itching on the fkin. The pupa is folliculate, with four black dots.

Lantanæ. Wings fnowy, with three or four ftreaks of connected brown rings. It is a native of America.

Amasis. Wings whitifh, with black ftreaks; lower ones yellow, fpotted with black; the abdomen is black, with red belts. It inhabits Surinam.

* Pudibunda. Wings cinereous, with three waved brown ftreaks.

* Fascellina. Wings cinereous, with black fpecks and two fulvous ftreaks.

Leucophæa. Wings brown, upper pair with a broad whitifh ftreak, a black line at the bafe, and a white dot at the hind angle. This and the next are natives of America.

Leucostigma. Wings grey, upper pair with black ftreaks and lines, and a white lunule at the hind angle. The female is apterous.

* Bucephala. Wings grey, with two double brown flexuous ftreaks, and a large yellow fpot at the tip.

Helops. Wings clouded; lower ones pale chefnut; abdomen chefnut-brown, annulate with white. A native of America.

Oleagina. Wings flightly tailed, green-brown, with two white fpots, the anterior pupillate, the hind one larger. Found in Germany.

Cœruleocephala. Wings brown, marbled with blueifh, and a double irregular whitifh fpot.

Argentina. The wings of this fpecies are toothed on the back, grey, with two filvery fpots, the anterior heart-fhaped. Native of Germany.

Decora. Upper wings variegated with red, yellow, and black; the lower ones red, edged with black. It inhabits the Cape of Good Hope.

Celsia. Wings above green, with a finuate indented glaucous band. A native of Sweden.

Dione. Wings white, ftriate, and dotted with black; beneath there is a purple margin. A native of North America.

* Ziczac. Wings toothed on the back, clouded brown and reddifh-white, with a large clouded ocellar fpot at the tip; the antennæ are fcaly. Larva folitary, naked, pale rofy, with white lateral lines, and two gibbofities on the back; the tail is red; pupa folliculate, dark brown.

Tritophus. Wings toothed on the back, clouded with brown; in the middle is a ferruginous lunule, furrounded with white. It is found in feveral parts of Auftria.

Elegans. Wings glaucous, with two black ftreaks and fpot in the middle, in the latter of which is a ferruginous lunule. It is found at the Cape of Good Hope.

Camelus. Wings yellowifh, with two red ftreaks, and a line in the middle. It is a native of India.

Dictæa. Wings appearing as if parched with a whitifh ftripe; the lower ones whitifh.

Gnoma. The wings of this fpecies are flightly indented, grey-

grey-white, with a marginal black band, in which is a white ſpot. Found at Hamburg.

Dromedarius. Upper wings toothed on the back, clouded, with a yellowiſh patch at the baſe, and near the tail.

Angnina. Upper wings clouded, with tranſverſe pale ſtreak and baſe, the tip with two black dots in a ſubocellar whitiſh ſpot. This and the three next inhabit America.

Concinna. Upper wings clouded, with a blackiſh patch at the baſe and angles, marginal ſtreaks and dots on the diſk.

Unicornis. Upper wings clouded with green and brown, the tip yellowiſh, with a blackiſh patch on the diſk, and marginal dots and ſtreaks.

Aurora. Upper wings yellow, the baſe and margin ſpeckled with red.

* Coryli. Wings glaucous, with a ferruginous band, in which is a black dot, annulate with white; thorax variegated.

Nuda. Upper wings naked, hyaline; lower ones cinereous, with a marginal naked ſpot. It is found in India.

Morio. Wings black, hyaline; abdomen villous, black; the ſegments are edged with yellow. It is found in different parts of Europe, on the Lolium perenne.

Rubea. Wings hyaline, pale reddiſh, with a pale dot in the middle. Found in Auſtria.

Alphæa. Wings ferruginous, with a white dot in the middle, and punctured brown ſtreak. It inhabits New Holland.

* Monacha. Wings white, waved with black, marked with blood coloured rings between the ſegments of the abdomen. It is found on the bramble, the willow, the apple, the oak, and different ſpecies of the pine.

Flava. Wings deep yellow, with three black dots at the tip. It is found in India.

Lutea. Wings deep yellow, immaculate. A native of New Holland.

Ephippigea. Wings yellow, with a common brown dorſal ſtreak. Found in the South American iſlands.

* Cortula. Wings glaucous, with white ſtreaks, and a teſtaceous immaculate ſpot at the tip.

Reclusa. Wings grey, with whitiſh ſtreaks; the tip with a ferruginous ſpot, in which is a marginal white dot. It is found in Germany.

Anchoreta. Wings grey, with white ſtreaks, the tip with a brown ferruginous ſpot, in which is a waved white ſtreak. A native of Auſtria.

* Anastomosis. Wings grey, with three whitiſh lines, which nearly meet below, the tip is marked with a reddiſh ſpot.

Cippus. Wings brown, with three green ſpots. Found in Surinam.

Reflexa. Wings varied with cinereous and brown; the feelers are reflected, and as long as the thorax. It is found in the South American iſlands.

* Palpina. Wings toothed, whitiſh, with black veins; feelers projecting, feathered.

* Trepida. Wings one-toothed on the back, with an ocellar dot in the middle, and macular brown ſtreaks behind.

Querna. Wings grey, with three black ſtreaks connected to as many white ones. This is a native of Auſtria.

* Capuzina. Wings indented, ferruginous, with a reflected tooth on the back.

* Camelina. Wings indented, ferruginous, with two oblique yellow lines; they have all a ſmall tooth on the back.

* Aulica. Upper wings grey, dotted with yellow; lower ones fulvous, ſpotted with black.

Helvola. Wings pale orange, with regular cinereous ſpots, and a ſtreak behind.

Undata. Wings cinereous, with two brown bands, including a few cinereous ſtreaks. It is a native of Germany.

Aeria. Wings ſnowy, with black dots; thoſe near the rib are larger; the legs are annulate. It inhabits Carolina.

* Erminea. Wings white, with ſcattered black dots; the abdomen is marked with five rows of black dots. The thighs of this inſect are covered with ferruginous wool.

* Lubriciperda. Wings pale orange, with black dots, generally placed in an oblique tranſverſe row.

* Mendica. Wings of the male brown, obſcure; of the female white, pellucid, both dotted with black.

* Papyratia. Wings ſnowy, with black dots at the tip; the abdomen has five rows of black dots.

Advena. Wings brown, with white coſtal dots; the lower ones black, with a fulvous ſpot in the middle, in which is a black dot. This is a native of Spain.

Rutila. Wings pale yellow, with a ferruginous hind margin. It inhabits Siam.

Lactifera. Wings black, yellow at the angle of the tail; abdomen above yellow, with a dorſal line of black dots.

* Leporina. Wings white, with branched black dots; abdomen immaculate.

Lota. Wings cinereous, with a black dot on the diſk, and a purpliſh broken ſtreak behind.

Strigosa. Wings brown, with yellow ſtreaks; lower ones black, with an angular ſubmarginal yellow ſtreak. It inhabits Lapland.

Læta. Upper wings ſnowy, with a broad black band; the antennæ are ſimple. It is a native of Sweden.

Communimacula. Wings pale fleſh-colour, with a common dorſal brown ſpot. Found in the ſouthern parts of Europe.

* Compressa. Wings compreſſed, ſnowy, with a common brown ſpot; grey in the middle, with a white lunule.

Milhauseri. Wings hoary, with two dorſal brown ſpots; antennæ ſetaceous. It is a native of Dreſden.

Spreta. Wings varied with fleſh colour and yellow, and white ſtigmata. It is a native of Germany.

Lineus. Wings black; upper pair fulvous at the tip, lower ones at the baſe. This is found at Surinam.

Ulmi. Upper wings grey, ſtriate, with white at the tip. This inhabits Germany, and is found on the elm.

Begga. Wings white, with a black rib. Found at Surinam.

Obsoleta. Wings yellowiſh, with a darker ſpot in the middle and obſolete ſtreak behind. It inhabits South America.

Lepida. Wings brown, upper pair with a broad green baſe. This is a native of Tranquebar.

Equestris. Wings brown; upper pair with a green band in the middle; the lower ones yellowiſh. It inhabits India.

Grata. Wings ſnowy, the ribs at the baſe and hind margin brown. This is found in Georgia, in America.

V. nigrum. The wings of this inſect are white, marked with a black *v*. It is found in divers parts of Germany.

* Chrysorrhæa. Wings ſnowy; tail bearded, ferruginous. It inhabits this and other countries of Europe. The larva of this inſect is gregarious, hairy, blackiſh, with two red lines down the back; the eggs are covered with a thick fulvous wool.

Auriflua.

Auriflua. Wings white, upper pair with a brown rib beneath; the tail is bearded with yellow.

Bicolora. Wings white, with a large yellow ſpot marked with black. It inhabits Saxony.

* Salicis. Wings white; legs black, annulate with white. The larva is very beautiful, being hairy, with white dots down the back, on the ſides of which are red dots.

Cassinia. Wings grey, with abbreviated ſcattered black lines. Native of Auſtria.

Centrolenea. Wings clouded with cinereous and brown, with a central white line edged with a black one. It is a native of Auſtria.

Tessellaris. Yellowiſh; wings abbreviated, with numerous teſſellate deeper bands on the upper pair. This is an American inſect.

* Cratægi. Wings rounded, dark cinereous, with a darker band; tail bearded.

Eridanus. Body and wings ſnowy; abdomen with fulvous rings. It is a native of Surinam.

Tibialis. Wings ſnowy; fore-ſhanks yellowiſh, dotted with black. It inhabits New Holland.

Nitidula. Wings ſnowy; upper pair with two coſtal, ſhining, glaucous ſpots, and a marginal band of the ſame colour. It is found in Coromandel.

Innocua. Wings white; upper pair with four abbreviated black ſtreaks, the hind margin is yellow. It inhabits South America.

Jilibata. Wings white; abdomen and fore thighs red above. This inhabits the American iſlands.

Repanda. Wings pale, with three white ſtreaks, and a pale ferruginous hind margin. This and the next inhabit the South American iſlands.

Exigua. Wings yellowiſh, with ferruginous bands.

Plumigera. Wings ſubferruginous, with a yellowiſh ſtreak; antennæ of the male pectinate. Found in Auſtria.

Obsoleta. Wings whitiſh, with a ferruginous rib; the feelers are ferruginous. It is found in New Holland. Sir Joſeph Banks has a ſpecimen of this inſect, and alſo of the next.

Corones. Upper wings cinereous; the lower ones are ſnowy. It inhabits New Holland.

Festiva. Wings yellowiſh, ſpotted with blue at the baſe, and dotted with black at the tip. It is found in America.

Dryas. Wings brown; abdomen fulvous, with black dots; the tail is black. It inhabits Surinam.

Ramosa. Wings yellow, with black branched lines and marginal dots. It is found in Italy.

* Russula. Wings yellow, with a red margin and brown ſpot; the antennæ are red. This is deſcribed and figured by Mr. Donovan, and ſo is the next.

* Jacobææ. Wings brown, with a red line and two dots; the lower ones are red, edged with black.

* Grammica. Wings yellow; the upper ones are of a deeper, ſtriate with black; the lower ones are marked with a black terminal band.

Pennatula. Wings cinereous on the outer part and cheſnut-brown within, a paler ſtripe dividing the colours. It is a native of the Eaſt Indies, as is the next.

Lineola. Wings white; upper pair with a black line; lower ones with a black dot on the diſk.

* Purpurea. Upper wings yellow, dotted with brown; lower ones red, ſpotted with black.

* Plantaginis. Wings black, with yellow rivulets; lower ones yellow, with black margin and ſpots.

Vittata. Wings black, with three abbreviated white fillets. This is a native of America.

Lugubris. Wings yellow, with black rivulets and dots; lower ones brown.

Heliophila. Wings varied with brown and cinereous; lower ones ſnowy, edged with black. This is found in Lapland.

Parthenias. Upper wings brown, with greyiſh ſpeckled bars; lower ones orange, with a triangular black ſpot at the inner margin and ſmall line. This is an European inſect.

* Matronula. Upper wings brown, ſpotted with yellow; lower ones yellow, with black bands.

* Villica. Wings black, with eight cream-coloured ſpots; the lower ones are fulvous, ſpotted with black.

Hebe. Wings black, with white bands; lower ones red, ſpotted with black. It inhabits Europe.

Tarquinius. Wings cinereous, with a black ſpot in the middle, in which is a branched line. Found at Surinam, as is the next.

Tarquinia. Upper wings black, with a hooked white line between two white ſtreaks.

* Caja; or Great Tyger Moth. Upper wings whitiſh, with irregular blackiſh ſpots; lower ones orange, ſpotted with black. This ſpecies is one of the larger Engliſh moths. The larva is of a deep brown, with white ſpecks; extremely hairy, and feeds on plants. It changes into a chryſalis in June, and the fly appears in July.

Pudica. Wings white; upper pair ſpotted with brown; lower ones immaculate. It inhabits the ſouth of France.

Casta. Wings black, with two indented white bands; the lower ones are red, with marginal brown ſpots. It inhabits Germany.

Maculosa. Wings ſpotted with black; upper pair brown; lower ones red. It is a native of France.

Virgo. Wings black, with reddiſh rivulets; lower ones red, dotted with black. It is a native of America.

Phyllina. Wings black, with reddiſh rivulets; lower ones red, ſpotted with black, and a marginal black line. A native of America, as are the five that follow.

Placentia. Wings black, with three white ſpots; lower ones red, with black ſpots and margin.

Isabella. Wings dotted with black; upper pair fulvous, lower ones roſy.

Echo. Wings ſnowy, with black marginal nerves on each ſide, the back is ſpotted with yellow and black.

Menete. Wings black, with white ſpots; lower ones purple, with a black central ſpot and margin.

Deflorata. Wings white, ſpotted with black; lower ones beneath black, with white bands.

Hyalina. Wings hyaline, cinereous; tail black, bearded. It inhabits Italy.

Albifrons. Wings grey; upper pair with a marginal angular ſnowy ſtreak, ſurrounded with black ſpecks. This and the three following are natives of America.

Ministra. Wings ferruginous; upper pair with five tranſverſe brown lines on the diſk and margin.

Gibbosa. Wings teſtaceous; the upper pair are marked with a double tranſverſe yellowiſh ſtreak, and intermediate double white dot.

Angulosa. Wings grey; the upper pair have black flexuous lines and blotches, and a projecting tooth on the back.

d. *Wings recumbent.*

Crotolarias. Upper wings purple, with ocellar black ſpots; lower ones red, ſpotted with black. This and the two next are natives of India.

Ricini. Wings duſky, with numerous ſubocellar brown ſpots;

ſpots; the lower ones are red, ſpotted with black. It is found on the ricinus.

Sanguinolenta. Wings ſnowy; upper pair with a ſanguineous rib, lower ones with black ſpots.

Puella. Wings brown; thorax dotted with black; tail and legs red. It inhabits Guinea.

Serva. Wings grey, mixed with cinereous and brown: the abdomen is red above

Hera. Wings greeniſh-black, with yellow rivulets; the lower ones are reddiſh, with three black ſpots.

* Dominula. Wings gloſſy-black, with white and reddiſh ſpots; the lower ones are of a dull red, with black ſpots. A native of Europe.

Credula. Wings and body black, dotted with white. Native of America.

Lectrix. Wings black, with blue, yellow, and white ſpots; the lower ones are red, ſpotted with white. Found in China.

* Furcula. Thorax variegated; wings grey, the baſe and tip white, dotted with black. A native of Europe.

Colon. Wings grey-brown, with two black diſtant dots. Found in Germany.

Populeti. Wings ſhining-grey, with a ſtreak of black dots behind. Found on the Populus tremula, in divers parts of Germany.

* Antiqua. Upper wings dull ferruginous, clouded with brown, a white lunule at the poſterior angle; the female is nearly apterous.

* Gonostigma. Wings brown, with two oppoſite white ſpots; female apterous.

Paradoxa. Wings varied with cinereous and brown, marked with a whitiſh central ſpot; the lower ones are black; the female is apterous.

Zona. Wings black, with white bands; the abdomen is black, with the edges of its ſegments red; the female is apterous. A native of Germany.

Pylotis. Wings yellow, with ſix bands of black dots; lower ones dotted with black. Found in New Holland.

Pulchella. Wings white; the upper pair is dotted with black and red; and the lower ones are tipt with black. Found in the Eaſt.

Grisea. The wings of this ſpecies are cinereous, waved with brown; and the lower ones are white. Found at Cayenne.

Priverna. Upper wings brown, with a yellow band; the lower ones are fulvous, edged with black. It inhabits Surinam.

Francisca. Upper wings fleſh-colour, with an interrupted white fillet; the lower ones hyaline. It inhabits Coromandel.

Jesuita. The wings of this ſpecies are black, with a fulvous ſtreak. It is a native of India.

Angulata. Wings angular, teſtaceous, with black ſpecks, and two obſolete cinereous ſtreaks. It inhabits India.

Viciella. Wings cinereous hyaline; the antennæ are brown. The body of this inſect is covered with wool. The female depoſits her eggs while in the pupa ſtate, and never becomes a perfect inſect.

Vestita. Wings black, immaculate; abdomen beneath downy, white. Found in Germany.

Muscella. The wings of this are of a dull hyaline colour; the body is black. It inhabits Auſtria.

Pectinella. Wings cinereous hyaline; the upper pair are marked with obſolete darker ſtreaks. This and the next are natives of Auſtria.

Bombella. Wings cinereous, ſpeckled with brown.

Munda. Wings cinereous hyaline, with a brown dot and band. Found on lichens in various parts of Europe.

Indiana. Wings hyaline, with a yellow border dotted with black. It is a native of India.

Annulata. Wings black, with ſnowy ſpots. The ſhanks are annulate with white. It is a native of Germany.

* Graminis. Wings grey, with a whitiſh line and dot.

Popularis. The wings of this are brown, with white veins; the lower ones are whitiſh. Found in Ruſſia and Germany.

Fulminea. The wings are indented, and variegated with grey and brown; the thorax is white on the fore part, with a black ſtreak. It is found on the Achillea millefolium.

Gloriosæ. The wings of this ſpecies are black, variegated with red and yellow; the lower ones are brown, edged with yellow. It is a native of India.

Crini. Wings black, ſubferruginous before the margin; the lower ones are white.

* Rosea. The wings of this inſect are roſy, with three brown ſtreaks, the ſecond is waved, the third at the tip is compoſed of dots. The larva of this inſect is ſhort and very hairy, with grey tufts; the head is orange; the pupa is incloſed in a thick follicle.

* Rubricollis. Black, with a red collar; the abdomen is yellow.

Fuliginosa. Wings red-brown, with a double black dot; the abdomen is red, and it is black on the back. The larva of this inſect is hairy and ferruginous, with black head and fore-legs; it wanders over the ſnow in winter, and is ſaid to prognoſticate a cold ſummer, and ſcarcity where it appears in conſiderable numbers.

Binotata. Wings cinereous, with two black dots between two brown waved ſtreaks. It is middle-ſized, and inhabits Sweden.

Cribrum. Upper wings white, tranſverſely dotted with black; the tail is yellowiſh. Found in the northern parts of Europe.

Obscura. Both ſurfaces of the wings alike, brown, with three hyaline dots on the upper pair; the abdomen is yellow, with a black line. It is found on the Lichen parietinus, in Germany.

Punctata. In this alſo both ſurfaces are alike; the upper pair is brown, dotted with white; the lower ones are tipt with brown. It is an Italian inſect.

e. *Wings convolute.*

Bella. Wings yellow, with ſix bands of black dots; the lower ones are red, tipt with black. It is a native of North America.

Ornatrix. Wings whitiſh, the margin red dotted with black; the lower ones are varied with white and black. Found in various parts of America.

Umber. Wings black; front and abdomen fulvous. It inhabits Surinam.

Histrio. Wings fulvous, with numerous white ſpots ſurrounded with blue. It inhabits the South American iſlands.

Geometra.

We ſhall in this and the following ſections mention only thoſe that are natives of this country, in order to ſhorten the article as much as poſſible, except in thoſe in which there are not a ſufficient number of Engliſh to illuſtrate the ſections.

a. *An-*

a. *Antennæ pectinate.*

* LACTEARIA. Wings angular, ſnowy, immaculate; antennæ bipectinate, ſetaceous at the tip. Very tender and pellucid.

* NIVEARIA. Wings ſubangular, white, with a brown hind margin; the under ſurfaces of the upper pair are brown, the lower ones are marked with a central black dot.

* VERNARIA. Wings angular, greeniſh, with two white flexuous ſtreaks; the antennæ are ſetaceous at the tip.

* PATATORIA. Wings angular, whitiſh, with two full white flexuous ſtreaks; the antennæ are ſetaceous at the tip.

* PUNCTARIA. Wings angular, cinereous, with a ferruginous ſtreak and row of black dots. The larva of this ſpecies is cinereous, with lateral yellow ſpots and marked with red; the pupa is bound to a leaf, above it is of a pale fleſh-colour, and beneath it is yellowiſh.

* AMATORIA. The wings of this are angular, and buff-coloured ſpeckled with brown, with a ſtraight purple line and obſolete flexuous brown one on each. The larva is green, with yellow belts above, and red ones beneath.

* PENNARIA. Wings ſlightly indented, reddiſh, with two brown ſtreaks, and a white dot at the tip.

* USTULARIA. Wings ſlightly indented, ochraceous, with three brown ſtreaks, and ſpot at the baſe and tip.

* BIDENTARIA. Wings jagged, grey, with a deeper coloured band, in the middle of which is an ocellar dot.

* FALCATARIA. Wings falcate, glaucous; the upper pair is marked with a grey band and waves, in the band is a brown dot.

* SAMBUCARIA. Wings tailed, angular, yellowiſh, with two darker ſtreaks; the lower ones with two reddiſh dots at the tip.

* LACERTINARIA. Wings toothed, yellowiſh, with two brown lines and a dot between them; the lower ones are whitiſh and immaculate.

* ALNIARIA. Wings angular, toothed, ſpeckled with brown, and croſſed with two brown ſpecks.

* SYRINGARIA. Wings angular, indented, grey, with fleſh-colour ſhades, and two brown ſtreaks on the upper pair meeting at the tip.

* LUNARIA. Wings jagged, reddiſh-brown; all with a white ocellate dot; the upper pair is marked with an incurved brown ſtreak.

* DENTARIA. Wings angular and indented, above pale, with ferruginous ſtreaks; beneath it is ferruginous, with a darker lunule.

* DOLABRARIA. Wings angular, yellow, with a ferruginous ſtreak; the angle of the tail is violet.

SUBERARIA. Wings yellowiſh, deeply indented; the upper pair is marked with a brown ferruginous patch, and two black ſtreaks; the lower ones with a brown ferruginous band and ſingle ſtreak.

PAPILIONARIA. Wings indented, green, with a flexuous white ſtreak, and contiguous ſmaller one. The larva is green, with ten incurved rufous prickles on the back; the pupa is green varied with yellow.

* PRUNARIA. Wings ſlightly indented, yellow-orange, ſpeckled with brown; the upper pair with a brown lunule. The larva is ferruginous, with two ſpines before and behind.

* PINIARIA. Wings ſpotted with yellow, beneath clouded with two brown bands.

* LIMBIARIA. Wings ferruginous, with a black border; lower ones beneath black ſtreaked with white.

ATOMARIA. All the wings yellowiſh, with brown ſtreaks and ſpecks.

* PROSAPIARIA. Wings yellowiſh, with brown ſpecks, and three brown ſtreaks, the laſt of which is compoſed of ſpots.

* PUSARIA. Wings ſnowy, with three obſolete brown ſtreaks.

* DEFOLIARIA. Wings grey, ſpeckled with brown, white in the middle, with a brown dot.

* HIRTARIA. Wings hairy, grey, with three black ſtreaks, the hinder ones approximate; antennæ black.

* VESPERTARIA. Wings yellowiſh, with two brown ſtreaks, the firſt angular, the poſterior one ſeparating the darker border.

* WAURIA. Wings cinereous; upper pair with four ſhort irregular bands, the middle one reſembling the letter L.

* DITARIA. Wings green, with ferruginous marginal ſpots.

* VIRIDARIA. Wings rounded, green, with whitiſh ſtreaks and a marginal black dot.

* PULVERARIA. All the wings powdered with teſtaceous, with a broad ferruginous band.

* FASCIARIA. In this ſpecies the wings are reddiſh, with a broad ferruginous band edged with white.

* DIVERSARIA. Upper wings reddiſh, lower ones whitiſh; the margin of all dotted with black.

* BETULARIA. All the wings white, ſpeckled, and waved with black; the thorax is marked with a black band; the antennæ are ſetaceous at the tip.

* PRODROMARIA. Wings white, ſpeckled with black; with two broad dark ferruginous bands.

* PLUMBARIA. Wings plumbeous, with three brown ſtreaks and a dot in the middle.

* PURPURARIA. Wings yellow; the upper pair with a purple margin and two bands.

b. *Antennæ ſetaceous.*

* FALCATA. Wings falcate, fulvous, with two brown dots between two yellow ſtreaks.

* DUBITATA. Wings indented, waved with brown, grey and black; the nerves are dotted with white.

* DIMIDIATA. Wings indented, yellow before, and brown behind.

* VIRIDATA. Wings angular, all green, with a pale ſtreak.

* STRIGATA. Wings indented, cinereous, with a broad brown band, in which is a waved black ſtreak.

* NOTATA. Wings angular, pale, with three browner ſtreaks; upper pair with four approximate dots.

* EMARGINATA. Wings emarginate, pale, with two grey bands and a brown dot.

* GROSSULARIA. Wings whitiſh, with round black ſpots, and two yellow ſtreaks on the upper pair.

* UNDULATA. All the wings with numerous, crowded, undulated ſtreaks.

* POPULATA. Wings pale yellow; upper pair ſubfaſciate at the tip, the lower part is darkened with brown.

* COMITATA. Upper wings yellowiſh, with three grey bands, and a brown dot and line at the tip.

* ULMATA. Wings white, with two ferruginous brown bands, the hindermoſt compoſed of ſpots.

* PRUNATA. Wings grey-brown, with two pale flexuous bands, the poſterior one nearly terminal.

* CRATÆGATA. Wings of a deep yellow, with three ferruginous ſpots on the rib of the upper pair, the middle one ſomewhat ſilvery.

* FERRUGINATA. Wings orange, with brown ſpots, waves

waves and ftreaks, and a line of white dots along the anterior margin.

* MARGINATA. All the wings are white, the exterior margin with a brown interrupted border.

* MIATA. Wings grey, with three green bands, the middle one broader, and waved with brown.

* DECUSSATA. Wings cinereous, with four black ftreaks, the two middle ones flexuous and croffing each other.

* ALBICILLATA. Wings whitifh, with a brown margin and fpot at the bafe and tip.

* HASTATA. All the wings white, irregularly barred, and fpotted with black.

* TRISTATA. All the wings black, with two white immaculate bands.

* CLATHRATA. All the wings yellowifh, with black lines and ftreaks croffing each other.

* CHÆROPHYLLATA. Black; wings erect; upper pair white at the tip.

* PROCELLATA. Upper wings white, with three brown bands, the middle one reaching half way acrofs, the hind one marginal, with a white fpot in the middle.

* FLUCTUATA. Wings pale cinereous, with three abbreviated brown bands on the upper pair.

* BILINEATA. Wings yellow, with teftaceous waves, and brown flexuous bands and white ftreaks. The larva is greenifh, nearly immaculate, and fometimes with white lines.

* VOLUTATA. All the wings of this infect are green, with two white ftreaks.

* LYNCEATA. Wings rounded, white, with two brown bands and a dot at the tip.

* BRUMATA. Wings yellowifh, with a black ftreak, and paler behind; the female is apterous and of a brown colour.

* CHENIPODIATA. Upper wings teftaceous, with three grey bands, a brown prominent dot and line at the tip above.

* HEXAPTERATA. Upper wings varied with grey and brown; lower ones whitifh, with an additional pair of wings at the bafe.

* DAPLICATA. Upper wings grey, with three brown flexuous bands.

* ALCHEMILLATA. Wings brownifh; the upper pair waved, with a fnowy band, with cinereous waves, and line within the tip.

* SUCCENTURIATA. Wings whitifh, with a darker border, and black dot.

* MACULATA. All the wings yellow, with brown fpots.

* EUPHORBIATA. All the wings brownifh-grey, immaculate.

* PUNCTATA. Wings rounded, fnowy; upper pair with a brown dot in the middle, the margin is dotted with black.

* MURINATA. Wings cinereous, with three darker ftreaks; all with a central black dot.

* SOCIATA. Wings deep yellow, with a brown band, in the middle of which is a recurved tooth.

* PURPURATA. Wings greenifh, with two purple bands on the upper pair.

* IMMUTATA. All the wings fnowy, with darker waved ftreaks; the hind margin dotted with black.

* CINGULATA. All the wings are brown, with a fnowy ftreak.

* URTICATA. Wings white, with macular brown bands; the thorax and tail yellow.

* LIMBATA. Wings rounded, yellow, with a brown ocellar dot, and hind margin.

* PALUDATA. Wings white, with a brown band or two, and black ocellar dot in the middle.

* STRATIOLATA. Wings with pale bands; upper pair with three black dots. The larva of this infect is aquatic, fix-footed, green, with tufted lateral fpiracles; the pupa is folliculate, tapering both ways, and of a ferruginous colour.

* NYMPHÆETA. Wings cinereous, all of them alike, with reticulate white fpots.

* LEMNATA. Wings white; lower ones with a terminal black band, in which are four white dots.

c. *Wings forked.*

* FARINALIS. Feelers recurved; wings polifhed, yellowifh, with white flexuous ftreaks, the bafe and tip glaucous. This is found chiefly in bran and meal.

* GLAUCINALIS. Feelers recurved; wings glaucous, with two brown flexuous ftreaks.

* BARBALIS. Antennæ pectinate, longer than the feelers; fore-thighs with a projecting beard. This is found on the Trifolium pratenfe.

* TENTACULARIS. Antennæ pectinate, as long as the projecting feelers; wings pale cinereous, with brown ftreaks.

* PROBOSCIDALIS. Feelers projecting, approximate, longer than the thorax; the wings are grey, with ferruginous ftreaks.

* ROSTRALIS. Feelers projecting, longer than the thorax; wings greyifh, with two muriate black dots, and line at the tip. This is found on the Carpinus and Humulus.

* NEMORALIS. Feelers recurved; wings grey, with three brown ftreaks, the middle one flexuous.

* PALPALIS. Feelers projecting, longer than the thorax; wings grey; lower ones white, at the thicker margin.

* FORFICALIS. Wings glabrous, pale, with oblique ferruginous ftreaks.

* VERTICALIS. Wings glabrous, pale, fub-fafciate with brown; beneath it is waved with brown. The larva of this infect is fixteen-footed, hairy, with yellow head and legs; the pupa is brown, the three laft fegments have each a fmall tooth.

SALICALIS. Wings cinereous, with three oblique fulvous ftreaks on the upper pair; antennæ pubefcent. The larva is fourteen-footed, naked, green, with a darker dorfal line. The pupa is of a fine fhining black.

* STICTICALIS. Wings grey, with a yellow fpot in the middle, and a marginal ftreak. The fpot in the middle is notched on each fide, and the marginal ftreak has a contiguous fmaller one. Beneath it is variegated.

* PURPURALIS. Wings purplifh, with two yellow bands on each.

* COSTALIS. Wings purplifh, with two yellow coftal fpots, and hind margin.

* ATRALIS. Wings black, with two white fpots on each.

NOCTUA.

a. *Wings expanded.*

ZENOBIA. Wings variegated; beneath ferruginous, with black waves. It inhabits Surinam.

PATROCLUS. Wings tailed, both furfaces alike, brown, with an oblique linear white band and tip. This is found in India.

CAPRIMULGUS. Wings indented, brown, with black waves; the upper pair with a blueifh eye, and double black pupil. A native of China.

NOCTILIO. Wings fuberous, brownifh, with waved

 black

black ſtreaks; the lower ones white at the tip, with a black ſpot. This is a native of the Eaſt Indies.

Crepuscula. Wings brown, with a white band, and marginal ſpot; the upper pair with an eye. This is a native of America. One ſex has a double eye with a pupil, the other a blind eye.

Troglodyta. Wings brown, with black waves, and a common white ſtreak; on the upper pair is a common ſhining eye. It is found in Guinea. This is a very curious inſect. Upper wings with a large eye dotted with blue, with a large lateral black pupil, blue lunule, and black iris; behind this is a common white ſtreak, and afterwards a ſtreak of ſmall black lunules. Beneath, it is all brown, with a broad white band behind, which are white lunules joined to the band.

b. *Wings flat, incumbent; thorax ſmooth.*

Dioscoreæ. Wings indented, grey; lower ones yellow, with a black lunule and border. It inhabits India.

Paphos. Upper wings brown, with white veins; the lower ones are varied with white and black. It is a native of Siam, and a ſpecimen is to be found in ſir J. Banks' muſeum.

Eugenia. Body dotted with black; wings ſnowy, with a hyaline diſk; the abdomen is red on the back part. It is a native of India.

* Complana. Wings with a paler outer margin; lower ones entirely yellow. It is found on the oak. The larva is hairy, and black, with two lines of pale dots.

* Quadra. Wings yellow, with two blue dots on the upper pair; there is a variety that has cinereous wings, and a yellow thorax.

c. *Wings flat, incumbent; thorax creſted.*

* Sponsa. Upper wings undulate with brown; the lower ones are red, with two black bands; the abdomen is entirely cinereous. The larva is ſtudded, the head is blueiſh, and the body variegated.

* Nupta. Wings cinereous, varied with brown; the lower ones are red, with two black bands; the abdomen is hoary beneath.

* Pacta. Wings greyiſh, ſlightly waved; the lower ones are red, with two black bands; the abdomen is red.

* Fraxini. Wings indented, grey, with waved dark bands; lower ones above black, with a blueiſh band.

* Pronuba. Lower wings teſtaceous, with a black nearly marginal band.

* Fimbria. The upper wings clay colour, with a paler tip; lower ones pale orange, with a broad black band. The larva is ſmooth, browniſh, with pale lines, and black ſtigmata; the pupa is blueiſh-black.

* Straminea. Wings ſtraw-colour, with a double blackiſh ſpot in the middle of the outer margin, and a darker ſub-marginal band; the lower ones have a broad brown border.

* Maura. Wings indented, dark brown, with irregular cinereous marks; beneath a whitiſh border.

* Libatrix. Wings jagged, reddiſh-grey, with two white dots, and two whitiſh ſtreaks.

* Plecta. Wings brown, with a white thicker margin.

* Brassicæ. Wings clouded with cinereous, with a black hook at the firſt ſpot.

d. *Wings deflected; thorax ſmooth.*

Ficus. Wings cinereous, with white veins, the baſe ſpotted with fulvous white and black. It is found in India, on the Ficus racemoſa.

Arundinis. Wings cinereous, with black dots and marginal lunules, beneath it is marked with a central brown ſpot. It is found in the ſtalks of the common reed, and is ſaid to occaſion the ſtaggers in horſes.

Virescens. Wings greeniſh, with three darker ſtreaks. It is found in the pods of the Cytiſus caian.

* Batis. Upper wings brown, with five peach-coloured ſpots; the lower ones are cinereous.

* Roboris. Wings cinereous, with two white waved ſtreaks, and a central ſnowy ſpot, in which is a black lunule.

* Trapezina. Wings whitiſh, with a very broad deeper band, in which is a black dot; the margin is dotted with black. The larva is greeniſh, with cinereous, with white and ſulphur-coloured lines; it preys on the larva of other moths, and even on its own ſpecies.

* Cerasi. Wings grey-ferruginous, with a yellowiſh ſpot, and ſtreak behind, the margin is dotted with black.

* Monilis. Wings cheſnut-brown, with four approximate white dots, the antennæ are pectinate.

Gracilis. Wings brown-cinereous, with a brown and waved ſtreak at the baſe, and a yellowiſh one at the tip, with a punctured one between them. The larva is naked, greeniſh, with yellowiſh ſides; the inciſures are yellow, each ſegment with four duſky ſpots, and a black one before. It is an American inſect.

e. *Wings deflected, thorax creſted.*

* Fulvago. Upper wings yellow, with ferruginous ſtreaks, the hind one compoſed of dots; the lower wings are white.

* Citrago. Wings yellow, with three oblique ferruginous ſtreaks.

* Chrysitis. The wings of this inſect are yellowiſh-brown, with two green-gold bands, and a yellowiſh marginal one.

* Festucæ. Upper wings varied with yellow and brown, with three ſilvery-gilt ſpots; the lower ones pale brown.

* Jota. Upper wings reddiſh-grey, with a large brown ſpot in the middle, in which is an inverted gold *i*.

* Meticulosa. Wings indented, pale; the upper pair is of a fleſh-colour at the baſe, with a brown triangle.

* Gothica. Upper wings browniſh, with a black curve and dot in the middle; the curve is turned upwards.

* Dorasa. Upper wings varied with rufous brown and white, with two black ocellar dots in the middle.

* Satellitia. Wings indented, reddiſh-brown, with a yellow ſpot in the middle, between two ſmaller white ones.

* Diffinis. Wings ferruginous, with three white ſpots at the rib, and two black dots behind. The larva is green, with white lines, head and fore legs black.

* Marginata. Wings yellowiſh, with ferruginous ſtreaks and hind margin; lower ones with a black central dot and marginal band.

* Absinthii. Wings hoary, with black bands, and dots diſpoſed in a quadrangle.

* Alori. Wings ſooty, with two grey patches, the firſt with a black marginal dot.

* Delphinii. Wings purpliſh, with two whitiſh bands; lower ones duſky.

* Perspicillaris. Wings with brown ſtreaks, twice two-toothed behind, with a ſingle kidney-ſhaped common ſpot.

* Pisi. Wings purpliſh, with two darker ſpots, and a yellowiſh waved ſtreak at the tip.

* Oxyacanthæ. The colour of the wings is dark

 brown,

brown, with two flesh-coloured spots and tip, the inner margin greenish, with a white lunule.

* CHRYSOCERAS. Upper wings olive-green, with sulphur-coloured streaks and hind margin; lower ones brownish, with a sulphur margin.

* GEMINA. The upper wings are of a brownish-grey, with two streaked darker bands, and two intermediate snowy dots.

PULLA. Upper wings brown, ferruginous, slightly clouded, with a white undulate streak.

* CHRYSOGLOSSA. Upper wings subfalcate, grey, with three streaks, the two first are abbreviated.

* ATRIPLICIS. Upper wings brown, with blue and yellow streaks; in the middle is a white mark, and a bifid yellow one.

* PRÆCOX. Wings cinereous, with two subocellar spots; the lower ones are of a reddish-brown, with an abbreviated rufous band. There is a variety which has its wings entirely greenish.

* PYRAMIDEA. Wings brown, with three flexuous, waved, yellowish streaks; the lower ones are ferruginous.

* LUCIPARA. Wings cinereous, with dark angular marks, and a broad brown band in the middle.

* OLERACEA. Upper wings ferruginous, with a yellowish lunule and white streak, two-toothed behind.

* XANTOGRAPHA. Wings black; lower ones snowy at the base.

* PINASTRI. Wings black, the thinner margin and angle of the tail dull cinereous.

* APRILINA. Upper wings greenish, with black spots, and triangular dot each side behind.

* LUDIFICA. Upper wings and abdomen yellow, the latter with three rows of black dots. It is found on the willow.

* LICHENES. Upper wings green, with various black marks; the lower ones and all beneath brown.

* PSI. Upper wings grey, with a black line at the base, and various marks resembling the Greek ψ; the legs are immaculate.

* COMMA. Wings indented, cinereous, with a black line at the base, and an adjacent thinner white one.

* CHI. Wings grey; upper pair marked with a black Greek χ.

* ACERIS. Wings grey, with black waves; abdomen pale ferruginous at the base beneath.

* LITURA. Wings grey, with a black patch in the middle, in which is a white dot.

* PERSICARIÆ. Wings clouded with brown, with a white kidney-shaped spot, in which is a yellow lunar pupil.

* TRAGOPOGINIS. Upper wings brown, with three black approximate dots in the middle; the lower ones livid.

* TRIPLACIA. Upper wings with a double curve, turning contrary ways, and three glaucous spots between them.

* RUMICIS. Wings grey, with brown streaks and clouds, and an ocellar spot in the middle.

* EXOLETA. Wings lanceolate, convolute, clouded with brown and cinereous, with four white marginal dots.

* VERBASCI. Wings scalloped, indented, pale yellow, with brown margins.

* UMBRATICA. Wings striate, lanceolate, grey, with a ferruginous spot in the centre, in which are two black dots.

* PUTRIS. Wings subpunctured, the outer margin is brown, with an adjoining subocellar spot.

* MYRTILLI. Wings ferruginous, spotted with white; lower ones yellow, with a black border. The larva is naked, green, with five rows of blackish tubercles: the pupa is chocolate brown, with white stigmata.

* ARBUTI. Wings brown; lower ones black, with a yellow band.

HYBLÆA.

LAGOPUS. Wings deflected, cinereous at the base, and tipt with brown; the legs are very hairy. The insects of this division are all natives of the East Indies.

ROSTRATA. Wings deflected, brown, with a common cinereous spot in the middle, and one at the rib.

DEFLORATA. Wings incumbent, grey; lower ones yellow, with a black fillet and marginal band.

SAGA. Wings incumbent, glossy brown; the lower ones are black, with two fulvous spots.

HEPIALUS.

* HUMULI. Wings of the male snowy, striate, of the female yellow, with fulvous marks.

* HECTA. Wings deflected, yellow, with two oblique whitish bands, consisting of interrupted dots.

COSSUS.

* COSSUS. Upper wings grey, with numerous short curves, and black streaks; the thorax with a black band.

* ÆSCULI. Wings white, with numerous dark blue spots; the thorax has six. The antennæ of the male are feathered at the base, and setaceous at the tip; of the female setaceous.

PYRALIS.

* BANKIANA. Wings brown, with two snowy bands; the hinder is one-toothed. It is found in the woods.

* LECANA. Wings pale, with a brown central spot.

* PRASINANA. Upper wings green, with two oblique yellowish streaks; the lower ones are white.

* FAGANA. Upper wings green, with three oblique white streaks; the lower ones are whitish-green.

* VIRIDANA. Wings rhombic; upper pair green, immaculate; lower ones brown. The larva is naked and sixteen-footed, green dotted with black, the head is red; and the hind legs are yellow.

* CHLORÆNA. Wings rhombic; upper pair green, with a white margin. The larva is green, dotted with white; the sides spotted with brown.

* UNCANA. Wings brown, with a whitish outer margin sending out a recurved branch in the middle.

* ROSANA. Upper wings testaceous, with an oblique grey band.

* CHRISTIERNANA. Wings yellow, with red bands, crossing each other in the middle.

* SMEATHMANNIANA. Wings whitish, with two oblique brown bands, the first abbreviated, the other interrupted.

* FUSCANA. Upper wings brown, immaculate.

* FOSTERANA. Upper wings dull cinereous, with two brown marginal spots.

* XYLOSTEANA. Upper wings testaceous, with an oblique brown band.

* MINISTRANA. Upper wings testaceous, with a rufous hind margin; in the middle is a ferruginous mark, with a white line.

* CRYSTALANA. Upper wings yellow brown, with dark shades; there is a broad irregular white mark, and a tuft in the centre.

* UDMANIANA. Wings dark grey, with an angular common chesnut-brown mark. The larva is rosy, with

white

white lateral ſpots, and black head and collar; pupa reddiſh-brown.

* SOLANDRANA. Wings pale, ſubfaſciate with white, with a dorſal ferruginous ſpot.

* PUPILLANA. Wings pale, with two oblique brown bands; the angle of the tail is marked with a blackiſh ſpot, in which are three ſilvery dots.

* ZOEGANA. Wings yellow, with a brown central dot; the tip is brown, and marked with a yellow ſpot.

* HAMANA. The upper wings of this ſpecies are yellow, with a reddiſh-brown dot, and hooked mark behind.

* OBLIQUANA. Wings cinereous, with oblique fulvous bands edged with white.

* BRYNNICHANA. Wings brown, with a common brown rhombic dorſal ſpot.

* PRUNIELLA. Wings purpliſh-brown, with a white ſtripe down the middle, in which is a black dot.

* ARCUANA. Wings pale yellow, with three curved bands, and a black ſpot on the diſk, in which are three ſilvery dots.

* LECHEANA. Upper wings teſtaceous; the thorax is ſilvery.

* AVELLANA. Upper wings teſtaceous, with three ſhort brown bands.

* HASSIANA. The upper wings of the inſects of this ſpecies are brown, with an oblique white ſtreak.

* INTERROGATIONANA. Wings red-brown, with a white flexuous line and dot, reſembling a note of interrogation.

* MODEIERIANA. Upper wings yellowiſh, with a marginal brown ſpot behind.

* SCHREBERIANA. Upper wings grey, with a white triangular marginal ſpot.

* HELMIANA. Upper wings pale yellow ferruginous, with a white triangular marginal ſpot.

* FRANCILLANA. Wings pale yellow, with two cheſnut brown ſtreaks.

* GNOMANA. Upper wings yellow, with an oblique teſtaceous band, and ferruginous marginal ſpot behind.

* ODORANA. Upper wings ferruginous, ſpotted and reticulate with brown.

* ILICANA. Upper wings brown-aſh, with brown dots, and a ſingle black one in the middle.

* LOGIANA. The upper wings are grey, with irregular black ſpecks; the lower ones whitiſh.

* DESFONTAINANA. Wings brown-cinereous, with an abbreviated fulvous fillet in the middle, in the middle of which is a hairy dot.

* PROFANANA. Wings cinereous, with a brown tufted dot in the middle.

* SQUAMMANA. Upper wings green, with numerous raiſed dots.

* STICTICANA. Wings browniſh, with a common white dorſal ſpot, in which there is a black dot.

* EMARGANA. Wings falcate, emarginate at the rib; it is brown, with reticulate dark lines.

* CAUDANA. Wings falcate, emarginate, the ribs grey, with a fulvous ſtreak.

* SCABRANA. The upper wings are cut off on the rib behind; they are rough cinereous, and ſlightly barred with brown. Found chiefly in the oak.

* QUERCANA. The upper wings are roſy, with two ſulphur coſtal ſpots.

* OCELLANA. Wings cinereous, with a red patch in the middle, in which is a whitiſh dot.

* FORSKAHLIANA. The upper wings are yellow, and reticulate with ferruginous, with a browniſh patch in the middle.

* LŒFLINGIANA. The upper wings are yellow, reticulate with teſtaceous, and marked with a double X.

* BERGMANNIANA. Upper wings yellow, varied with orange, and four ſilvery bands, the third bifid.

* YEATIANA. Upper wings grey, with a black ſpot, and two central dots.

* ALSTROEMIANA. Wings whitiſh; upper pair with a lateral ruſty-brown ſpot in the middle.

* NITIDIANA. Wings ſhining brown, with a broad ſilvery band in the middle, in which is a brown ſtreak.

* NIGRICANA. Wings blackiſh, the rib dotted with yellow, the tip with a black dot.

* PARIANA. Wings brown, with two black ſtreaks, and cheſnut-brown hind margin.

* CONWAYANA. Wings ruſty brown, with ſilvery dots, and a yellowiſh dorſal ſpot.

* AURANA. Wings brown, with two orange ſpots.

* POMANA. Wings clouded, with red-gold ſpot behind.

* UNGUICANA. Wings cinereous, ſub-faſciate, the tip recurved and pointed, the outer margin behind tranſverſely ſtriate with white.

* CYNOSBANA. Upper wings brown, tipt with white.

* SPARMANNIANA. Wings flat, pale, with two black dots on the diſk.

TINEA.

* COLONELLA. Wings oblong, cinereous, with two black dots before a curved undulate obſolete ſtreak.

* PANNERELLA. Wings oblong, brown, with a blackiſh line down the middle, and a few dots at the tip.

* PRUNIELLA. Wings purpliſh-brown, with a white line in the middle, in which is a blackiſh ſpot.

* GELATELLA. Wings brown-aſh, with a white fillet on the upper pair.

* EUONYMELLA. Upper wings ſilvery-white, with fifty black dots.

* PADELLA. Upper wings lead-colour, with twenty black dots.

* LAMDELLA. Upper wings yellow-brown, with a dark triangular ſpot, terminated by a detached ſmall dot.

* SEQUELLA. Upper wings white, with a common ſinuate flexuous black line and lateral ſpots.

* SEMIARGENTELLA. Upper wings ſilvery, with gold bands, croſſing each other in the middle.

* IRRORELLA. Wings yellow; upper pair with three rows of black dots; thorax fulvous before and behind.

* MESOMELLA. Upper wings pale, with a yellow margin and two brown dots.

* GUTTELLA. Wings black, with numerous white dots on the upper pair; the head is ferruginous.

* PINETELLA. Upper wings yellowiſh-brown, with two clear white ſpots, ſeparated by a blackiſh band.

* PRATELLA. The upper wings are cinereous, with a clear white line branched behind, the tip with oblique ſtriæ.

* PASCUELL. Wings cinereous, with a clear white line, hind margin dotted with black.

* CULMELLA. Wings cinereous, with a ſingle abbreviated clear white line.

* ARGENTELIA. Wings and body ſilvery; the antennæ are annulate and brown.

* CARNELLA. The upper wings are of a roſe colour, with yellowiſh anterior and poſterior margins.

* GRAMELLA. Wings cinereous, with two angular brown ſtreaks, and a marginal ſilvery one.

* SALICELLA. Wings blueiſh-grey, white in the middle, with black dots on the hind margin; the thorax is creſted.

* PUSIELLA.

* Pusiella. Wings blueiſh-grey, with a black dot, fillet in the middle, and contiguous rhombic dots.

* Foenella. Wings brown, with clear white ſpots, the anterior one falcate, the poſterior kidney-ſhaped.

* Cratægella. Upper wings whitiſh, with two blackiſh bands, and a third which is terminal.

* Tapezella. Wings black, white behind; head ſnowy. A variety has its wings and head brown. This inſect is found in ſkins, where it gnaws cylindrical cavities and ſecretes itſelf.

* Vestianella. Wings cinereous, with a white rib; the tips are aſcending and feathered. This attaches itſelf to clothes and woollen furniture, to which it is very deſtructive.

* Sarcitella. The wings of this are cinereous; the thorax has a white dot on each ſide. Found in ſkins, clothes, and woollen furniture.

* Stigmatella. Wings nearly linear, ferruginous, with a white coſtal ſpot.

* Mellonella. Wings grey, the hind part purpliſh, with a white ſtreak; the ſcutel is black, tipt with white.

* Curtisella. Upper wings and thorax white, ſpotted and ſpeckled with brown; the lower wings and body are pale brown.

* Maculella. This is ſnowy; the wings with a large marginal ſpot and tip.

* Arbutella. Wings rufous, with ſilvery ſtreaks, the middle ones bifid. It is found chiefly on the Arbutus.

* Marginella. Upper wings rufous, with broad white margins.

* Tessella. Wings black, with two very remote teſſellate bands.

* Clementella. Upper wings ſnowy, with a black line at the baſe, band in the middle and dot at the tip.

* Bicostella. Wings cinereous, with a brown fillet; feelers projecting; antennæ hairy.

* Parenthesella. Upper wings teſtaceous, with a longitudinal white line.

* Radiatella. Upper wings yellow, with dark purple ſtripes, and white one nearer the thinner margin.

* Elongella. Wings linear, teſtaceous; the antennæ are moderate.

* Cinctella. Wings black; the upper pair with a ſilvery ſtreak.

* Leucatella. Wings blackiſh, with two white bands; the poſterior one fainter; head white.

* Strobilella. Wings waved with brown and ſilvery; lower ones brown, edged with white.

* Dodecella. Grey, dotted with black; wings with pale bands, and three pair of brown dots.

* Viridella. Wings greeniſh, with white dots, and two interrupted cheſnut bands.

* Combrella. Wings brown, thickly ſpeckled with whitiſh.

* Fuscella. Wings grey-brown, with two black dorſal dots.

* Cinerella. Wings grey-brown, gloſſy, immaculate.

* Trigonella. Wings brown, with a common white dorſal double triangular ſpot.

* Rhomboidella. Wings brown, with a black rhombic ſpot.

* Capitella. Wings brown, with three yellowiſh ſpots; the head is ferruginous.

* Compositella. Wings brown, with a common ſilvery dorſal ſpot, compoſed of four ſtreaks.

* Minutella. Wings black, with two ferruginous ſpots, nearly oppoſite.

* Petiverella. Wings greyiſh, with a yellow dorſal patch and three black dots at the tip.

* Listerella. Wings grey-brown, with black dots at the tip; the antennæ are moderate, annulate.

* Alcella. Snowy; upper wings ſpotted with black.

* Moufsetella. Wings pointed, livid, with oblong brown ſpecks; antennæ ſhort, annulate with white.

* Albinella. Wings brown, with a ſingle gold curve turned upwards. It is found among the ſhrubs of Europe.

* Sepella. Wings gold, with two ſilvery ſtreaks. It inhabits England.

* Merianella. Wings black, with three tranſverſe, divaricate, ſilvery bands.

* Lyonetella. Wings yellow, with four ſilvery bands; the third bifid above.

* Bonnetella. Wings white, with two ſilvery bands, and waved behind. This is found in gardens, and among hedges.

* Schæfferella. Wings orange, with ſilvery dots and band in the middle; the tip is fringed with black.

* Scopolella. Wings black, with ſcattered white dots; the antennæ are annulate with white.

* Gleichella. Wings flat, black, with a ſilvery band in the middle, and two oppoſite ſpots at the tip.

* Rhediella. Wings black, the tip fulvous, with interrupted ſilver ſtreaks.

* Roesella. Wings black-gilt, with nine ſilvery convex ſub-marginal dots.

* Leuwenhoekalla. Wings gilt, with a ſilvery ſtreak at the baſe, and four oppoſite dots.

* Myllerella. Wings gilt, with two ſilvery ſtreaks at the baſe, and three lines near the tip.

* Linneella. Wings brown-gilt, with four raiſed ſilvery dots.

* Rayella. Wings gilt, with ſeven ſilvery ſpots, the ſecond and third united.

* Schreberella. Wings gilt, with two ſilvery bands at the baſe, and two ſpots at the tip.

* Harrisella. Wings ſilvery-gilt, the tip obtuſe, parched, and ſub-ocellate.

* Cramerella. Wings ſilvery, with oblique marginal brown lines, and a black dot at the tip.

* Blancardella. Wings gilt, with a ſilvery line at the tip, and ſeven marginal ſpots.

* Lichenella. Apterous, ſmooth, black. Found on various lichens.

Alucita.

* Marginella. Upper wings pale brown, with ſnowy margins.

* Granella. Wings varied with white and black; the head is ſnowy. This is found in corn lofts, where it devours the grain, and cauſes it to cling together: in winter it crawls up the walls.

* Nivella. Wings ſnowy, with a black band between two marginal ſpots; the head is white.

* Asperella. Upper wings emarginate at the tip, whitiſh, with two common blackiſh ſpots.

* Costella. Snowy; wings reddiſh-gold, with a white coſtal ſpot at the baſe, dotted with brown.

* Scabrella. Wings grey-brown, with black raiſed dots.

* Aristella. Whitiſh; wings with a ſilvery line.

* Swammerdammella. Wings pale, immaculate; the antennæ are very long.

* Robertella. Wings brown, angle of the tail white; antennæ very long.

* Frischella. Wings brown-gold; the antennæ are moderately long, and tipt with white.

* Calthella. Black; upper wings gold, the head is ferruginous.

* Degeerella. Wings black-gold, ftriate with yellow in the middle a yellow band; the lower wings are brown; the antennæ are very long. The yellow lines on the upper wings are fometimes wanting.

* Podella. Wings black-gold, ftriate with yellow; in the middle there is a pale band; the lower ones are purple, and the antennæ are very long.

* Sulzella. Wings black-gold, with a gold band; the antennæ are very long. This is thought to be a variety of the laft.

* Reaumerella. Wings black, bronzed outwardly; the antennæ are very long.

* Fasciella. Wings gilt, with a brown band; the antennæ are tipt with white.

* Sulphurella. Upper wings gilt, with two oppofite fulphur fpots; the lower ones are yellow.

* Oppositella. Wings brown, with two yellow oppofite fpots; the lower ones are brown.

Pterophorus.

* Monodactyla. Wings expanded, linear, undivided.

* Didactyla. Wings cleft, red-brown, with white ftreaks; the upper pair bifid.

* Tesseradactyla. Wings expanded, cleft, clouded with cinereous; the lower ones are clouded with brown.

* Pterodactyla. Wings extended, cleft, teftaceous, with a brown dot.

* Pentadactyla. Body and wings fnowy; upper pair bifid, lower ones three-parted. The larva of this fpecies is fixteen-footed, hairy, green, with black dots, and a white dorfal line; the pupa is hairy, green, dotted with black. It appears in Auguft: its larva feeds on nettles.

* Hexadactyla. Wings cleft, cinereous, fpotted with brown; all of them are fix-parted. This fpecies is found on the Lonicera xylofteum, or Honey-fuckle; it as a very elegant and beautiful infect, and often flies into the houfe in the evening: it makes its appearance in the month of September. It has been frequently called, by Englifh collectors, the twenty-plumed moth; this, however, is an improper name, the plumes being, in reality, twenty-four.

PHALAIA, a word invented by Bafil Valentine, and ufed as the name of a panacea, or univerfal medicine; but Rolfink has fince ufed it to exprefs a tincture of jalap.

PHALAINA, φαλαινα of Ariftotle, a fpecies of *Balæna*. See Mysticetus.

PHALANGER. See Didelphis *Orientalis*.

PHALANGIUM, in *Botany*, φαλαγγιον, a name adopted, by the earlier botanifts among the moderns, from Diofcorides. Their example was followed by Tournefort, Haller, and others; but Linnæus always objected to this name, as properly belonging to an infect, to which it had been appropriated from the moft remote antiquity, and for which therefore he retained it in the Zoological part of his fyftem, preferring *Anthericum*, another ancient denomination, for the genus of plants in queftion. Of late, however, Juffieu and other French botanifts, fome of whom never heartily affented to the above decifion of Linnæus, having divided his genus *Anthericum*, have reftored *Phalangium*. Whether the genus to which they have applied it, characterifed by its fmooth filaments, be a good one, is a matter of opinion. It is adopted by Mr. Ker in Curtis's Magazine, but not by the late Mr. Dryander in Ait. Hort. Kew. nor by Willdenow. We are inclined to admit it, but certainly not under the above appellation, which is equally contrary to good fenfe and to every fyftematic rule. *Phalangites* prefents itfelf as a fynonym to the fame plant in Diofcorides, and is unexceptionable. The flowers of this genus are obferved by Juffieu to be white or purplifh; thofe of his *Anthericum* yellow. *Anthericum græcum*, *ferotinum*, Engl. Bot. t. 793, *Liliago*, *Liliaftrum*, &c., are examples of the former; *A. frutefcens*, Curt. Mag. t. 816, *aloides*, t. 1317, *afphodeloides*, and feveral others, of the latter, in which *Narthecium* of Fl. Brit. is, by fome botanifts, alfo retained. See Anthericum and Narthecium.

Phalangium, in *Entomology*, a genus of infects of the order Aptera; the generic character is, mouth with horny mandibles, the fecond joint with a very fharp moveable cheliferous tooth; feelers filiform; no antennæ; two eyes on the crown, and two at the fides; eight legs, the abdomen is generally rounded. There are nineteen fpecies, divided into two fections, which are fubdivided. Of all the infects of this order, few are more repulfive than thofe of the Phalangium genus. Some of them are armed with weapons refembling thofe of the fpider genus, but operating with much malignity. They differ very much in fize, fome being very minute, while others are equal in magnitude to the larger kind of fpiders.

A. *Mouth with a conic tubular fucker.*

a. Four feelers, the upper ones chelate.

Species.

* Grossipes. Body minute, cylindrical glabrous; fhoulders tuberculate; legs very long. It inhabits European feas. The body is of a dirty red, very minute and flow; it infinuates itfelf into the fhells of mufcles, and deftroys the fifh.

Hirtum. Body filiform and hairy. It inhabits the Norway ocean, and is about the fize of the laft.

Spinipes. Body cylindrical, flender; legs very long and fpinous. This alfo is found in the feas of Norway.

b. Two feelers.

* Balænarum. Two feelers; body ovate, red on the back. It inhabits European feas. Found under ftones. The fucker projects ftraight, is obtufe at the lip, with a round perforation; the feelers as long as the fucker, and placed at its bafe; the legs are pointed.

B. *Mouth without fucker.*

a. Feelers projecting, incurved.

Bicolor. Body roundifh and black above; legs very long, with teftaceous joints and tips. It is a large infect, and is found in Switzerland.

Morio. Abdomen ovate, black beneath, and bafe of the legs pale. It inhabits Norway, about rocks; larger than the Opilio, which comes next.

* Opilio. Abdomen ovate, grey, beneath whitifh. It inhabits Europe and America, and wanders about by night. This is the moft common infect of the genus, and during autumn it may be obferved in gardens, about walls, &c.; it is remarkable for its plump, but at the fame time flattifh orbicular body, and its extremely long and flender legs, which are generally fo carried that the body appears fufpended or elevated to a confiderable height above the furface on which the animal refts; the eyes are fituated on the top of the head, and refemble two very minute glaffy globules; the colour of the whole animal is a pale greyifh-brown. This fpecies preys on the fmaller kind of infects.

* Cornutum. Abdomen depreffed; mandible conic, afcending; feelers refembling eggs. It is found in this country and other parts of Europe, like the laft, to which it bears a refemblance.

Bilineatum. Pale, with two black dotted dorfal lines. This and the next are found among the rocks of Norway.

Diadema. Thorax with an elevated fpinous tubercle on the back. This tubercle is furnifhed with a large eye on each fide.

Carinatum. Brown; abdomen depreffed, carinate; the fore legs are one-toothed before the tip. It is found chiefly at Drefden, and is about the fize of the Opilio.

* Duo-maculatum. Abdomen black, with two white fpots. This is an Englifh infect, and is defcribed and figured by Mr. Donovan. The body is very fmall, ovate, and black, with two white fpots; abdomen is furrounded with a very fine fub-marginal white line; the legs are long and black.

Aranoides. The claws are toothed and villous; the body oblong. Inhabits the Cape of Good Hope, and fouthern parts of Ruffia. Its bite is faid to be extremely poifonous, occafioning livid tumours, and fometimes death itfelf. The body of this infect is foft, livid, woolly, with inflated claws.

* Cancroides. Abdomen obovate, depreffed, ferruginous; the claws are oblong and hairy. A variety has ovate claws. It is found in divers parts of Europe, befides this country, in cellars and damp places, and is the little infect which gets into our legs and under the fkin, caufing a very painful itching.

Acaroides. Abdomen cylindrical, yellowifh; claws ovate and fmooth. It inhabits America. Is twice as large as the former, and its bite is reported to be extremely painful and dangerous.

b. Feelers thick, fpinous, and furnifhed with a claw at the tip.

* Hirsutum. Feelers ferrate; body fub-oval, with ten angles. It is found in this country.

Reniform. Feelers ferrate; fore-legs very long and filiform; thorax kidney-fhaped. It inhabits South America, and its iflands. It is one of the largeft of the genus, and has the appearance of a very large fpider.

Caudatum. The feelers of the infects of this fpecies are branched; the tail ends in a briftle. The claws are large, and toothed on the infide towards the tips. It is a native of the Eaft Indies.

Lunatum. Feelers very long, and fpinous at the tip; thorax kidney-fhaped. It inhabits America. The feelers are four times as long as the body, they are fmooth, except at the tip, which is very fpinous.

Phalangium *Apulum*, the *Apulian phalangium*, a name given by authors to that large and poifonous fpecies of fpider, called by the vulgar the tarantula, from the name of a city of Calabria, Tarantum; near which it is very common.

PHALANGOSIS, from φαλαγξ, *a row of foldiers*, in *Surgery*, a difeafe, in which the row of hairs, compofing the eye-lafhes, turn inward, and irritate the eye. See Trichiasis.

PHALANX, in *Anatomy*, a name applied to the bones of the fingers and toes, which are diftinguifhed by the numerical terms, firft, fecond, and third, reckoning from the metacarpus and metatarfus. The two rows of carpal bones are alfo called phalanges; the firft or radial, the fecond or metacarpal.

Phalanx, φαλαγξ, in *Antiquity*, a huge, fquare compact battalion, formed of infantry, fet clofe to one another, with their fhields joined, and pikes turned crofs-ways; infomuch that it was almoft impoffible to break them.

It confifted of eight thoufand men: Livy fays, that this fort of battalion was invented by the Macedonians, and that it was peculiar to them; whence, among writers, it is fometimes called the *Macedonian phalanx*.

St. Evremont obferves, that the Macedonian phalanx had the advantage in valour and ftrength over the Roman legion.

Phalanx, in *Natural Hiftory*, a term ufed by Dr. Woodward, and fome other writers of foffils, to exprefs an arrangement of the columns of that fort of foffil coralloid body found frequently in Wales, and called *lithoftrotion*.

In the great variety of fpecimens which are found of this, fome have the whole phalanx of columns cracked through, and others only a few of the external ones; but thefe cracks never remain empty, but are found filled up with a white fpar, as the fmaller cracks of ftone ufually are. This is not wonderful, as there is much fpar in the compofition of this foffil; and it is eafily wafhed out of the general mafs to fill up thefe cracks, and is then always found pure, and therefore of its natural colour, white. The lithoftrotion, or general congeries of thefe phalanges of columns, is commonly found immerfed in a grey ftone, and found on the tops of the rocky cliffs about Milford in Wales. It is ufually erect, though fomewhat inclining in fome fpecimens, but never lies horizontal. It feems to have been all white at firft, but to have been fince gradually tinctured with the matter of the ftone in which it lies. The fingle columns which form each phalanx are ufually round or cylindric, though fometimes flattened and bent; fome of them are alfo naturally of an angular figure; thefe, however, are not regular in the number of their angles, fome confifting of three fides, fome of five, and fome of feven; fome are hexangular alfo, but thefe are fcarce. They are from five or fix to fixteen inches in length; and the largeft are near half an inch over, the leaft about a quarter of an inch; the greater number are very equal to one another in fize; but the fides of the columns being unequal, the fame column meafures of a different thicknefs when meafured different ways; the phalanges or congeries of thefe are fometimes of a foot or more in diameter.

The columns are often burft, as if they had been affected by external injuries; and it is evident, that they were not formed before feveral other of the extraneous foffils; for there are found fometimes fhells of fea-fifhes and entrochi immerfed and bedded in the bodies of the columns. It appears plainly from hence, that when thefe bodies were wafhed out of the fea, and toffed about in the waters which then covered the tops of thefe cliffs, this elegant foffil, together with the ftony bed in which it is contained, were fo foft, that thefe other bodies found entrance into their very fubftance, and they were formed, as it were, upon them. This foffil takes an elegant polifh, and makes in that ftate a very beautiful appearance, being of the hardnefs of the common white marble, and carrying the elegant ftructure vifible in the fmalleft lineaments. Woodward's Coll. of Foff. p. 11.

PHALARIS, in *Biography*, tyrant of Agrigentum, in Sicily, who rendered himfelf famous by the cruelties which he committed, but of whofe perfonal hiftory very little is known. He is thought to have been born in Crete, and to have been banifhed from that ifland on account of his political intrigues. He went to Sicily, and by his abilities was enabled to obtain the fovereignty of Agrigentum about the year B. C. 571. He found it neceffary to maintain by harfhnefs and feverity, the place to which he had rifen by force or fraud, and he became one of the moſt deteſted of tyrants. The moſt marked inſtance of his cruelty is his puniſhment by the brazen bull. (See AGRIGENTUM, and BULL *of Phalaris.*) There is extant a ſeries of letters under the names of Phalaris and Abaris, the genuineneſs of which has been the ſubject of much controverſy, eſpecially between the honourable Charles Boyle and the celebrated Dr. Bentley. Boyle, who gave an edition of thoſe epiſtles with a new Latin verſion, in 1695, made a reflection upon the conduct of Bentley in his preface, which induced the critic to undertake to prove that the letters were ſpurious, and conſequently the labour beſtowed upon them uſeleſs. He carried his point, and the ſpuriouſneſs of the epiſtles of Phalaris is now generally admitted: hence the circumſtances of his life deduced from them loſe their authority. An hiſtory of Phalaris was publiſhed in 1726, by a Frenchman, entitled "L'Utilité du Pouvoir Monarchique," &c. which is a mere romance. Perhaps the lateſt edition of the Epiſtles is that of Valkenaer, Groningen, 4to. 1777. Univerſal Hiſt. Moreri.

PHALARIS, in *Botany*, ſuppoſed to be the φαλαρις of Dioſcorides, with whoſe deſcription the firſt or principal ſpecies tallies tolerably well, and anſwers ſtill better to the idea of the name, in the neat ſhining aſpect of its glumes and ſeeds.—Linn. Gen. 32. Schreb. 45. Willd. Sp. Pl. v. 1. 326. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 62. Prodr. Fl. Græc. Sibth. v. 1. 36. Ait. Hort. Kew. v. 1. 137. Juſſ. 29. Lamarck Illuſtr. t. 42. Gærtn. t. 80. Schrad. Germ. v. 1. 177.—Claſs and order, *Triandria Digynia.* Nat. Ord. *Gramina.*

Gen. Ch. reformed. *Cal.* Glume ſingle-flowered, of two compreſſed, nearly equal, keeled, acute valves, their ſtraight parallel margins brought cloſe together. *Cor.* but half the ſize of the calyx, and concealed within it, double; the outermoſt ſmalleſt, of one or two lanceolate, acute, keeled, nearly equal, more or leſs downy valves, cloſely applied to the back of the innermoſt, which conſiſts of two larger, oblong, concave, acute valves, finally permanent and cartilaginous, inveſting the ſeed, the inner one ſmalleſt. Nectary of two lanceolate, pointed, pellucid leaves, tumid at the baſe. *Stam.* Filaments three, capillary; anthers oblong, forked at each end. *Piſt.* Germen ovate; ſtyles two, capillary, combined at the baſe; ſtigmas villous. *Peric.* none, except the permanent hardened inner corolla, which does not ſeparate. *Seeds* ſolitary, ovate-oblong, acute, ſmooth.

Eſſ. Ch. Calyx ſingle-flowered, of two, nearly equal, keeled valves, encloſing the double corolla. Seed coated with the hardened inner corolla.

Many changes, and ſome miſtakes, have taken place with regard to the ſpecies of this elegant genus of graſſes, ſo that it is neceſſary to exhibit the whole in detail.

1. Ph. *canarienſis.* Common Canary-graſs. Linn. Sp. Pl. 79. Willd. n. 1. Ait. n. 1. Engl. Bot. t. 1310. Knapp. t. 3. Mart. Ruſt. t. 17. Schreb. Gram. t. 10. f. 2. Leers t. 7. f. 3 +. Sm. Fl. Græc. Sibth. v. 1. 40. t. 55. (Phalaris; Ger. Em. 86. Matth. Valgr. v. 2. 270.)—Panicle ovate, ſpike-ſhaped. Valves of the calyx boat-like. Outer corolla of two valves; inner one villous. Root fibrous.—Native of cultivated fields in the ſouth of Europe; naturalized occaſionally in England, flowering in July and Auguſt, and generally occurring about dunghills. It is ſown as a crop, chiefly in the county of Kent, according to profeſſor Martyn, being much uſed as the food of ſinging birds in cages. The *root* is annual, of ſeveral branched fibres. *Stems* ſeveral, eighteen inches or two feet high, bent at the lower joints, but otherwiſe erect, round, leafy, ſmooth. *Leaves* ſpreading, lanceolate, taper-pointed, rather glaucous, roughiſh beneath; their ſheaths long, ſtriated, inflated upwards, eſpecially the uppermoſt. *Stipulæ* blunt, moſtly torn. *Spikes* terminal, ſolitary, an inch or two long, thick, very handſome; the valves of the *calyx*, the only ones that are viſible, being prettily ſtriped with green and white; they are uſually ſmooth, ſometimes a little downy, the white dilated keel of each often furniſhed with a notch near the ſummit. The outer *corolla* is of two equal lanceolate ſmooth valves, clapped cloſe to the keels of the valves of the inner, which are downy and unequal. *Anthers* yellow, prominent. Linnæus and Schreber reckon the outer *corolla* an inner *calyx*, perhaps not incorrectly.

2. Ph. *nodoſa.* Knotty Canary-graſs. Linn. Syſt. Veg. ed. 14. 104. Willd. n. 5. Sm. Fl. Græc. Sibth. v. 1. 41. t. 56. (Ph. tuberoſa; Linn. Mant. 557. Ph. bulboſa; Cavan. Ic. v. 1. 46. t. 64. Ph. bulboſa, albo ſemine; Scheuch. Agr. 53. t. 2. f. 3 F.)—Panicle lanceolate, ſpike-ſhaped. Valves of the calyx boat-like. Outer corolla of one valve. Stems bulbous at the baſe.—Native of the ſouth of Europe. Barnadez found it in Spain; Sibthorp about the borders of fields in the Archipelago. The *root* is perennial, of many downy fibres. *Stems* numerous, twelve or eighteen inches high, aſcending, leafy; decumbent at the baſe, where two or three of the lower joints are tumid and ovate, aſſuming a bulbous aſpect, which ſhews that the plant is accommodated to a ſoil whoſe moiſture varies much. *Leaves* ſpreading, graſs-green, linear, longer and narrower than in the preceding, with cloſe *ſheaths*, and long *ſtipulæ*. The *ſpike* is alſo much narrower and rather longer. Keel of the *calyx* entire, roughiſh. Outer *corolla* of only one lanceolate villous valve. Linnæus cultivated this ſpecies at Upſal, and from a more accurate obſervation of its *root*, was led to change the name he had given it in the *Mantiſſa*, to *nodoſa.* It has been much miſunderſtood, and is a ſtranger to our gardens.

3. Ph. *aquatica.* Water Canary-graſs. Linn. Sp. Pl. 79. Willd. n. 2. Ait. n. 2. Sm. Fl. Græc. Sibth. v. 1. 42. t. 57. Schrad. Germ. v. 1. 179. Hoſt. Gram. Auſtr. v. 2. 29. t. 39. (Ph. minor; Retz. Obſ. faſc. 3. 8. Ehrh. Exſicc. 61. Gramen typhinum phalaroides majus bulboſum aquaticum; Barrel. Ic. t. 700. f. 1.)—Panicle cylindrical, ſpike-ſhaped. Valves of the calyx boat-like, ſomewhat crenate. Outer corolla of one valve. Root knotty, creeping.—Native of Egypt and of the Tiber, according to Linnæus. Dr. Sibthorp found it in watery ſituations in Aſia Minor. The *root* is branched, knotty and jointed, creeping, with numerous downy fibres. All authors, even the accurate Schrader, aſſert it to be annual, which nobody could ſuppoſe from its appearance. *Stems* erect, ſtraight, ſmooth and rather glaucous, in our ſpecimens four or five feet high; Schrader ſays a foot and a half. *Leaves* very long and rather narrow, rough on both ſides; the ſheaths long and tight. *Panicle* from three to five inches long, cylindrical, bluntiſh, three quarters of an inch thick. Keel of the *calyx* thin, with ſeveral ſmall ſhallow irregular notches. Outer *corolla* of one minute, lanceolate, cloſe-preſſed, villous glume; both valves of the inner more or leſs ſilky. This ſpecies has long been cultivated at Paris, as appears by the Linnæan herbarium, and was ſent to Kew by M. Thouin in 1778. Ehrhart's ſpecimen agrees exactly with our's, except in being leſs luxuriant. We ſee no reaſon for rejecting Barrelier's ſynonym.

4. Ph. *cæruleſcens.* Blueiſh Canary-graſs. Desfont. Atlant. v. 1. 56. (Gramen phalaroides hirſutum, ſpicâ longiſſimâ; Buxb. Cent. 4. 30. t. 53.)—Panicle cylindrical, ſpike-ſhaped, rather lax. Valves of the calyx boat-like,

 tapering,

tapering, pointed. Corolla acute.—Gathered by Buxbaum, in meadows about the Bofphorus, in May; by Desfontaines in fields at Algiers. This is compared by the latter to *Ph. bulbofa*, by which there is good reafon to fuppofe he meant the grafs fo called by Linnæus; fee PHLEUM *tenue*. Buxbaum took his plant for that of Barrelier, cited under our laft fpecies, and therefore found fault with that figure; but he was miftaken, as was Linnæus no lefs in citing him under *aquatica*, from which the plant of Buxbaum and Desfontaines feems to differ in having fmooth *leaves*, and a more lax *panicle;* but efpecially in the *calyx*, which is blueifh, with taper-pointed valves. We do not underftand why Buxbaum terms his "a hairy grafs." We have feen no fpecimen, and as Desfontaines does not advert to the double *corolla*, even in *Ph. canarienfis*, it is impoffible to afcertain from him whether the prefent plant has one or two valves in the outer *corolla*. His expreffion of "an inner *calyx*," in thefe and other graffes, alludes only to the *corolla* altogether, after the French mode.

5. Ph. *paradoxa*. Briftled-fpiked Canary-grafs. Linn. Sp. Pl. 1665. Willd. n. 11. Ait. n. 6. Sm. Fl. Græc. Sibth. v. 1. 43. t. 58. Schrad. Germ. v. 1. 179. Linn. fil. Dec. 2. 35. t. 18. Schreb. Gram. 93. t. 12. Hoft. Gram. Auftr. v. 2. 30. t. 40.—Panicle cylindrical, obtufe, fpike-fhaped. Valves of the calyx fingle-toothed, awned. Lower flowers abrupt and abortive.—Native of Iftria, Italy and Greece, in cultivated ground, flowering in May and June. *Root* annual, of many downy fibres. *Stems* numerous, afcending, 12 or 18 inches high, bent at the joints, almoft entirely clothed with the long, more or lefs inflated, fheaths of the *leaves*, the uppermoft of which embraces the lower part of the *panicle*, where a great many of the *flowers* affume a ftrange appearance, being ftarved, abortive, and of an abrupt wedge-like figure. The *flowers* above, in their natural ftate, are prettily variegated with green and white. *Calyx-valves* lanceolate, each with a broad, but partial and acute, dilatation of the keel, like a tooth, and a terminal rough ftraight awn, various in length. Schrader has obferved a minute outer *corolla* of two valves; the inner confifts of two, rather unequal, ovate, acute, fomewhat downy ones. *Seed* minute. Linnæus obferved, that all the *flowers* became perfectly formed, in cultivated fpecimens.

6. Ph. *arundinacea*. Reed Canary-grafs. Linn. Sp. Pl. 80. Fl. Dan. t. 259. Ehrh. Calam. 51. Schrad. Germ. v. 1. 180. t. 6. f. 5. Engl. Bot. t. 402. and t. 2160. f. 2. Hoft. Gram. Auftr. v. 2. 25. t. 33. Leers 18. t. 7. f. 3. (Arundo colorata; Soland. in Ait. H. Kew. ed. 1. v. 1. 116. Dryand. in ed. 2. v. 1. 174. Sm. Fl. Brit. 147. Prodr. Fl. Græc. Sibth. v. 1. 69. Knapp. t. 98.)—Panicle upright, with fpreading branches. Flowers crowded, leaning one way.—Native of rivers, ditches and lakes, throughout Europe, flowering in July. A variety with variegated *leaves* is common in gardens. The *root* is perennial, creeping and tufted, fpreading to a great extent. *Stems* from two to five feet high, erect, ftrong, reedy, fmooth and leafy, with feveral joints. *Leaves* alfo reed-like, lanceolate, ftriated, pointed, fmooth, rather glaucous, with tight, or fcarcely fwelling, fheaths. *Stipula* fhort, bluntifh. *Panicle* very different from any of the preceding, confifting of numerous, compound, angular, rough *branches*, turned one way, and bearing numerous, crowded, often purplifh, tufts of *flowers*. The *calyx-valves* are lanceolate, nearly equal, keeled, ribbed, awnlefs. Outer *corolla* of two very minute, linear, gibbous, hard valves, each bearing a tuft of hairs exceeding their own length. Thefe hairs mifled the ingenious Dr. Solander to refer the grafs in queftion to *Arundo*, a miftake in which we concurred in Fl. Brit. but which is now corrected in *Engl. Bot.* by the fubftitution of a new page 402, in confequence of the very accurate remarks of Dr. Schrader, whofe *Flora Germanica* excels every work, in this tribe of plants, that we have feen.

7. Ph. *capenfis*. Cape Canary-grafs. Thunb. Prodr. 19. Willd. n. 3.—"Panicle ovate, fpike-fhaped. Glumes entire. Stem bent and decumbent."—Native of the Cape of Good Hope. Having feen neither fpecimen, nor any further defcription of this fpecies, we dare not remove it from *Phalaris*, though it may poffibly be a *Phleum*.

To the latter genus we now refer the Linnæan *Phalaris bulbofa*, *dentata*, *phleoides*, as well as *arenaria* of Fl. Brit. and *afpera* of Willdenow. The *utriculata* is fhewn in Fl. Græc. t. 63 to be an *Alopecurus*, beyond all poffible doubt; *oryzoides* will be found under *Leerfia; zizanoides* is *Andropogon muricatum*, Retz. Obf. fafc. 3. 43. *Ph. hifpida*, Thunb. Jap. 44, appears a very doubtful plant, but there is evidently no reafon to retain it here. See PHLEUM.

PHALARIS, in *Agriculture*, the title of a genus of graffes, of which there are feveral fpecies, but none that can be introduced into field culture with advantage. It is the canary grafs.

PHALARIS, in *Ornithology*. See FULICA *Atra*.

PHALARIS'S *Bull*, in *Ancient Hiftory*, was a brazen bull for tormenting criminals, conftructed by Perillus the Athenian, in order to flatter the cruelty of Phalaris, tyrant of Agrigentum. The artift, demanding too great a reward for his contrivance, was the firft who fuffered in it. Some have treated this fragment of ancient hiftory as a fable; but we learn from Diodorus Siculus, lib. xiii. cap. 13. that Scipio Africanus, when he razed Carthage, about 260 years after the deftruction of Agrigentum, found among other things this bull, and reftored it to the inhabitants of Agrigentum, where it was to be feen when Diodorus wrote his hiftory, *viz.* in the reign of Auguftus. See BULL *of Phalaris*.

PHALAROPE, in *Ornithology*, is a fpecies of the *tringa* in the Linnæan fyftem. Mr. Pennant gives the following general character of this fpecies: the bill is ftraight and tender; the noftrils minute; the body and legs like thofe of the fand-piper, and the toes furnifhed with fcallopped membranes. He alfo more particularly defcribes the grey phalarope, or *tringa lobata* of Linnæus, and the red or *tringa hyperborea* of the fame author. See TRINGA.

PHALEMPIN, in *Geography*, a town of France, in the department of the North; 9 miles S.W. of Lille.

PHALERA, the name of a bandage for the nofe, defcribed by Galen in his Treatife on Bandages.

PHALERÆ, among the *Ancients*, horfe-trappings.

PHALERUM, in *Ancient Geography*, the moft ancient port of Athens, which, being found narrow and inconvenient, was fucceeded by the more capacious harbour of Piræus, conftructed by Themiftocles. (See PIRÆUS.) Phalerum was diftant from the city, according to Thucydides, 35 ftadia, but, according to Paufanias, only 20. It was from this port that Mneftheus, an ancient king of Athens, took his departure with a fquadron for the fiege of Troy. Thefeus likewife went from hence to Crete, to combat the Minotaur. Near this port was a temple of Ceres, a temple of Minerva Scirada, fo called after Sciras, one of the propheteffes of Dodona, a temple of Jupiter, fome altars to unknown gods, different altars to feveral heroes, fuch as the children of Thefeus and thofe of Phalerus, from whom this port derived its name, and who was ranked among the Argonauts, and an altar to Androgeus, with this brief infcription, "To the Hero." Paufan. in Attic. On the road which led from Phalerum to Athens there had fubfifted for

for a long time a temple of Juno, which was burnt by Mardonius, on occaſion of the invaſion of the Perſians. See Athens.

PHALEUCUS, or Phalecius, in *Poetry*, a kind of verſe, in uſe among the Greeks and Latins; conſiſting, like the Sapphic, of five feet; the firſt a ſpondee, the ſecond a dactyl, and the three laſt trochees.

The phaleucus is very proper for epigrams. Catullus excelled in it. Its original author is not known; though ſome have ſaid it derives its name from its inventor.

PHALLICA, φαλλικα, in *Antiquity*, feaſts or ſacrifices celebrated at Athens, in honour of Bacchus.

The Phallica were inſtituted on the following occaſion: one Pegaſus, a citizen of Eleutheris, having carried ſome ſtatues of Bacchus to Athens, drew on himſelf the laughter and contempt of the Athenians. Soon after this, the people were ſeized with an epidemic diſeaſe; and, upon conſulting the oracle how to get free of it, were anſwered, that there was no way but to receive Bacchus in pomp: they did it, and thus inſtituted the Phallica; wherein, beſides the ſtatues and trophies of the god, they bore figures of the parts affected, tied to thyrſi.

PHALLOPHORI, φαλλοφοροι, a name given at Sicyon to certain mimes, who ran about the ſtreets ſmutted with black, and clothed in ſheep ſkins, bearing baſkets full of various herbs, as chervil, brancha urſina, violet, ivy, &c.

The word is formed from φαλλος, *a pole*, at the end of which was faſtened the figure of a human penis made of leather; and φερω, *I bear*.

They danced in cadence, and were crowned with ivy, in honour of Bacchus; carrying the phallus before them as the enſign of their office.

PHALLUS, in *Botany*, a genus of *Fungi*, whoſe whimſical conformation bears too ſtriking a reſemblance to the Greek φαλλος to be overlooked or diſſembled. Linn. Gen. 568. Schreb. 769. Mart. Mill. Dict. v. 3. Perſ. Syn. 242. Hudſ. 629. Juſſ. 4. Lamarck Illuſtr. t. 885. Venten. Mem. de l'Inſtit. v. 1. 503. Uſt. Annal. faſc. 21. 67.—Claſs and order, *Cryptogamia Fungi*. Nat. Ord. *Fungi*.

Eſſ. Ch. Volva radical. Head ovate, ſtalked, entire, clothed with a fluid containing the ſeeds.

Obſ. The above characters, to which the genus in queſtion is very juſtly reſtricted by Perſoon, exclude from it the ſeveral kinds of Morel (ſee Morchella), which indeed have no natural affinity in texture, characters, or properties to *Phallus*, though confounded with it by Linnæus and his followers, as well as by Ventenat. The following are all the genuine ſpecies known.

Section 1. *Head reticulated and cellular.*

1. Ph. *fœtidus*. Common Stink-horn. Sowerb. Fung. t. 329. (Ph. impudicus; Linn. Sp. Pl. 1648. Curt. Lond. faſc. 3. t. 72. Bolt. Fung. t. 92. Bull. Fr. t. 182. Fl. Dan. t. 175. Schæff. Fung. t. 196—198. Ph. vulgaris, &c.; Mich. Gen. 201. t. 83.)—Stalk with numerous perforations, ſomewhat oblique. Head honeycomb-like, pervious.—This occurs not unfrequently in autumn, on a ſandy ſoil, in various parts of Europe, either on open heaths, or under trees; exciting attention by the odious ſcent, which it diffuſes widely around, while the liquor is flowing from the head, and which is, naturally enough, often miſtaken for that of carrion. The *root* is fibrous. *Volvas* ſeveral together, partly buried in the ground, white, each reſembling a hen's egg in ſize and ſhape. *Stalk* erect, the growth of a few hours, about ſix inches high, tubular, whitiſh, highly cellular and tender, an inch, or almoſt two, in diameter. *Head* ovate, unconnected, except at the top; externally much like a honeycomb, pale, but covered when at maturity with a viſcid, fœtid, greeniſh-black fluid, which ſoon runs off, carrying away the *ſeeds*. Flies are very fond of this fluid.

2. Ph. *cancellatus*. Latticed Stink-horn. Perſ. n. 2. Venten. n. 10. (Ph. volvatus, pileo apice clauſo; Rothm. Stockh. Tranſ. for 1742. 19. t. 2. Ph. alpinus, volvâ ſubrotundâ albâ, pileolo cellulato, umbilico pervio carente, pediculo dilutè fulveſcente; Mich. Gen. 202. Boletus phalloides; Petiv. Oper. v. 1. 6. t. 129. f. 10.)—Stalk cylindrical, even. Head reticulated, impervious.—Native of Sweden, in barren moſſy ground, as well as of mountains in Tuſcany, having been found by Tozzi, who ſent a figure of it to Petiver, in woods about the celebrated monaſtery of Valumbroſa. Its ſize, and general aſpect, are like the former, with which Linnæus confounds it, nor does even Perſoon aver it to be indubitably diſtinct. Yet the ſpecific character appears deciſive. Its ſcent is reported to be agreeable, and like ſome of the Orchis tribe.

3. Ph. *induſiatus*. Veiled Stink-horn. Venten. n. 13. Perſ. n. 3. (Ph. dæmonum; Rumph. Amboin. v. 6. book 11. 131. t. 56. f. 7.)—Stalk round, cellular, with a net-like veil. Head roundiſh, reticulated, pervious.—The plant which Ventenat deſcribes was found abundantly in the French ſettlements at Guiana, by Vaillant, father of the romantic African traveller, in the year 1755. Its *volva* was not obſerved. The *ſtalk* is ſix inches high, milk-white, tubular, its ſurface covered with bliſters, which at length burſt, and become cells. *Head* bell-ſhaped, connected only at the top, reticulated, or like a honey-comb, of a deep blue, the elevated reticulations white. From the lower margin of the *head* hangs down an ample, very tender, netlike *veil*, at firſt white, then reddiſh, gradually expanded, and finally reaching to the ground, which is the greateſt peculiarity of this ſpecies. Rumphius's Amboyna plant does not appear to us ſpecifically different. He attributes to it a very intolerable ſcent, which Vaillant did not obſerve, and ſpeaks of it as held in abhorrence by the Malays, who ingeniouſly imagine this fungus to ſpring from the urine of demons. Dr. Buchanan found in Upper Nepaul, in Auguſt, a ſingle ſpecimen which anſwers to the above deſcription, but which decayed before he could have it delineated. In this the *head* was livid, the *veil* of a pale ſtraw-colour; but probably theſe parts may undergo changes in this reſpect, during their rapid growth. After all, we do not mean to aſſert that there may not be ſeveral ſpecies furniſhed with a *veil*, but we have not materials to diſtinguiſh them.

Section 2. *Head tuberculated, combined with the Stalk.*

4. Ph. *inodorus*. Small Scentleſs Stink-horn. Sowerb. Fung. t. 330. (Ph. caninus; Schæff. Fung. t. 330. Curt. Lond. faſc. 4. t. 73. Perſ. n. 4. Venten. n. 7.)—Stalk cylindrical, with numerous perforations, yellowiſh. Head united with the ſtalk, red, plaited lengthwiſe, impervious. This very pretty ſpecies is not half the ſize of the firſt, and much more rare. It is found every autumn, in Caen wood near Hampſtead, and very frequently in the woods of Coſſey and Crown Point, near Norwich. Mr. Bowman ſays the unexpanded volva, brought into the houſe in an evening, has before morning produced a full-grown plant, but he never obſerved it to grow in the day-time. We have, on the contrary, had theſe plants before us, while writing, during a whole morning, and have ſeen them ſhoot up in the courſe of three or four hours. They may be obſerved without inconvenience, being deſtitute of the fetor of our other Britiſh ſpecies. The *root* is much branched,

ſpreading

ſpreading horizontally to a great extent, and producing here and there ſolitary, ovate, whitiſh *volvas*. *Stalk* two or three inches high, and half an inch thick, yellowiſh. *Head* while covered with its viſcid liquor, not unlike a pickled olive in ſize and colour, but when that ſubſtance is removed, which happens more tardily than in the *fœtidus*, the *head* appears of a dull red, plaited or furrowed longitudinally, and without any terminal orifice: its lower edge moreover is cloſely united with the ſtalk.

5. Ph. *Mokuſin*. Chineſe Stink-horn. Cibot Act. Petropol. v. 19. 373. t. 5. Linn. Suppl. 452. Perſ. n. 5. Venten. n. 8.—Stalk with five angles. Head acute, in five deep cohering ſegments.—Grows on the old decaying roots of Mulberry trees in China. Father Cibot, one of the miſſionaries, obſerved it about Pekin, and ſent a full account, with excellent drawings of the plant, to the Academy of Peterſburg. Its growth is rapid, ſize rather inferior to the laſt, and ſcent very offenſive. The *volva* reſembles that of *Ph. inodorus*. *Stalk* rather curved, hollow, very tender and cellular, of a delicate fleſh-colour at the baſe, which becomes deeper afterwards. The greateſt peculiarity of this ſpecies is the *ſtalk* having five angles, and the red *head* being deeply divided into as many oblong portions, all cohering, and cemented, as it were, by the greeniſh viſcid fluid which envelopes the *ſeeds*. Inſects are ſaid to devour this fungus as ſoon as it comes in their way. It is reported to vary greatly in ſize in various parts of China, and in ſome to be eatable, though in others poiſonous. Perhaps ſeveral ſpecies are confounded under the above name. The aſhes of the burnt fungus are eſteemed ſerviceable if ſprinkled over cancerous ulcers.

6. Ph. *Hadriani*. Smooth Dutch Stink-horn. Venten. n. 11. Perſ. n. 6. (Phallus n. 140; Sterb. Fung. 277—279. t. 30. f. A—G. Fungus marinus; Dod. Pempt. 483. Fungus; Ger. Em. 1583. f. 2.)—"Stalk cylindrical, ſpotted with grey. Head ſmooth and even, with a prominent dilated orifice." This is ſaid by Dodonæus to grow on the ſand-hills which border the coaſt of Holland, amongſt *Carices*. It is repreſented with a double *volva*, an even, not cellular, *ſtalk* and *head*, the latter with a prominent wide mouth. Sterbeeck's figures A—D ſeem intended for the ſame plant, in an earlier ſtate, as his E—G. The latter repreſentations are copied from Dodonæus, and repeated over and over again in various books; they are alſo copied in Barrelier's t. 1258. As no recent author ſeems to have obſerved this ſpecies, we cannot but ſuppoſe it a variety, or perhaps miſrepreſentation, of the *fœtidus*, which is found on our Norfolk coaſt, oppoſite to Holland, in the ſituations mentioned. The ſpecific name alludes to Hadrianus Junius, who has deſcribed the plant in a copy of Latin verſes, printed by Dodonæus.

Fungus phalloides gallus, Barrel. t. 1264, appears, as Perſoon well obſerves, a diſtinct ſpecies. Poſſibly it may be akin to the *cancellatus*, n. 2. Were it not for the *volva*, we ſhould ſuſpect it might be a bad repreſentation of Perſoon's *Morchella coſtata*; Boletus of Micheli, t. 85. f. 3.

PHALLUS *Marinus*, a name given by ſome authors to a ſpecies of *canalis* or *tubulus marinus*, found about Amboyna, and called by the French writers *priape* and *arroſoir*. It is an oblong ſhell, with a large head, which is pierced full of holes; ſo that it at once reſembles the glans penis, and the noſe of a watering-pot, uſed by gardeners.

PHALSBOURG, in *Geography*, a town of France, in the department of the Meurthe, and chief place of a canton, in the diſtrict of Sarrebourg, founded in 1570, and fortified by Vauban in 1680; 4 miles E.N.E. of Sarrebourg. The place contains 2032, and the canton 12,760 inhabitants, on a territory of $197\frac{1}{2}$ kiliometres, in 27 communes.

PHANAGORA, a town of Ruſſia, in the government of Caucaſus, at the mouth of the Kuban, on the coaſt of the Black ſea; called by the Tartars "Taman," without a harbour; 60 miles E. of Theodoſia. N. lat. 45°. E. long. 36° 40′.

PHANATIC, PHANATICUS, commonly written *fanatic*, a viſionary; one who fancies or thinks he ſees ſpectres, ſpirits, apparitions, or other imaginary objects, even when awake; and takes them to be real.

Such are phrenetics, necromancers, hypochondriac perſons, lycanthropi, &c. See PHRENZY, HYPOCHONDRIASIS, LYCANTHROPY, &c.

Hence the word is alſo applied to enthuſiaſts, pretenders to revelation, new lights, prophecies, &c. See FANATIC.

PHANERA, in *Botany*, from φανερος, *conſpicuous*, a genus of Loureiro's, founded on the *Bauhinia ſcandens*, Linn. Sp. Pl. 535, the Folium linguæ, Rumph. Amboin. v. 6. 1. t. 1. This plant, it ſeems, has but three *ſtamens*, and a *calyx* of four leaves. Its habit however is altogether that of a genuine *Bauhinia*, a genus in which the ſtructure of both thoſe parts is variable. Rumphius ſays the *flowers* are white or yellowiſh; Loureiro deſcribes them ſcarlet. See BAUHINIA.

PHANTASM, φαντασμα, *phantom*, a ſpecies of an object perceived by an external ſenſe, and thence retained in the phantaſy.

Ariſtotle taught, that all the objects of our thought enter at firſt by the ſenſes; and, ſince the ſenſe cannot receive external material objects themſelves, it receives their ſpecies, that is, their images or forms, without the matter; as wax receives the form of the ſeal, without any of the matter of it. Theſe images or forms, impreſſed upon the ſenſes, are called "ſenſible ſpecies," and are the objects only of the ſenſitive part of the mind; but by various internal powers, they are retained, refined, and ſpiritualized, ſo as to become objects of memory and imagination, and at laſt of pure intellection. When they are objects of memory and of imagination, they get the name of "phantaſms." When by farther experiment, and being ſtripped of their particularities, they become objects of ſcience, they are called "intelligible ſpecies:" ſo that every immediate object, whether of ſenſe, of memory, of imagination, or of reaſoning, muſt be ſome phantaſm or ſpecies in the mind itſelf. Such was the theory of the Peripatetics, with regard to the objects of our thought; and it has been ſaid that the doctrine of modern philoſophers concerning ideas is built upon it. Mr. Locke, who uſes this word frequently, tells us that he means the ſame thing by it, as is commonly meant by ſpecies or phantaſm. Gaſſendi, from whom Locke borrowed more than from any other author, ſays the ſame. The words ſpecies and phantaſm are terms of art in the Peripatetic ſyſtem, and from this we are to learn the meaning of them. We ſhall here add, that the theory of Democritus and Epicurus, on this ſubject, was not very unlike to that of the Peripatetics. They held, that all bodies continually ſend forth ſlender films or ſpectres from their ſurface, of ſuch extreme ſubtilty, that they eaſily penetrate our groſs bodies, or enter by the organs of ſenſe, and ſtamp their image upon the mind. The ſenſible ſpecies of Ariſtotle were mere forms without matter. The ſpectres of Epicurus were compoſed of a very ſubtile matter. See IDEA, PERCEPTION, and *Mental* PHILOSOPHY.

PHANTASMAGORIA, a term which denotes the raiſing of ſpectres, is a ſpecies of magic lantern, exhibited on a large ſcale, and projecting an image on a ſemi-tranſparent

rent screen of taffetas, instead of a wall. For the principle of the construction, see MAGIC *Lantern*.

PHANTASTIC, in *Music*. Phantastic style is a free, easy manner of composition; proper for instruments. See STYLE.

PHANTASTICAL COLOURS, is a denomination given by the Peripatetics to those colours exhibited by the rainbow, or a prism; they erroneously supposing them not to be real colours, but only phantoms, or deceptions of the sight.

But many experiments of the moderns, and particularly those of sir Isaac Newton, demonstrate the contrary, and prove them as real as any other colours in nature. See EMPHATICAL.

PHANTASY, or FANCY. See IMAGINATION.

PHARÆ, or PHARES, in *Ancient Geography*, a town in the eastern part of Achaia, on the river Melas, distinguished by a variety of beautiful ornaments. It had a statue of Mercury *Agoræus*, and also opposite to it another statue, which represented the goddess Vesta; and it was famous for its oracles.—Also, a town of Messenia, on the Messenian gulf, N.W. of Cardamyla. Its foundation is ascribed to Phares, the son of Mercury and Philodamæa, one of the daughters of Danaus. Among other divinities reverenced in this place were Nicomachus and Gorgazus, sons of Machaon. They had both governed this city after the death of their father, to whom as well as themselves was attributed the art of healing maladies. Hence arose the veneration paid in this place to demi-gods. Their temples were full of the richest presents, and almost constantly emitted the incense of sacrifices. Here was a beautiful temple of Fortune. Pharæ was situated at the distance of six stadia from the sea, and near it was a sacred grove dedicated to Apollo Carneus; and in this grove a fountain.—Also, a town of the island of Crete, in which was a colony of Messenians.—Also, a town of Greece, in Bœotia.

PHARAMBARA, in *Ancient Geography*, a town of Asia, in the interior of Media, between Tigrana and Tachasara. Ptolemy.

PHARAN, a desert of Arabia Petræa, near Kadesh-Barnea. It was in a place of this desert, called "Rothma," that the Israelites had their 15th station.

PHARAN, in *Geography*, a town of Arabia Petræa, near the gulf of Suez, once the see of a bishop, but now sunk into decay; 40 miles N. of Tor.

PHARAOH, in *Biography*, a common name of the kings of Egypt. The etymology of this name is variously stated by different writers. Le Clerc, in Gen. xii. 15, derives it from the root *pharah*, to be exalted, or to be superior. The abbé Renaudot says, that Pharaoh is the same as the Egyptian word *poura*, which signifies a king. Kircher deduces Pharaoh from the word *pharah*, which sometimes signifies to deliver; and he would have Pharaoh to denote one who is exempted from the jurisdiction of the laws. Josephus says (Antiq. l. viii. c. 2.), that all the kings of Egypt, from Minæus (or Menes), the founder of Memphis, who lived several ages before Abraham, had the name of Pharaoh, down to the time of Solomon, for more than 3300 years. He adds, that when these princes ascended the throne, they assumed this name, laying aside their former appellation; the word Pharaoh, in the Egyptian language, signifying a king. Accordingly Josephus says, that Herodotus names none of the kings of Egypt after Minæus, the builder of Memphis, though he had 330 kings for his successors, because they had all the name of Pharaoh; but he names an Egyptian queen, Nicaule, (or Nitocris,) who succeeded them. Josephus also says, that he finds from the ancient records of the Jewish nation, that after the age of Solomon, no king of Egypt had the name of Pharaoh. Josephus seems to have misunderstood and misrepresented the account given by Herodotus: for this ancient historian expressly says, that in the books of the Egyptian priests were registered the names of 330 kings, of whom 18 were Ethiopians, and a woman who was a foreigner, called Nitocris; and the others were Egyptians. These princes had each his proper name in this catalogue. We see also in the fragments of Manetho, that each king of Egypt had a name peculiar to him; and we find the name of Pharaoh only in scripture. Josephus is also mistaken in asserting, that since the time of Solomon, the kings of Egypt had no longer the name of Pharaoh; since we find this name under Hezekiah (2 Kings, xviii. 20.), under Josiah (ch. xxiii. 29, 30, &c.), under Jehoiakim (ch. xxiii. 35.), and in the prophets Isaiah, Jeremiah, and Ezekiel; who are much later than Solomon. It is very probable, that the Egyptians gave the name of Pharaoh to their kings, as long as the Egyptian language was in common use, and as long as their kings were of their own nation. But, after the conquest of Egypt by the Persians, and especially by Alexander the Great, and the Grecians introduced their language, with their government, the name of Pharaoh ceased among them.

The *first* Pharaoh, known to us, is the person in whose time Abraham went down into Egypt (Gen. xii. 10, &c.), A.M. 2084, B.C. 1919. The *second* Pharaoh, noticed in scripture, reigned in Egypt in the time of Joseph. The *third* Pharaoh is he who persecuted the Israelites. The *fourth* was probably the Pharaoh before whom Moses appeared, and in whose sight he smote Egypt with plagues. This Pharaoh was drowned in the Red sea. The *fifth* Pharaoh, known to us, is he who gave protection to Hadad, the king of Edom (1 Kings, xi. 15—18.), about A.M. 2960. The *sixth* is the Pharaoh, who gave his daughter in marriage to Solomon. (1 Kings, iii. 1. ix. 16.) The *seventh* Pharaoh is Shishak, who protected Jeroboam, and afforded him a refuge against king Solomon, his master, (1 Kings, xiv. 25. 2 Chron. xii. 2. 5, &c.) A.M. 3033. The *eighth* is the Pharaoh, with whom Hezekiah made a league against Sennacherib, king of Assyria, A.M. 3290. The *ninth* is Pharaoh-Necho, son of Psammitichus, who subdued Josiah. The *tenth* is Pharaoh-Ophrah, who entered into alliance with Zedekiah, king of Judah, and attempted to assist him against Nebuchadnezzar, king of Chaldæa. Against this Pharaoh Ezekiel pronounced several prophecies, Ezek. xxix, xxx, xxxi, xxxii. He is called Apries by Herodotus. He is also mentioned Habakkuk ii. 15, 16. If. xix. xx. Jerem. xlvi. 17. Calmet on the Bible.

PHARAON, the denomination of a game of chance. The principal rules of this game are, that the banker holds a pack of fifty-two cards; that he draws all the cards one after the other, and lays them down at his right and left hand alternately; that the ponte may at his choice set one or more stakes upon one or more cards, either before the banker has begun to draw the cards, or after he has drawn any number of couples; that the banker wins the stake of the ponte, when the card of the ponte comes out in an odd place on his right hand, but loses as much to the ponte when it comes out in an even place on his left hand; that the banker wins half the ponte's stake, when it happens to be twice in one couple; that when the card of the ponte being but once in the stock, happens to be the last, the ponte neither wins nor loses; and that the card of the ponte being but twice in the stock, and the last couple containing his card twice, he then loses his whole stake. M. De Moivre

Moivre has ſhewn how to find the gain of the banker in any circumſtance of cards remaining in the ſtock, and of the number of times that the ponte's cards is contained in it. Of this problem he enumerates four caſes; *i. e.* when the ponte's card is once, twice, three, or four times in the ſtock. In the firſt caſe, the gain of the banker is $\frac{1}{n}$, n being the number of cards in the ſtock. In the ſecond caſe, his gain is $\frac{\overline{n-2} \times y}{n \times \overline{n-1}} + \frac{2}{n \times \overline{n-1}}$, or $\frac{\frac{1}{2}n+1}{n \times \overline{n-1}}$, ſuppoſing $y=\frac{1}{2}$. In the third caſe, his gain is $\frac{3y}{2 \times \overline{n-1}}$, or $\frac{3}{4 \times \overline{n-1}}$, ſuppoſing $y=\frac{1}{2}$. In the fourth caſe, the gain of the banker, or the loſs of the ponte, is $\frac{2n-5}{\overline{n-1} \times \overline{n-3}}\, y$, or $\frac{2n-5}{2 \times \overline{n-1} \times \overline{n-3}}$, ſuppoſing $y=\frac{1}{2}$. M. De Moivre has calculated a table, exhibiting this gain or loſs, for any particular circumſtance of the play; and he obſerves, that at this play, the leaſt diſadvantage of the ponte, under the ſame circumſtances of cards remaining in the ſtock, is when the card of the ponte is but twice in it, the next greater when three times, the next when once, and the greateſt when four times. He has alſo demonſtrated, that the whole gain *per cent.* of the banker, upon all the money that is adventured at this game, is 2*l.* 19*s.* 10*d.* De Moivre's Doctrine of Chances, p. 77, &c. p. 105, &c. See BASSETTE.

PHARASTIA, in *Ancient Geography*, a town of Aſia, in the interior of Media, between Phaſaba and Curia, according to Ptolemy.

PHARATHA, a town which was ſituated in the interior of Arabia Felix. Ptol.

PHARATHOU, or PHARATUS, a town of Paleſtine, in the tribe of Ephraim.

PHARAZANA, a town placed by Ptolemy in Drangiana.

PHARBÆTHUS, a town of Egypt, and capital of the Pharbæithes nome. Ptol.

PHARGA, a town of Arabia Deſerta, near the Euphrates. Ptol.

PHARI, among the *Ancients*, a kind of candleſtick. See BRANCH.

PHARICUM, the name of a famous poiſon among the ancients: it was ſaid to be compoſed of many ingredients, but we know nothing of it at this time.

PHARIGIUM, in *Ancient Geography*, a promontory of Greece, in the Phocide, between Marathon and the foot of Mychus.

PHARINGOTOMUS, in *Surgery*, from φαρυγξ, *the throat*, and τομη, *an inciſion*, an inſtrument for ſcarifying the tonſils, on opening abſceſſes about the fauces.

PHARIS, in *Ancient Geography*, a ſmall town of the Peloponneſus, in Laconia, according to Pauſanias, who ſays that it was ſituated near the river Phellia, on the route from Amyclæa to mount Taygetes. From his time its ruins only have been ſeen.

PHARISEES, a celebrated ſect among the ancient Jews: ſo called, as ſome ſay, becauſe ſeparated from the reſt by the auſterity of their life, and by their profeſſing a greater degree of holineſs, and a more religious obſervation of the law.

This is the import of the word פרם, in the Hebrew, or rather Chaldee tongue; whence is formed the Greek Φαρισαιος, and the Latin *Phariſæus*. St. Jerom, and ſeveral of the rabbins, maintain this etymology; which is very agreeable to the ſtate and character of the Phariſees; who were not only diſtinguiſhed from the reſt by their manner of life, but by their habit. However, others, with leſs probability, have derived the name from פרש, *expoſuit*, becauſe the Phariſees were in the higheſt reputation for expounding the law.

It is very difficult to fix the preciſe origin of the Phariſees. The Jeſuit Serrarius places their firſt riſe about the time of Eſdras, becauſe it was then that the Jews firſt began to have interpreters of their traditions. Maldonat, on the other hand, will not have this ſect to have ariſen among the Jews till a little before the time of Chriſt. Others, perhaps with more probability, refer the origin of the Phariſees to the time of the Maccabees.

Dr. Lightfoot thinks, that Phariſaiſm roſe up gradually, from a period which he does not aſſign, to the maturity of a ſect. It is certain, from the account given by Joſephus, that in the time of John Hyrcanus, the high-prieſt and prince of the Aſmonean line, about a hundred and eight years before Chriſt, the ſect was not only formed, but made a conſiderable figure; and that it had advanced to a high degree of popularity and power about eighty years before Chriſt. Calmet places their origin about A.M. 3820, B.C. 184. Joſ. Ant. lib. xiii. cap. 10. §. 5, 6. cap. 15. § 5. and cap. 16. § 1. According to Baſnage, Hiſt. of the Jews, book ii. cap. 9. § 2, one Ariſtobulus, an Alexandrian Jew, and a Peripatetic philoſopher, who flouriſhed about a hundred and twenty-five years before Chriſt, and wrote ſome allegorical commentaries on the Scripture, was the author of thoſe traditions, by an adherence to which the Phariſees were principally diſtinguiſhed from other ſects.

Be this as it will, Phariſaiſm is ſtill the prevailing doctrine in the Jewiſh religion; that vaſt number of traditions in the Talmud, which bear ſo great a ſway among the Jews, coming all from the Phariſees, which they aſcribed to God, and received as of equal authority with the ſacred writings. See MISCHNA.

Joſephus, who deſcribes their dogmata, ſays, that they attributed all to deſtiny, and to God; ſo, however, as not to deprive man of his free agency, which Sixtus of Sienna thus explains: the Phariſees believed, that all things were done by deſtiny, *i. e.* with God's foreknowledge, and in conſequence of his immutable decree; the will of man ſtill remaining free and unaffected: "Fato, hoc eſt, Dei præſcientia, & immobili decreto, omnia geri; manente tamen libero humanæ libertatis aſſenſu."

They owned the immortality of the ſoul, a reſurrection, and a future ſtate; but they admitted, at the ſame time, as ſome have ſuppoſed, a kind of metempſychoſis, or tranſmigration of ſouls. They alſo held the doctrine of angels, and ſeparate human ſpirits. They were alſo much addicted to aſtrology.

The Phariſees were great ſticklers for the allegorical or myſtical ſenſe of the Scriptures; whence moſt of the converts made to Chriſtianity among the Jews were of the number of the Phariſees.

In effect, the Phariſees were in every thing directly oppoſite to the *Sadducees;* which ſee.

PHARIUM, in *Ancient Geography*, a town of Aſia, in Cilicia. Suidas and Xenophon.

PHARKOVA, in *Geography*, a town of Ruſſia, in the government

government of Tobolsk, on the Niznei Tungunska. N. lat. 61° 35'. E. long. 106 54'.

PHARMACEUTICA, Φαρμακευτικη, that part of physic which directs the preparation and application of medicines. See PHARMACY.

PHARMACI, Φαρμακοι, among the Greeks, an appellation used for two persons who were employed in the lustration or purification of cities.

These were two men, according to some; but others suppose them to have been a man and woman, to represent the male and female sex, for each of which they offered a sacrifice. It was usual for the man to carry about his neck figs, called ισχαδες, of a blackish colour; and the woman such as were white. Pott. Archæol. Græc. tom. i. p. 400, seq.

PHARMACIA, Φαρμακεια, in *Antiquity*, denotes the art of effecting strange and wonderful things, by means of medicated and enchanted compositions of herbs, minerals, &c. These things themselves were called *pharmaca*, some of which, being taken inwardly, were said to cause blindness, madness, love, &c. Such were the medicaments by which Circe transformed Ulysses' soldiers: others infected by touch; such was the garment Medea sent to Creusa: others spread their venom afar off, and operated upon persons at a great distance.

There were also *pharmaca soteria*, Φαρμακα σωτηρια, which were amulets against the former: such was the herb moly, which preserved Ulysses from Circe's enchantments; the laurel, the sallow-tree, the rhamnus or Christ-thorn, fleabane, the jasper-stone, and many others mentioned by Albertus Magnus, and Orpheus, in his book De Lapillis. Pott. Archæol. Græc. lib. ii. cap. 18. tom. i. p. 353. See AMULET.

PHARMACITIS TERRA, in the *Materia Medica*, a name which some authors have given to the common ampelites, or cannel-coal.

PHARMACIUS SINUS, in *Ancient Geography*, a gulf of Thrace, on the Bosphorus of the same name, south-west of the gulf Bætycolpas. A considerable river ran into this gulf.

PHARMACOCHEMIA, a term used to express that part of the chemical art which treats of the preparation of medicines.

It is thus called by way of distinction from that chemistry which is wholly employed about the transmutation of metals by means of the philosopher's stone; this being called *spagirico-chemia*.

PHARMACOLOGY, a treatise of medicines, or the art of preparing them, judging of them, &c.

PHARMACOPŒIA, formed from Φαρμακον, *remedy*, and ποιειν, *to make*, a dispensatory, or a treatise describing the preparations of the several kinds of medicines, with their uses, manner of application, &c.

We have various pharmacopœias; as those of Bauderon, Quercetan, Zwelfer, Charas, Bates, Salmon, Lemery, Quincy, &c. The latest, and most in esteem, are the Edinburgh, London, and Dublin Dispensatories.

PHARMACOPOLA, or PHARMACOPOEIUS, an apothecary, or a person who prepares and sells medicines. See APOTHECARY.

The word is seldom used but by way of ridicule. It is formed from Φαρμακον, and πωλειν, *to sell*. See Horace, Satire 2. lib. i. vers. 1.

PHARMACUM, Φαρμακον, a medicament, or medicine; whether of salutary, or poisonous quality.

PHARMACUSA, in *Ancient Geography*, an island of the Ægean sea.—Also, the name of two small isles, situated near that of Salamina; in the largest of which, according to Strabo, was seen the tomb of Circé.

PHARMACY, Φαρμακεια, derived from Φαρμακον, *remedy*, that branch of medicine, which teaches the choice, preparation, and mixture of medicines.

Most of the natural bodies being some way or other employed as subjects of pharmacy, the materia medica is extremely large, and its operations various. Its materials in the earliest ages, indeed, were very few, and the ways of managing them very simple: subjects afterwards multiplied, operations increased, and at present we seem abundantly stocked with both simple and compound medicines.

Diseases must have been very early, if the first inhabitants of the earth experienced the same changes of seasons, breathed the same kind of air, and used a like kind of diet and regimen of life with ourselves: but soon after the disease afflicts, the patient seeks a remedy; and this appears to have been the foundation of pharmacy in different parts of the world.

Experiments being thus multiplied, and the preparations of simples better made, pharmacy became at length an art. Hippocrates, however, when he came to compile a kind of system of physic from the observations of antiquity, described but few, and those generally simple.

Succeeding physicians then enlarged the *materia medica*; which see. Galen considerably swelled the catalogue, and the Arabians much more; and when learning began to revive in Europe, the materia medica was again enlarged, and great changes wrought upon it by chemistry.

The art of pharmacy must be considered under the management of physicians, apothecaries, trading chemists, and druggists. To the physician it belongs to direct the medicines, and to give the rules of extracting and managing the simples. To the apothecary belongs the reduction of the materia medica into certain forms of medicines, according to the direction of the physician. And the design of trading chemists, and druggists, is to furnish medicinal matters to the apothecary, who cannot always detect an artificial counterfeit, or a dexterous sophistication; and perhaps many remedies, well designed by the physician, have failed, or had mischievous effects on this account. Shaw's Lectures, p. 195.

Pharmacy has been divided (without any sufficient reason) into Galenical and chemical.

PHARMACY, *Galenical*, called also simply pharmacy, is that derived to us from the ancients; consisting in the knowledge and management of the several parts of the materia medica, now in the hands of the apothecaries. See GALENIC.

PHARMACY, *Chemical*, called also *spagirical* and *hermetical*, is that introduced by Paracelsus, who calls it *ars distillatoria*; consisting in the resolving of mixed bodies into their component parts, in order to separate the useless and ill, and collect and exalt the good. See CHEMISTRY.

Under the direction of modern chemistry and medical skill, the state of modern pharmacy has been much improved. The pharmaceutical apparatus consists of furnaces, baths, and a variety of vessels made of glass, &c. For the weights and measures, we refer to these articles. The operations of pharmacy are solution, extraction, depuration, crystallization, precipitation, distillation, sublimation, expression, exsiccation, fusion, calcination, &c. For the preparation of different articles, we refer to the terms that denominate them.

PHARMACY, *Characters in*. See CHARACTER.

PHARMUTHI, in the *Egyptian Chronology*, one of the months

months of their year, which anfwered to the month of April among the Romans.

PHARNACEUM, in *Botany*, a name taken from Pliny, faid to have been given to fome plant in honour of its difcoverer Pharnaces, fon of Mithridates, king of Pontus. But what the ancient *Pharnaceum* was, though its dried root is reported to have improved the flavour of wine, commentators have conjectured in vain. We may venture to affert it has nothing to do with the prefent Linnæan genus; nor can we guefs at the motive for its application to a fet of plants, almoft deftitute of any fenfible qualities, and of too trivial an afpect to have attracted notice, except from the curious enquirers of modern time. Linn. Gen. 150. Schreb. 202. Willd. Sp. Pl. v. 1. 1507. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 2. 173. Juff. 300. Lamarck Illuftr. t. 214. Gærtn. t. 130.—Clafs and order, *Pentandria Trigynia*. Nat. Ord. *Caryophyllei*, Linn. Juff.

Gen. Ch. *Cal.* Perianth of five, nearly ovate, concave, fpreading, equal, permanent leaves, coloured withinfide, thin-edged. *Cor.* none; hence the coloured thin-edged calyx. *Stam.* Filaments five, awl-fhaped, the length of the calyx; anthers cloven at the bafe. *Pift.* Germen fuperior, ovate, triangular; ftyles three, thread-fhaped, the length of the ftamens; ftigmas obtufe. *Peric.* Capfule ovate, flightly triangular, invefted by the clofed calyx, of three cells and three valves. *Seeds* numerous, polifhed, orbicular, depreffed, furrounded by an acute border.

Obf. Reichard remarks that the parts of fructification in *Ph. Mollugo* differ fomewhat from the above account. This remark is fuggefted by the defcription in Linn. Mant. 561, which belongs to *Mollugo Spergula*, fee MOLLUGO; but we find the flowers are variable on the fame individuals. We have already indicated the clofe affinity between thefe genera.

Eff. Ch. Calyx of five leaves, coloured internally. Corolla none. Capfule fuperior, of three cells, with many feeds.

The four fpecies defined in Sp. Pl. ed. 2, have fubfequently been augmented, chiefly by difcoveries at the Cape of Good Hope, to 14, as may be feen in Willdenow. Their habit is for the moft part flender, like a *Spergula* or *Arenaria*; in fome cafes herbaceous and annual, in others fhrubby; but always of humble ftature. *Leaves* fimple, entire, fmoothifh, varioufly difpofed; their *ftipulas* fometimes very remarkable for a fhining membranous afpect, and curious fubdivifion. *Inflorefcence* moftly forked, panicled. *Flowers* copious, variegated with green and white, or a reddifh tint.

1. Ph. *Cerviana*. Umbellate Pharnaceum. Linn. Sp. Pl. 388. Willd. n. 1. Ait. n. 1. (Ph. umbellis fimpliciffimis; Gmel. Sib. v. 3. 102. t. 20. f. 2. Alfine; Pluk. Phyt. t. 332. f. 1.)—Flower-ftalks lateral, fomewhat umbellate, about as long as the linear whorled leaves.—Native of Ruffia, Siberia, Spain, Guinea and the Eaft Indies. The *root* is fmall and annual. *Herb* fmooth. *Stems* numerous, fpreading in every direction, thread-fhaped, yellowifh, three or four inches long, fimple or divided. *Leaves* about ten in each whorl, linear, glaucous, an inch long, more or lefs. *Umbels* of two or three greenifh-white *flowers*, on capillary *ftalks* bent toward one fide. Minuart, a Spanifh botanift, is cited by Linnæus as having written a monograph on this fpecies, under the name of *Cerviana*, but we have never been able to difcover any fuch work.

2. Ph. *Mollugo*. Bedftraw Pharnaceum. Linn. Sp. Pl. 389. Mant. 562, but not 561. (Ph. glomeratum; Linn. Suppl. 185. Thunb. Prodr. 53. Willd. n. 7. Alfine procumbens, gallii facie africana; Herm. Lugd-Bat. 19. t. 21. Rubia ftellaris five Afperula minor humifparfa, flofculis albis æthiopica; Pluk. Mant. 163. Mollugo n. 1.; Linn. Hort. Cliff. 28.)—Flower-ftalks axillary, fingle-flowered, half the length of the linear whorled leaves.—Native of the Cape of Good Hope. The *root* is annual. *Stems* numerous, proftrate, alternately branched, zigzag, round, jointed, whitifh, very fmooth and polifhed. *Leaves* fix or feven in a whorl at each joint, fpreading, about half an inch long, linear, entire, fmooth, light green, each tipped with a fmall briftly point. *Flowers* very minute, about the fize of a *Herniaria*, green, with white edges, pentandrous, each on a fhort fimple ftalk, feveral together at each whorl; but we find no proper umbel, as defcribed in the *Supplementum*, though we perceive what caufed that error.

Great confufion has exifted between this plant and the *Mollugo Spergula* of Linnæus, but the above fynonyms will not fail to prevent any further miftake. Since the article MOLLUGO was publifhed, various fpecimens from Dr. Rottler have enabled us better to underftand the *M. Spergula*, a moft variable plant, fome of whofe *flowers* anfwer, as far as we can judge of them dried, to the defcription in Mant. 561; whilft others, from the fame root, are fimply triandrous, without either *petals* or barren *filaments*, as they ought to be in a *Mollugo*. Linnæus cultivated it in the Upfal garden, and, no doubt, faw there what he has fo minutely defcribed, though one of his fpecimens from thence has fimply triandrous *flowers*. This fpecimen, moreover, has fo nearly loft all the lateral pubefcence from the *ftem*, and has its *leaves* fo much elongated, that no one could think it the fame with the authentic wild fpecimen of *M. Spergula*, which we have defcribed in its proper place, did not the various parts of Dr. Rottler's moft fatisfactorily combine the two. We muft obferve that *M. Spergula* is the *Pharnaceum Mollugo* of moft botanifts, they being mifled by the wrongly printed fpecific name in *Linn. Mant.* 561, which in the margin ought to have been *Spergula*. Willdenow, bewildered by this miftake, has increafed it by the mention of *Mollugo verticillata*.

3. Ph. *ferpyllifolium*. Thyme-leaved Pharnaceum. Linn. Suppl. 186. Willd. n. 8. Thunb. Prodr. 54.—"Stalks fingle-flowered. Leaves ovate, ftalked."—From the Cape. A delicate annual herb, refembling a fmall plant of *Herniaria glabra*. *Stems* branched, forked, thread-fhaped, jointed, fmooth. *Leaves* two or more at each joint, ftalked, ovate, many times fhorter than the intermediate fpaces. *Stalks* lateral, capillary, the length of the *leaves*. *Linn.*

4. Ph. *dichotomum*. Forked Pharnaceum. Linn. Suppl. 186. Willd. n. 12. Thunb. Prodr. 54. Ait. n. 5.—"Stalks axillary, elongated, forked. Leaves whorled, linear."—From the fame country. Willdenow and Aiton mark it annual. We have feen no fpecimen of this or the laft.

5. Ph. *lineare*. Linear-leaved Tawny Pharnaceum. Linn. Suppl. 185. Willd. n. 2. Ait. n. 2. Andr. Repof. t. 326.—Umbels irregular, partly compound, on long terminal ftalks. Leaves linear, whorled. Stem proftrate, fomewhat fhrubby.—Sent from the Cape by Mr. Maffon, in 1795, and occafionally introduced fince, though often loft, being difficult of prefervation. The *ftem* is fomewhat fhrubby and perennial, and is, according to Mr. Andrews, increafed by cuttings. *Leaves*, and whole appearance, much like our Englifh *Spergula arvenfis*, but the *flowers* have a tawny hue, and grow in fpurious *umbels*, fome of whofe ftalks are racemofe. The ftructure of the *fructification* anfwers well to the generic character.

6. Ph. *teretifolium*. Thread-leaved Pharnaceum. Thunb. Prodr.

Prodr. 53. Willd. n. 3.—"Umbels lateral. Leaves thread-ſhaped, pointed. Stem erect, ſhrubby."—Gathered by Thunberg at the Cape.

7. Ph. *microphyllum.* Small-leaved Pharnaeeum. Linn. Suppl. 185. Willd. n. 4. Thunb. Prodr. 54.—Umbels moſtly terminal. Leaves ſpatulate, cluſtered, obtuſe. —Stipulas woolly.—Found by Thunberg in the ſame country. *Stem* woody, erect, determinately branched; *branches* very numerous, ſhort, aſcending. *Leaves* imperfectly oppoſite, ſhort, recurved, with denſe axillary tufts of ſmaller ones, all enveloped at the baſe with white, woolly, criſped *ſtipulas.* *Umbels* ſimple, on ſtout purpliſh *ſtalks,* which are crowned with a tuft of ſmall leaves and ſtipulas in a ſingular manner, and ſeem therefore an elongation of the ſtem. *Flowers* few, yellowiſh, drooping.

8. Ph. *marginatum.* Bordered Pharnaceum. Thunb. Prodr. 54. Willd. n. 5.—"Leaves ovate, bordered, obtuſe. Flowers axillary, ſeſſile."—From the Cape. *Thunb.* We know nothing more of this ſpecies, nor whether Willdenow has rightly placed it next to *microphyllum.*

9. Ph. *quadrangulare.* Quadrangular Pharnaceum. Linn. Suppl. 185. Willd. n. 9.—Panicles denſe, leafy, terminal. Leaves lanceolate, thick-edged, cloſely imbricated in four rows.—Gathered at the Cape of Good Hope by Bladh, who communicated it to Linnæus. This ſpecies is extremely rare, and altogether ſingular for the Heath-like aſpect of the innumerable, minute, imbricated *leaves* on the young *branches.* *Flowers* greeniſh, in denſe *panicles,* or *cluſters,* accompanied by ſhorter ovate *leaves.* The *ſtem* is ſtout and woody.

10. Ph. *incanum.* Hoary Pharnaceum. Linn. Sp. Pl. 389. Suppl. 186. Willd. n. 10. Ait. n. 4.—Figured in Pluk. Phyt. t. 304. f. 4.—Panicles umbelled, forked, leafy, on very long ſtalks. Leaves linear. Stipulas in long capillary ſegments.—Native of Southern Africa. The *ſtem* is ſhrubby, much branched. *Leaves* about an inch long, very narrow, flat, beſet with long, white, ſhining, capillary *ſtipulas,* which give the *branches* a hiſpid aſpect. *Inflorescence* of the ſame ambiguous kind as we have mentioned under n. 7, but the common *ſtalks* are even ſix inches long; the partial ones repeatedly compound, and of conſiderable length alſo. *Flowers* green and white, far more abundant, but ſmaller than in our ſpecimen from a garden, or in Plukenet's figure.

11. Ph. *albens.* Silver-branched Pharnaceum. Linn. Suppl. 186. Willd. n. 11. Thunb. Prodr. 53.—Panicles ſomewhat umbelled, forked, on very long ſtalks. Leaves linear, recurved, pointed. Stipulas minute, fringed.—Gathered at the Cape by Thunberg. Linnæus had ſpecimens from his friend Bæck.—*Stem* ſhrubby, like the laſt, but the *branches* are of an elegant blueiſh ſilvery hue, not concealed by the *ſtipulas,* which are very ſmall, fringed, and united to the ſides of each leaf, at the baſe. *Leaves* rather above half an inch long, fleſhy, glaucous, obtuſe, with a ſmall terminal briſtle. *Inflorescence* much like the laſt, but leſs umbellate, and ſcarcely leafy, the common *ſtalks* four or five inches long, blueiſh and ſhining. Willdenow miſapplies to this Plukenet's ſynonym, which belongs to the *incanum.*

12. Ph. *diſtichum.* Double-cluſtered Pharnaceum. Linn. Mant. 221. Willd. n. 13. (Alſine ſpergula indiæ orientalis, ſpicatis floribus ex alis emergentibus; Pluk. Mant. 9. Phyt. t. 332. f. 4. A. holoſtea villoſa, foliis caulem ambientibus; multiflora; Pluk. Phyt. t. 130. f. 6.) Cluſters axillary, zigzag, ſtalked, in pairs. Leaves linear-lanceolate, downy.—Native of the Eaſt Indies. The *ſtem* appears herbaceous. *Leaves* whorled, various in ſize, downy. Common *ſtalks* of the twin *cluſters* longer than the leaves. *Flowers* ſmall.

13. Ph. *cordifolium.* Heart-leaved Pharnaceum. Linn. Sp. Pl. 389. Am. Acad. v. 6. 85. Willd. n. 14. Thunb. Prodr. 54.—Panicles forked, on lateral ſtalks, much exceeding the inverſely heart-ſhaped, whorled, ſtalked leaves. Native of the Cape. *Stems* herbaceous, proſtrate, branched, a foot or more in length. *Leaves* thick, half an inch wide, ſmooth. *Stipulas* white, finely fringed. *Inflorescence* and *flowers,* except the want of *petals,* much like *Spergula arvenſis.*

The reader will obſerve that *Ph. depreſſum,* Linn. Mant. 562, is Loefflingia *Indica;* ſee that article; and ſeems to be figured in Pluk. Phyt. t. 334. f. 3. S.

PHARNACIUM, in *Ancient Geography,* a town of Aſia Minor, in Phrygia.

PHAROS, or Issa Pharos, an iſland of the Adriatic ſea, on the coaſt of Illyria.—Alſo, a river of Aſia, in the environs of Cilicia and the Euphrates.—Alſo, an iſland on the coaſt of Italy, over-againſt Brunduſium, which is ſaid to have been ſo called from the Pharos, or light-houſe, erected there for the ſecurity of navigation.

Pharos, *Phare,* a light-houſe, a pile raiſed near a port, where a fire is kept burning in the night, to guide and direct veſſels near at hand.

The pharos of Alexandria, built in a ſmall iſland at the mouth of the Nile, was anciently very famous, inſomuch as to communicate its name to all the reſt. It was ſo magnificent a ſtructure, being built by the famed architect Soſtrates, a native of Cnidos, or, as ſome ſay, by Deiphanes, the father of Soſtrates, that it coſt Ptolemy Philadelphus eight hundred talents. It had ſeveral ſtories raiſed one over another, adorned with columns, baluſtrades, galleries of the fineſt marble and workmanſhip, to which, ſome add, that the architect had contrived to faſten ſome looking-glaſſes ſo artificially againſt the higheſt galleries, that one could ſee in them all the ſhips that ſailed in the ſea for a great way; inſtead of which noble ſtructure, one ſees now only a kind of irregular caſtle, without ditches or outworks of any ſtrength, the whole being accommodated to the inequality of the ground on which it ſtands, and which it ſeems is no higher than that which it ſhould command. Out of the midſt of this clumſy building riſes a tower, which ſerves for a light-houſe, but which hath nothing of the beauty and grandeur of the old one. The coloſſus of Rhodes alſo ſerved as a pharos.

Ozanam ſays, pharos anciently ſignified a ſtreight; as the pharos or pharo of Meſſina. See Light-*Houſe.*

PHARPAR, or Pharphar, in *Ancient Geography,* one of the rivers of Damaſcus, or rather an arm of the Barrady or Chryſorrhoas (which ſee), that waters the city of Damaſcus, and the adjacent country. 2 Kings, v. 12.

PHARRKIRCHEN, in *Geography,* a town of Bavaria; 24 miles W. of Paſſau.

PHARSALIA, in the hiſtory of *Poetry,* a poem of Lucan, which belongs to the epic claſs. The ſubject of this poem bears characters of epic grandeur and dignity, nor does it want unity of object; *viz.* the triumph of Cæſar over Roman liberty. As it is not brought to a proper cloſe, we have either been deprived by time of the laſt books, or the author left an incomplete work. Although the ſubject be abundantly heroic, Dr. Blair points out two defects: the one is, that civil wars, eſpecially when fierce and cruel, like thoſe of the Romans, preſent too many ſhocking objects to be fit for epic poetry, and give odious and diſguſting views of human nature. But Lucan's genius ſeems to delight in ſavage ſcenes, and he dwells on them too much. The other defect of Lucan's ſubject, is its being too near the times in which he lived; becauſe he is thus deprived of the aſſiſtance of fiction and machinery, and his work is thus rendered leſs ſplendid and amuſing. As to characters, Lucan has drawn them with ſpirit and with force. Although Pompey be his profeſſed hero, he has failed in intereſting us much in his favour; he is always eclipſed by the ſuperior abilities of Cæſar. But Cato is Lucan's favourite character; and wherever he introduces him, he appears to riſe above himſelf. His ſpeech, in particular, to Labienus, who urged him to enquire at the oracle of Jupiter Ammon concerning the iſſue of the war, deſerves to be remarked as equal, for moral ſublimity, to any that is to be found in all antiquity. In the conduct of the ſtory he has attached himſelf too much to chronological order, which breaks the thread of the narration; and he is often too digreſſive.

In the Pharſalia, the reader will perceive ſeveral very poetical and ſpirited deſcriptions: nevertheleſs, the author's chief ſtrength does not lie in narration or deſcription; his narration is often dry and harſh, and his deſcriptions are frequently overwrought, and employed alſo upon diſagreeable objects. His principal merit conſiſts in his ſentiments, which are generally noble and ſtriking, and expreſſed with that glow and ardour of manner, for which he is peculiarly diſtinguiſhed. Lucan is the moſt philoſophical, and the moſt public ſpirited poet of all antiquity (ſee LUCAN); and he is the only ancient epic poet, who was really and deeply intereſted by the ſubject of his poem. Hence he abounds in exclamation and apoſtrophes, almoſt always well timed, and ſupported with a vivacity and fire highly honourable to him. But he is apt to exceed due bounds, carrying every thing to an extreme, and not knowing where to ſtop. Attempting to aggrandize his objects, he becomes tumid and unnatural; and when the ſecond line of his deſcriptions is ſublime, the third, in which he meant to riſe ſtill higher, is bombaſt. Upon the whole, his ſentiments are ſo high, and his fire occaſionally ſo great, as to atone for many of his defects: and paſſages may be produced from him which are inferior to none in any poet whatever. The characters which he draws, *e. g.* of Pompey and Cæſar, in the firſt book, are maſterly, and the compariſon of Pompey to the aged decaying oak, is highly poetical. But judging of the whole execution of his poem, Dr. Blair pronounces, that his poetical fire was not always under the government of either ſound judgment or correct taſte. In his ſtyle there is abundance of force, blended with harſhneſs and obſcurity, from a deſire of expreſſing himſelf in a pointed and unuſual manner. Compared with Virgil, he may be allowed to have more fire and higher ſentiments; but in every thing elſe, particularly in purity, elegance, and tenderneſs, he falls infinitely below him. Blair's Lectures, vol. iii.

PHARSALUS, in *Ancient Geography*, a town of Theſſaly, upon the Enipeus, S.W. of Lariſſa, famous on account of the battle fought on a plain near it, in which Pompey was completely defeated by Cæſar.

PHARSANG, or PARASANG. See PARASANG.

PHARUS, in *Botany*, ſuppoſed to be ſo called from φαρος, *a cloak*, or *outer covering*; but whether this idea applies to the large wrapping glume of the female flower, as we are inclined to believe; or, as a late French writer, de Theis, aſſerts, on the alleged authority of Browne, to the economical uſe which the negroes in Jamaica make of the broad leaves of this graſs, muſt remain doubtful. We find no ſuch account in our original edition of Browne; either in the proper page, or at p. 333, cited by de Theis. Linn. Gen. 492. Schreb. 639. Willd. Sp. Pl. v. 4. 396. Mart. Mill. Dict. v. 3. Browne Jam. 344. Ait. Hort. Kew. v. 5. 278. Juſſ. 33. Lamarck Illuſtr. t. 769.—Claſs and order, *Monoecia Hexandria*. Nat. Ord. *Gramina*.

Gen. Ch. Male flowers ſtalked, *Cal.* Glume ſingle-flowered, of two ovate, membranous, coloured valves; the outermoſt ſhort, rather acute; the inner twice as long, rounded at the end. *Cor.* Glume longer than the calyx, of two equal, oblong, membranous, coloured valves; the outer are ſharpiſh, keeled below the point; the inner emarginate. *Stam.* Filaments ſix, very ſhort, erect; anthers linear, cloven at each end, the length of the corolla.

Female flowers larger, ſeſſile in the ſame panicle, *Cal.* Glume ſingle-flowered, of two lanceolate, membranous, ſharpiſh, ribbed, nearly equal valves. *Cor.* Glume rather longer, of two valves; the outer nearly cylindrical, rigid, denſely downy, with an acute triangular point, keeled at the back, bent backwards, and ſhaved off at the baſe; the inner linear, very narrow, as long as the other, membranous, its margins folded together, both the prominent edges thickened and downy, the apex cloven. *Piſt.* Germen ſuperior, linear; ſtyle ſimple; ſtigmas three, capillary, downy, projecting from the outer glume of the corolla. *Peric.* none; the outer glume of the corolla enlarged inveſts the ſeed, being all over muricated with little ſoft adheſive hooks. *Seed* oblong, large, with a furrow along one ſide.

Obſ. The above is the improved deſcription of Schreber, who was not able to diſcover any nectary.

Eſſ. Ch. Male, Calyx a glume of two valves, ſingle-flowered. Corolla a glume of two valves.

Female, Calyx as in the male. Corolla a glume of two valves, long, involving the ſolitary ſeed. Style ſimple; ſtigmas three.

1. Ph. *latifolius.* Broad-leaved Pharus, or Wild Jamaica Oat. Linn. Sp. Pl. 1408. Willd. n. 1. Ait. n. 1. (Ph. n. 1; Browne Jam. t. 38. f. 3. Gramen avenaceum ſylvaticum, foliis latiſſimis, locuſtis longis non ariſtatis, glumis ſpadiceis; Sloane Jam. v. 1. 116. t. 73. f. 2.)—Panicle much branched. Calyx awnleſs, naked. Leaves obovate, ſtalked, reverſed.—Frequent on the woody hills of Jamaica, according to Browne and Sloane, who both mention it as a remarkably good and nouriſhing food for cattle. From an expreſſion of the latter, that it is as good for this purpoſe as oats, we preſume the ſeeds are the part uſed, though this is not intelligibly expreſſed. The broad *leaves* are harſh and coarſe, remarkable for being turned upſide down, their length about four inches, and the *footſtalk* as much. *Root* perennial, of many ſtrong fibres. *Stem* ſimple, a foot high, or more, leafy. *Panicle* erect, or rather ſpreading, purpliſh, of numerous upright *flowers*, alternately ſpiked. We had ſpecimens from the Hon. Mrs. Barrington's ſtove in 1791.

2. Ph. *ciliatus.* Fringed Pharus. Retz. Obſ. faſc. 5. 23. Willd. n. 2.—"Panicle ſlightly branched. Calyx awnleſs, fringed. Corolla wanting. Leaves linear."—Gathered about the margins of pools in the Eaſt Indies, by Koenig, who ſent it to Retzius. *Stems* two feet high; clothed with numerous, linear, narrow, rough *leaves*. *Panicle* ſhort, ſometimes a ſimple *cluſter*. *Calyx-valves* ovate, convolute, with two furrows at the back, no awns, and no *corolla*. *Retz.*

3. Ph. *ariſtatus.* Awned Floating Pharus. Retz. ibid. Willd. n. 3.—Panicle umbellate. Calyx awned. Corolla wanting. Leaves ovate.—Native of ponds in the Eaſt Indies, where this graſs was gathered by Koenig, from whom we have it. The long leafy *ſtems* float on the water, ſending down abundance of tufted finely branched *roots*. *Leaves* ſhort, broad, ovate-oblong, obtuſe, with long tumid *ſheaths*,

sheaths. *Panicles* short, forming a terminal umbel. The ribs of the *calyx* are all finely fringed in our specimens, as Retzius describes them; yet he calls the *calyx* naked in his specific character.

We readily agree with Mr. Brown, Prodr. Nov. Holl. v. 1. 211, that these two last species do not properly belong to *Pharus*, but are more akin to *Zizania*, or rather, constitute perhaps a new genus. See LEPTASPIS for a more genuine *Pharus* or two.

PHARUSII, in *Ancient Geography*, a people of Africa, in the interior of Mauritania Cæsariensis; N. of the Melanogetulians and of mount Sagapola.

PHARYCADUM, a town of Macedonia, in the Estiotide, at the confluence of the rivers Peneus and Curialus. Strabo.

PHARYNGÆUM SAL, a name given by authors to an artificial salt, of use in the quinsey, and cases of the like kind, when the pharynx, or fauces, are incommoded by a discharge of serous or other humours.

It is prepared of cream of tartar and nitre, each an ounce, with half an ounce of burnt alum; all these are to be dissolved in vinegar, and coagulated according to art. This salt mixed with honey, and dissolved in plantain-water, makes an excellent gargle.

PHARYNGEA, ARTERY, in *Anatomy*, a branch of the external carotid. See ARTERY.

PHARYNGEUS, the name given by Douglas to the constrictor muscle of the pharynx.

PHARYNGO-STAPHYLINUS, is Winslow's name for the palato-pharyngæus.

PHARYNX, φαρυγξ, Gr. the large membranous and muscular cavity, placed at the back of the mouth and nose, through which the food passes into the œsophagus, and the air goes to and from the lungs. See DEGLUTITION.

PHASCHIN, in *Geography*, a small island in the Frozen ocean, near the S. coast of Nova Zembla. N. lat. 70° 30′. E. long. 57° 24′.

PHASCUM, in *Botany*, an ancient Greek name, φασκον, for some kind of mossy production, adopted by Linnæus for a most distinct and natural genus of *Musci*, properly so called, whose species are in general the most diminutive of their whole natural order. Dillenius comprehended such of them as he had met with, under his *Sphagnum*. Schreber first gave a scientific and critical account of the genus, in a learned dissertation, published at Leipsic in 1770, with two plates, since which the species have been much investigated, and many new ones described by Dickson, Hedwig and others.—Linn. Gen. 562. Schreb. 758. Mart. Mill. Dict. v. 3. Hedw. Fund. v. 2. 85. Sp. Muf. 19. Sm. Fl. Brit. 1149. Turn. Musc. Hib. 1. Swartz. Musc. Suec. 17. Juss. 11. Lamarck Illustr. t. 873. Class and order, *Cryptogamia Musci*. Nat. Ord. *Musci*.

Eff. Ch. Capsule ovate, without any separate lid, deciduous. Veil minute, deciduous.

The minute mosses which compose this genus are generally of the most simple form of growth, with an undivided, short, and sometimes scarcely discernible *stem*, though with several *leaves*, and the *capsule* is, in that case, solitary, either terminal or lateral, sessile or stalked. The *lid* is scarcely discernible from the rest of the *capsule*, even in colour, nor are its limits defined by any distinct separation; the *seeds* therefore escape by an irregular, and seemingly accidental, laceration, at one side, where the lid usually separates in other mosses. The last edition of *Syst. Veg.* contains but five species of *Phascum*, and of that small number no more than two are really such. The *Species Muscorum* of Hedwig describes twelve genuine ones. The *Flora Britannica* however enumerates seventeen, all natives of Britain, in the discovery of the more minute and curious of which, Mr. Dickson has had a principal share. They occur chiefly on banks and heaths, sometimes in bogs. The annual ones, which are most numerous, keep vegetating through the open weather of winter, often bearing their minute *flowers* in November and January, and ripening fruit in the early spring, at which season several of them compose a fine green turf on exposed gravelly banks, and as the power of the sun prevails, are soon afterwards dried up. Their little *capsules*, innumerable in themselves, and beyond all calculation as to the abundance of their *seeds*, lie hid and undistinguishable among the sandy particles of the soil, till the moisture of declining autumn calls forth a new progeny. Several species are furnished, besides the fibres that draw nourishment from the ground, with very curiously branched and reticulated spreading filaments, extending themselves like a sort of *Conferva*, and throwing up separate buds or plants here and there. Yet it is not certain that even such are all of perennial duration, nor do these jointed filaments seem to take root. They are probably of the nature of roots notwithstanding, destined to imbibe moisture from the surface of the soil, or from the moisture which it exhales, or retains. The latter appears to be more particularly the case with *Phascum stoloniferum*. This grows on naked clay, serving merely to fix the plants, which can probably obtain no nutriment but from these filaments, spreading widely, and collecting from its inhospitable surface, what some trivial decomposition, aided by the moisture of the atmosphere, may afford. America affords a similar species to the last-mentioned, *Ph. cohærens*, Hedw. Sp. Musc. 25. t. 1. f. 1 - 6. We have however, from Mr. Menzies, a New Holland nondescript *Phascum*, with actually creeping roots. The following examples will give a sufficiently accurate idea of the whole.

Ph. *subulatum*. Awl-leaved Earth-moss. Linn. Sp. Pl. 1570. Hedw. Crypt. v. 1. 93. t. 35. Curt. Lond. fasc. 4. t. 67. Engl. Bot. t. 2177. (Sphagnum acaulon trichodes; Dill. Musc. 251. t. 32. f. 10. Muscus trichoides minor acaulos, capillaceis foliis; Vaill. Paris. 128. t. 29. f. 4.)—Stem simple. Capsule on a short stalk. Leaves awl-shaped, spreading; dilated at the base; capillary at the point.—Frequent in shady hollows of sandy banks, bearing fruit in March. *Roots* fibrous, annual. *Plants* rather dispersed, forming loose velvet-like patches, of a pleasant green. Each is about a quarter of an inch high; its short *stem* clothed with very short, taper *leaves*, and crowned with a spreading tuft of much longer ones, whose point is very obscurely serrated. At the top stands the little chesnut-coloured oval *capsule*, slightly elevated on a scarcely discernible *stalk*. The *veil* is very short, and at first slender, till it is split open at one side, by the rapid growth of the *fruit*, and soon falls off.

Ph. *strictum*. Upright Earth-moss. Dicks. Crypt. fasc. 4. 1. t. 10. Sm. Fl. Brit. n. 4. Engl. Bot. t. 2093.—Stem scarcely any. Capsule ovate. Leaves awl-shaped, upright, straight, slightly serrated.—A very rare species, found as yet by Mr. Dickson alone, on alpine bogs in Scotland. This is not half the size of the foregoing, and is distinguished by its dark and blackish-green hue, the want of a leafy *stem*, and the straight uprightness of its *foliage*. *Capsule* dark brown when ripe, on a short fruit-stalk, and greatly overtopped by the *leaves*.

Ph. *multicapsulare*. Many-fruited Earth-moss. Sm. Fl. Brit. n. 7. (Ph. sphærocarpos; Abbot. 230. Ph. crispum; Swartz Musc. Suec. 17. Engl. Bot. t. 618, but not of Hedwig.)—Caulescent and branched. Stem-leaves alternate;

alternate; floral ones linear-lanceolate, crowded, ſtraight. Capſules numerous.—Diſcovered by the Rev. Dr. Abbot in cart-ruts in woods about Bedford; but we have received it from no other perſon except profeſſor Swartz. It is annual, bearing capſules all winter long. The *ſtems* are more or leſs divided into ſpreading leafy *branches*, clothed with ſmall alternate *leaves*, and crowned with a large tuft of large ones, which never curl like thoſe of the real *criſpum* of Hedwig, Engl. Bot. t. 1680, for which this was miſtaken in *Fl. Brit.*

Ph. *bryoides*. Tall Earth-moſs. Dickſ. Crypt. faſc. 4. 3. t. 10. f. 3. Sm. Fl. Brit. n. 10. Engl. Bot. t. 1280.—Stem ſimple. Leaves ovate, hair-pointed, upright. Capſule elliptical, beaked. Fruit-ſtalk erect, ſtraight, taller than the leaves.—Found by Mr. Dickſon in heathy woody places, and by the Rev. Dr. Abbot at Clapham ſprings, Bedfordſhire. It is annual, arriving at perfection in the ſpring, and diſtinguiſhed from moſt of its genus, though eaſily confounded with ſeveral ſpecies of other genera, by its elongated *fruit-ſtalk*, reſembling thoſe of moſſes in general. The *capſule* too has a more elongated beak than moſt others, but no ſeparate lid.

Ph. *muticum*. Common Dwarf Earth-moſs. Schreb. Phaſc. 8. t. 1. f. 11—14. Sm. Fl. Brit. n. 14. Engl. Bot. t. 2027. (Ph. acaulon β; Linn. Sp. Pl. 1570. Sphagnum acaulon bulbiforme minus; Dill. Muſc. 252. t. 32. f. 12.)—Stem none. Leaves ovate, concave, cloſely imbricated, beardleſs; the upper ones ſerrated towards the point. Capſule globoſe, nearly ſeſſile. We ſelect this as one of the moſt common ſpecies, and yet one that, for a long time, was not well underſtood. It is indeed among the ſmalleſt, as well as the moſt ſimple in ſtructure. It covers expoſed banks, in the early ſpring, and is conſpicuous for a tawny though ſhining green hue, whoſe brilliancy is enhanced by the dew impriſoned in the concave pellucid *foliage*. The *roots* are fibrous, and ſo entangled, that they have a creeping appearance; ſee Engl. Bot.; but we ſuſpect each fructifying portion to be a diſtinct plant. The want of a terminal hair to the *leaves*, ſome of the larger of which have been obſerved by Mr. J. D. Sowerby to be ſerrated or toothed, the more diminutive ſize of the whole plant, and the abſolute want of a *ſtem*, diſtinguiſh the preſent ſpecies from the equally common *cuſpidatum* of Hedwig, Engl. Bot. t. 2025, with which it was confounded by Linnæus, Hudſon, and others, under the name of *acaulon*.

Ph. *ſerratum*. Serrated Phaſcum. Schreb. Phaſc. 9. t. 2. Sm. Fl. Brit. n. 15. Engl. Bot. t. 460. Dickſ. Crypt. faſc. 1. t. 1. f. 1.—Stem none. Shoots ſpreading, repeatedly branched, capillary, jointed, barren. Leaves lanceolate, acute, ſerrated.—Schreber, who diſcovered this extremely minute ſpecies, in rich moiſt meadows near Leipſic, could not fail to obſerve the fibrous jointed ſhoots that always accompany it, but he miſtook them for *Byſſus*, or rather *Conferva, velutina*, Engl. Bot. t. 1556. Mr. Dickſon firſt detected the true nature of theſe appendages, to which we have adverted above. The *root* is ſmall, annual, and fibrous, throwing out from its crown a number of ſuch branched filaments; ſo that ſeveral plants, growing near each other, appear ſeated on a bed of *Conferva*, compoſed in reality of their own intermingled ſhoots. Each has no true *ſtem*. Four or five lanceolate, ſtrongly ſerrated, pellucid *leaves* riſe from the crown of the root, and envelop a nearly ſeſſile, ovate, brown, pointed *capſule*, whoſe *veil* is, above all others, minute and evaneſcent.

Ph. *ſtoloniferum*. Branching-rooted Earth-moſs. Dickſ. Crypt. faſc. 3. 1. t. 7. f. 2. Sm. Fl. Brit. n. 16. Engl. Bot. t. 2106.—Stem creeping, jointed, branched. Shoots ſpreading, branched, capillary, jointed, barren. Leaves lanceolate, pointed, toothed.—Firſt diſcovered by Mr. Edward Forſter, near Walthamſtow. Mr. G. Don has found the ſame in Scotland, and Mr. Turner, who conſiders it as a variety of the laſt, in Ireland. It grows on naked clay, in damp places, and is diſtinguiſhed from *ſerratum* chiefly or entirely by the truly creeping *roots*, which do indeed appear to originate from the jointed filaments, above deſcribed, taking upon themſelves the nature of roots. How far this is poſſible, we are all too imperfectly acquainted with theſe minute, though highly curious, productions, to declare with any degree of certainty.

PHASELIS, or PHASAELIS, in *Ancient Geography*, a town of Paleſtine, in the tribe of Benjamin, ſituated N. of the plain of Jericho, upon the banks of the river Carith, three leagues from the Jordan; ſaid to have been built by Herod in honour of his brother Phaſelus.

PHASEOLUS, in *Botany*, φασηλος, or φασηολος, of the Greeks; names ſuppoſed to allude to the ſhape of the ſeed-veſſel, which reſembles a kind of ſmall boat, known under the ſame denomination; the Kidney-bean. Linn. Gen. 372. Schreb. 494. Willd. Sp. Pl. v. 3. 1030. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 4. 288. Juſſ. 356. Lamarck Illuſtr. t. 610. Gærtn. t. 150. Claſs and order, *Diadelphia Decandria*. Nat. Ord. *Papilionaceæ*, Linn. *Leguminoſæ*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, two-lipped; the upper lip emarginate; the lower with three teeth. *Cor.* papilionaceous; ſtandard heart-ſhaped, obtuſe, emarginate; reclining, reflexed at the ſides; wings ovate, the length of the ſtandard, ſupported by long claws; keel narrow, ſpirally revolute, contrary to the courſe of the ſun. *Stam.* Filaments in two diſtinct ſets, one ſimple, the other in nine diviſions, ſpirally twiſted within the keel; anthers ten, ſimple. *Piſt.* Germen oblong, compreſſed, downy; ſtyle thread-ſhaped, ſpirally inflexed, downy in the upper part; ſtigma obtuſe, thickiſh, villous. *Peric.* Legume long, ſtraight, coriaceous, obtuſe, with an oblique point. *Seeds* kidney-ſhaped, oblong, compreſſed.

Obſ. The keel, and organs of impregnation within it, being both ſpiral, afford the eſſential mark of the genus; ſee DOLICHOS. The perianth in many ſpecies is accompanied by two roundiſh leaves, termed by Linnæus an external calyx; but ſurely rather to be deemed bracteas.

Eſſ. Ch. Keel twiſted ſpirally, along with the ſtamens and ſtyle. Stigma downy.

This genus is rather leſs numerous in ſpecies than its near relation *Dolichos*, but is, like that, divided into two ſections, the one compoſed of climbing, the other of upright plants. The 14th edition of Syſt. Veg. contains ſeventeen ſpecies in all; Willdenow has twenty-four, fifteen of which are enumerated in the ſecond edition of Hort. Kew. without the addition of any new ones. Fourteen of Willdenow's are climbers, ten grow erect. They are moſtly tropical productions, though ſome of the annual kinds prove ſufficiently hardy in our climate, and are valuable articles of the kitchen garden, as well as very ornamental. We ſhall particularize ſome of the principal.

Section 1. *Stem twining.*

Ph. *vulgaris*. Common Kidney-bean, or French bean; Haricot of the French. Linn. Sp. Pl. 1016. ed. 1. 723. Lob. Ic. v. 2. 59. (Ph. albus; Ger. Em. 1212. Phaſioli; Math. Valgr. v. 1. 388.)—Stem twining. Cluſters ſolitary, ſhorter than the leaves. Flower-ſtalks in pairs. Bracteas ſpreading, larger than the calyx. Legumes pendulous.—Native of the Eaſt Indies. Cultivated throughout Europe, either for the ſake of its young legumes, which are boiled for the table, and so much esteemed as to be thought worth forcing; or especially in France, and the south of Europe, for the ripe beans, not plentifully perfected in more northern countries, but much esteemed where they abound, as an ingredient in soups, and various made dishes. For these uses the variety whose skin is of a pure white is preferred. Others are brown, or variously spotted. There are varieties of this species in the height, or mode of growth, of its twining *stem*. The *root* in all of them is annual. *Leaves* ternate, as in the whole genus, on longish stalks: leaflets nearly smooth, broad-ovate, inclining to square, more or less pointed, entire, veiny; the lateral ones oblique. *Stipulas* oblong; those on the partial stalks narrowest. *Flowers* four or six in each long-stalked axillary cluster, their partial stalks opposite, short. *Corolla* of a pale blueish white. *Legumes* linear, six inches long. Each *flower* is accompanied by a pair of large, rounded, many-ribbed, pale green, spreading *bracteas*, larger than the *calyx*, and not, as in Willdenow and Aiton, smaller. This error is copied from the second edition of Linn. Sp. Pl., the first edition being in this respect more correct. See the following.

Ph. *multiflorus*. Scarlet Kidney-bean. Lamarck Dict. v. 3. 70. Willd. n. 2. Ait. n. 2. (Ph. coccineus; Linn. Sp. Pl. ed. 1. 724. Schkuhr Handb. v. 2. 343. t. 199, a. *Ait.* Ph. puniceo flore; Cornut. Canad. 184. t. 185. Ph. indicus, flore coccineo; Moris. sect. 2. t. 5. f. 4.)—Stem twining. Clusters solitary, about equal to the leaves, many-flowered. Flower-stalks in pairs. Bracteas close-pressed, smaller than the calyx. Legumes pendulous. The native country of this beautiful species is unknown. Miller, in his 8th edition, is remarkably confused in his account of this genus, and has misled Lamarck to assert that he gives South America as the country of the Scarlet Bean; whereas that account applies to his *coccineus*, his 6th not 5th sort, a totally different plant, though it is not easy to say what. Linnæus originally distinguished our Scarlet Bean by the name of *coccineus*, which ought to have been retained, though for convenience we have adopted what seems likely to prevail, and which is not exceptionable in itself, the *flowers* of the present being much more numerous in each *cluster* than in the Common Kidney-bean. Their beautiful brilliant scarlet colour causes them to be universally cultivated, nor are the *legumes* of less value for the table than the former; Miller prefers them. The plant however is rather more tender, and perishes at the first frost. Gerarde says, p. 1215, that Tradescant introduced this *Phaseolus* into the English gardens. Now it adorns every cottage bower, blooming abundantly from July till late in autumn, but its crop is not abundant. There is a white or pink-flowered variety. As far as we have observed, the small close *bracteas* afford an invariable specific distinction between this and the *vulgaris*; see our remark on that species.

Ph. *inamoenus*. Green-flowered Kidney-bean. Linn. Sp. Pl. 1016. Willd. n. 6. Ait. n. 4. Jacq. Hort. Vind. v. 1. 27. t. 66. (Ph. n. 2; Linn. Hort. Cliff. 359.)—Stem twining. Standard of the flower revolute, hairy, the colour of the calyx. Leaflets elongated. Linnæus says this was raised from African seeds in Mr. Cliffort's garden, where it flowered, we presume in the stove, in Dec. 1736. At Kew it is said to be a hardy annual, flowering in July and August. The oblong-pointed *leaflets* distinguish the plant, and the small *flowers*, with their green revolute *standard*, are peculiar, though by no means ornamental. The *legume* is short and cimeter-shaped. *Seeds* beautifully speckled with red.

Ph. *vexillatus*. Sweet-scented Kidney-bean. Linn. Sp. Pl. 1017. Willd. n. 8. Ait. n. 6. Jacq. Hort. Vind. v. 2. 46. t. 102. (Ph. flore odorato, vexillo amplo patulo; Dill. Elth. 313. t. 234.)—Stem twining. Flower-stalks thicker than the footstalks. Flowers crowded. Wings rather falcate; one of them lobed at the base. Legumes linear, straight. This species was raised in Sherard's garden at Eltham, from seeds collected near the Havannah. It is annual, flowering in the stove in July and August, but not often met with. The incumbrance of the large rambling plant is scarcely compensated by the beauty, or even fragrance of the *flowers*. Their common *stalks* are a foot long, and remarkably stout. *Legumes* long, narrow, and hairy. The *keel* is obliquely curved, but scarcely spiral; so that, as Linnæus observes, its character is intermediate between *Phaseolus* and *Dolichos*. We should incline to remove the plant to the latter genus.

Ph. *Caracalla*. Snail Kidney-bean. Linn. Sp. Pl. 1017. Willd. n. 13. Ait. n. 10. Andr. Repos. t. 341. (Ph. indicus, cochleato flore; Triumf. Obs. 93. t. 95.)—Stem twining. Standard and wings, as well as the keel, spiral. The native country of this magnificent species is not clearly determined. We suspect it to be of African origin; at least it is common in all the gardens at Algiers, from whence M. Desfontaines brought us the only flowers we have ever seen; so little was Mr. Andrews aware of the great rarity he was exhibiting to the public in his plate. The plant indeed may often be seen in stoves, but blossoms so rarely, that few persons have patience to allow it the requisite time and space. It was first brought to Italy by the Portuguese, and long most jealously preserved in the Grand Duke's gardens at Florence. In that country it acquired the name of Caracol, which properly belongs to a large snail. The *root* is perennial, and *stem* woody. The *flowers* are produced plentifully, if at all; many together in long, axillary, dense *clusters*. The *buds* are of a pearly whiteness; the *flowers* variegated with purple and buff, large, and very fragrant, but short-lived. Their greatest peculiarity consists in the *petals* being all rolled spirally together.

Section 2. *Stem erect, or nearly so; in one instance decumbent.*

Ph. *trilobus*. Three-lobed Kidney-bean. Ait. n. 12. Willd. n. 16. (Ph. maderaspatanus, foliis glabris trilobatus, &c.; Pluk. Phyt. t. 214. f. 3. Dolichos trilobus; Linn. Sp. Pl. 1021. Burm. Ind. 160. t. 50. f. 1.)—Stem somewhat twining, smooth. Lateral leaflets two-lobed; terminal one three-lobed; lobes ovate. Stipulas ovate. Stalks three-flowered, much longer than the leaves.—Native of the East Indies, from whence it was procured by sir J. Banks in 1777. It is annual, kept in the stove, and chiefly remarkable for the formal segments of the *leaves*, the *flowers* being small and inconspicuous. *Glycine triloba*, Willd. Sp. Pl. v. 3. 1056, is the same plant.

Ph. *Max*. Hairy-podded Kidney-bean. Linn. Sp. Pl. 1018. Willd. n. 21. Ait. n. 14. (Cadelium; Rumph. Amboin. v. 5. 388. t. 140. Mungo, sive Phaseolus orthocaulis; Hernand. Mexic. 887.)—Stem erect, angular, rough with deflexed hairs. Legumes drooping, hairy.—Native of the East. The *root* is annual. *Stem* upright, but a little zigzag, somewhat branched two or three feet high, leafy, angular, densely clothed with rigid deflexed hairs. *Leaves* not much unlike the Common Kidney-bean, but rather hairy, on hairy *stalks*. *Clusters* axillary, hairy, on short *stalks*, each of three or four pale greenish-yellow *flowers*. *Legumes* an inch and a half long, drooping or even pendulous, very hairy, each containing from two to ten roundish-oblong black *seeds*, variegated with brown. These serve for the food of men as well as horses in Turkey, Persia and Arabia, and are called *Max* or *Mex*, a word borrowed from

from the Arabians. Columna has given a complete account of this plant, with a very good wooden cut, in the work of Hernandez, as above quoted.

Ph. *Mungo.* Hairy-headed Kidney-bean. Linn. Mant. 101. Willd. n. 22. (Ph. hirfutus flexicaulis, Mungo affinis e maderafpatan, caule tereti; Pluk. Almag. 290.) —"Stem zigzag, fomewhat twining, hairy, round. Legumes capitate, hairy."—Native of the Eaft Indies. Linnæus having raifed this in the Upfal garden, found it diftinct from the preceding, with which it appears by his manufcripts he had once confounded it. The round *ftem*, more difpofed to climb, and the capitate *flowers*, feated on a fmooth, ovate, long-ftalked receptacle, are, by his defcription, fufficient marks of difference. We find no fpecimen in his herbarium of this fpecies, but it is mentioned in the late Mr. Donn's Cambridge catalogue.

Ph. *capenfis.* Trailing Cape Kidney-bean. Thunb. Prodr. 130. Willd. n. 18.—Stem thread-fhaped, decumbent. Stalks fingle-flowered. Leaflets lanceolate.—Gathered at the Cape of Good Hope by Thunberg. The *ftem* is very flender, rough with minute briftles or prickles. *Leaflets* an inch and a half long, linear-lanceolate, veiny, minutely hifpid. *Stipulas* fmall, ovate. *Flower-ftalks* axillary, thrice as long as the leaves, and thrice as thick as the footftalks, ftraight, fingle-flowered, very rough at the top with deflexed rufty briftles, as is the *calyx* with erect ones. The *corolla* is purple, large and handfome. Our fpecimen fhews nothing of the proper character of the genus, for which we muft rely on Thunberg. In the Bankfian herbarium this plant is referred to *Dolichos*. There appears to us much of the character of *Glycine*, the *ftyle* being actually curved backwards, with the *keel*, fo as nearly to touch the upper lip of the *calyx*, and the habit of the whole plant accords with that genus better than with either *Dolichos* or *Phafeolus*.

Phaseolus, in *Gardening*, contains plants of the climbing, efculent, and flowering kinds, of which the fpecies cultivated is the common kidney-bean (P. vulgaris.)

But other fpecies may be cultivated, for the purpofe of variety, as flower-plants.

Thefe were formerly called *Sperage beans*, *French beans*, &c.

And the principal fub-varieties of the dwarf, or low-growing forts, are; the early white dwarf; the early fpeckled dwarf; the early yellow; the early liver-coloured; the early dun-coloured dwarf; the larger white, or cream-coloured dwarf; the larger black and white fpeckled dwarf; black-ftreaked dwarf; the red-fpeckled dwarf; the fpeckled amber dwarf; the fparrow-egg dwarf; the Canterbury white dwarf; the Batterfea white dwarf; the China fpeckled dwarf, confifting of black and white fpeckled, brown and white, red and white, &c. Thefe are of upright dwarf-bufhy growth, rarely exceeding fifteen or eighteen inches in height; and feldom throw out runners, except the Canterbury and Batterfea forts, which fometimes fend out a few ftragglers, but which feldom extend to much diftance.

But the firft three or four forts are at prefent in moft efteem for their coming early into bearing; being of fmaller growth than the other forts, they fooner form themfelves for bloffom and bearing, of courfe are proper for planting for the earlieft crops, and for forcing in hot-beds, &c. As they, however, do not continue long in bearing, they are not fo proper for the main crops as the larger dwarf forts; particularly the black and white fpeckled, the Canterbury and Batterfea kinds, which are all excellent bearers; but the two latter moft of all, and the pods are fmaller, more numerous, and efteemed the fweeteft eating of all the dwarf kinds whilft young, though the pods of the large white dwarf, and the fpeckled kind in particular, continue exceedingly good, even when of pretty large fize, but fuperior in the latter, both in a more plentiful longer production, and goodnefs for eating, being excellent for a principal crop in a family garden; as are alfo the Batterfea and Canterbury forts, which fhould not be admitted on the fame occafion; and thefe two varieties are commonly in moft efteem for general culture by the market-gardeners for main crops, as being by them confidered both the moft profitable for bearing, and having a fmaller pod, the moft faleable in the markets: however, any of the other dwarf forts are alfo proper to cultivate occafionally, for variety, both for private and public ufe.

There is a fcarlet bean, which is by fome confidered as a diftinct fpecies, but probably a variety of this, the running or twining ftalks of which, if properly fupported, rife to the height of twelve or fourteen feet: the leaves are fmaller than thofe of the common garden-bean: the flowers grow in large fpikes, and much bigger, and of a deep fcarlet colour: the pods are large and rough; and the feeds are purple marked with black, and fometimes pure white.

The principal fub-varieties of thefe are; the large fcarlet climber, which rifes with many twining runners upon fupport, eight or ten to twelve or fifteen feet high, having numerous large clufters of fcarlet flowers, fucceeded by large, thick, rough, flefhy feed-pods, containing large, thick, purplifh beans.

The large white climber, having large clufters of white flowers, large, thick, rough feed-pods, and white feed. Thefe forts are all alike in refpect to their growth, differing only in the colour of their flowers and feed, which is pretty permanent: they are great bearers; and the plants of the fame crop continue in bearing from July or Auguft until October; the pods, even when large, boiling exceedingly green, being remarkably tender and well-flavoured.

The large Dutch climber, which rifes with twining runners, upon fupports, ten or twelve feet high; has numerous clufters of white flowers, fucceeded by long, broad, comprelfed, flat, fmooth pods, containing large, oblong, flat, white feed: this is alfo a very great bearer, but it does not continue near fo long in production as the two former climbers; its pods, however, which are very long, fmooth, and flefhy, boil exceedingly green, tender, and good: and, of the runner kind, it is a very defirable family bean, inferior to none for fweetnefs of flavour.

But the following forts are of a more moderate growth. The Negro runner; the Batterfea white runner; and the Canterbury runner; which, though climbers, ramble lefs, but bear plentifully and continue fome time. The pods are fmaller, but very tender, and very delicate in eating, while in moderate young growth.

Method of Culture.—As thefe are all plants of the annual tender tribe, they require to be raifed every year, in the latter fpring and fummer months, as from April till June, or later, by different fowings, at the diftance of a few weeks, when the danger of frofts is over.

Culture in the Dwarf kinds.—In cultivating thefe forts, proper kinds fhould be chofen for the different crops, as for the forward ones, any of the early forts are proper, but the early white, early fpeckled, dun, and yellow kinds, are rather the earlieft bearers; and for the main crops, any of the larger dwarf kinds, though preference fhould be given to the fpeckled, the Batterfea, and the Canterbury dwarf kinds, as being all plentiful bearers, and continuing long in fucceffional bearing on the fame plants.

Thefe forts of beans, from their tender nature, feldom admit

admit of being fown or planted earlier than April, when the weather is become a little fettled ; as the feed is not only impatient of cold moifture in the ground, and very fubject to rot, but the young plants that happen to come up early are often cut off, or greatly injured, by the morning frofts, or cold cutting winds, that frequently prevail in the beginning of this and the following month. But towards the middle of it, if the weather is fine and dry, fome may be ventured in a warm dry fituation, and light foil, for the early natural crops ; and in the latter end of it, or beginning of the following month, when the weather is fuitable, it is proper to begin to put in the firft general crops in the open quarters, &c., and to continue planting fome every fortnight or three weeks, until the middle or latter end of July ; by which means regular fupplies of young kidney-beans may be had for the table or market, from about the middle or latter end of June until the beginning of the autumnal feafon.

Where, however, it is defired to try them as early as poffible in the full ground, fome may be put in about the beginning of April, in dry weather, clofe under a warm wall, or other fimilar fituation, where the foil is dry ; and in a fortnight after fome more, in a larger proportion. If the firft fhould fail, thefe fometimes fucceed ; and if both are attended with fuccefs, one will follow the other in bearing ; though it is two to one againft the fuccefs of the firft planting. But as only a few fhould be planted fo early, if they fail, it is only the lofs of a little labour and feed, as the fame ground will do again ; and if they fucceed, and produce only a few but a week fooner than common, they will be efteemed a rarity, either for family ufe or the market.

They all fucceed in any common dry foil of the garden ; but for the forward crops, a dry light foil fhould conftantly be chofen, rejecting heavy and wet grounds, for in fuch a foil moft of the early planted feed infallibly rot. Likewife for the early crops, it is highly requifite to have a fheltered warm fituation, full to the fun : a warm fouth border is a very proper expofure ; but for the main crops, any of the open quarters may be made ufe of with propriety.

The methods of fowing or planting all the forts is in fhallow drills, from two to three feet afunder, to remain where fown.

For the early crops, take advantage of a dry day ; neat drills fhould be drawn with a hoe from north to fouth, two feet or thirty inches afunder, and near an inch deep, and to afford a greater chance of fuccefs, a drill may be made clofe along under the wall, where practicable ; in thefe drills the beans fhould be dropped in rows along the bottoms, only about an inch and a half afunder, as many of this early fowing may fail ; covering them evenly with the earth, not more than an inch deep ; as when covered too deep at an early period, many are apt to rot, by the cold moift dampnefs of the earth. As foon as they are covered in, the furface fhould be lightly raked fmooth ; when the work is finifhed. They come up in about twelve days or a fortnight ; when they fhould be managed as directed below ; and the plants moftly come into bearing in fix or eight weeks afterwards.

For the main crops to be planted afterwards, almoft any fituation, either in the borders, or an open expofure, may be employed ; though an open fituation in any of the large quarters is, as has been feen, the moft proper. In this cafe drills fhould be drawn two feet and a half afunder, and about one inch deep ; or, when it is defigned to plant rows of favoys or cabbage plants between, (as is often practifed where neceffary to hufband the ground to the beft advantage but which fhould always be avoided if poffible,) the drills fhould be a yard afunder at leaft ; the beans being dropped in fingly along the bottom of each drill, about two or three inches afunder, covering them in evenly afterwards with the earth about an inch deep, and finifhing with a light raking to fmooth the furface. They moftly come up at this feafon in ten or twelve days, and fometimes fooner in fine weather ; and the plants ufually come into plentiful bearing in fix or eight weeks afterwards.

In planting out the later general crops, when the weather proves very dry and hot, and the ground of courfe very dry, it is proper either to foak the beans a few hours in foft water previous to planting ; or, inftead of this, letting the drills for the reception of the beans be well watered, and planting them immediately as above, covering them in the proper depth. Either of thefe methods is very advifable in dry weather in the heat of fummer ; it being neceffary at fuch times to promote the free germination of the feed, in order to bring them up foon and regularly, as they would otherwife rife in a ftraggling manner.

General Culture.—When the plants of all the above crops are come up, they are in general to remain where fown or planted, to yield their produce ; though when neceffary fome may be tranfplanted, keeping them clean from weeds by occafional hoeing in dry weather ; and when the plants are advanced about three or four inches high, hoeing up a little earth to their ftems on each fide, which will forward their growth and promote their ftrength ; continuing the care of deftroying weeds as often as their growth may render it neceffary ; which is principally all the culture required for thefe forts, in the full ground, till they arrive at a bearing ftate, and their produce is fit to gather ; except to the earlieft crops on warm funny borders, in very hot dry weather, when it may be beneficial to give occafional waterings to the plants in the mornings or evenings, efpecially when in bloffom, or fruiting.

In gathering the produce of thefe forts of beans, it fhould always be performed when the pods are quite young, or at leaft before they become large, and the beans in them attain any confiderable fize, as they are then tough, ftringy, and rank tafted ; and in order to continue the plants in bearing as long as poffible, the gatherings fhould be regularly repeated two or three times a week ; for by gathering the pods often and clean, as they become fit, the plants bloffom more abundantly, and continue fruiting more plentifully, and for a much longer period.

Large quantities of thefe dwarf kinds are often cultivated in the gardens and fields in the neighbourhood of large towns, for fupplying the markets during the latter part of the fummer feafon.

Culture of early Crops by artificial Heat.—In order to have thefe forts of beans as early as poffible, recourfe is had to raifing them by the aid of heat, in two or three different methods, as by raifing the plants in a hot-bed, an inch or two high, and then planting them out into a warm border, by raifing and continuing the plants in a hot-bed fo as to bear their crops, and by aid of a hot-houfe.

In the firft of thefe methods, they may be forwarded a fortnight earlier than thofe fown entirely in the full ground ; for this purpofe, towards the latter end of March, or early in the following month, a moderate hot-bed fhould be prepared a foot and a half or two feet in depth of dung, covered either with a frame or hand-glaffes, or arched over with hoops or rods, to be covered with mats ; earthing the bed with fine, light, rich mould, fix inches deep ; then having fome feed of the early forts, it fhould be fown pretty clofe either all over the furface, an inch or two apart, covering them with earth about half an inch deep, or in fmall clofe drills, earthing them over the fame depth ; or where only

only a few are wanted, they may be ſown in large pots at about an inch diſtance and half a one deep, and the pots plunged into a hot-bed, or placed in a hot-houſe; and when the plants come up, the pots be removed by degrees into the full air in warm days, to harden the plants for tranſplantation: and it is a good method to plant a quantity of beans in ſmall pots (thirty-two or forty-eights), three in each pot, plunging the pots in a hot-bed; and when the plants are fit for being tranſplanted out, they can be readily turned out of the pots with the whole ball of earth about their roots, ſo as not to feel their removal. But in raiſing the plants in either of theſe methods with this view, attention is particularly neceſſary to inure them gradually to the full air, by taking off the covers of the glaſſes or mats in all mild weather from thoſe in hot-beds, and only covering them in cold nights; or the pots in the hot-houſe ſhould be placed abroad in fine days; but as they advance in growth, and the weather becomes warmer, they muſt be expoſed by degrees to the full air, day and night, to harden them properly, previouſly to their being finally tranſplanted out. They ſhould alſo be allowed frequent moderate refreſhments of water.

When they have ſhot out their proper leaves an inch or two broad, and all danger of froſty mornings and other bad weather is apparently over, proceed to plant them out into a warm border, under a wall or other fence, taking them up with their roots as entire as poſſible, and with as much earth as will hang about them, or with a ſmall ball of earth; and thoſe raiſed in ſmall pots by threes may alſo be eaſily turned out with the whole ball of earth entire: and as to the mode of planting them, thoſe that cannot readily be taken up with balls may be planted by dibble, in a row along cloſe under a ſouth wall, or ſome in croſs rows two feet aſunder, forming ſhallow drills for their reception, in which the plants ſhould be ſet three or four inches apart; but thoſe with good balls about their roots ſhould be holed in with a trowel; and if ſome of thoſe for a ſmall early production are alſo diſpoſed in patches, three plants in each, ſo as to be covered occaſionally in cold nights with hand-glaſſes, it will be found very beneficial in forwarding their growth. As ſoon as they are planted, in either method, a moderate watering ſhould be given to ſettle the earth cloſe about the roots, and repeated in dry weather as there may be occaſion, till the plants have taken freſh root in their new ſituations.

After this they ſhould be kept clean from weeds; and when they are a little advanced in growth, ſome earth drawn lightly up about their ſtems; and as the warm ſeaſon advances, if it prove hot and dry, refreſhments of water will greatly forward and ſtrengthen the growth of the plants, and forward their perfection.

In the ſecond method, about the beginning or towards the middle of February, a dung hot-bed ſhould be made, either a ſmall one in which to ſow the beans thick for being tranſplanted, when the plants are about an inch high, into a larger hot-bed, to remain for bearing; or a large one at firſt, in which to ſow the ſeed and continue the plants to attain perfection, as for one, two, or more three-light frames, about two feet and a half high in dung: and when the great heat and ſteam are a little abated, the bed ſhould be covered with light, rich, dry mould, ſix or eight inches thick, for the reception of the ſeed; then ſmall drills ſhould be drawn from the back to the front of the bed, near an inch deep, and about fifteen or eighteen inches aſunder; placing the beans two or three inches apart, and covering them evenly with earth the above depth, then putting on the lights, tilting them behind an inch or two high daily, to give vent to the ſteam; and when the plants appear, continuing every day to admit air to them at all opportunities, in proportion to the temperature of the weather and heat of the bed, to prevent their drawing up weak, and promote their ſtrength as they riſe in height; beſtowing alſo at this time moderate refreſhments of water in ſunny days; and when they are two or three inches high, applying a little earth to their ſhanks; likewiſe ſupporting a moderate heat in the bed during the cold weather, by occaſional linings of hot dung: and accordingly as the plants advance in growth, and the warm ſeaſon increaſes, augmenting gradually the portion of freſh air daily to harden them by degrees, ſo as almoſt to be fully expoſed occaſionally in very warm days, eſpecially when beginning to bloſſom; but keeping them cloſe on nights; continuing alſo the care of frequent light waterings, which muſt be increaſed in quantity as the plants advance in ſize, particularly when they are in bloſſom and in a fruiting ſtate: in their advanced growth if they preſs much againſt the glaſſes of the frame, it is proper to raiſe it at bottom two or three inches, to give room at top for their free growth, which is neceſſary to promote a plentiful bloom for furniſhing a ſufficiently full crop of beans.

In this mode they may be had at as early a period as poſſible, as in April or early in May; but to have a conſtant ſucceſſion of early kidney-beans till crops in the natural ground come in, another crop ſhould be brought forward in hot-beds, as above, three weeks after the firſt hot-bed is made up.

When frames cannot be afforded for the above purpoſe, it may be effected in March with occaſional coverings of mats; a hot-bed being made about two feet high of dung, earthing it directly ſix or ſeven inches thick, ſowing the beans as directed above, then arching the bed over with hoops, &c., and covering it every night, and in all bad weather, with mats; but admitting the free air every mild day, gradually hardening the plants as they acquire ſtrength, and giving occaſional waterings.

In the third method, early kidney-beans may be obtained with very little trouble at almoſt any time in winter or ſpring, by raiſing them in pots, or long narrow trough-like boxes, about two or three feet long and eight or ten inches broad at top, placing them any where in the lower part of the hot-houſe; when the plants will ſucceed.

The proper kinds for this purpoſe are; the early white, yellow, and dun-coloured dwarfs, the latter being rather a preferable bearer, continuing in longer production; and the ſpeckled dwarf alſo ſucceeds very well, and continues long in bearing in this mode of culture.

In reſpect to the method of management in theſe caſes, any time in winter or early ſpring, ſome large pots (ſixteen or twenty-fours) or boxes may be filled with light, rich earth, and placed in the hot-houſe, ſome being arranged upon the top of the ſurrounding wall of the bark-bed, and on the top of the front flues towards the upright glaſſes, and in other ſimilar convenient ſituations as room may admit, planting in each pot four beans, near an inch deep, or, if boxes, along the middle, in a ſort of double row, triangular-ways, about four inches aſunder, and the above depth: they ſoon germinate, and in a few days appear above ground: when they begin to ſprout, it is proper to moiſten the mould with a little water, which facilitates the protruſion of the plants out of the earth.

Their after-culture is very eaſy: when they are come up, frequent waterings ſhould be given, as three times a week, as the earth dries very faſt. It ſhould always be kept moderately moiſt, in order that the plants may bloſſom freely and produce a plentiful crop, which is often in as great perfection as in the full ground.

As in the other crops, they ſhould be gathered often; as it is the way to continue the plants long in a bearing ſtate.

A regular ſucceſſion of early young crops of theſe beans may be obtained in this way two or three months, by repeated ſowings at the interval of about three weeks, ſo as to have young plants advancing in pots or boxes in two or three different degrees of growth ſucceeding each other.

Where there is not much ſtove-room, it may be proper to plant beans for ſucceſſion crops in ſmall pots (forty-eights), three beans in each; and as theſe take up but little room, they may be ſtowed any where cloſe together, or between the other larger pots: the plants will come up and be advancing in growth, ſo as that when thoſe of the preceding crops are going off, theſe may be readily turned out of the ſmall pots with the whole ball of earth about their roots, and replanted into large pots, &c. to remain for fruiting, giving water at planting, and frequently afterwards, as above, in the firſt crop: by this practice a month's growth in the plants may be gained, and a conſtant ſucceſſion of beans for the table had.

Culture in the Climbing Kinds.—Theſe are raiſed from the ſeed, by ſowing it annually in the later ſpring and ſummer months, as in the dwarf ſorts. For this purpoſe, the ſcarlet runner, and the white ſub-variety of it, are the moſt proper for the general crops, as being not only very great bearers, and continuing in perfection two or three months, but from their pods, when even pretty large, remaining green, fleſhy, tender, and well-flavoured. Some of the Dutch runners, and any of the other climbers, may alſo be cultivated with advantage.

The moſt proper ſeaſon to begin planting the main crops of all thoſe ſorts is the firſt or ſecond week in May, if the weather be fine; as being of a delicate nature like the dwarfs, when planted earlier, both the ſeed and plants are ſubject to danger from the ſame cauſes: however, in a ſouth border, or ſome ſimilar warm ſituation and dry ſoil, a few may be planted in the middle, or towards the latter end of April, to take their chance; but for the general crops, the moſt ſucceſsful ſeaſon for planting is from the above period until the middle or latter end of June, but not later than the beginning of July; but where the ſcarlet kind and variety are planted principally, one planting in May or beginning of June will come into bearing in July or Auguſt, and when the pods are kept gathered clean, according as they are fit for uſe, the plants continue ſhooting, bloſſoming, and bearing abundantly until the end of September, and often until the end of October, or even till deſtroyed by the cold and froſts; but two plantings of any of the ſorts of runners, one in May and the other in June, or early in July, are amply ſufficient to furniſh a very abundant ſupply for the whole ſeaſon of this ſort of crop.

All theſe kinds proſper almoſt any where in the garden, both in cloſe and open ſituations; chooſing principally a lightiſh ſoil, eſpecially for the forward crops: and the richer the ground the better it is for the purpoſe.

As all the running kinds require ſupport of ſome kind or other to climb upon, they ſhould be planted either in wide rows for the convenience of placing tall ſticks or poles along each row for the runners of the plants to wind themſelves round for ſupport, or be planted againſt ſome ſort of fence or treillage work for the ſame purpoſe of training up and ſupporting the runners. When, however, it is deſigned to train them up ſticks or poles, drills ſhould be drawn four feet, or four and a half, aſunder, eſpecially for the larger kinds, and an inch deep, in which the beans ſhould be dropped three or four inches apart; covering them in evenly with earth, and raking the ſurface ſmooth. The beans will ſprout in a few days, and come up in leſs than a fortnight.

When the plants are three or four inches high, a little earth ſhould be drawn with a hoe up to their ſtems, to ſtrengthen them, and encourage them to ſend forth ſtrong runners. At this time alſo all weeds between the rows ſhould be cut up and be removed.

As ſoon as they begin to puſh forth their runners, ſome tall ſticks or poles ſhould be placed for them to aſcend upon; and as they are placed, conducting the runners towards them, in a direction according to their natural mode of climbing, which is generally to the right, or contrary to the ſun's motion: they will thus naturally encircle the ſticks or poles, and aſcend to their tops, even if ten or fifteen feet high, producing bloſſoms and fruit from bottom to top.

When it is intended to plant theſe ſorts againſt fences for ſupport, it ſhould be done in a row cloſe along to the fence; and if againſt a wall or paling, either placing tall poles, or drawing ſome ſtrong packthreads from top to bottom at ſix inches diſtance; the plants readily twining round them, and ſupporting themſelves to a great height.

In gathering the produce of all theſe kinds, the ſame circumſtances ſhould be attended to as in the dwarfs—to gather the pods whilſt young and tender; and to continue the plants long in full bearing, always gathering the pods clean as they become of a proper ſize: and they will continue fruiting more abundantly, and in better perfection.

When it is intended to cultivate any of theſe climbing beans as flowering plants, the ſcarlet kind and its variety are the beſt ſorts for the purpoſe. They ſhould be ſown as above in any of the compartments of the pleaſure-garden, in patches, alternately ſcarlet and white ſort, two or three beans in each patch, about an inch deep; and when the plants are up, and begin to puſh forth runners, tall poles or branchy ſticks ſhould be placed for them to climb upon: they will thus effect a very fine variety all ſummer, until the autumn.

Theſe kinds of beans are alſo often employed to run over arbours, and to twine round lines, from the top of tall ſtakes, and ſtems of ſmall trees; alſo to run up along the ſides of houſes, or againſt walls, either upon poles, or upon packthread ſtrings, ſuſpended from above, about which they will twine themſelves many feet high, bearing abundance of flowers and fruit: they are likewiſe ſometimes trained to form ſhady walks, by means of ſticks or poles arranged along each ſide, or by ſupport of a ſort of treillage-work, ranging ſome tall ſtakes five or ſix feet aſunder, railing them along the top with poles or pan-tile laths, or extending ſtrong packthread lines; and from either of which ſuſpending ſtrings to the ground, ſix or eight inches aſunder, faſtening them down with pegs: upon theſe ſtrings the plants will climb and form a cloſe hedge; or they might be occaſionally arched over the top in a ſimilar manner, for the runners to extend, and form a vaulted roof and complete ſhade. Thus, this fine climber may be trained in various ways according to fancy, both for uſe and ornament; from which thoſe not accommodated with gardens may plant them in pots or boxes, to be placed in court-yards, windows, balconies, &c.

Saving Seed.—In order to have perfectly good ſeed, it is neceſſary to ſow a ſufficient quantity in rows on purpoſe, ſuffering the whole crop of the plants to remain without gathering any for uſe: by this means the ſeed ripens early, and in the higheſt perfection; which is eſſentially neceſſary

for

for thoſe who deſign the ſeed for public ſupply. In private gardens, and many others, they often, however, after having gathered the prime of the principal crops, leave the latter produce of them to grow for ſeed; which, although it may be tolerably good, is not always ſo large, plump, and fine, as in the former method.

When the ſeed is quite ripe, which is eaſily known by examining a ſeed pod, the plants ſhould be pulled up and ſpread looſely along in rows, or upon any low hedges, &c. turning them occaſionally that the beans may dry and harden well; which, when effected, either thraſh them out directly, or lay them up in ſome dry loft or other room till convenient; and when thraſhed out and cleared from the rubbiſh, ſpread them upon ſome clear airy floor, or ſome ſuch place in the dry, to harden perfectly; then they ſhould be put up in bags for next year's uſe: ſome think the change of ſeed of this kind to be of much conſequence.

PHASES, φασεις, formed from φαινω, *I appear*, in *Aſtronomy*, the ſeveral appearances, or quantities of illumination of the moon, Venus, Mercury, and the other planets; or the ſeveral manners wherein they appear illuminated by the ſun.

The variety of phaſes in the moon is very remarkable: ſometimes ſhe increaſes, ſometimes wanes, ſometimes is bent into horns, and again appears like a ſemicircle; at other times ſhe is gibbous, and preſently again reſumes a full circular face. For the theory of the lunar phaſes, ſee MOON.

As to the phaſes of Venus, the naked eye does not diſcover any diverſity in them; but the teleſcope does. Copernicus anciently propheſied, that after-ages would find that Venus underwent all the changes of the moon, which prophecy was firſt fulfilled by Galileo, who, directing his teleſcope to Venus, obſerved the phaſes to emulate thoſe of the moon; being ſometimes full, ſometimes horned, and ſometimes gibbous.

Mercury alſo does the ſame; all the difference between theſe and thoſe of the moon, is, that when theſe are full, the ſun is between them and us; whereas, when the moon is full, we are between her and the ſun.

Saturn puzzled the aſtronomers a long time with his ſtrange variety of phaſes. Hevelius and others found him, 1. Monoſpherical. 2. Triſpherical. 3. Spherico-anſated. 4. Elliptico-anſated. 5. Spherico-cuſpidated. But Huygens ſhews, that theſe monſtrous phaſes were principally owing to the imperfections of their teleſcopes. That great author, aſſiſted by the beſt teleſcopes, noted three principal phaſes; *viz.* Jan. 16, 1656, he was round; Oct. 13, brachiated; and Decem. 17, 1657, inſated. See SATURN.

PHASES *of Comets.* See COMET.

PHASES *of an Eclipſe for any given Time, To determine the.*— Find the moon's place in her viſible way for that moment; and thence, as a centre, with the interval of the moon's ſemidiameter, deſcribe a circle. Find, in like manner, the ſun's place in the ecliptic, and thence, with the ſemidiameter of the ſun, deſcribe another circle; the interſection of the two circles ſhews the phaſes of the eclipſe, the quantity of obſcuration, and the poſition of the cuſps or horns. See ECLIPSE.

PHASIANELLUS, in *Ornithology*, a ſpecies of *Tetrao*; which ſee.

PHASIANUS, *the Pheaſant*, a genus of birds of the order Gallinæ. The generic character is; bill ſhort and ſtrong; cheeks covered with a ſmooth, naked ſkin; legs generally with ſpurs. Of this genus the females produce many young ones at a brood, and take care of them for ſome time, leading them abroad, and pointing out food for them. The young are at firſt clad with a thick ſoft down. The neſts of the whole tribe are formed on the ground. There are fifteen ſpecies enumerated by Gmelin, beſides varieties.

Species.

GALLUS; Common, or Wild Cock. Comb on the crown and two wattles on the chin compreſſed; ears naked; tail compreſſed, erected; feathers of the neck linear, long, membranaceous at the tips. It inhabits, in a wild ſtate, India. The feet are three or four inches long: it is domeſticated every where, feeds on grains and worms, which it ſcratches out of the ground, and ſhews to the young chickens; it is very courageous, proud, watchful, and ſalacious (ſee COCK); it claps it wings before it crows; has a piercing ſight, and never fails to cry in a peculiar note at the ſight of a bird of prey. The hen, if ſhe have plenty of food, will lay nearly through the year. The body, when wild, is leſs than that of the common cock; the comb is large, indented, ſhining red; temples, and line from the creſt to the eyes, naked, and of a fleſh colour; behind the eyes a clay-colour ſpot, of the ſhape of a man's nail, and covered with ſhort feathers; the feathers of the reſt of the head and neck long, narrow, grey at the baſe, black in the middle, and tipt with white; the feathers of the upper part of the body greyiſh, with a white and black ſtreak; breaſt reddiſh; greater wing-coverts reddiſh-cheſnut, with tranſverſe black and white ſtreaks; tail-coverts gloſſy-violet; middle tail-feathers long, falcate; ſpur large, curved. The female has neither comb nor wattles; the head and neck grey, cheeks and chin whitiſh; body more duſky, and varied with brown, grey, and rufous. It has no ſpur.

Of the period when this bird was firſt introduced into Europe, all reſearches will not enable us even to preſume a conjecture; but it ſeems to be taken for granted, that the cock is one of the oldeſt companions of mankind, and that he was among the firſt who were drawn from the wilds of the foreſt, to become a partaker of the advantages of ſociety. Although it does not appear at what period this took place, yet it is almoſt certain that the firſt accounts we have of the cock is from the Perſian hiſtory, to which kingdom, according to Buffon, the weſtern parts of the world are certainly indebted for him. Ariſtophanes calls the cock the Perſian bird, and it was known ſo early in the moſt ſavage parts of Europe, that we find the cock was one of the forbidden articles of food among our early anceſtors the ancient Britons. The domeſtic fowl has almoſt every where baniſhed the wild one; it is ſtill, however, found wild in the Tinian iſlands, and in many others in the Indian ocean, and in the woods on the coaſt of Malabar, in his ancient ſtate of independence. In his wild ſtate, his plumage is black and yellow, and his comb and wattles yellow and purple. Among the ancients, at leaſt the Europeans, after this bird's firſt introduction among them, thoſe whoſe feathers were of a reddiſh caſt, were conſidered as invaluable; but thoſe whoſe plumage was white they conſidered as unfit for domeſtic purpoſes. Ariſtotle has treated of them as being the leaſt fruitful of the two; the firſt he calls generous and noble, being remarkable for their fecundity; the other ignoble and uſeleſs, on account of their ſterility. Theſe diſtinctions, as Buffon obſerves, differ widely from our modern experience, the generous *game-cock* (ſee COCK) being by no means ſo fruitful as the dung-hill cock. The varieties of this ſpecies are as follow.

1. Crown with a thick downy creſt. This is called the *creſted* cock.
2. Feet five-toed, two behind. This is the *Dorking* cock.
3. In the *frizzled* cock all the feathers are turned back.
4. The *Perſian* cock has neither rump nor tail-feathers.

5. The *dwarf* cock has its legs very ſhort.

6. The *Bantam-cock*, ſo called from having been firſt found at Bantam in India. This variety is not half the ſize of the common cock, which he ſomewhat reſembles in colour and ſpirit, for he will attack cats, dogs, or any other animal, totally indifferent as to their ſize; he has a reddiſh bill, red eyes, and a curious roſe comb on the top of his head; his ears are covered with a tuft of white feathers; his neck and back are clothed with long feathers, intermixed with orange, black, and yellow; his breaſt and lower part of the belly are black. The hens of this variety differ from the cocks, principally by varying in their colours, but which at all times are more brown and yellow, and leſs black, than his; they have alſo but a ſmall red comb on the tops of their heads; their legs, like thoſe of the cock, are feathered down to the toes, and this is one of the chief marks by which the true breed is diſtinguiſhed.

7. The *rough-legged* cock, another variety, has its legs feathered down to the toes.

8. The *Turkiſh* cock is variegated with beautiful colours.

9. The *Paduan* cock is chiefly diſtinguiſhed by its great ſize.

10. The *Negro* cock has a creſt, the wattles and chin are black.

11. The hen with a tuberous crown is called the *crowned* hen.

12. The *horned* cock has a crowned horn.

13. The *ſilk* cock has feathers reſembling hairs.

Varius, variegated Pheaſant, is black; front red; neck and back gloſſy-green; tail compreſſed, aſcending, the coverts hanging down on each ſide. It is leſs than the common cock, and is probably found in India.

Ignitus; Fire-backed Pheaſant. Black, with a ſteel-blue gloſs; the ſides are rufous; lower part of the back fiery ferruginous; the two middle tail-feathers yellowiſh-brown. It inhabits Java, and is the ſize of a common fowl.

Motmot; Motmot Pheaſant. This ſpecies is brown, beneath reddiſh; the tail is wedged, the lateral feathers rufous. It inhabits Braſil and Guiana, and is eighteen inches long.

Parraka; Parraka Pheaſant. Brown, beneath and crown tawny; tail long, even. It inhabits the thick woods of South America, is twenty-three inches long; and at ſunriſe it makes a clamour like a cock.

Mexicanus; Courier Pheaſant. It is tawny white; tail long, ſhining-green. It is about eighteen inches long, inhabits New Spain; is ſlow in flight, but ſo ſwift on foot as to outrun the ſwifteſt horſes.

Impejanus; Impeyan Pheaſant. Creſted; purple gloſſy-green, beneath black; feathers of the neck with a changeable luſtre of gold, copper, and green; tail entire, rufous. It is larger than a common fowl. It inhabits India; it is not at all a common bird, being brought down from the hills in the northern parts of Hindooſtan to Calcutta as a curioſity. The lady of ſir Elijah Impey attempted, with a probability of ſucceſs, to bring over with her ſome of them to England, but after living on ſhip-board a few weeks, they caught a diſorder from the reſt of the poultry, very like the ſmall-pox, and died in conſequence. They will bear cold tolerably, but are impatient of heat. The cock was never obſerved to crow, but had a ſtrong hoarſe cackle, not unlike that of a pheaſant. It is deſcribed and figured by Latham.

Cristatus; Creſted Pheaſant. Brown above; beneath reddiſh-white; vent rufous; head creſted; orbits red, naked; tail wedge-ſhaped, and tipt with yellow; bill and unarmed legs black; feathers of the creſt whitiſh-brown; beneath black; feathers from the hind head to the lower part of the neck have a white ſtreak down the middle; coverts of the wings at the tip and edge white, quill-feathers rufous; the tail is ten inches long, and the length of the body about twenty-two inches. It is a native of New Spain, frequents trees, in the neighbourhood of water, feeds on worms, inſects, and ſerpents.

Africanus; African Pheaſant. The body is of a blue-aſh colour, beneath it is white; the head is creſted; the two middle tail-feathers at the tip and lateral ones entirely black. It, as its name imports, inhabits Africa, and is about nineteen inches long.

Colchicus, or common Pheaſant. Rufous, head blue; tail wedged; cheeks papillous; bill pale; horn colour; irides yellow; cheeks red, ſpeckled with black; in the old birds wrinkled and pendulous; a greeniſh-black feathered line from the noſtrils to beneath the eyes; reſt of the head and neck green-gold, with a gloſs of violet and blue; lower part of the neck, breaſt, back, and rump, ſhining tawny; quill-feathers brown, with ochreous ſpots; belly and vent white; tail-feathers eighteen, with tranſverſe black bars; legs duſky, armed with ſpurs. Female leſs, varied with brown, grey, rufous, and blackiſh; cheeks feathered; and, after ſhe has done breeding, puts on the appearance of the male. There are ſeveral varieties. This beautiful bird is about nineteen inches long, and weighs from two pounds twelve ounces to three pounds four ounces. It is ſaid to have been brought from the iſland of Colchis by the Argonauts; is a native of Africa, and very common in almoſt all the ſouthern parts of the old continent, whence it was originally imported into Great Britain. Pheaſants are much attached to the ſhelter of thickets and woods, where the graſs is very long; but they alſo often breed in clover fields. They form their neſts on the ground, and the females lay from twelve to fifteen eggs, which are ſmaller than thoſe of the domeſtic hen. The neſt is uſually compoſed of a few dry vegetables put careleſsly together, and the young follow the mother like chickens, as ſoon as they break the ſhell. The parents and their brood remain in the ſtubble and hedge-rows, if undiſturbed, for ſome time after the corn is ripe. If diſturbed, they ſeek the woods, and only come forth in the mornings and evenings to feed in the ſtubbles. Though very fond of corn, they are often obliged to content themſelves with wild berries and acorns. In confinement, the female neither lays ſo many eggs, nor hatches and rears her brood with ſo much care and vigilance as in the fields. In a mew ſhe will very rarely diſpoſe her eggs in a neſt, or ſit on them at all; and the domeſtic hen is uſually entruſted with the charge of incubation and rearing the young. The wings of the pheaſant are very ſhort, and ill adapted for conſiderable flights. As the cold weather approaches, theſe birds begin to fly at ſunſet among the branches of oak trees for rooſting during the night; and this they do more frequently as the winter advances, and the trees loſe their foliage. The male birds at theſe times make a noiſe, which they repeat three or four times, and which the ſportſmen call coketing. The hens on flying up utter one ſhrill whiſtle, and then are ſilent. Poachers avail themſelves of all theſe notes, and, unleſs the woods are ſtrictly watched, ſecure the birds with the greateſt certainty. The crowing of the males, which begins in the firſt week of March, may be heard at a conſiderable diſtance. During the breeding ſeaſon, the cocks will ſometimes intermix with the common hen, and produce a hybrid breed. The pheaſant does not appear to pair, for the female carefully hides her neſt from the male; and where they are in plenty, and food provided for them, the two ſexes are ſaid in general not to feed together. In a domeſtic ſtate they are ſometimes

ſometimes more or leſs mixed with white, and ſometimes wholly ſo. A variety with a white ring round the neck, and hence called the ring pheaſant, is not uncommon in ſome parts of England. This ſpecies rarely occurs in Scotland. See Pheasant.

The varieties are

1. The *ringed* pheaſant with a white collar.

2. The *variegated* pheaſant, which is white varied with rufous.

3. The *white* pheaſant, which is white, with a few ſmall black ſpots on the neck, and rufous ones on the ſhoulders.

4. The *pied* pheaſant; this is rufous above, varied with brown and whitiſh; the tail-feathers are black, edged with white.

5. The *Turkey* pheaſant, that has naked orbits which are red; the reſt of the head is feathered. This inhabits Africa and Aſia; is domeſticated every where; in breeding time, on each ſide, above the ears, is a golden feathered tuft like horns.

Argus Pheaſant. Pale yellow, ſpotted with black; face red; hind head creſted, blue; bill yellowiſh; orbits and whiſkers black; front, chin, and throat red; hind-head and nape blue; wings grey, with eye-like ſpots; tail wedged; the colour of the wings; two middle feathers three feet long, with large eye-ſpots at the ſhaft; feet armed; ſize of a turkey. Inhabits Chineſe Tartary and Sumatra. This is a moſt beautiful bird, though its colours are not brilliant. It is with great difficulty kept alive for any time after it has been caught in the woods. It ſeems to have an antipathy to the light, being quite inanimate in the open day; but when kept in a dark place, it appears to be perfectly at eaſe, and ſometimes makes its call, which is rather plaintive, and not harſh, like that of the peacock. The fleſh reſembles that of the common pheaſant.

Pictus; Painted Pheaſant. Creſt yellow; breaſt ſcarlet; ſecondary quill-feathers blue; tail wedged; bill, irides, and armed legs, yellow; feathers of the creſt ſilky, and hanging backwards; cheeks naked and fleſh-coloured; feathers of the hind-head tawny, with black lines, and beneath theſe green ones; back and rump yellow; upper tail-coverts long, narrow, and ſcarlet; wing-coverts varied with bay and brown; ſcapulars blue; quill-feathers brown, with yellowiſh ſpots; tail-feathers varied bay and black, and twenty-three inches long. Female reddiſh-brown; yellowiſh-brown beneath; legs unarmed; leſs than the common pheaſants; length two feet nine inches and a half. The native country of this beautiful ſpecies is China, where it is called Kin-ki. It bears confinement well, and will breed readily in that ſtate. The eggs are redder than thoſe of the common pheaſant, and ſomewhat reſemble thoſe of the Guinea fowl. An inſtance of their breeding with the common pheaſant is mentioned by Buffon. Edwards informs us, that ſome females of this ſpecies, kept by lady Eſſex, in the ſpace of ſix years gradually gained the male feathers; and we are told that it is not unuſual for the hen birds, when about four or five years old, to be neglected by the cocks, and gradually to gain the plumage of the males.

Nycthemerus; Pencilled Pheaſant. This ſpecies is white; the creſt and belly are black, and the tail wedged. It inhabits China, and is about thirty inches long. Bill and irides are yellow; temples naked, red; head and body beneath purpliſh-black, above white; the two middle tail-feathers are white; the reſt with oblique, black ſtreaks; the legs are red and armed. The female of this ſpecies is brown, beneath white, varied with brown, and with tranſverſe black bands; the legs are unarmed.

Superbus; Superb Pheaſant. Unarmed; rufous, varied with green and blue; caruncles of the front rounded; wattles ſubulate. It is found in divers parts of China. The bill and body are red. On each ſide the neck are long feathers turned back; the crown is green, the hind part with a folding blue creſt; ſhoulders green, ſpotted with white; primary quill-feathers blue; tail long, wedged, the feathers are varied with blue and red; coverts declined, of various mixed colours; legs are yellow.

Leucomelanos; Coloured Pheaſant. Creſted, black; feathers of the body edged with white. It inhabits India, and is nearly two feet long. For a method of catching pheaſants, ſee Pheasant.

PHASIS, Pache, in *Ancient Geography*, the name of the moſt celebrated of the towns which were ſituated on the river Phaſis, according to Strabo. Its poſition was on the left bank and near the mouth of the river. Mela ſays, that it was built by Themiſtagorus, the Mileſian. It had a temple of Phryxus, and a grove memorable on account of the fable of the golden fleece.

Phasis, *Nehr Pache*, a river of Aſia, which had its ſource in the mountains of Armenia, and after a long courſe, in which it was augmented by ſeveral ſtreams, and in paſſing through the Colchide, and dividing it into two almoſt equal parts, diſcharged itſelf into the Euxine ſea. Strabo, Pliny, Ptolemy, &c. mention this river. Procopius ſays, that it was called "Bous," from its ſource to the extremities of Iberia, where it aſſumed the name of Phaſis, and began to become navigable by large veſſels to its mouth. Strabo reports, that Caſtor and Pollux built upon the banks of the Phaſis the town of Tindaris, and according to Euſtathius, Jaſon aſcended this river as far as the neighbouring mountains of Armenia.—Alſo, a river of the iſland of Taprobana. Ptol.

PHASMATA, in *Phyſiology*, certain appearances ariſing from the various tinctures of the clouds, by the rays of the heavenly luminaries, eſpecially the ſun and moon.

Theſe are infinitely diverſified by the different figures and ſituations of the clouds, and the appulſes of the rays of light; and, together with the occaſional flaſhings and ſhootings of different meteors, they have, no doubt, occaſioned thoſe prodigies of armies fighting in the air, &c. of which we have ſuch frequent accounts in moſt ſorts of writers. Vide 2 Maccab. xi. 8. Melancth. Meteor. 2 Shel. de Comet. ann. 1618.

Kircher, and his imitator Schottus, have erroneouſly endeavoured to explain the phenomenon from the reflection of terreſtrial objects made on opaque and congealed clouds in the middle region of the air, which, according to them, have the effect of a mirror. So that, according to theſe authors, the armies pretended by ſeveral hiſtorians to have been ſeen in the ſkies, were no other than the reflection of the like armies placed on ſome part of the earth. Vide Hiſt. Acad. Roy. Scienc. ann 1726, p. 405, & ſeq.

PHASSACATES, in the *Natural Hiſtory of the Ancients*, the name of a ſpecies of agate, which, in its different appearances, they ſometimes called alſo *leucachates* and *perileucos*. It is found in the Eaſt Indies, in Bohemia, and ſome other parts of Europe.

PHATCZ, in *Geography*, a town of Ruſſia, in the government of Kurſk, on the Uſoza; 40 miles N. of Kurſk.

PHAUSINGES, a name given by the ancients to red circles on the legs, occaſioned by fire: it is by ſome alſo extended to ſeveral other ſpots and blemiſhes on the ſkin.

PHAYLOPSIS, in *Botany*, ſo named by Willdenow, apparently from φαυλος, *vile* or *contemptible*, and οψις, *aſpect*. Willd. Sp. Pl. v. 3. 342. (Micranthus; Wendl. Obſ. 38.)

Clafs and order, *Didynamia Angiofpermia.* Nat Ord. *Perfonatæ*, Linn. *Scrophulariæ*, Juff.

Eff. Ch. Calyx five-cleft; upper fegment largeft. Corolla ringent; upper lip very fmall, cloven. Capfule pod-fhaped, of one cell, with four feeds.

1. Ph. *parviflora.* Willd. (Micranthus oppofitifolius; Wendl. Obf. 39.)—Suppofed to be a native of India. *Root* annual. *Stem* erect, fquare, clothed in the upper part with long white hairs, furnifhed at its fummit with fmall reddifh granulations. *Branches* oppofite. *Leaves* oppofite, on long ftalks, ovate, pointed, flightly toothed, veiny, hairy, running down into the footftalks. *Stalks* axillary, three-flowered. *Calyx* covered with glandular hairs, its upper fegment oblong-lanceolate, veiny, the four others fetaceous. *Corolla* narrow; the lower lip in three deep fegments, twice as long as the upper. *Capfule* fmaller than the calyx. *Willd.*

We have feen no authenticated fpecimen, but we doubt not that this plant is to be found among the numerous unfettled fpecies of this natural order, of which drawings have been brought from India by colonel Hardwicke and others, and which from their inconfpicuous appearance and annual duration, have not as yet been thought worthy of introduction to the European ftoves. They indeed conftitute a tribe not a little puzzling to the fcientific botanift. The fruit of the prefent genus indeed appears, by the defcription, very peculiar. We prefume it confifts of two valves, with the feeds inferted, one above another, along one or both edges.

PHAZEMONITIS, in *Ancient Geography*, a country of Afia, in Pontus, which, according to Strabo, extended from the river Amyfus to the Halys.

PHEA, a town of the Peloponnefus, in the Elide.—Alfo, a confiderable river of the Peloponnefus.

PHEANTIDES, in *Natural Hiftory*, a name given by fome to the ftone called *encymonites*; it was of the nature of our fparry incruftrations on the roofs of fubterraneous caverns. It was fuppofed to have great virtues in promoting delivery, and was given to women when they fell in labour.

PHEASANT, in *Ornithology*. See Phasianus.

Pheafants were firft brought into Europe from the banks of the Phafis, a river of Colchis. Martial, lib. xiii. ep. 72.

The pheafant is fo nearly allied to our common poultry, that it would naturally appear a very eafy thing to breed them up from young; but the proper food of them is not fufficiently inquired into. Though they eat corn when full grown and in health, yet they have recourfe, in their younger ftate, and when fick, to another fort of food, preying on feveral infects, and that in a very voracious manner.

The young pheafant and partridges prey upon ants; and they will never fucceed with us, if they have not a proper quantity of ants to have recourfe to, as foon as they leave their rooft in a morning. When mufty corn, or want of due care in cleaning their houfes, has made them fick, a repaft of ants will often recover them. When that fails, they may be offered millepedes or ear-wigs, or both together, which will always do much better than either fingly. To this medicine muft be added a proper care that their common food of corn be very fweet, their habitation be kept nicely clean, and their water fhifted twice a day. They muft not be let out of the houfe in a morning, till the dew is off the ground; and after funfet, they muft be immediately taken in again: in the heat of the day, they muft be allowed to bafk in the fun in a dry fandy place. With thefe regulations, the birds of this kind will fucceed much better than they ufually do.

The pheafant is a bird of a fullen difpofition; and when the coupling time is over, there are feldom found more than one in a place. Phil. Tranf. N 23.

The way of taking pheafants is, firft, to be acquainted with their haunts and breeding-places; which are ufually young, thick, and well-grown coppices, free from the difturbances of cattle, and having no path-way through them; for the pheafant is an extremely timorous bird. When the haunts are difcovered, the next thing to be attempted is, to find where the eye or brood is. In order to this, it is to be confidered, that the pheafant comes out of the wood three times a day to feed in green corn, frefh paftures, or the like places. The times of coming out are in the morning foon after fun-rife, at noon, and at fun-fet. The fide of the wood, where they are fuppofed to come out, is to be carefully watched on this occafion; and the young ones will be feen following the female, juft as a flock of chickens follow the hen. The wood may be alfo well watched in the evenings, and the noife of the cock and hen, calling the young ones together, will foon be heard; and the fportfman is on this occafion to get as near as he can to the place, and being very ftill and filent, he may obferve their numbers and difpofition, and learn how to fpread his nets fo as to take the whole brood with great eafe; but if his leaft motion, when near them, difcover him, they will all take to their legs, and run to a great diftance: they feldom rife on the wing, except very clofe frighted indeed. Practice will make fome people fo expert at imitating the voice of the old pheafant, that they will be able to call the young ones together to any place that they pleafe, when the haunts are once found out, and by this means they are eafily led into the nets.

The beft time for ufing the call is in the morning or evening; and the note imitated fhould be that by which the old ones call them out to feed; but by learning to imitate the other notes, they will be brought together at any time of the day. The fportfman who can make this call, muft fhelter himfelf in fome clofe place, and begin by very foftly making the note; then, if none are near enough to be within hearing, he is to raife it to more and more loudnefs, and at length he will be anfwered as loud, if any are within hearing, though at a confiderable diftance; whereas, if he fhould fet up the call too loud at firft, and any of the birds fhould happen to be very near, they will be frighted away.

As foon as a pheafant anfwers, the fportfman is to creep nearer and nearer, ftill calling, though not fo loud; he will ftill be anfwered, till at length he will be led by the bird's voice within fight of it. As foon as this is the cafe, he is to fpread his net, and then begin to call again, keeping in fome clofe and well-fheltered place behind the net: in this place he is to call till the bird approaches; and when he has drawn it under the net, he is to appear fuddenly, and the bird, rifing up, will be caught in the net.

Another method of taking pheafants, much quicker than by this means, is, the having a live cock pheafant to ufe as a ftale: this bird is to be fixed under the net, and by his crowing he will foon entice others in. The fportfman muft lie concealed; and as foon as another pheafant comes in, he is to draw the net over him. Many people have a method of taking pheafants in fpringes or horfe-hair fnares: the fucceeding in this depends on the carefully fearching out their haunts, and the places by which they go out of the woods into the fields. When thefe are found, a peg is to be fixed in the ground at each, and at each peg two fpringes are to be laid open; the one to take in the legs, the other the head. As foon as the fpringes are fet, the fportfman is to to go into the woods, and getting behind the birds, he is to fright them with some little noise, such as shall not be enough to raise them to the wing, but only to set them a-running. They will naturally make their way out of the wood, through their accustomed passes, and be then caught in the springes.

There is another method of taking these birds in the winter, provided that there is no snow. This is to be done with a net made like a casting net, but with the meshes much wider; they may be five inches wide. Some pease or wheat are to be taken out; and the path of the pheasant being discovered, which may easily be done by their dung, a pint or thereabout of corn is to be thrown down in the path in a place marked, so that the sportsman can come to it again. This is to be done for several days, till at length the pheasants are expecting it every day regularly; and all the birds of this kind that frequent the place, are brought together to feed there, and then the net is to be fixed over the place; its top being tied up to some bough of a tree, and its bottom fixed down all around, except in one place, where the walk of the pheasants lies. In this place it is to be raised in form of an arch, and the entrance is to be lined with several rods of hazel; the thick ends of which are to be tied to the net, and the thin ones let into the space covered by it; and thus the pheasants will easily get in by parting the small ends of the sticks, as fish into a wheel, but they will not easily get out again. The nets are to be dyed of a russet-colour, by laying them in a tan-pit; and they must, when planted for this purpose, be covered with boughs, so that the birds do not discover them, and then they will easily run into them, and be all taken at once.

Pheasants frequently inhabit and infest the grain-fields of the farmer. But, where practicable, they are generally confined in preserved places, as in inclosed woods of the coppice or other kinds; but none, or very few, attempts have hitherto been made to rear this sort of birds in a domestic manner, for their uses in that way: yet it would appear to be a very easy matter, from the great resemblance which they have to poultry in their habits, modes of feeding, and several other particulars, though unquestionably they are much less hardy in their nature. When pheasants become full grown, they are found to be great devourers of most sorts of grains, to the great injury of the farmers who are near their habitations.

They would be a very good bird for the table, if they could be raised with facility in the farm-yard.

PHEASANT'S *Eye*, in *Botany*. See *Flos* ADONIS.

PHEASANT'S *Eye-pink*. See DIANTHUS.

PHEASANT'S *Island*, or *Island of Conference*, in *Geography*, an island situated in the river Bidassao, between France and Spain.

PHEASANT *Sea*, or *Pin-tail Duck*. See DUCK (*Acuta*).

PHEASANTRY, in *Ornamental Gardening*, a building or place constructed for the purpose of breeding, rearing, and keeping these sorts of birds; and which should constantly be raised near to, and be well covered with plenty of wood, in different states of growth; the whole being inclosed with a high fence, in order that the young may be allowed, as soon as possible, to run freely through it, and pick up their food, as well as other matters.

The buildings of this nature should be formed in a very neat, ornamental manner; sometimes in a square, at other times in an oval or oblong shape, as may be the most suitable to the particular spots on which they are to be erected.

PHEBALIUM, in *Botany*, a name adopted by Ventenat from John Bauhin, who, in his Hist. Plant. v. 1. 509, mentions it as applied by some Greek comic poets to the Myrtle, to which Ventenat thought his plant allied. But Bauhin writes the word *Phibaleon*, and nothing can be more unlucky than its application here, the genus of Ventenat, if we mistake not, being one of the *Rutaceæ*, not *Myrti*, and having as little resemblance to a Myrtle as may be. Notwithstanding the elaborate description and figure of this excellent botanist, in his Jardin de la Malmaison, we cannot but think he has erred in describing the calyx without any teeth, and that he has totally misunderstood the fruit, which indeed he did not see ripe. We have not however met with his identical species, but we presume on its evident and close affinity to one before us; and on these grounds we venture to attempt a history of the genus; tolerating the name, for its sound at least, which considering some others, that we are forced to endure, is no small recommendation. Vent. Malmais. 102.—Class and order, *Decandria Monogynia*. Nat. Ord. *Rutaceæ*, Juss.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, with five shallow teeth, permanent. *Cor.* Petals five, equal, elliptic-oblong, concave, entire, nearly sessile. Nectary glandular beneath the germen. *Stam.* Filaments ten, capillary, simple, smooth; anthers terminal, incumbent, of two round lobes. *Pist.* Germens five, erect, pointed; style central, from the base of the germens, erect, thread-shaped; stigma obtuse. *Peric.* Capsules five, combined at the base, spreading, ovate, compressed, of one cell and two valves. *Seeds* solitary, smooth, in an elastic tunic of two valves.

Ess. Ch. Calyx five-toothed. Petals five. Stamens capillary, simple. Anthers terminal, simple. Style from the base of the germens. Capsules five, combined, seated on a glandular nectary. Seeds solitary, in an elastic tunic.

1. Ph. *squamulosum*. Scaly Phebalium. Vent. Malmais. t. 102.—Leaves lanceolate, scaly beneath. Umbels terminal, solitary.—Native of the mountains of New South Wales. A greenhouse plant at Paris, flowering in the beginning of summer. *Stem* shrubby, erect, much branched, a yard high. *Leaves* alternate, about an inch long, lanceolate, acute, entire, on short stalks; their upper surface dark green, smooth, dotted; under clothed with minute, whitish scales. *Umbels* at the ends of the branches, solitary, of six or eight small yellowish *flowers*, whose *stamens* are capillary to the very base, and twice as long as the *petals*. The *style* is rather shorter than the *stamens*. Ventenat did not perceive any teeth or divisions to the *calyx*. The *leaves* when bruised are aromatic. We have seen no specimen.

2. Ph. *dentatum*. Toothed Phebalium.—Leaves linear, toothed, revolute; hoary beneath. Umbels axillary.—Brought by Gen. Grose from some part of New Holland, and communicated to us by A. B. Lambert Esq. A larger shrub, apparently, than the preceding; the *branches* round, hoary with extremely minute starry scales. *Leaves* scattered, about two inches long, on short stalks, linear, bluntish, revolute, rather distantly toothed; upper side dark shining green, besprinkled with glandular dots; under white or hoary, with a sort of mealy pubescence, not discernibly scaly. *Umbels* about the upper part of the branches, axillary, on dark coloured stalks, much shorter than the leaves, slightly hoary like the branches, each of eight or ten pale yellowish *flowers*. These in every part answer to Ventenat's description and representation of the last, except that the *calyx* is very manifestly five-cleft. Each *anther* consists of two round, almost separate, lobes, without any appendage. The *stamens* and *style* are twice the length of the *petals*, which are full of large glandular dots, or cells of essential oil, most apparent at the back; but we see nothing like the peltate

peltate ſcales which are deſcribed by Ventenat as covering the backs of the *petals* in his ſpecies.

3. Ph. *argenteum*. Silvery-ſcaled Phebalium. (Erioſtemon ſquamea; Labill. Nov. Holl. v. 1. 111. t. 141.)—Leaves lanceolate, entire, naked on both ſides. Cluſters axillary, compound, ſcaly.—Our ſpecimen was gathered by Mr. Menzies, near King George's ſound, on the weſt coaſt of New Holland. Labillardiere found his at the cape of Van Diemen. He ſpeaks of it as a *tree*, from five to ſeven fathoms high, with ſpreading *branches*, angular and ſcaly when young. Theſe ſcales in our's are ſcattered, and finely ſtellated, very like thoſe of a turbot in miniature. *Leaves* two or three inches long, bright green, ſomewhat coriaceous, lanceolate, flat, entire, about half an inch wide, naked on both ſides, except in a very young ſtate, when the back is ſcaly like the branches. *Footſtalks* ſhort. *Flower-ſtalks* axillary, much ſhorter than the leaves, racemoſe, compound, many-flowered, angular, entirely covered, as well as the *calyx*, under ſide of the *petals*, and the *germens*, with the moſt beautiful, crowded, convex, ſnow-white, ſilvery ſcales. The upper ſurface of the *petals* is ſmooth, naked, and ſeems to be white. *Stamens* but half the length of the corolla, very ſlightly dilated at their baſe, ſmooth in every part. *Style* ſhorter than the ſtamens. *Capſules*, according to Labillardiere, five, ovate, ſlightly compreſſed, pointed, gibbous at the upper edge where they burſt, lined with an elaſtic cartilaginous tunic to the *ſeed*, of the ſame form, and burſting in the ſame manner. *Seed* ſolitary, nearly kidney-ſhaped, black and ſmooth. This excellent author, fearing leſt the genera of the *Rutaceous* family ſhould be too much multiplied, refers this plant to our ERIOSTEMON, (ſee that article); but the ſtamens are too different to admit of ſuch a meaſure. A moſt valuable remark is ſubjoined, that except in number of the parts of fructification, the plant in queſtion agrees with *Melicope* of Forſter. We are happy to meet with this confirmation of our conjecture reſpecting the natural order of that genus, (ſee MELICOPE,) which we had not till now ſeen in Labillardiere. As to the difference of number, we ſhould not think it of importance in this caſe. But the ternate *leaves*, general ſmoothneſs, deeply divided *calyx*, and oblong arrow-ſhaped *anthers* of *Melicope*, excite conſiderable doubts; and if Gærtner be correct, the want of an elaſtic tunic to its *ſeeds*, affords a moſt eſſential diſtinction.

PHECOS, a name uſed by ſome authors for the ſagittaria, or water-arrow-head.

PHEDOROVKA, in *Geography*, a town of Ruſſia, in the government of Ekaterinoſlav, on the Bug; 60 miles N.W. of Cherſon.

PHEDOSIEVKA, a town of Ruſſia, in the country of the Coſſacks, on the Choper; 44 miles W. of Archedinſkaia.

PHEER-FARRID, a town of Hindooſtan, in Berar; 25 miles E.N.E. of Notchengong.

PHEGEA, in *Ancient Geography*, a town of the Peloponneſus, in Arcadia.

PHEGOS, a town of Greece, in Theſſaly, ſituated near the place where was an oracle of Jupiter, which was afterwards transferred to Epirus.

PHEIA, a town of Triphylia, north-weſt of Letrini, at the bottom of a ſmall gulf, which had a port and a ſmall iſland.

PHELDAHANATZ, in *Geography*, a town of Ruſſia, in the government of Caucaſus; 20 miles S.E. of Kizliar.

PHELIN, a town of Ruſſia, in the government of Riga, on the river Phelin; 96 miles N. of Riga. N. lat. 58° 10′. E. long. 25° 14′. The river of this name runs from lake Vertz into the Baltic, which it enters at Pernov.

PHELLANDRIUM, in *Botany*, the Water Hemlock, is uſually derived from φελλος, *cork*, and ανηρ, ανδρος, *a man*; but as ſuch an etymology throws no light on the ſignification of the word, and is actually without any meaning, may we preſume to ſuggeſt that the firſt ſyllable ought perhaps to be *Phel*, from φηλεω, *to deceive*, in alluſion to the dangerous qualities of the herb, and its reſemblance to ſome that are wholeſome? This meaning is ſtrengthened by Pliny's comparing the leaves to *Apium*, for which, if the *Phellandrium* were miſtaken, the error would be very dangerous. Linn. Gen. 140. Schreb. 190. Willd. Sp. Pl. v. 1. 1444. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 321. Ait. Hort. Kew. v. 2. 149. Juſſ. 221. Tourn. t. 161.—Claſs and order, *Pentandria Digynia*. Nat. Ord. *Umbelliferæ*.

Gen. Ch. *General umbel* of numerous rays; *partial* ſimilar to it. *General Involucrum* none; *partial* of ſeven acute leaves, the length of the partial umbel. *Perianth* of five teeth, permanent. *Cor. Univerſal* nearly uniform; flowers all fertile; thoſe of the diſk ſmalleſt; *partial* of five unequal, pointed, inflexed, and ſo becoming heart-ſhaped, petals. *Stam.* Filaments five, capillary, longer than the corolla; anthers roundiſh. *Piſt.* Germen inferior, oblong; ſtyles two, awl-ſhaped, erect, permanent; ſtigmas obtuſe. *Peric.* Fruit ovate, ſmooth, crowned with the perianth and piſtils, ſeparable into two parts. *Seeds* two, ovate, ſmooth.

Eſſ. Ch. Flowers all fertile; thoſe of the diſk ſmalleſt. Fruit ovate, ſmooth, crowned with the calyx and ſtyles. General involucrum wanting.

Obſ. This genus is certainly nearly allied to OENANTHE, (ſee that article,) to which Lamarck has united it; but the flowers being all fertile, the general involucrum wanting, and the coat of the ſeeds, though ſmooth and even, not tumid or corky, may keep it diſtinct. In habit and economy, as well as in qualities, the firſt ſpecies, at leaſt, agrees with *Oenanthe*. Crantz refers *Phellandrium* to *Liguſticum*.

1. Ph. *aquaticum*. Common Water Hemlock. Linn. Sp. Pl. 366. Engl. Bot. t. 684. Woodv. Med. Bot. ſuppl. t. 266. (Phellandrium; Rivin. Pentap. Irr. t. 65. Dod. Pempt. 591. Cicutaria paluſtris; Ger. Em. 1063. Lob. Ic. v. 1. 735.)—Subdiviſions of the leaflets divaricated, bluntiſh. Stem leafy.—Native of ditches, rivulets, and the margins of pools, in moſt parts of Europe, flowering copiouſly in June and July. The *root* is biennial, ſpindle-ſhaped, thick, with whorled fibres. *Stem* two or three feet high, thick, cylindrical, hollow, furrowed, buſhy, with many wide-ſpreading branches; its ſtrong fibres, when bleached and diſſected by the water, forming an elegant, reticulated tube, often found about marſhland ditches. *Leaves* ſpreading, dark ſhining green, ſmooth, thrice pinnate, cut, all the ſegments divaricated. *Umbels* on ſhort ſtalks, oppoſite to the leaves, denſe, with thick rays. *Flowers* purpliſh-white. *Fruit* ſomewhat angular, but not furrowed. The *leaves* are lengthened out in running ſtreams, and the *flowers* rarely produced. When the plant happens to grow out of the water, the *leaves* are rounder and leſs divided, ſo as to aſſume a very different aſpect.

2. Ph. *Mutellina*. Mountain Water Hemlock. Linn. Sp. Pl. 366. Jacq. Auſtr. t. 56. (Mutellina; Bauh. Hiſt. v. 3. 66. Camer. Epiſt. 8.)—Subdiviſions of the leaves cloſe, acute. Stem nearly naked.—Native of the alps of Auſtria, Carniola, Switzerland, and Siberia, flowering from June to September. The *root* is perennial, long, and

and tapering, crowned with the rigid fibres of old leaf-ſtalks. Its flavour, and that of the whole herb, is compared by Cluſius to the Carrot. *Stem* ſcarcely a foot high, erect, ſlightly branched, round, ſmooth, almoſt naked. *Leaves* ſubdivided as in the former, but their ſegments are narrower, more lanceolate, crowded, and very ſharp. They are moſtly radical, ſupported by long ſtalks. *Umbels* terminal, reddiſh. *Fruit* ſomewhat angular. *Mutellina*, or rather *Muttellina*, is the vulgar name of this plant upon the alps, according to John Bauhin, who ſays the paſtures where it grows are eſteemed good for milch cows.

PHELLOE, in *Ancient Geography*, a pretty conſiderable town of the Peloponneſus, in Achaia, near Egira, according to Pauſanias. In this place were temples of Diana and Bacchus, ornamented with ſtatues.

PHELLOS, in *Botany*, a name uſed by ſome authors for the cork-tree.

Phellos, φελλος, in *Antiquity*, a feſtival in honour of Bacchus, being a preparative to the Dionyſia.

PHELLUS, in *Ancient Geography*, a town of Aſia Minor, in Lycia, ſituated on low ground, oppoſite to Antiphellus.

Phellus, or *Phello*, a town of the Peloponneſus, in the Elide, in the vicinity of Olympia. Strabo.

PHELLUSA, an iſland ſituated near that of Leſbos. Pliny.

PHELYPÆA, in *Botany*, a genus of Tournefort's, reſtored by Deſfontaines, after it had been all along confounded, by Linnæus and his followers, as well as by Juſſieu, either under Lathræa or Orobanche. (See thoſe articles.) The name was given in honour of the family of Phelipeaux, two of whom Tournefort mentions as the Mœcenates of his time; but we know nothing of their botanical claims, and feel little partiality for the name, except on account of its author. Thunberg and Schreber, ſuppoſing the Tournefortian genus aboliſhed, have transferred it to an entirely new plant from the Cape; ſee Thunb. Nov. Gen. 91; and Schreb. Gen. 672. n. 1489 (not 489). The latter therefore will now require a new appellation. Tourn. Cor. 47. t. 479. Deſfont. Atlant. v. 2. 60.—Claſs and order, *Didynamia Angioſpermia*. Nat. Ord. *Perſonatæ*, Linn. *Pediculares*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, bell-ſhaped, in five, rather deep, ovate, obtuſe, erect, ſlightly unequal ſegments, permanent. *Cor.* of one petal, ringent; tube ſlightly curved, ample, dilated upwards; limb in five ſhort, broad, rounded, imbricated ſegments, the lower one moſt diſtant, with an elevated two-lobed palate, and intermediate longitudinal furrow. Nectary ..... *Stam.* Filaments four, awl-ſhaped, about as long as the tube, two of them longeſt; anthers thick, oblong, hairy, approaching each other, and cohering by their pubeſcence, with two acute lobes. *Piſt.* Germen ſuperior, ovate; ſtyle cylindrical, the length of the ſtamens; ſtigma drooping, thick, of two obtuſe lobes. *Peric.* Capſule ovate, compreſſed, of two cells and two valves, the partitions from the centre of each valve. *Seeds* numerous, minute, roundiſh.

Eſſ. Ch. Calyx deeply five-cleft, inferior. Corolla ringent; limb in five ſhort rounded ſegments; the lowermoſt with an elevated palate. Anthers cohering. Capſule of two cells and two valves. Seeds numerous.

Obſ. The calyx ſufficiently diſtinguiſhes this genus from *Orobanche*, and indeed, as to number and form of the ſegments, from *Lathræa*. The *corolla* is very different from both. Not having examined the capſule ourſelves, we cannot be certain that the ſuppoſed partitions are different from what are termed receptacles in the character of *Lathræa*. Nothing is ſaid, except by Forſkall, of any thing like a nectariferous gland in *Phelypæa*; yet it can hardly be ſuppoſed wanting. Three ſpecies are recorded by authors.

1. Ph. *coccinea*. Scarlet Phelypæa. (Ph. orientalis, flore coccineo; Tourn. Cor. 47. t. 479. Orobanche coccinea; Willd. Sp. Pl. v. 3. 354. O. Phelypæa; Marſchall von Bieberſtein in Sims & Kon. Ann. of Bot. v. 2. 447. Lathræa Phelypæa β; Linn. Sp. Pl. 844.)—Stem ſingle-flowered. Three upper ſegments of the calyx cohering.—Gathered by Tournefort in the Levant: by von Bieberſtein on graſſy hills, in the diſtrict of mount Caucaſus bordering on Circaſſia, and ſome other places, flowering in May or June. *Root* paraſitical, perennial. *Stem* one or more, quite ſimple, a ſpan high, brown, ſcaly, very like thoſe of *Orobanche major*. *Flower* terminal, ſolitary, ſeſſile, inclining toward one ſide, thrice the ſize of *O. major*, very handſome. *Calyx* the colour of the ſtem; its three upper ſegments erect, cohering, oblong, channelled; the two lower longer and more acute, directed forward, and applied to the tube of the corolla under the lower lip. *Corolla* beautiful; externally yellowiſh, and clothed with rather viſcid pubeſcence, as in *Orobanche;* internally like velvet, and of the richeſt ſcarlet; with two large deep-black ſpots in the throat. *Stigma* entire, hemiſpherical. *Bieberſt.*

2. Ph. *lutea*. Yellow Phelypæa. Deſfont. Atlant. v. 2. 61. t. 146. (Ph. luſitanica flore luteo; Tourn. Cor. 47. Orobanche tinctoria; Forſk. Ægypt-Arab. 112. Vahl. Symb. v. 2. 70. Willd. Sp. Pl. v. 3. 353. O. elegantiſſima verna, flore luteo; Griſl. Luſit. 66. Moriſ. v. 3. 502. Lathræa Phelypæa α; Linn. Sp. Pl. 844.)—Stem many-flowered. Tube of the corolla contracted below; inflated above.—Native of Portugal, Barbary, and Arabia. Gathered at Algiers, by Brouſſonet and Durand; on the moiſt ſandy banks of the river El hammah, near Maſcar, by Deſfontaines. Forſkall ſays it grows paraſitically on old roots. The *ſtem* of this very noble plant is erect, quite ſimple, ſmooth, ſucculent, ſcaly, from one to two feet high; its upper half conſiſting of a cloſe cylindrical *ſpike* of numerous large yellow *flowers*, ſpreading every way. *Bracteas* large, ovate, crenate, with a pair of internal ſmaller ones. *Calyx* five-cleft about half way down. Tube of the *corolla* above an inch long, cylindrical beyond the calyx, then bent forward, and ſuddenly inflated; ſegments of the limb ſpreading, rounded, nearly uniform, of a rich ſhining yellow within. *Anthers* very hairy. The whole plant dries brown.

Forſkall ſays the baſe of the *germen* is ſurrounded by a yellow ring. That our plant is what Griſley and Tournefort deſcribed, we know by an examination of original ſpecimens. If Linnæus had compared Moriſon with Tournefort, he could never have ſuppoſed this and the foregoing to be only varieties. *Ph. lutea* has often thirty *flowers* in a ſpike.

3. Ph. *violacea*. Violet Phelypæa. Deſfont. Atlant. v. 2. 60. t. 145. (Orobanche Phelypæa; Willd. Sp. Pl. v. 3. 352.)—Stem many-flowered. Tube of the corolla funnel-ſhaped.—Gathered by Deſfontaines, in the ſandy deſert of Africa, near Tozzer.—Much reſembling the laſt, except that the *flowers* are violet-coloured, with two yellow prominences on the palate, which appear leſs conſpicuous, though they do exiſt, in the *flava*. The regular ſwelling of the *tube* from the bottom upwards is a mark of this ſpecies. It is juſtly termed by its diſcoverer "a very beautiful plant," flowering in winter. The *bracteas* and *calyx* are coloured, partaking, in ſome degree, of the hue of the *corolla*.

We have great pleaſure in reſtoring the original and characteriſtic

characteriſtic names of theſe three ſpecies, ſo perverſely changed and confuſed by various hands.

PHENEOS, in *Ancient Geography*, a town of Arcadia, N.W. of Orchomené. It was originally built on the ſummit of a mountain, the ruins of which were ſeen by Pauſanias. The new town was erected at the bottom of the ſame mountain; but the citadel was ſituated on a very elevated rock. At Pheneos are the ruins of a temple of Minerva Tritonia; on the declivity of the mountain was a ſtadium, and upon a ridge of it was the tomb of Iphicles, brother of Hercules, and another of Iolas, the brave companion of his travels. A religious ceremony was annually celebrated in honour of him. Mercury was the principal divinity of the country; who had a fine temple, with a marble ſtatue, executed by a very ingenious ſtatuary. Annual games, called "Hermæan," were celebrated in honour of him. The Pheneates had alſo a temple of Ceres; and the myſteries of this goddeſs were celebrated by them with great ſolemnity, and in the ſame manner as they were obſerved at Eleuſis; and the people of the country claimed this original invention. Near Pheneos was a temple of Apollo Pythius, which was in ruins at the time of Pauſanias. The inhabitants, however, continued to offer ſacrifices to him, though they had only an altar of marble, inſtead of a temple. Evander is ſaid to have been a native of Pheneos, according to the verſe in Virgil, Æn. l. viii. v. 165:

"Acceſſi et cupidus Phenei ſub mœnia duxi."

PHENEUS, a lake or marſh of the Peloponneſus, in Arcadia. According to Pauſanias, it was the ſource of the river Ladon.

PHENGITES, in the *Natural Hiſtory of the Ancients*, the name of a very beautiful ſpecies of alabaſter. It is a very rude and irregular maſs, very ſhattery and friable, yet of a brightneſs ſuperior to that of moſt of the other marbles, and excelling them all in tranſparence; it is in colour of an agreeable pale, yellowiſh, white, or honey colour; the yellowiſh is more intenſe in ſome places than in others, and ſometimes makes an obſcure reſemblance of veins. It is very weak and brittle in the maſs; and when reduced to ſmall pieces, eaſily crumbled between the fingers into looſe but conſiderably large angular pieces, ſome perfect, others complex, irregular, or mutilated, and all approaching to a flat ſhape.

The ancients were very fond of this ſpecies in their public buildings; and the Temple of Fortune, built wholly of it, has long been famous. Its great beauty is its tranſparence, from which alone this temple was perfectly light when the doors were ſhut, though it was built without a window, and had no other light but what was tranſmitted through the ſtone its walls were built with. It was anciently found in Cappadocia, and is ſtill plentiful there: we have it alſo in Germany and France, and in our own kingdom in Derbyſhire, and ſome other counties. It takes an excellent poliſh, and is very fit for ornamental works, where there is no great ſtrength required. Hill's Hiſt. of Foſſ. p. 490. See GLASS.

PHEONS, in *Heraldry*, the barbed head of darts, arrows, or other weapons.

PHEOS, in *Botany*, a name given by Theophraſtus, Dioſcorides, and others, to a plant uſed by the fullers in dreſſing their cloths, and of which there were two kinds, a ſmaller, called ſimply *pheos*, and a larger, called *hippopheos*.

The name of this plant is ſometimes written *phleos*; and it is by that confounded with a kind of marſh-cudweed, or gnaphalium, called alſo by that name; but it may be always found which of the two plants an author means, by obſerving the ſenſe in which the word is uſed, and the uſe to which the plant was put. The phleos, properly ſo called, that is, the cudweed, was uſed to ſtuff beds and other ſuch things, and to pack up with earthen veſſels to prevent their breaking; but the pheos, improperly called *phleos*, only about cloths; this was, however, alſo called *ſtæbe* and *cnaphon*.

PHERÆ, in *Ancient Geography*, a river of the Peloponneſus, below the river Pamiſus, in the gulf of Meſſenia. Ptolemy. Strabo.—Alſo, a town of Macedonia, in the Pelaſgia, according to Ptolemy and Livy. But Cicero and Pauſanias place it in Theſſaly.—Alſo, a town of Aſia, in the Serica. Ammian. Marcell.—Alſo, a town of Theſſaly, on the confines of the Pelaſgiotide, towards Magneſia and the Phtiotide. It was ſituated on the left bank of a ſmall river, called Naurus, towards the S.E. of the lake Bœbeis. According to Strabo, it had a port on the Pelaſgic gulf, called Pagaſes. This town, in the time of Philip, the father of Alexander, occupied a conſiderable rank in Theſſaly, as Alexander, who was its king, and whom the Greek authors denominate a *tyrant*, had ſubjected to his dominion ſeveral towns of Theſſaly. The Theſſalians implored ſuccour of Philip, who defeated him, and ſoon after he was put to death by his own wife: Philip obtained from Lycophron, whom he twice vanquiſhed, this town. On this occaſion Philip reſtored liberty to the whole of Theſſaly; but this town ſuffered by the ravages of war, when the Romans carried their arms into Theſſaly and Macedonia.

PHERECRATES, in *Biography*, a Greek comic poet, the contemporary with Eupolis and Ariſtophanes, flouriſhed about the year 420 B.C. He obtained a high reputation, writing in the utmoſt purity of ſtyle, and was the inventor of a meaſure called the Pherecratian, conſiſting of the three laſt feet of an hexameter, the firſt being invariably a ſpondee; of this, Horace's line "Quamvis Pontica pinus" is an example. The titles of ſeveral of his comedies have been preſerved, with ſome fragments, particularly in Athenæus. In the Obſerver there are tranſlations of three paſſages, one of which gives a ſtriking idea of the comic extravagance of the author. A fragment relative to ancient muſic, cited by Plutarch, has been particularly examined by M. Burette in the Memoir of the Academy of Inſcriptions. Gen. Biog.

PHERECYDES, a Grecian philoſopher, the contemporary with Terpander and Thales, who flouriſhed about the year 600 B.C., was a native of the iſland of Scyros, one of the Cyclades, near Delos. Some writers ſuppoſe that he derived his principles of philoſophy from the ſacred books of the Phœnicians, but others, who have carefully examined into the matter, think that he had them from the Grecian philoſophers. Joſephus advances the opinion that he ſtudied in Egypt, which is not improbable, ſince that country, in his time, was univerſally reſorted to as the ſeat of learning. It was pretended that he had the power of predicting future events; that he foretold the deſtruction of a veſſel at ſea, and the approach of an earthquake; and that the event, in both caſes, juſtified the prophecy. Admitting, however, the truth of theſe ſtories, it is eaſy to imagine that his knowledge was the reſult of a careful obſervation of thoſe phenomena which commonly precede ſtorms and earthquakes, in a country where they frequently happen; and it is not improbable that Pherecydes, like many other ancient philoſophers, availed himſelf of his ſuperior knowledge of nature to impoſe upon the ignorant multitude, by pretending to powers that he did not poſſeſs. He is ſaid to have been the firſt among the Grecians,

Grecians who wrote concerning the nature of the gods; that is, who wrote upon that ſubject in proſe, ſince, before his time, Orphæus, Muſæus, and others, had written theogonies in verſe. Pherecydes was much eſteemed at Lacedæmon, on account of his poetry inculcating the maxims of Lycurgus. He died at the age of eighty-five. It is not eaſy to aſcertain the nature of the doctrines which he taught: he probably believed in an eternal firſt cauſe of all things; and in the immortality of the ſoul. According to Cicero, he was the firſt philoſopher in whoſe writings this doctrine appeared. He is ſaid to have taught the belief of the tranſmigration of the ſoul: this is probably true, it being a tenet commonly received among the Egyptians, and afterwards taught by Pythagoras, who was a pupil of Pherecydes. Enfield's Hiſt. Phil.

PHERENDIS, in *Ancient Geography*, a town of Aſia, in Greater Armenia, E. of the Tigris, between Siæ and Tigranocerta. Ptolemy.

PHEREPHATTIA, Φερεφαττια, in *Antiquity*, a feſtival at Cyzicum, wherein a black heifer was ſacrificed to Pherephatta or Proſerpine.

PHERME, or FERME, in *Ancient Geography*, a mountain of Egypt, in the Thebaid, which is ſaid to have been the abode of Paul the Hermit.

PHERONIA, a town on the E. ſide of the iſland of Sardinia, between the mouth of the river Cœdrus and the town of Olbia. Ptolemy.

PHERRACIA, a town of Aſia, in the Colchide. Strabo.

PHERVINTASKOI, in *Geography*, a cape of Ruſſia, on the E. coaſt of Nova Zembla. N. lat. 77° 30'. E. long. 77° 14'.

PHESTE, in *Ancient Geography*, a town of the iſland of Cyprus, ſituated on the ſea-coaſt, in the ſouthern part, according to Diodorus Siculus. But Dionyſius Periegetes places it in the interior of the iſland, near Gortyna.

PHESTI, a place of Italy, in Latium, at the extremity of the territory, belonging to the city of Rome, where, according to Strabo, the prieſts offered the ſacrifices called "Ambarvalia."

PHEUGARUM, a town of Germany, between Tuliſurgium and Canduum. Ptolemy.

PHIAL, PHIALA, formed of φιαλη, which ſignifies the ſame, a ſmall thin glaſs bottle, popularly called a *vial.*

PHIAL, *Leyden.* See LEYDEN.

PHIALA, in *Ancient Geography*, a fountain or lake at the foot of mount Hermon, which, according to Joſephus, was one of the two ſources of the Jordan: he ſays, that it ran by ſubterraneous canals, and then guſhing out of the earth, joined the other at the town of Dan.

PHIALIA, a town of the Peloponneſus, in Arcadia, between Heræa and Tegea. Ptolemy. It was alſo called Phigalea. Steph. Byz. Pauſanias.

PHIDALIA, a ſmall port of Thrace, upon the Thracian Boſphorus, towards the S.E. of the gulf Leoſtenius. A ſmall river runs into this port.

PHIDIAS, in *Biography*, an Athenian, the moſt celebrated ſculptor of antiquity. His diſtinguiſhing character was grandeur and ſublimity; and he particularly ſtudied optical effects. To this purpoſe it is related, that having, in competition with Alcamenes, made a ſtatue of Minerva to be placed on a column; the work of the latter appeared ſo finiſhed when viewed on the ground, that it was univerſally admired, whilſt that of Phidias ſeemed to be a mere rough ſketch; but when both were ſeen from their deſtined ſituations, the beauties of the firſt were loſt, while the ſecond produced the moſt ſtriking effect. After the battle of Marathon he converted a block of marble, which the Perſians had brought for a trophy of their expected victory, into a fine ſtatue of Nemeſis, the goddeſs of Vengeance. His reputation was ſo high at Athens, that Pericles regarded him as his particular friend, and appointed him ſuperintendant of all the public edifices with which that city was decorated. One of his greateſt performances was a coloſſal ſtatue of Minerva, in the temple called Parthenon. In this work he diſplayed his ſkill in minute ſculpture, no leſs than his grandeur of conception in the main figure. On the convexity of the goddeſs's ſhield was repreſented the battle of the Amazons, and on its concave ſurface the combat of the gods with the giants; whilſt her ſlippers were adorned with the fight of the Centaurs and Lapithæ. On her breaſt-plate was a Meduſa's head. The baſe contained the birth of Pandora, with twenty figures of the gods. He is ſaid to have been the firſt who brought the bas-relief to perfection. His fame and fortune excited envy, and ſeveral accuſations were brought againſt him, which he was enabled to repel. At length he was charged with having introduced the portraits of himſelf and Pericles in the battle of the Amazons, and this being regarded as a kind of profanation, he was thrown into priſon, where, according to Plutarch, he died. Others, however, affirm, that he eſcaped to Elis, where he afterwards executed his Olympian Jupiter, the moſt famous piece of ſculpture in all antiquity. It was a coloſſal ſtatue, ſixty feet high, of incomparable majeſty and dignity in its attitude and expreſſion. The name of the artiſt was engraved on the baſe. The Eleans, in gratitude for this extraordinary work, ſettled upon his deſcendants a perpetual office, the ſole duty of which was to preſerve the luſtre of the ſtatue. Plutarch.

PHIDITIA, or PHILITIA, in *Antiquity*, feaſts inſtituted by Lycurgus, and celebrated with great frugality at Lacedæmon.

The Phiditia were held in the public places, and in the open air: rich and poor aſſiſted at them alike, and on the ſame footing; their deſign being to keep up peace, friendſhip, and good underſtanding and equality among all the citizens, great and ſmall. Bernegger ſays, they who attended at this feaſt, brought each a buſhel of flour, eight meaſures of wine, called chorus, and five minæ of cheeſe, and as much figs.

The Phiditia of the Greeks were much the ſame with the Chariſtia at Rome.

PHIGALIA, or PHIALIA, in *Ancient Geography*, a town of Arcadia, upon a high and craggy rock, near the river Lymax, and S.W. of Megalopolis. This town, being the key of Arcadia, appeared ſo deſirable a poſſeſſion to the Lacedæmonians, that they laid ſiege to it, and took it in the year 659 B.C. The Phigalians, deſirous of regaining it, conſulted the oracle of Delphos, who directed them to procure 100 choſen men from Oreſtaſium to accompany them in their expedition. Neverthelefs, theſe brave men periſhed in the attempt. The Oreſtaſians, however, in concert with the Phigalians, attacked their enemies, and made a great ſlaughter of the Lacedæmonians, who all periſhed, except ſome few, who ſaved themſelves by flight.

In this town were two remarkable monuments; one a ſtatue of the famous athleta, Arrachion: and the other, the place of burial of the 100 Oreſtaſians, who generouſly devoted themſelves to death in order to ſecure the conqueſt of the town. Upon the ſummit of the rock, which was the ſcite of Phigalia, there was a temple of Diana

Diana Confervatrix, in which was her ftatue. There were fome other ftatues in a place of exercife not far diftant.

PHIGIA, a town in the interior of Arabia Felix, between Saphtha and Badais. Ptolemy.

PHI-HAHIROTH, or PI-HAHIROTH, a town fituated on the banks of the Red fea: it denotes the defile or the mouth of Hahiroth. Calmet fuppofes that it was the town of Heroopolis.

PHILA, an ifland of Africa, in the courfe of the river Triton, in Libya. Diod. Sic.

PHILA, in *Mythology*, one of the attributes of Venus, which diftinguifhes her as the mother of love, from φιλεω, *to love*.

PHILACTES, in *Ancient Geography*, a river of Afia Minor, which ran into the gulf "Hermonius," in the Thracian Bofphorus.

PHILADELPHIA, in *Antiquity*, were games inftituted at Sardis, to celebrate the union of Caracalla and Geta, the fons of Septimius Severus.

PHILADELPHIA, in *Ancient Geography*, a town of Afia Minor, at the foot of mount Tmolus, at fome diftance E. of Sardis. It derived its name from Attalus Philadelphus, the brother of Eumenes: and was much celebrated for its feafts and public games. It became epifcopal, and was very confiderable when the Turks took poffeffion of it.—Alfo, a town of Afia, in the interior of Cilicia, between Domitiopolis and Seleucia Afpera, according to Ptolemy: it was feated on the Calycadnus, at a fmall diftance W. from Olba. This alfo became epifcopal.—Alfo, a capital of the Ammonites, fituated on the mountains of Gilead, towards the fources of the river Arnon. Its eaftern name was Rabbath-Ammon. According to Steph. Byz. it was the third town of Syria, which affumed fucceffively the name of Ammana (or Ammon), Aftarte, and then Philadelphia, after the name of Ptolemy Philadelphus. It was one of the Decapolis of Paleftine. See AMMONITES.—Alfo, a town of Egypt. Steph. Byz.

PHILADELPHIA, in *Geography*, a populous and highly cultivated county of Pennfylvania, bounded W. by Delaware county, N.W. by Montgomery, N.E. by Poquafin creek, which feparates it from Burk's county, and S. and S.E. by the river Delaware, which divides it from the ftate of New Jerfey. It contains about 89,600 acres, and is divided into 18 townfhips, and contains 81,009 inhabitants. On the banks of Schuylkill in this county is an excellent quarry of marble, which fupplies the ftone-cutters of Philadelphia.

PHILADELPHIA, the metropolis of Pennfylvania, is fituated in the county to which it gives name, on the weftern bank of the river Delaware, which is here a mile broad. This city is diftant 110 miles from the Atlantic ocean by the courfe of the bay or river, and about 55 or 60 in a S.E. direction. The river is navigable for a 74-gun fhip as far as the city; for floops 35 miles farther to Trenton, and for boats loaded with eight or nine tons to a greater diftance of 100 miles. Philadelphia was laid out by the famous William Penn (fee his article) in the year 1683, and fettled by the influx of adventurers from England to fuch a degree, that in lefs than a century it was eftimated to contain 6000 houfes, and 40,000 inhabitants, including thofe of the fuburbs as well as the city. The form of the ground plot of the city is an oblong fquare, about one mile N. and S. and two E. and W. lying in the narroweft part of the ifthmus between the Delaware and Schuylkill rivers, about five miles in a right line above their confluence. In the progrefs of building, it was found that the Delaware front was of itfelf fufficient for quays and landing places. The buildings now occupy a fpace not exceeding three miles in length from N. to S., and in the moft extended part do not reach a mile from the Delaware. All the houfes built beyond the boundary line of the oblong fquare are faid to be in the "Liberties," as the jurifdiction of the corporation does not extend to that part of the town. Here the ftreets are very irregularly built. But the city is interfected by a great number of ftreets, which crofs each other at right angles. Of thefe there were originally nine, which extended from the Delaware to the Schuylkill, and thefe were croffed by 23, running N. and S. The number of fquares in the original plan was 184; but as feveral of thefe have been interfected by new ftreets, their number now amounts to 304; and feveral of thefe are again interfected by lanes and alleys. Broad-ftreet is 113 feet wide; High-ftreet 100; Mulberry-ftreet 60; and the other ftreets in the original plan 30 feet wide. The greateft part of the city is tolerably well paved with pebble ftones in the middle, and with neat foot paths of brick, furnifhed with common fewers and gutters, fo that the ftreets are, in general, kept very clean. The fpace occupied by Water-ftreet was intended, in the original plan, for a cart way, in order to accommodate the wharfs and ftores; but it is now occupied, a few vacancies excepted, by lofty houfes, reaching through the whole front, and commodious wharfs of a rectangular form, and conftructed of wood, are extended into the river, and here the largeft fhips that are in the port may lie in fafety, both to receive and difcharge their cargoes; and they are defended from the ice, in winter, by piers firmly fixed. Another ftreet, called Dock-ftreet, was formerly a fwamp, but is now by a plantation of a row of Lombardy poplars on each fide rendered one of the pleafanteft ftreets in the city. Lamps, to the amount in number of 662, difpofed at convenient diftances, give light to all parts of the city in the night.

The houfes in the city and fuburbs are generally conftructed of brick, three ftories high, plain and neat, without much ornament. The general height of the ground, on which the city ftands, is nearly 40 feet above the Delaware; but fome of the ftreets are confiderably lower, and have on this account been fubject to damage from the overflow of the river, by flood tides, and a ftrong fouth-eaft wind.

The city contains 27 places for public worfhip, *viz.* five for Friends or Quakers, fix for Prefbyterians and Seceders, three for Epifcopalians, three for Roman Catholics, two for German Lutherans, two for Methodifts, one for German Calvinifts, one for Swedifh Lutherans, one for the Moravians, one for Baptifts, one for Africans, and a Jewifh fynagogue. The other public buildings are a ftate-houfe and offices, two city court-houfes, a county court-houfe, an univerfity, the philofophical fociety's hall, a public library, an hofpital, difpenfary, an alms-houfe, a gaol, three incorporated banks, two dramatic theatres, a medical theatre, a laboratory, an amphitheatre, four brick market-houfes, a fifh-market, a houfe of correction, and a powder magazine. Two fteam-engine houfes have not long ago been erected, for fupplying the city with wholefome water from the Schuylkill. The roof of the firft Prefbyterian church is fupported in front by fix pillars of the Corinthian order, and the whole building would do honour, by the elegance of its ftructure, to any part of Europe. The German Lutheran church, erected to fupply the place of that which was burnt in 1795, is one of the handfomeft churches in the United States. Each of the Epifcopal churches is furnifhed with an organ; fo are the German, and two of the

Roman Catholic churches. The ſtate-houſe was erected about the year 1753, and its architecture is admired. Adjoining to it is a garden, which occupies a whole ſquare, and is ornamented with ſeveral rows of trees and gravel walks: that which was formerly a burying-place, is now converted into a public walk, and planted with rows of trees, ſo as to form a pleaſant promenade. The Philadelphia library originated with Dr. Franklin, and was incorporated in 1742, and has been gradually gaining an increaſe in books, &c. At preſent it contains upwards of 12,000 volumes, beſides a muſeum, and a valuable philoſophical apparatus. It is open every day in the week, except Sunday, to any perſon who has an inclination for reading. Books may alſo be borrowed out of the library, by leaving a depoſit to inſure their ſafe return, and paying a ſmall ſum for the uſe of them. The ſubſcribers amount to ſeveral hundred, and each ſubſcriber pays ten ſhillings annually. The building belonging to the library company is an elegant ſtructure; and in front of the edifice is a ſtatue of Dr. Franklin of white marble, executed in Italy at the expence, as it is ſaid, of 500*l.*, and given to the company by William Bingham, eſq. The apartments of the public gaol are arched with ſtone, as a ſecurity againſt fire; and the whole building is the largeſt, ſtrongeſt, and neateſt of the kind in the United States. Adjoining to it is a work-houſe, in which the ſexes are kept apart, and the criminals are ſeparated from the debtors, which undoubtedly is a circumſtance of great importance. Here are alſo apartments for the ſolitary confinement of criminals. The market-houſe is amply ſupplied with various proviſions, which are expoſed for ſale every Wedneſday and Saturday. This is an extenſive building, and is ſupported by 300 pillars. The new bank of Pennſylvania, lately erected under the ſuperintendance of Mr. Latrobe, is a large and remarkably elegant edifice of marble, of the Ionic order, conſtructed after the model of the ancient temple of Minerva in Greece. The eaſtern and weſtern fronts are adorned with two lofty colonnades of ſolid marble. The new theatre near the ſtate-houſe, finiſhed in 1793, is ſpacious and convenient. The large building, intended for the accommodation of the preſident of the United States, has been purchaſed by the univerſity of Pennſylvania, which conſiſts of two literary inſtitutions, that had for ſome time been eſtabliſhed in Philadelphia; one deſignated by the above name, the other by that of the college, academy, and charitable ſchools of Philadelphia. They now conſtitute a reſpectable ſeminary, incorporated in 1791. The philoſophical apparatus has lately been very much enlarged at a conſiderable expence, and is very complete of its kind. The funds of the univerſity produce annually a revenue of about 2365*l.* The aggregate number of ſtudents in the ſeveral ſchools is, on an average, about 510; and thoſe uſually admitted to degrees every year are about 25. The chief literary and humane ſocieties are the American philoſophical ſociety, formed in 1769; the college of phyſicians, inſtituted in 1737, and incorporated in 1739; the ſociety for promoting political inquiries, inſtituted in 1787; the Pennſylvania hoſpital, eſtabliſhed in 1751; the Philadelphia diſpenſary, in 1786; the Pennſylvania ſociety for the abolition of ſlavery, begun in 1774, and enlarged in 1787; the ſociety for alleviating the miſeries of priſons; the Pennſylvania ſociety for the encouragement of manufactures and uſeful arts, inſtituted in 1787; the Philadelphia ſociety for the information and aſſiſtance of immigrants, inſtituted in 1794; and two other ſocieties of the ſame kind; and an humane ſociety, inſtituted in 1790, an agricultural, marine, and various charitable ſocieties. Here are alſo a grand lodge of free and accepted maſons, and eight ſubordinate lodges. Few cities in the world, of the ſame population and wealth as Philadelphia, are more liberally provided with uſeful inſtitutions, both public and private. Here are alſo numerous academies for the inſtruction of both ſexes. Almoſt every religious ſociety has one or more ſchools under its immediate direction, in which children belonging to the ſociety are taught to read and write, and are furniſhed with books and ſtationary articles.

In the city and ſuburbs are ten rope-walks, which manufacture about 800 tons of hemp annually; 13 breweries, which are ſaid to conſume 50,000 buſhels of barley yearly; ſix ſugar-houſes; ſeven hair-powder manufactories in and about town; two rum diſtilleries and one rectifying diſtillery; and three card manufactories. The other manufactories are 15 for earthen-ware, ſix for chocolate, four for muſtard, three for cut nails and one for patent nails, one for ſteel, one for aquafortis, one for ſal ammoniac and Glauber ſalts, one for oil colours, twelve for bruſhes, two for buttons, one for Morocco leather, and one for parchment; beſides gun-makers, copper-ſmiths, hatters, tin-plate workers, coach-makers, cabinet-makers, and a variety of others. In this city is the public mint, in which the national money is coined. The great number of paper-mills in the ſtate enable the printers to carry on their buſineſs more extenſively than is done in any other place in America. There are 31 printing-offices in this city; five of which publiſh each a daily gazette; two others publiſh gazettes twice a-week, one of which is in the French language; beſides four weekly papers, one being in the German language. The other offices are employed in printing books, pamphlets, &c. The catalogue of books for ſale in this city contains upwards of 300 ſets of Philadelphia editions, together with a great variety of maps and charts. The pleaſure-carriages are, according to enumeration, 553 two-wheeled carriages, 80 light waggons, 137 coaches, 22 phaetons, 35 chariots, and 33 coachees. The coachee is a carriage thought to be peculiar to America: the body of it is rather longer than that of a coach, but of the ſame ſhape; in the front it is left quite open down to the bottom, and the driver ſits on a bench under the roof of the carriage. There are two ſeats in it for the paſſengers, who ſit with their faces towards the horſes. The roof is ſupported by ſmall props, which are placed at the corners: on each ſide of the doors, above the pannels, it is quite open; and to guard againſt bad weather, there are curtains, which are made to let down from the roof, and faſtened to buttons placed for the purpoſe on the outſide. There is alſo a leathern curtain to hang occaſionally between the driver and the paſſengers. The light waggons are on the ſame conſtruction, and are calculated to accommodate from four to twelve people. The roads from this city are in a ſtate of progreſſive improvement; ſtage-coaches perform the journey to Lancaſter, the diſtance being 58 miles, on the new turnpike-road, in 11 hours.

This city is governed by a mayor, recorder, eight aldermen, and ſixteen common-council men, who make a quorum to tranſact buſineſs: they have full power to conſtitute and appoint laws and ordinances for the government of the city. The mayor, recorder, and aldermen, are juſtices of the peace, and juſtices of oyer and terminer. They hold a court four times a-year, to take cognizance of all crimes and miſdemeanors committed within the city; and two aldermen, appointed by the mayor and recorder, hold a court on Mondays and Thurſdays in every week, to determine matters cognizable before a juſtice of the peace. The trade of Pennſylvania is chiefly carried on from this city, and there are few commercial ports in the world where ſhips from Philadelphia may not be found in ſome ſeaſon of the year; but the amount of the exports and imports has varied at different periods, and under different circumſtances.

Accordingly the trade ſuffered an interruption in 1793, which laſted nearly five months, in conſequence of the yellow fever, of three months' duration, to which nearly 5000 inhabitants were victims. In the year 1794, there were 9000 houſes in the city, beſides 400 which were then building. In 1800, the number of inhabitants within the city was 41,220. The ſuburbs and county contained 39,783, and of theſe only 85 were ſlaves. In 1810, the number of inhabitants was 92,247; and in Pennſylvania the number was 810,091.

Philadelphia is the grand reſidence of Quakers or Friends in America; but their number does not bear the ſame proportion now to that of other citizens, which it did formerly. At preſent, it is ſaid, they form about one-fourth only of the inhabitants. This is not owing to any diminution of the number of Friends, becauſe, on the contrary, they have conſiderably increaſed, but to the great influx into the city of perſons of a different perſuaſion. According to a liſt publiſhed of the births and deaths in the ſeveral religious ſocieties of Philadelphia, it appears that from Auguſt 1, 1792, to Auguſt 1, 1793, the births amounted to 2511, and the deaths to 1497. The inhabitants conſiſt of Engliſh, Iriſh, Scots, Germans, French, and America-born citizens, deſcended from people of theſe different nations, who are of courſe by far the moſt numerous claſs. They are all, for the moſt part, engaged in ſome ſort of buſineſs; few living, without any oſtenſible occupation or profeſſion, on the fortunes which they themſelves have raiſed. The purchaſe and ſale of lands conſtitute objects of peculiar attention in Philadelphia, as well as in other parts of America. It may naturally be expected, that amongſt a people aſſembled from ſo many different quarters, there ſhould be a great diverſity of manners. It is a remark, however, ſays Mr. Weld, very generally made, not only by foreigners, but by perſons from other parts of the United States, that the Philadelphians are extremely deficient in hoſpitality and politeneſs towards ſtrangers. This author obſerves, that in the uppermoſt circles of Philadelphia, pride, haughtineſs, and oſtentation are conſpicuous; ſo that it ſhould ſeem they would be rendered happy if an order of nobility were eſtabliſhed, which would ſerve to exalt them in rank as much above their fellow-citizens as they are in their own imagination. It is obſerved further, that in the manners of the people in general there is a coldneſs and reſerve, as if they were ſuſpicious of ſome deſign againſt them, which chill to the heart thoſe who come to viſit them. It is added, that in their private ſocieties a *triſteſſe* is apparent, near which mirth and gaiety can never approach.

The women, it is ſaid, when young, are generally very pretty; but when they become mothers, in advancing age, they loſe their beauty. Their complexions fade, their teeth begin to decay, and they manifeſt a wonderful change. In a few inſtances only, ſays Mr. Weld, it would be poſſible to find a fine woman at the age of 40, who has had a large family. The ſudden decay of the teeth is a circumſtance that has attracted attention, and that has been made the ſubject of inveſtigation. It has been aſcribed to various cauſes, and particularly to the immoderate uſe of confectionary; but it is more probably owing to the very general uſe that is made of ſalted proviſions.

The greater number of ſervants in Philadelphia conſiſts of emigrant Europeans, who only remain in that condition till they can ſave a little money, and gain that kind of independence which every perſon, who is induſtrious, may enjoy in America. The wages of thoſe who are retained in ſervice are exorbitant. The Americans themſelves conſider ſervitude as ſuitable only to negroes. Amongſt the generality of the common ſort of people in the United States, and particularly amongſt thoſe of Philadelphia, there is, ſays Mr. Weld, a want of good manners, which excites the ſurpriſe of almoſt all foreigners. He adds, "civility cannot be purchaſed from the lower claſſes of people on any terms: they ſeem to think, that it is incompatible with freedom, and that there is no other way of convincing a ſtranger that he is really in a land of liberty but by being ſurly and ill-mannered in his preſence."

The environs of Philadelphia are pleaſant and well cultivated. Towards the north are Kenſington, near the ſuburbs on Delaware, noted for ſhip-building; Germantown, a populous neat village, with two German churches; and Frankfort, another village, both within ſeven miles; beſides many country ſeats. Towards the ſouth is Darby, a ſmall, pleaſant borough, above ſeven miles diſtant, and on Schuylkill, four miles from the city, the botanical garden of Meſſrs. Bartrams. In the weſt, on the ſame river, 18 acres of ground have been deſtined for a public botanical garden.

As you approach Philadelphia by the river, it cannot be ſeen farther off than three miles; a point of land covered with trees concealing it from the view. On weathering this point it ſuddenly opens upon you, and at that diſtance looks extremely well; but, on a nearer approach, the city makes a poor appearance, as nothing is viſible from the water but confuſed heaps of wooden ſtore-houſes, crowded upon each other, the chief of which are built upon platforms of artificial ground, and wharfs which project a conſiderable way into the river. Behind theſe wharfs, and parallel to the river, runs Water-ſtreet, which does not give a ſtranger a very favourable opinion of Philadelphia. The ſtreet is about 30 feet wide; and behind the houſes is a high bank, ſuppoſed to be the old bank of the river, which renders the air very confined. But modern improvements will remedy this inconvenience. Philadelphia is diſtant 728 miles S.W. of Paſſamaquoddy, the moſt eaſterly part of the ſea-coaſt of the United States; 347 S.W. of Boſton; 958 W. of New York; 102 N.E. of Baltimore; 144 N.E. of Waſhington; and 925 N.E. by N. of Savannah in Georgia. N. lat. 39° 56′ 54″. W. long. 75° 13′ 45″. Morſe's Geog. vol. i. Weld's Travels, &c. vol. i. See PENNSYLVANIA.

PHILADELPHIA *Stones*, a name given by ſome authors to what are called by others *Chriſtians' bones*, found in the walls of that city. It is a common error, that theſe walls are built of bones, and the tradition of the country is, that when the Turks took the place, they fortified it for themſelves, and built their walls of the bones of the Chriſtians whom they killed there. Dr. Smyth, in one of his epiſtles, mentions this wall as an inſtance of the Turkiſh barbarity; but this is an idle opinion, what paſſes for bone being only a looſe and porous ſtone, of the ſparry kind, found in an old aqueduct, which is ſtill in the wall. Sir Paul Rycaut brought home pieces of theſe ſtones, which he alſo ſuppoſed to have been bones, but on examination they proved to be no other than various bodies, chiefly vegetable, incruſted over and preſerved in a ſpar of the nature of that which forms incruſtations in Knareſborough ſpring, and other places with us. Theſe bodies are often cemented together in great numbers by this matter, and their true ſhape loſt in the congeries, till a diligent and judicious eye traces them regularly.

PHILADELPHIAN SOCIETY, in *Eccleſiaſtical Hiſtory*, an obſcure and inconſiderable ſociety of myſtics, formed, towards the cloſe of the 17th century, by an Engliſh female fanatic, named Jane Leadley, who ſeduced by her viſions, predictions, and doctrines, ſeveral diſciples, among whom were ſome perſons of learning. This woman apprehended, that all diſſenſions among Chriſtians would ceaſe, and the

 kingdom

kingdom of the Redeemer become a ſcene of charity, concord, and felicity, if Chriſtians, without regarding the forms of doctrine or diſcipline that diſtinguiſh particular communions, would all join in committing their ſouls to the care of the internal gûide, to be inſtructed, governed, and formed by his divine impulſe and ſuggeſtions. Nay, ſhe pretended a divine commiſſion to proclaim the approach of this glorious communion of ſaints; and imagined that the ſociety eſtabliſhed by herſelf was the true kingdom of Chriſt. One of her leading doctrines was, that of the final reſtoration of all intelligent beings to perfection and happineſs.

PHILADELPHUS, Φιλαδελφος, in *Antiquity*, a title or ſurname, borne by ſeveral ancient kings; formed from the Greek φιλος, *friend, lover*, and αδελφος, *brother*; *q. d.* one who loves his brother, or brethren.

Ptolemy Philadelphus erected a library at Alexandria, and furniſhed it with four hundred thouſand, others ſay with ſeven hundred thouſand volumes, by the advice, and with the aſſiſtance, of Demetrius Phalereus. See ALEXANDRIAN *Library*.

It was the ſame Philadelphus that procured the Greek verſion of the books of Moſes, called the *Septuagint*.

Father Chamillart has a medal of the queen of Comagene, which bears the title of Philadelpha, without any other name. M. Vaillant tells us, that Philip, king of Syria, had alſo the title Philadelphus.

PHILADELPHUS, in *Botany*, φιλαδελφος, the name of a ſhrub mentioned by Athenæus, which it is impoſſible for us to aſcertain. Caſpar Bauhin firſt applied this ſynonym to our Syringa, or Mock Orange, with which it remains, as the generic appellation. Linnæus ſuppoſes it was deſigned to commemorate Ptolemy Philadelphus, king of Egypt; but a much more probable opinion ſeems to be, that the plant of Athenæus was of the twining or claſping kind, ſomething like *Periploca græca*; and that the word, by a poetical fancy, was intended to expreſs its brotherly love for thoſe near it. The name *Syringa*, which Tournefort retained for this ſhrub, and by which it is now univerſally called in Engliſh, originated in a confuſion of ideas. That name equally belongs to the Lilac; and though really, as Bauhin ſays, of Mooriſh origin, has been ſuppoſed to be derived from συριγξ, *a pipe*, becauſe the young branches of Lilac are uſed in Africa and the Levant for tobacco-pipes. Thoſe of our *Philadelphus* alſo are reported to ſerve the ſame purpoſe. Hence one ſhrub has been termed *Syringa cærulea*, or Blue Pipe; the other *S. alba*, or White Pipe. But their wide generic difference, requiring an alteration of this unſcientific nomenclature, and *Lilac* being barbarous, Linnæus was perhaps led, by the pipe-like flower, to prefer *Syringa* for that genus; eſpecially as *Philadelphus* was already applied to the other. Juſſieu however, following Tournefort, retains *Lilac*, though againſt his own general rule.—Linn. Gen. 247. Schreb. 332. Willd. Sp. Pl. v. 2. 947. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 180. Juſſ. 325. Lamarck Illuſtr. t. 420. Gærtn. t. 35. (Syringa; Tourn. t. 389.)—Claſs and order, *Icoſandria Monogynia*. Nat. Ord. *Heſperideæ*, Linn. *Myrti*, Juſſ.

Gen. Ch. *Cal.* Perianth ſuperior, of four oblong, acute, equal, ſpreading leaves. *Cor.* Petals four, roundiſh-ovate, ſeſſile, flat, large, ſpreading. *Stam.* Filaments 20, awl-ſhaped, the length of the calyx; anthers erect, with four furrows. *Piſt.* Germen inferior, pointed; ſtyle thread-ſhaped, in four deep ſegments; ſtigmas ſimple. *Peric.* Capſule ovate, pointed at each end; coated below; naked, and riſing rather above the inſertion of the calyx, at the top, of four cells, and four valves, with partitions from their centres. *Seeds* numerous, minute, oblong, decumbent, inſerted into the thickened edges of the partitions, each inveſted with a tapering tunic, fringed at the baſe.

Eſſ. Ch. Calyx of four leaves, ſuperior. Petals four. Style four-cleft. Capſule of four cells. Seeds numerous, each in an oblong tapering tunic.

Obſ. The number, in the parts of fructification, occaſionally varies from four to five. For the differences between this genus and LEPTOSPERMUM, ſee that article.

1. Ph. *coronarius*. Common Syringa, or Mock-Orange. Linn. Sp. Pl. 671. Willd. n. 1. Curt. Mag. t. 391. (Syringa alba; Ger. Em. 1399.)—Leaves with ſhallow teeth. Native of the ſouth of Europe, and north of Africa, if we miſtake not, though ſo generally cultivated, that we know not where it can be ſeen truly wild. Dr. Sims in Curt. Mag. p. 1478, ſuſpects it may come from Japan. In our gardens and ſhrubberies it is a hardy deciduous tall ſhrub, flowering in May and June. The *leaves* are elliptical, recurved, oppoſite, on ſhort ſtalks, darkiſh green, ſmooth, with broad ſhallow teeth; their taſte remarkably like cucumber, but diſagreeable if too copiouſly taken. *Flowers* in denſe terminal upright cluſters, large, white, looking ſomewhat like thoſe of the Orange, powerfully ſcented, ſo as to be intolerable to moſt people in a cloſe room, though pleaſant in the open air. Gerarde, having laid ſome in his chamber window, ſays they awaked him out of his ſleep, and he was forced to throw them away. There is a dwarf variety.

2. Ph. *inodorus*. Carolina Scentleſs Mock-Orange. Linn. Sp. Pl. 672. Willd. n. 2. Curt. Mag. t. 1478. (Ph. flore albo majore inodoro; Cateſb. Carol. v. 2. 84. tab. 84.)—Leaves entire. Native of Carolina. Rather more tender than the former, and not often met with in gardens, though it is preſerved in the open ground at Kew. This is a humbler, more ſlender and ſpreading *ſhrub* than the common kind, bearing fewer, rather later, and much larger, as well as more elegant, ſnow-white *flowers*, which are deſtitute of ſcent; a quality that might render this ſpecies, to ſome perſons, the moſt deſirable of the two.

PHILADELPHUS, in *Gardening*, contains plants of the hardy, deciduous, flowering, ſhrubby kind, of which the ſpecies cultivated, is the common ſyringa, or mock orange (P. coronarius).

There are two ſpecies; the dwarf ſyringa, which ſeldom riſes above three feet high; the leaves are ſhorter, more ovate, and little indented on their edges; the flowers come out ſingly from the ſide of the branches, and have a double or treble row of petals of the ſame ſize and form as the other, and the flowers have the ſame ſcent; but flowering very rarely, it is not ſo much in eſtimation.

And the Carolina ſyringa, which riſes with a ſhrubby ſtalk about ſixteen feet high, ſending out ſlender branches from the ſides, oppoſite to each other; the leaves ſmooth, ſhaped like thoſe of the pear-tree, entire, oppoſite, on pretty long footſtalks; the flowers are produced at the ends of the branches; they are large, but without ſcent; each has four white oval petals ſpreading open, and a large calyx, compoſed of four acute-pointed leaflets.

Method of Culture.—Theſe plants may be increaſed by ſuckers, layers, and cuttings. The ſuckers are ſent from the roots in great plenty; theſe ſhould be taken from the old plants in autumn, and be planted in a nurſery, to grow one or two years, till they have obtained ſufficient ſtrength, when they may be removed to the places where they are to remain.

The layers may be laid down in the autumn, being made from the young twigs. Theſe may be taken off in the following autumn, when well rooted, being planted out where they are to remain.

The

The cuttings of the young ſhoots may be planted in the autumn, in a ſhady ſituation, where they ſoon form plants.

The plants are extremely hardy, and thrive in almoſt any ſoil or ſituation, but grow taller in light good ground than in that which is ſtiff.

Theſe plants are commonly diſpoſed in plantations of flowering ſhrubs, among others of the ſame growth; mixing very well with lilacs, gelder roſes, and laburnums; and particularly valuable from their thriving under the ſhade of trees, and forming a blockade againſt low buildings, where perſons have no objection to their ſtrong ſmell.

PHILÆNI, in *Mythology*, two brothers reckoned by the Carthaginians among their gods. Theſe brothers, having been ſent, by their countrymen, to accommodate ſome differences with the Cyreneans, and, in conjunction with the commiſſaries appointed by theſe people, to ſettle the limits of their reſpective dominions, by fraud extended their own frontiers to the prejudice of the others. The Cyreneans, incenſed at this unfair dealing, would not cede the tract demanded, unleſs the Philæni would ſuffer themſelves to be buried alive in the place which they had pitched upon for their boundary. To this propoſal they inſtantly agreed, and had afterwards two altars erected to their memory; which ſerved as a land mark or limit to the Carthaginian territories on the ſide of Cyrenaica for many ſucceeding ages. Salluſt, Mela, and Valerius Maximus, relate all the particulars of this ſtory.

PHILÆNORUM Ara, in *Ancient Geography*, the *altar* of the Philæni, a place of Africa, on the ſouthern coaſt, and nearly at the bottom of the gulf which forms towards the S.E. the greater Syrtis. It derives its name from the circumſtance mentioned in the preceding article.

PHILAMMON *of Delphos*, in *Biography*, the ſon of Chryſothemis of Crete, obtained the prize at the Pythic games the ſecond time they were celebrated. His father was victor at the firſt, and his ſon Thamyris won the third prize. Chryſothemis was the ſon of Carmanor, who lived before Homer, and was the twin brother of Antolycus, maternal grand father of Ulyſſes. Their mother, Rhiona, daughter of Dedalion, brother of Ceyx, king of Trachia, was beloved the ſame day by Apollo and Mercury; at the end of nine months Antolycus and Philammon were born. Philammon ſung to his lyre the birth of Apollo and Diana. Plutarch ſays that he ſung in verſe the birth of Latona, Apollo, and Diana. It was troops of mortals, male and female, who danced and ſung the praiſes of the gods to the ſound of inſtruments. His ſon Thamyris was celebrated for the diſpute which he had with the Muſes.

PHILANDER, in *Zoology*. See Didelphis.

PHILANTHROPOS, in *Botany*, a name uſed by ſome authors for the common *aparine*, *cleavers*, or *gooſe-graſs*.

PHILANTHROPY, φιλανθρωπια, *love of mankind*, a general benevolence towards the ſpecies. See Passions.

PHILARMONICI, is the denomination of a literary ſociety eſtabliſhed at Verona in 1543. See Academy.

PHILAUTIA, φιλαυτια, formed from φιλος, *amicus*, and αυτος, *ipſe*, in the *Schools*, *ſelf-love*, a vicious fondneſs and complaiſance for a man's ſelf. See Passion and Self-love.

PHILE, Manuel, in *Biography*, a modern Greek poet, was a native of Epheſus, and flouriſhed about the year 1321, under the emperor Michael Paleologus the younger, to whom he dedicated a poem on the properties of animals, compoſed in Iambic verſe. It was printed firſt in Greek at Venice, in 1530. In the year 1730 an edition in Greek and Latin was given by Corn. de Pauw at Utrecht. He was author of other poems, ſome of which are contained in Fabricius' Biblioth. Græc. All his poems, under the title of Carmina, were edited by Wensdorf, at Leipſic, in 1768. Moreri.

PHILEBERT, in *Geography*, a town of France, in the department of the Lower Loire, and chief place of a canton, in the diſtrict of Nantes. The place contains 2032, and the canton 7473 inhabitants, on a territory of 305 kiliometres, in ſix communes.

PHILELEUTHERUS, φιλελευθερος, formed of φιλος, and ελευθερος, *free*, a lover of liberty.

PHILELIA, the name of a ſong among the ancient Greeks, in honour of Apollo. Athenæus, lib. xiv. cap. 3.

PHILEMON, in *Biography*, a Greek comic poet, ſon of Damon, flouriſhed about the year 274 B.C. in the reign of king Antigonus Gonatas. He was a rival of Menander, againſt whom he frequently gained the prize. The titles of ſome of his plays are preſerved; and the "Mercator" of Plautus is profeſſedly taken from the Εμπορος of Philemon. It is ſaid that he died at the age of 97 or 99, and that the cauſe of his death was a fit of laughter, occaſioned by ſeeing his aſs eat figs. Philemon the younger, ſon of the preceding, was alſo a comic writer, and, according to Suidas, compoſed 54 comedies, of which fragments remain, and have been publiſhed with thoſe of Menander, and alſo in the Poet. Græc. Minor.

PHILESIA, in *Botany*, ſo named by Commerſon, from φιλεω, *to love*, in alluſion to its lovely aſpect; nor could many plants be more worthy of ſuch a diſtinguiſhing appellation. See Enargea.

PHILETA, in *Ancient Geography*, a town of Aſia Minor, in the vicinity of Caria.

PHILETERIUM, in *Botany*, a name uſed by ſome authors for the *behen album*, the common white-flowered bladder-campion, called *white ben*.

PHILIA, in *Ancient Geography*, an iſle of Egypt, on the confines of Ethiopia, near the town of Tacompſon. Steph. Byz.—Alſo, a promontory of Thrace, upon the Euxine ſea, near Philopolis. Ptolemy.

PHILIASKOI, in *Geography*, a town of Ruſſia, in the government of Tobolſk, on the Irtiſch; 120 miles N. of Tobolſk.

PHILIDOR, Andre', in *Biography*, born at Dreux in 1726, was deſcended from a long line of muſical anceſtors, who, in different branches of the art, had been attached to the court ever ſince the time of Louis XIII. The family name was Danican; and it is pretended that this monarch, himſelf a dilettante muſician, occaſioned the ſurname of Philidor, a famous performer on the hautbois, whom this prince had heard in his progreſs through France, to be given to Danican, whoſe inſtrument being the hautbois, when the king heard him perform, he cried out "here's another Philidor!" Andrew was educated as a page or choriſter in the chapel royal, under Campra, maitre de chapelle. In 1737 he produced his firſt motet, or full anthem, which was performed in the chapel, and complimented by the king as an extraordinary production for a child of eleven years old. On his change of voice, and quitting the chapel, he eſtabliſhed himſelf at Paris, where he ſubſiſted by a few ſcholars, and by copying muſic; but every year he went to Verſailles with a new motet.

The progreſs which he had made at cheſs awakened in him a deſire to travel, in order to try his fortune; and in 1745 he ſet out for Holland, England, Germany, &c. In theſe voyages he formed his taſte in muſic upon the beſt Italian models. In 1753 he tried his ſtrength as a muſical compoſer in London, by new ſetting Dryden's ode on St. Cæcilia's day. Handel is ſaid, by his biographer, to have found his choruſſes well written, but diſcovered a want of taſte in his airs.

As

As his time was more occupied by chefs than mufic, he printed in London, at a large fubfcription, in 1749, his "Analyfis of the Game of Chefs," *Analyfe des Echec.* In 1754 he returned to Paris, in the month of November, and devoted his whole time to mufic. He had his "Laudæ Jerufalem" performed at Verfailles; but it was found to be too Italian, and as the queen of Louis XV. difliked that ftyle of mufic in the church, his hopes of obtaining, by this compofition, a place of maitre de chapelle, were fruftrated.

In 1757 he compofed an act of a ferious opera, but Ribel, opera manager, would not let it be performed, telling him that he would have no airs introduced in the fcenes of that theatre.

In 1758 he produced fome airs for "the Pilgrims of Mecca," at the comic opera; Corbi, the manager, propofed to him the undertaking to fet an entire opera for that theatre; and the firft drama he fet was "Blaife le Savetier," Blaife the Cobler, which was performed at La Foire St. Laurent, in 1759, with the greateft fuccefs, and afterwards five more fuccefsful comic operas iffued from his pen, among which "Le Marechal ferrant," or the Blackfmith, fupported more than a hundred reprefentations. In 1762, at the union of the Opera Comique and the Theatre Italien, he produced "Sanch Panca;" in 1763, "Le Bucheron," and a mufical entertainment for the piece; in 1764, "Le Sorcier;" in 1765, "Tom Jones," which at firft was hiffed, but afterwards acquired great favour. In 1767 his ferious opera of "Ernclinde" was performed at the great operahoufe, which was the beginning of the revolution in the ftyle of mufic at that theatre. In 1769 he fet for the comic opera "Le Jardinier de Sidon;" in 1770, "Le Jardinier fuppofé;" in 1771, the "New School for Wives;" in 1772, "Le Bon Fils;" in 1773, the "Navigator;" in 1775, "Les Femmes vengées;" and in 1779, in London, "The Carmen Seculare" of Horace.

In the conduct of this performance, Philidor placed himfelf under the guidance of Baretti. The performance was attended at Freemafons' Hall by all perfons of learning and talents, in expectation of a revival of the mufic of the ancients, and, by many, of its miraculous powers. To what kind of mufic the "Carmen Seculare" was performed at Rome, we pretend not to fay; but in London we could trace the compofer's models for the choruffes in the oratorios of Handel, and the operas of Rameau; and for the airs in his own comic operas, and the favourite melodies then in vogue in that theatre, many of which, with Italian words, and Italian finging, particularly thofe of Gretry, would be elegant and pleafing mufic any where.

Philidor, however, in fetting the fecular ode, it muft be confeffed, manifefted his knowledge of counterpoint in the ftyle of the old mafters; and that, in fpite of chefs, he had found time for the ferious ftudy of mufic; we believe that no one found himfelf much the wifer concerning the mufic of the ancients after hearing this mufic performed to Latin words, than after hearing an oratorio of Handel, or an opera of Rameau. This miraculous chefs-player, and ingenious and pleafing compofer of comic operas, died in London in 1795. Laborde.

PHILINUS, in *Medical Hiftory*, a phyfician, born in the ifland of Cos, was a difciple of Herophilus, and flourifhed in the thirty-eighth century, A.M. He was a diftinguifhed member of the Empirical fect, of which, indeed, he divides the honour with Serapion, of Alexandria, of being efteemed the founder. He is faid, by Athenæus, to have been the author of a treatife on herbs, and of fome commentaries on the works of Hippocrates. See Le Clerc, Hift. de la Med.

PHILIP II., in *Biography*, king of Macedon, was the third fon of king Amyntas. In his youth he was fent, by his father, as a hoftage to Thebes, where he was educated in the houfe of Polymnas, the father of Epaminondas. On the death of his brother Perdiccas, he returned fuddenly and fecretly to Macedon, where he affumed the regency, as guardian to his infant nephew. It was, however, with the unanimous confent of the nation, then furrounded by enemies, and under circumftances of great difficulty, that he took upon himfelf the royal title and authority, in the year 360 B.C., being then in the 23d year of his age. His firft meafures were thofe of a prudent politician. By declaring Amphipolis free, he took away the chief caufe of a war with the Athenians, who had fent an army in fupport of a competitor to the crown; and by prefents diftributed among the leading people of Pœonia, he prevented a war with that people. He next turned his attention to the effential point of new-modelling and difciplining his army, in which he applied the leffons of military art that he had derived from the Thebans. He very foon acquired the confidence of his troops, defeated Argæus, his competitor for the crown, invaded and fubdued the Pœonians, and forced the Illyrians to fubmit to a treaty, by which they refigned all their conquefts in the Macedonian territory.

Philip was a decided character, and he fet out in life with a determinate object, of which he appears never to have loft fight, *viz.* the extenfion of his dominions, and the elevation of the kingdom of Macedon to that confequence among the Grecian ftates, which circumftances had hitherto prevented it from affuming. This purpofe he fteadily purfued, by policy or by force, as beft fuited the occafion, neither deterred by difficulties, nor moved by confiderations of juftice. One of his firft offenfive meafures was an attack upon Amphipolis, to which city he had, by his treaty with Athens, renounced all claim. He took it by ftorm, banifhed or put to death fuch of the citizens as oppofed his intereft, and treated the reft with kindnefs. He next reduced Pydna and Potidea, the latter of which he gave to the Olynthians. He next acquired the country between the rivers Strymon and Neftus, rich in gold mines, and at that time poffeffed by the Thracians. He took Crenides, its principal town, the name of which he changed to Philippi; and inftantly began to work the mines, which fupplied him with a metal not lefs powerful in effecting his purpofes than iron. The Phocian or facred war occupying at this time the attention of all Greece, Philip was at liberty to purfue unmolefted his plans of aggrandizement. Being defirous of fubjecting Thrace, he determined to poffefs himfelf of Methone, a fmall city, incapable of fupporting itfelf by its own ftrength, but which gave him much uneafinefs, and obftructed his defigns, whenever it was in the hands of his enemies. Accordingly he razed it to the ground. Here he loft one of his eyes. After of Amphipolis had offered his fervices to Philip, telling him that he was fo excellent a markfman, that he could bring down birds in their moft rapid flight. "Well," faid the monarch, "I will take you into my fervice, when I make war upon ftarlings." Stung with the reply, he refolved upon revenge. After, having thrown himfelf into the city, let fly an arrow, on which was written, "To Philip's right eye." This carried the moft unqueftionable evidence as to his fkill in fhooting, for it hit the king exactly in his right eye. Philip ordered the arrow to be fent back, with the following label: "If Philip takes the city, he will hang After;" and he was as good as his word.

An

An invitation from the Theſſalians, to come and reſtore order in their country, which the contentions in the family of the Pheræan tyrants had thrown into confuſion, was gladly accepted by Philip, who, after ſome variety of fortune, totally defeated the forces of Lycophron, and his Phocian auxiliaries. It was a vaſt advantage to his deſigns, that he was able to engage ſuperſtition in his favour, by the decided part he took againſt the Phocians, whoſe ſeizure of the temple of Delphi had occaſioned the ſacred war. The jealouſy of the Athenians, however, rendered of no avail his attempt to paſs the Pyla, or defiles leading into Greece: he, therefore, bent his whole force to the humiliation of that powerful republic. He was not contented with hoſtile meaſures, but employed his gold to corrupt the venal orators of Athens, and would probably have obtained an aſcendancy in the councils of the ſtate, had it not been for the ſuperior genius of Demoſthenes. An attack upon the powerful republic of Olynthus was his next meaſure. The Athenians, rouſed by the eloquence of Demoſthenes, ſent ſuccours to the Olynthians; but it was too late: Philip had, by corrupting two of its magiſtrates, gained poſſeſſion of the city, with an immenſe booty. The two magiſtrates complained to Philip of the treatment they had experienced from his ſoldiers, who reproached them as traitors; to which the monarch replied: "You muſt not regard them; they are ruſtics, who always call things by their right names."

He was next ſolicited to put an end to the Phocian war; and with a large army paſſed the ſtraits of Thermopylæ, entered Phocis, aſſuming the character of vicegerent of the god Apollo, whoſe ſanctuary had been violated. The Phocians, not daring to reſiſt, ſubmitted to his mercy; and Philip, having referred the judgment of their cauſe to the grand council of Amphictyons, and executed their decree, marched back into Macedon. This event occurred in the year 348 B.C.

After this he marched againſt a Scythian prince, whom he totally defeated. Returning with a rich booty, he was refuſed a paſſage through the territory of the Triballi, a tribe of fierce barbarians, unleſs he would ſhare his plunder with them. Diſdaining this condition, he proceeded to force his way. An engagement enſued, in which he received a wound in the thigh, was thrown to the ground, and would probably have been killed, had he not been reſcued by his ſon Alexander, then a youth. In the end he obtained a ſignal victory, and returned to Macedon in triumph.

A length, by a train of fortunate circumſtances, he was enabled to march into Greece; and at Cheronæa, in the year 338 B.C., the battle was fought which put an end to the liberty of Greece. The confederates at firſt obtained ſome advantages, but were afterwards thrown into confuſion by the Macedonian phalanx, and totally defeated with great ſlaughter. Philip's joy at this ſucceſs for a time overcame the uſual moderation of his character, and he indulged himſelf in ludicrous ſarcaſms againſt the Athenians, and inſults to his priſoners, till he was recalled to reaſon by the manly reproof of the orator Demades, who told him, that when fortune ſeemed to have aſſigned him the part of Agamemnon, he ought not to diſhonour himſelf by playing that of Therſites. He inſtantly checked his ſallies of wit, treated Demades as a friend, and releaſed all the Athenian priſoners. At their requiſition, he even reſtored to them their baggage, but not without humorouſly remarking upon the demand, "theſe people do not ſeem to think we have been fighting in earneſt." He then ſent ambaſſadors to renew the peace with Athens upon the moſt favourable terms; and after leaving a garriſon in Thebes, he withdrew from Bœotia, without doing any injury to the country. By this well-timed moderation he eſtabliſhed his authority in Greece, much more effectually than he could have done by ſeverity.

Philip was now at leiſure to turn his thoughts to ſome other great object worthy of his ambition, and he determined to return upon the Perſian empire the evils it had formerly inflicted upon Greece, and carry his conqueſts into the opulent regions of Aſia. With this view he ſummoned a general aſſembly of the Grecian ſtates, ſettled the terms of an univerſal peace, as it was called, and got himſelf acknowledged ſupreme chief of the nation, in the intended war againſt Perſia. He fixed the quota of each ſtate in the combined army, and then returned to Macedon, to make his own preparations. Shortly after, to pacify ſome family diſcontents, he gave in marriage his daughter Cleopatra to the brother of Olympias, his divorced queen, and the mother of Alexander the Great. The nuptials were to be celebrated with great ſplendour at Ægæ; and at the ſame place and time he appointed the ambaſſadors of all the Grecian ſtates to aſſemble, in order to partake of a grand entertainment before his departure for Aſia. The concourſe was prodigious, and all ſtrove to ſurpaſs each other in demonſtrations of reſpect and attachment to the effective ſovereign of Greece. It happened that a young Macedonian, named Pauſanias, had ſome time before received an injury from Attalus, the brother of Philip's ſecond wife, and had ſought redreſs of the king in vain. He reſolved upon revenge, to which, it has been thought, he was excited by Olympias, the diſcarded wife of the monarch, and likewiſe by Darius the Perſian. Philip, during the feſtivity, going in ſtate to the theatre, with his guards at a diſtance, for the purpoſe of ſhewing the confidence he placed in his people, was ſuddenly ſtabbed to the heart by Pauſanias, who had planted himſelf at the door of the theatre, and fell dead at his feet. The aſſaſſin was near eſcaping to his horſe, but being accidentally thrown down, he was diſpatched by his purſuers. Thus fell Philip, at the age of 47, in the year B.C. 336, "juſt," ſays the hiſtorian, "as he was about, probably, to anticipate his ſon Alexander in thoſe great exploits, which have given the latter ſuch ſuperiority of fame, though founded on the preparations made by his father: for had not Philip, by his extraordinary efforts of military ſkill and policy, firſt rendered himſelf maſter of Greece, his ſon would never have been in the condition to lead a conquering army into Aſia."

Pauſanias's body was immediately hung on a gibbet; but in the morning it appeared crowned with a golden diadem, the only method that Olympias had to expreſs her reſentment of Philip. In a few days after, ſhe took occaſion of giving farther proof of her triumph and exultation in Philip's fall, by cauſing the ſame funeral honours to be paid to the remains of Pauſanias, which were prepared for Philip: both bodies were burnt on the ſame pile, and the aſhes of both were depoſited in the ſame tomb. Such was the commencement of the completion of Hermocrates' prediction, who being aſked by Pauſanias, "What that man ſhould do, who wiſhes to tranſmit his name with luſtre to poſterity," replied, "He muſt kill him who hath achieved the greateſt actions: thus ſhall the memory of the hero be joined with his who ſlew him, and both deſcend together to poſterity."

In the character of Philip was a ſingular mixture of good and bad qualities. He was crafty and diſſembling; he ſcrupled the uſe of no means of fraud or violence to obtain his purpoſes, and was occaſionally rigorous to his enemies. At the ſame time, he had much kindneſs and benignity in his nature, was affable, ſocial, liberal, and clement; a kind maſter,

master, and generally a just sovereign. He was himself learned, and a patron of learning. A variety of anecdotes are recorded of this prince, which redound greatly to his credit. Of these we shall select two or three, that shew the greatness of his mind, in bearing patiently reproof from inferiors. It was his custom, as it had been that of his predecessors, to administer justice in person; but a love of conviviality would sometimes interfere with the more imperious calls of duty. Having several times told a woman, who came with a petition, that he was not at leisure; she at length lost her temper, and replied, "If you have not leisure to do justice, cease to be a king." Struck with the propriety of the reprimand, he instantly attended to her case, and gave redress. At another time, having given an hasty decision against a woman, upon rising from a banquet, she cried, "I will appeal." "To whom?" said Philip. "To Philip sober," she replied. He reconsidered, and retracted his judgment. After his breach with his son, whom he had banished from his court, being visited by his friend Demaratus of Corinth, and asking him if all was quiet in Greece; "You have reason, truly," he replied, "to concern yourself about the quiet of Greece, when you have filled your own family with strife and disorder." Philip took the reproof kindly, and recalled his son. Univer. Hist. Plutarch.

Philip V., the next of the Macedonian Philips who require to be noticed in our work, was the son of Demetrius II., who at his death, in the year 232 B.C. (see his article) left him, then but three years of age, in the tutelage of his uncle Antigonus Doson. On the decease of the latter, in the year 221, Philip took the reins of government into his own hands. At this time he displayed many qualities which gave promise of a happy and illustrious reign. He possessed quick parts, a solid understanding, and a retentive memory. He had been sent by Antigonus at an early age into Peloponnesus, to study the art of government under that eminent patriot and statesman, Aratus of Sicyon; and his uncle, upon his death-bed, had charged him to follow his counsels in every thing relative to Grecian politics. By the advice of Aratus, he joined the Achæans in the social war between them and the Etolians; and soon after his accession he departed for Greece, and arrived at Corinth. During the course of this war he distinguished himself by his vigour and enterprise, and performed various brilliant actions. His minister Apelles, who was greatly in his confidence, abused that confidence, and was guilty of various acts of treachery against his sovereign, for which, at length, he, his son, and some others, were put to death. The war continued some time longer to the advantage of Philip and his allies, till the successes of Hannibal in Italy inspired the young king with ambitious projects of extending his dominions, while the two powerful nations, the Romans and Carthaginians, were exhausting each other. A peace was concluded among the Grecian states, and Philip, after the battle of Cannæ, entered into a treaty offensive and defensive with Hannibal, who then appeared likely to turn the balance of empire in favour of Carthage. He now began to pursue a similar plan of policy with that of his predecessor Philip II., and by fomenting disturbances in the Grecian states, endeavoured to bring them under subjection to himself; upon which, Aratus discovering the change in his character, withdrew from his court, and lived as a private person at Sicyon. Not long after, Philip employed, it is said, one of his officers to administer a slow poison to the venerable patriot; of the consequences of which he died. From this period Philip was engaged in almost incessant wars, in which he shewed no want of courage and activity, though he frequently failed in his enterprises; but in the year 197 B.C., Flaminius, the Roman commander, brought him to a general engagement at Cynoscephalæ, which terminated in the king's total defeat, and reduced him to supplicate for peace. This was granted upon the terms, that he should withdraw all his garrisons from the Greek cities of Europe and Asia, which were to be left free; that he should deliver up his prisoners and deserters, and all his decked ships; should reduce his army; should carry on no war beyond the limits of Macedon, without the consent of the Roman senate; and should pay a thousand talents to the conquerors. His younger son, Demetrius, was to be sent for education to Rome as a hostage. Such was the end of the projects for aggrandisement, which had kept him in perpetual action from the period of his accession to the throne. It was now his great object to make use of the peace he was compelled to keep, in recruiting his strength for any favourable opportunity that might offer of resuming his arms. He augmented his revenues not only by increasing the taxes and customs, but by opening the old mines, and working new ones; and in order to repair the loss of people sustained in the wars, he promoted marriage among his subjects, and brought a great number of Thracians to settle in Macedonia. Having more confidence in them than in his other subjects, he had practised the violent and cruel policy of transporting the inhabitants of his maritime towns into the inland and remote district of Pæonia, and giving their houses to be occupied by the Thracians and other barbarians. This and other tyrannical acts rendered him extremely unpopular, but a family dissention, more than all other evils, embittered his declining days. To this we have already alluded in the article Perses, in which we have shewn in what manner the king was imposed on to agree first to confine, and then to put to death, his younger son Demetrius. The discovery of the fraud, which had been practised upon him, and of the innocence of Demetrius, threw him into a state of grief and remorse, which almost deprived him of his reason, and he died miserably in the year 178 B.C., at the age of 58, after having taken ineffective measures to exclude his son Perses from the throne.

Philip, Roman emperor, was an Arab, born at Bostra in the Trachonitis, and the son, it is said, of a captain of robbers, which circumstance, however, does not, as an Arabian, prove him to have been of base extraction. It is probable he entered very early into the imperial service. In the reign of the third Gordian, he was appointed to succeed him as prætorian prefect. This elevation was regarded by him as an immediate step to the throne, and his first measures were directed to deprive the young emperor of the affection of his soldiers; and such was his villainous success, that by his intrigues, the army was induced unanimously to demand Philip for their emperor, and Gordian was obliged to consent to receive him at once in the character of a colleague and tutor. He soon arrogated to himself the supreme authority, and finding that Gordian still had many and warm adherents, he took care to have him removed, but in what manner is not known. To the senate he wrote, that the young emperor was dead of a disease. This happened in the month of March, A.D. 244. Philip was about forty years old at the time he came into possession of the throne, and his first act was to declare his son, a child of seven years of age, his partner in the empire. His popular manners and mild administration gained him the attachment of his new subjects, and having provided for his security abroad, by placing his brother at the head of the Syrian army, and his father-in-law at that of the troops in Mœsia and Macedonia, he marched against the Carpians, a barbarous tribe who

who infested the banks of the Danube. After defeating them, and obliging them to fue for peace, he returned to Rome.

The year 248 was regarded as the thoufandth year from the foundation of Rome, and on this occafion Philip celebrated the fecular games with great magnificence. Thefe were the laft celebrations of the kind, and they were fucceeded in the following ages by the Chriftian jubilees. He likewife publifhed an ordinance, by which he abolifhed that public licence of unnatural practices, which had hitherto fubfifted even under the beft emperors. Philip had thus far worn in peace the crown which he had acquired by the worft of crimes; but in the fifth year of his reign, a revolt was excited in the eaftern provinces. To reduce the troops to fubmiffion, Philip obliged Decius, a fenator of high reputation, much againft his will, to accept the government of Pannonia and Mœfia. As foon as he arrived in that country, he was compelled by the foldiers to affume the imperial purple, and either led or followed the army to the confines of Italy. Philip marched to meet him with a more numerous, but lefs warlike body of troops. An engagement enfued near Verona, which terminated in the defeat and death of the emperor. His fon alfo was killed by the prætorians as foon as intelligence of the event reached Rome. This event occurred in June 249.

It has been a matter of warm controverfy whether Philip was or was not a Chriftian, not that his conduct would in any degree do honour to the religion of the meek and benevolent Jefus, but in order that it might be afcertained whether he was entitled to the honour of being the firft Chriftian emperor. Dr. Lardner enters at large into this fubject; he fays, "Baronius, Huet, and fome others, take the affirmative fide of the queftion, others the negative. Tillemont fays, it is not without difficulties, and Mofheim has done his utmoft to perplex this queftion; and, the more to increafe the difficulty, argues, that he might be a Chriftian fecretly, though not openly." Having quoted his authorities on both fides of the queftion, he gives his reafons to prove that Philip was not a Chriftian, which are as follow: 1. That divers Chriftian writers fay, that Conftantine was the firft Roman emperor that made a profeffion of faith in the Chriftian religion; 2. That all heathen writers are filent about the Chriftianity of Philip and his fon; 3. That Philip celebrated the fecular games at Rome, in the thoufandth year of the city; 4. That the Philips were deified after their death. Upon the whole, therefore, fays Dr. Lardner, "I can fee no reafon to believe that the emperor Philip was by belief or profeffion a Chriftian. There is no doubt, however, that he was a protector of the new faith, and fhewed refpect to its minifters." Origen addreffed feveral epiftles to him, his wife and mother, which are not preferved.

Philip I., king of France, fon of Henry I., was born in 1052. At the death of his father in 1060, he was left under the guardianfhip of Baldwin, earl of Flanders, who adminiftered the public affairs with much ability and wifdom till his death in 1067. Philip then, at the age of 15, was declared of age, and affumed the government. One of his firft exploits was to enter Flanders with an army, to fupport the family of Baldwin's eldeft fon againft the younger, but meeting with a defeat near St. Omers, he abandoned the caufe. After this, he was involved in wars with William of England, called the Conqueror, and with thefe two kings commenced that rivalry between the Englifh and French crowns, which fubfifted fo long, and with fo much mutual lofs and bloodfhed.

After the death of William, Philip took little part in foreign affairs; he was naturally indolent and fond of pleafure, and a paffion in which he became involved, occupied him with domeftic difputes during many years of his reign. He had married Bertha, daughter of the count of Holland, by whom he had three children; but upon fome difguft, he divorced her on the pretence of kindred, and married Bertrade, wife of Foulques, count of Anjou. In confequence of this irregularity, he was excommunicated by pope Urban II., and his fubjects were difcharged from their allegiance. He repented, was abfolved, but fell into the fame fin again, which produced a repetition of the punifhment. At length Bertha died, and the marriage with Bertrade was at leaft connived at. To ftrengthen his authority, which had been greatly weakened by his own mifconduct, he affociated in the government, in the year 1104, his fon, Lewis le Gros; but Bertrade, who had children of her own, rendered the fituation of Lewis fo difagreeable, that he withdrew to the court of England, where his mother-in-law made fome attempts upon his life, which, however, he fortunately efcaped, and obliged the unnatural queen to beg forgivenefs of her crimes. Philip, after a long and inglorious reign of 48 years, died in 1108. The firft crufade was undertaken in his reign, but though it was very popular, he took fcarcely any part in it. Univer. Hift. Hift. of France, 1790.

Philip II., king of France, furnamed *Auguftus*, fon of Lewis the Young, was born in 1165, and fucceeded to the throne on the death of his father, in 1180. Though but fifteen years of age, and under the nominal tutelage of the count of Flanders, he affumed the reins of government, which he managed during his whole reign with equal vigour and prudence. One of his firft meafures was to banifh from his court the licentious players and buffoons who infefted it; he next expelled from his kingdom all the Jews, who by their art and induftry had poffeffed themfelves of a large fhare of its wealth. Their ill conduct and extortions were made the pretext for this feverity, but the true caufe appeared in the king's feizure of all their immoveable property, and his cancelling all debts due to them from his fubjects. He afterwards found it expedient to recall them, at the fame time, by laws made for the occafion, fetting fome limits to their ufurious extortions. The mercenary bands which had been engaged in the fervice of his father and the king of England, now committing great outrages in the kingdom, under the name of Brabancons, Philip fent troops againft them, which cut off the greater part, and expelled the reft. The capture of Jerufalem, in 1187, roufed the zeal of the weftern Chriftians, and a new crufade was fet on foot by the pope. In confequence, the kings of France and England took the crofs, and promifed to fufpend their differences. Their friendfhip was but fhort lived; a war between the monarchs enfued, and Henry of England was obliged to make a humiliating compromife, which he did not long furvive. Richard, who fucceeded to the Englifh crown, agreed with Philip upon a conjoint expedition to the Holy Land, in which both feemed actuated by the generous fpirit of chivalry. They met in the ifland of Sicily, and quarrelled about the king of that place. When the difputes were adjufted, they proceeded to the fiege of Acre, which fell before them. New differences arofe, and Philip returned to his own dominions in 1191. Soon after his return, Philip married Ingelburga, fifter of the reigning king of Denmark, againft whom, on the marriage night, he conceived a difguft, which induced him immediately to feparate from her. Philip, on pretence of remote affinity, procured from fome of his bifhops a divorce, and he efpoufed Agnes, daughter to the duke of Merania. Upon the complaint of the king of Denmark, pope Celeftin declared this marriage null,

null, and his successor, Innocent III., upon Philip's refusal to take Ingelburga again, laid the kingdom under an interdict. The king, after some resistance, thought it prudent to come to terms with the court of Rome, and to take back his lawful wife, at least to let her enjoy the title of queen in a distant castle.

Philip now turned his thoughts to Normandy, which was possessed by John, king of England; and when the latter had rendered himself odious to the whole world by the murder of Arthur of Britanny, Philip summoned him as a vassal to appear at his court of peers, and upon his refusal, procured a sentence against him of confiscation of all his lands in France. This was not an act of mere form, for Philip proceeded against him with great celerity; and in a short time, availing himself of John's inactivity and cowardice, re-annexed to the crown of France the whole of the fine province of Normandy, after it had been three centuries detached from that crown. He carried war still farther, so that in a short time, of all the English territories in France, Guienne alone remained to that sovereign. In 1213, upon a quarrel between John and the pope, the latter declared the English crown vacant, and offered it to Philip, who accepted it, and made preparations for taking possession of it. John, however, by his mean and debasing concessions, made the pope his friend, and assumed a degree of vigour which was not supposed to adhere at all to his mind. He formed a new confederacy; fitted out a fleet, which gained a greater naval victory than almost any recorded in the English annals; 300 of Philip's vessels were taken, 100 were sunk, and almost 1000 more were burnt, to prevent their falling into the hands of the victors. Philip, however, compensated this disgrace by a signal victory, which he obtained at Bouvines, in Flanders, in 1214, over the confederate army. He was present in the action, and was exposed to great danger through his martial ardour. The count of Flanders and several other great men became his prisoners. This success did not prevent him concluding a peace with John for five years. After this, some attempts were made to fix the French prince, Lewis, on the throne of England, but the enterprize ended in the complete expulsion of the French from the island. Philip died in 1223, in the 59th year of his age. He was accounted, and very justly, one of the ablest and greatest princes of his line: he was equally eminent for civil and military qualities, and scarcely any French monarch made such additions to the power and dominions of the crown. He was the first who maintained a standing army, even during peace, and he introduced several improvements in the military system. He was a patron to learning, raised up useful edifices, made roads, built bridges, fortified the principal towns, and employed for the benefit of the country the great sums which he amassed by taxes and economy. For the great additions which he made to his kingdom, he was called *The Conqueror*. He was easy and affable in his manners, and though little scrupulous in his politics, was not devoid of principles of equity and generosity. As a general, his reputation at least equalled that of any of his contemporaries; and the ingenuity with which he invented a variety of warlike engines, for the destruction of the human race, may be either applauded or regretted. But the character of the hero was surpassed by that of the statesman; his policy extended the narrow limits of kingly power, and his successors on the throne of France were indebted to Philip II. for the grandeur to which they attained. Univer. Hist. Stockdale's edition of Campbell's Lives of the Admirals. History of France, 1790.

Philip III., king of France, surnamed *Le Hardi*, son of Lewis IX., was born in 1245. He was with his father at Tunis at the time of his death, in 1270, when he succeeded to the regal title and dignity, and received the homage of the kings of Sicily and Navarre. He continued some time to carry on the war begun by his father with the Moors, in which he displayed so much courage, as to confer upon him his surname. At length he made an honourable peace, and returned to France. By the death of his uncle, the count de Poictiers, and his countess, without heirs, their domains reverted to the crown, consisting of part of Poitou, Auvergne, part of Saintonge, Aunis, and the county of Toulouse. Out of this secession, he made a present to the papal see of the county of Venaissin, which remained in its possession till the French revolution, which commenced in 1789, and which cannot even now be said to be terminated. Philip engaged in two wars concerning the succession to the crown of Castile, which produced no remarkable event, and which were terminated by the interposition of the pope. During his reign there happened the revolution in Sicily called the Sicilian vespers, in which his uncle, Charles of Anjou, lost his crown. The revolters were supported by Peter, king of Arragon, who claimed the kingdom of Sicily; but the pope excommunicated him, and conferred the title of king of Arragon upon the count of Valois, Philip's second son, and a crusade was declared against Peter. Philip, in support of his son's claim, entered Catalonia with an army, and took Gerona. The fleet was afterwards destroyed by that of Arragon, the chagrin of which, together with an epidemic disease, put an end to his life at Perpignan, in the year 1285, being the 41st year of his age, and the 16th of his reign. This monarch was the first who granted letters of nobility, that rank having previously been either hereditary, or derived from the possession of certain fiefs, or the profession of arms. He died regretted by an army which he had unsuccessfully commanded, and lamented by a people whom he had reluctantly impoverished. Univer. Hist. Hist. of France, 1790.

Philip IV., king of France, surnamed *Le Bel*, son of the preceding, was born in 1268, and succeeded to the crown in 1285, when he was seventeen years of age. He was already titular king of Navarre, in right of his wife Joan, heiress to that crown. Finding his affairs in a very disordered state, he was desirous of terminating the war in Spain, which he accomplished. The great rival of Philip IV. was Edward I. of England, who had done homage to the French king. Both sovereigns were high spirited, and in consequence of some acts of hostility, Philip demanded satisfaction, and cited his rival as a vassal before the parliament, to answer for the outrage. He did not appear, and Philip instantly proceeded to the arbitrary measure of confiscating all his possessions in France. Edward did not wish for a war, being already engaged in a contest with Scotland, and Philip obtained Guienne without resistance. The war which ensued in 1295 was carried on with vigour on both sides, in the course of which Philip became involved in the most serious disputes with the pope, Boniface VIII. who was unquestionably one of the most arrogant pontiffs of the Roman see. Philip had demanded a subsidy of his clergy, and the pope instantly issued a bull, prohibiting the clergy of every rank and order from paying any kind of tax to a layman, without permission of the holy see, and denouncing the awful penalty of excommunication against the defaulters, as well those who paid as those who received. Philip, on his part, forbade the exportation of money, jewels, goods, &c. out of the kingdom, without permission signed with his own hand. The pope, at length, ordered his legates to proceed to excommunication, but they were too prudent to comply without previous remonſtrance, and the diſpute was for the preſent compromiſed. Philip even conſented to make the pope arbitrator between him and Edward; and his award was, that not only Guienne ſhould be reſtored to the king of England, but that the earl of Flanders, who had been deprived of part of his kingdom in aſſiſting him, ſhould have it reſtored to him. The rancour ſtill ſubſiſting between Philip and Boniface, ſoon broke out with more fury than ever. The pope ſummoned the king to acknowledge that he held his temporal ſovereignty from him, and he ordered the French prelates and doctors to aſſemble at Rome, for the purpoſe of holding a council. Philip was firm, and convoked the ſtates-general of his kingdom, for the purpoſe of averting the blow aimed againſt his authority. The nobles, and the third eſtate, (now probably ſummoned for the firſt time,) warmly and decidedly ſupported the crown. The clergy temporized, and requeſted leave to go to Rome in conformity with the ſummons of the pope. The king and the barons joined in a prohibition; nevertheleſs, a number of them choſe to obey the court of Rome rather than their king. The concluſion of this violent quarrel was, that the king was excommunicated by the pope, and his crown was offered to Albert of Auſtria, but Philip appealed to a future pope and council, and by the aſſiſtance of the Colonna family arreſted Boniface at Anagnia, who eſcaped to Rome, where he ſoon after died.

During theſe tranſactions, a fierce war raged in Flanders, which country Philip had determined to unite to his own, and in the courſe of which the king defeated the Flemings in a bloody action, in which he diſplayed extraordinary valour at Mons-en-Puelle. He afterwards took Liſle, but finding the enemy ſtill numerous and obſtinate, he concluded a peace on advantageous terms. Theſe military tranſactions did not preclude Philip's attention to the reformation of internal abuſes. For this purpoſe he rendered ſedentary at Paris the parliament which had hitherto been ambulatory, and attached to the court, and from that time it became more properly a court of law. Benedict VI., who ſucceeded Boniface, had already abſolved Philip from the cenſures of the church, and after his death Philip procured the election of Clement V., having firſt made him promiſe upon oath to do what he ſhould deſire. He accordingly revoked the bull of pope Boniface, which prohibited the clergy from paying taxes to the king without permiſſion from Rome; granted him a tenth of their revenues for five years; annulled the declaration of the abſolute ſovereignty of the popes and finally was prevailed upon to conſent to a judicial proceſs againſt the memory of Boniface. The king's pecuniary wants led him more than once to the vile expedient of altering the ſtandard of the coin, and it was raiſed in 1306 to triple the value it had borne under St. Lewis, to the great diſcontent of the nation. The ſame neceſſity produced a new expulſion of the Jews, with the confiſcation of their property. A matter ſtill more injurious to Philip's character was the cruel perſecution which, in conjunction with the pope, he inſtituted againſt the Knights Templars. (See Templars, *Knights*.) Upon the moſt trifling evidence, the whole body of Templars throughout France were apprehended in one day, and committed to different priſons. Fifty-nine of them were burnt alive by ſlow fires, all aſſerting their innocence, and enduring their ſufferings with the greateſt conſtancy. The order was ſolemnly aboliſhed by the pope, and all its property confiſcated. The landed eſtates were conferred upon the order of Knights Hoſpitallers, ſince changed to that of Malta. Of the perſonal property, Philip took two-thirds by way of re-imburſement of the expences of the proceſs, which laſted ſome years. Philip was not without many domeſtic vexations: the wives of his three ſons were accuſed, and two of them convicted, of adultery. Theſe were ſentenced to perpetual impriſonment, and their lovers, Philip and Walter de Launay, ſeverely atoned for the tranſports of illicit love: after ſuffering the torment of being flayed alive, they, with an uſher of the chamber, the confident of their amours, were ſuſpended on a public gibbet. The many troubles to which Philip was ſubjected threw him into a lingering decline, which put an end to his life, after an eventful reign of twenty-nine years, in the year 1314. Though avarice and cruelty have caſt a ſhade over his talents and virtues, yet the vigour which he diſplayed in his conteſt with the pope, and the ſucceſs with which he reſiſted the formidable thunders of the Vatican, muſt not be forgotten. He made great additions to the power of the crown, by his introduction of lawyers and their maxims of juriſprudence into the parliament, and by the conſequence which he gave to the third eſtate, in ſummoning them to the ſtates-general. He was an encourager of letters, and promoted the tranſlation of ſeveral works into the French language. Univer. Hiſt. Hiſt. of France, 1790, vol. i.

Philip V., king of France, ſurnamed *Le Long*, was the ſecond ſon of the preceding, and born in 1293. On the death of his elder brother Lewis, in 1316, he obtained the regency till the widow whom he left pregnant ſhould be delivered. She brought forth a ſon, who lived but a few days, after which Philip was declared king of France, to the excluſion of Joan, the late king's daughter, who, however, inherited the kingdom of Navarre. Philip, by his firmneſs and attention to juſtice, quelled ſome diſturbances that were about to break out in the provinces. His ſtrict regard to his word had nearly impelled him to engage in a new cruſade, to which he thought himſelf bound by having taken the croſs with his father; but it fortunately ſuited the intereſts of the pope, whoſe ſee was at Avignon, to keep him in France. The Mahometans were apprized of the king's intention, and according to the common report, engaged the Jews to poiſon the wells, in which deadly work they were aſſiſted by the lepers, a numerous body of that time, living in richly endowed hoſpitals. To this machination, of which there was no ſpecific evidence, the credulity and prejudices of the age imputed an epidemic diſeaſe, that carried off vaſt numbers of the people; and the pretended conſpiracy was puniſhed with horrible executions, among which was that of 160 Jews in one burning pile, and with the confiſcation of the eſtates of the hoſpitals of the lepers. After this, Philip finding himſelf in a ſtate of tranquillity as to foreign affairs, meditated various reforms at home. One, which he carried into effect, was the excluſion of eccleſiaſtics from a ſeat in parliament, that they might not be diverted from their ſpiritual concerns. He had an enlarged mind for the times in which he lived, and planned an uniformity of coins, weights, and meaſures throughout France. From the counts of Valois, Clermont, and Bourbon, he purchaſed their claims of coinage within their own dominion; but though he carefully explained the benefits that would ariſe to the country, in general, from perſevering in this undertaking, he found himſelf continually embarraſſed by new and unexpected obſtacles. The mind of Philip was too ſenſibly wounded by the injurious ſuſpicions of his ſubjects; he beheld his honeſt endeavours productive of jealouſy and diſappointment; the violence of a fever only gave way to the mortal ravages of a dyſentery, and after languiſhing about five months, he died in the ſixth year of his reign. The hiſtorians of that credulous age have attributed his death to poiſon, but they all agree in acknowledging that

that he conftantly merited, though he was never able to acquire, the efteem and affection of his fubjects. He is characterifed as a wife, confcientious, public-fpirited prince, pious without bigotry, and a great lover of learning.

Philip VI., king of France, furnamed *De Valois*, born in 1293, was fon of Charles of France, count of Valois, and grandfon of Philip le Hardi. At the death of Charles le Bel, in 1328, who left no male heir, but his wife being pregnant, the regency was difputed between Philip and Edward III. king of England, who was fon of Ifabella, fifter to the late king. The title to the regency was in truth that of the fucceffion to the crown, and it was adjudged to Philip, on the principle that Edward could not derive a claim through a female. The queen being, in a fhort time, delivered of a daughter, Philip affumed the title of king, and was crowned at Rheims with unufual pomp. His firft great act was to reftore the count of Flanders to that throne from which he had been expelled by his fubjects for his attachment to the interefts of France. The terror of his arms induced the Flemings to make their fubmiffion, and confent to the reftoration of their count. The competition for the crown between Philip and Edward naturally left much ill blood, and Philip, to increafe the difference, fummoned Edward to do homage for Guienne and his other fiefs in France, who returned for anfwer, that it did not become the fon of a king to humiliate himfelf before the fon of a count. The threat, however, of confifcation of his revenues brought him very unwillingly to Amiens the next year, where he appeared with a magnificent retinue, and was met by Philip in equal ftate. After many difputes concerning the nature of homage, he was permitted to pay it in general terms. But after his return, a deputation was fent to England, which induced Edward to acknowledge that a liege homage was due to the king of France. He accordingly returned to France the next year, and was received by Philip with great refpect, fo that their amity feemed to be well eftablifhed; but this was only in outward appearance, and an incident foon occurred which caufed their fecret animofity to burft into a flame. The count of Artois, after the death of the laft count, had been adjudged to Maud, his daughter, in oppofition to the pretenfions of Robert d'Artois, Maud's nephew. Robert retired to England, and did not ceafe to urge the commencement of hoftilities againft Philip, who had proved himfelf inimical to his claims. In 1339 the war commenced. Edward, having made an alliance with the emperor Lewis of Bavaria, and alfo with Arteville, the brewer of Ghent, laid fiege to Cambray, but without fuccefs; and Philip, with a very numerous army, covered his frontiers fo well, that his rival could obtain no advantage over him. At the fame time the French fleet made great depredations on the Englifh coaft, took and burnt Southampton, and landed in various other places. Thefe infults were however completely revenged the next year, by the great naval combat of Sluys, in which Edward in perfon deftroyed half the French fleet with the crews. The war was continued with various fuccefs for feveral years. In the fummer of 1346, Edward landed at La Hogue with 30,000 men, accompanied by his fon, the Black Prince. They immediately began reducing the ftrongeft cities in the neighbourhood, after which they fpread fire and fword on every fide, even to the very gates of Paris. All the efforts of Philip, who long kept the field, though wounded, were unable to turn the fortune of the day. The French were defeated, in the famous battle of Crecy, with a lofs of men greater than the number of the whole Englifh army, comprehending many of the principal nobility. In the courfe of this war France was reduced to the moft diftrefsful condition; the people difheartened and ruined by exceffive impofitions, famine defolating the country, and a peftilence raging in the capital. Fortunately for Philip, peace was as neceffary for Edward as for him, and a truce was negociated for three years. Philip now became captivated with the charms of the princefs Blanche of Navarre, whom he had deftined for the fecond wife to his eldeft fon, that he efpoufed her himfelf, and married his fon to the widow of Philip of Burgundy, count d'Artois. The feftivities on account of thefe nuptials were however very foon fucceeded by mourning for the king's death, which happened in 1350, when he was in the 57th year of his age, and the 23d of his reign. He lived to lofe the affections of his fubjects, by whom he was once idolized, though his misfortunes rather than his faults were the occafion. Univer Hift. Hift. of France, 1790.

Philip I., king of Spain, and archduke of Auftria, fon of the emperor Maximilian I., was born in 1478. A marriage between him and Joanna, daughter of Ferdinand of Arragon and Ifabella of Caftile, took place in 1496; and the death of her only brother, Don Juan, left Joanna the heirefs of their vaft dominions. In 1502, the archduke and his fpoufe vifited Spain, where they were acknowledged by the Cortes as the lawful fucceffors to the crown of that kingdom. In paffing through France, Philip had done homage to the king, Lewis XII., for the earldom of Flanders, which he inherited in right of his mother, Mary, daughter of Charles the Bold, duke of Burgundy. The temper of Philip was ill fuited to the folemn ftatelinefs of the Spanifh court, and notwithftanding the intreaties of his wife, who doated on him, he haftily returned to the Low Countries. He now figned a treaty with Lewis, by which he hoped all differences between the crowns might be adjufted, but his father-in law, Ferdinand, finding his affairs profperous in Italy, paid no regard to it. Ifabella died in 1504, and left the regency of Caftile to Ferdinand, till her grandfon Charles fhould come of age. Ferdinand was however obliged to refign the regency, and Philip was put in poffeffion of the royal authority. The diflike which this prince always fhewed to the Inquifition, and the preference which he gave to his Flemifh favourites, began to produce alarming difcontents, when death put a period to his reign, in the year 1506, at the age of twenty-eight. He is diftinguifhed only as being the father of the emperor, Charles V., fee his article. Univer. Hift. Robertfon.

Philip II., king of Spain, fon of the emperor Charles V., and Ifabella of Portugal, was born in 1627. When he was only in his fixteenth year he was married to Mary, daughter to the king of Portugal, and at the fame time his father, on leaving Spain for Germany, committed the adminiftration of that country to him, with minute inftructions for his conduct, and affigning him the duke of Alva as his counfellor in military affairs. No event of confequence happened under his regency in Spain, and in 1547, Charles being defirous of having him near his perfon, he configned his authority to his coufin Maximilian, and embarked for Germany. In this progrefs, he acted the part of a great prince with a dignity fuitable to his high rank, and gave a favourable impreffion of himfelf to all the diftinguifhed perfonages in Italy and Germany, who were introduced to him on the way. He met the emperor at Bruffels, and the ftates of the Low Countries formally recognized Philip as their future fovereign; and in all the towns which he vifited, he was received with extraordinary rejoicings; but in the midft of thefe feftivities he difplayed a feverity of difpofition, and an exclufive attachment to his Spanifh attendants, which infpired the Flemings with a permanent diflike.

In

In 1550 he appeared with his father at the diet of Augsburg. This was a ſtep towards the ſcheme which Charles had much at heart, *viz.* that of procuring his ſon's ſucceſſion to the imperial dignity. But independently of other obſtacles, Philip's whole demeanor was ſo offenſive to the Germans, that his preſence only proved an additional impediment, and he was ſent back to Spain. Mary of England having ſucceeded to the crown on the death of her brother Edward VI., Charles inſtantly thought of her as a fit wife for his ſon, who was now a widower. Philip, though much younger than Mary, agreed to the propoſal, the marriage was agreed on, and Philip came over to England in 1554 for its celebration. He found the people wholly averſe from the union: the parliament ſhewed its diſapprobation by rejecting a motion that England ſhould give aid to the emperor in his war with France, and they went farther, by refuſing their conſent to Philip's coronation as the queen's huſband. Finding little ſatisfaction in this country, and being rather diſguſted than gratified by his wife's importunate fondneſs, he withdrew to Flanders. In 1555 the emperor Charles reſigned his authority and crown, and Philip at once roſe from a ſubordinate ſtation to that of the moſt powerful prince of Europe. At Bruſſells he received the full ſurrender of the ſovereignty over that part of his dominions; and in a few weeks afterwards he was put in poſſeſſion of the crown of Spain, and all its vaſt dependencies. The firſt meaſure of Philip as ſovereign was to conclude a truce for five years with the king of France. This truce was broken in a few months by the French, and pope Paul IV., the avowed enemy of Philip, declared him to have forfeited the kingdom of Naples, which was a fief of the holy ſee. Philip had too much religion to take up arms againſt the head of the church, neverthelefs, he found himſelf conſtrained to ſend his general the duke of Alva againſt him, to bring his holineſs to terms, in which he ſoon ſucceeded. War was in the mean time renewed in the Low Countries, and Philip viſiting England, uſed all his endeavours to engage that country to join him as an ally. Mary perſuaded her miniſters to declare war againſt France, and in the end ſhe loſt Calais: but Philip gained a great victory over the French at St. Quintin, in Auguſt 1557, and to mark his gratitude for the event, he built a church, a monaſtery, and a palace to the honour of St. Lawrence, on whoſe feſtival the battle was fought. The Eſcurial was the monument erected on this occaſion. In the ſame year, Philip's ſuperſtitious fears induced him to grant a peace to the pope, upon terms more humiliating to himſelf than to the vanquiſhed. In 1558 Mary died, and Philip made propoſals of marriage to her ſucceſſor Elizabeth, of whom he had been the protector, when her life was endangered by the jealous bigotry of her ſiſter. She was, however, too well acquainted with Philip's diſpoſition, and too ſenſible of the diſlike borne him by the Engliſh nation, to liſten to the propoſal. In 1559 peace was concluded, which put an end to the long and deſtructive conteſt between the Spaniſh and French monarchies. In the courſe of that year he returned to Spain, and was treated by the Spaniſh inquiſition with an *auto de fè* (ſee the article Act *of faith*); and his devout behaviour at the burning of his wretched ſubjects, which ſhews the blackneſs and malignity of his heart, has been commended by Spaniſh hiſtorians, who were nearly as ſavage as the prieſts who performed the horrid deed. At this period thoſe commotions began to prevail in the Auſtrian Netherlands, which produced the moſt memorable events in Philip's reign. The principles of the reformation had made great progreſs in thoſe ſtates, and Philip, equally deſpotic in his temper, and bigotted to his religion, was determined to uſe his authority to ſilence all diſcontents. For the effectual ſuppreſſion of hereſy, he eſtabliſhed a court of inquiſition, on the model of that infernal one in Spain, and he retained a body of foreign troops in the country, to overawe oppoſition, notwithſtanding the remonſtrances of the ſtates, who ſaw that the ſubverſion of their liberties was the aim of his policy. It was the maxim of this tyrant, "that a king had better be without ſubjects, than be a king of heretics." At one time, however, he found it neceſſary to temporize, having againſt him a moſt formidable oppoſition, headed by the prince of Orange, and the counts of Egmont and Horn. He was, at the ſame time, in conjunction with the court of France under Catharine de Medicis, and her ſon Charles IX., laying a plan for the total extirpation of the Proteſtants. When this was matured, the perſecution of the heretics was reſumed; and in 1567, the criſis of tyranny and cruelty arrived in the miſſion of the deteſted duke of Alva, who was prepared with means, as extenſive as his own heart was black, for cruſhing all reſiſtance, and carrying into full execution the coercive plans of the Spaniſh court. The eſtabliſhment of the bloody council, the execution of counts Egmont and Horn, with a multitude of others of inferior condition, were among the immediate effects of the duke of Alva's preſence. Though Philip was, perhaps, only the remote cauſe of theſe evils, yet he never ſhewed any ſigns of compunction for the miſeries which were occaſioned under the ſanction of his name and authority; and it is pretty certain the ſevereſt meaſures had his full approbation.

Philip was now doomed to domeſtic diſquiet; his eldeſt ſon Carlos engaged in intrigues againſt his government, and being unſucceſsful, he was driven to deſpair, and exhibited ſuch marks of derangement, as to juſtify the king in ſecuring him in a place of confinement. In a few months the prince died, but by what means is not known: ſome writers aſcribe his death to the conſequences of his own irregularities, and others have not ſcrupled to charge the king with being privy to it. This event took place in 1567. A revolt of the Moriſcoes in Granada occupied the Spaniſh arms two or three years, and gave Philip much uneaſineſs; it was, however, concluded in 1570, and in the ſame year he married his fourth wife, the archducheſs Anne of Auſtria. In 1571, the Spaniſh arms, in conjunction with thoſe of the confederates, acquired great glory by the naval victory obtained under the command of Don John of Auſtria, Philip's natural brother, over the Turks at Lepanto. In the Low Countries the cruelties of Alva had excited ſuch a determined ſpirit of reſiſtance, that he ceaſed to be ſucceſsful in his military enterprizes, and was recalled in 1573. Requeſens was ſent to ſucceed him; and upon his death in 1576, the government was committed to Don John of Auſtria, with full powers to grant any terms for concluding a war already extremely burdenſome, *except liberty of conſcience.* On the death of Don John, in 1578, the prince of Parma ſucceeded to all his authority, and for ſome years proceeded in a career of ſucceſs, which finally terminated in the recovery of the ten ſouthern provinces to the crown of Spain. On the death of Sebaſtian, king of Portugal, Philip laid claim to the crown, and by the help of the bloody duke of Alva obtained the object of his wiſhes. The aſſaſſination of William, prince of Orange, in 1584, delivered him from an inveterate foe, and was the cauſe of indecent rejoicings at the Spaniſh court; but his ſon Maurice proved a ſtill more formidable opponent. For ſome time cauſes of mutual complaint had ſubſiſted between the courts of Spain and England, and in 1586, Elizabeth, ſeeing the imminent danger of the united ſtates of the Netherlands, and impending hazard to her own crown and the Proteſtant religion, ventured to en-

ter

ter into an open treaty with them, by which ſhe engaged to ſupply them with men and money. At the ſame time ſhe ſent ſir Francis Drake with a powerful armament to attack the Spaniſh ſettlements in America. Philip retaliated by exciting an inſurrection in Ireland, and by his well-known *Armada;* which ſee. The ſame political ſyſtem of exciting civil diſturbances among his neighbours, together with zeal for the Catholic religion, the principal ſupporter of which he affected to be thought, induced him to give his aſſiſtance to the famous league in France. He became the avowed enemy of Henry IV. a declared Proteſtant, and even after he had renounced his faith he continued his hoſtility, and employed his influence at Rome to retard that king's abſolution as long as poſſible. This conduct produced a declaration of war from Henry in 1595, which was carried on with various ſucceſs. In the mean time war continued with England, in which Spain ſuffered the ſevereſt diſaſters. Philip, at length, broken by diſappointments and infirmities, was deſirous of reſtoring tranquillity to his kingdom, and in 1597, peace was concluded between France and Spain, but he ſurvived it only a few months. When he found his end approaching, he cauſed himſelf to be conveyed from Madrid to the Eſcurial, where he died in September 1598, in the 72d year of his age, and the 43d of his reign. His character has been fully diſplayed in the account of his conduct and actions. He had ſagacity to diſcover, and wiſdom to employ, men of abilities: he was a friend to learning and the arts, where they did not interfere with his religious prejudices. His domeſtic adminiſtration was in ſome reſpects laudable, but his boundleſs ambition and bigoted principles rendered his whole reign a period of war and contention, and waſted the vaſt reſources which he poſſeſſed, without effecting any of the great objects at which he aimed, and the Spaniſh monarchy dates its decline from his reign. Univer. Hiſt. Robertſon and Hume.

PHILIP III., king of Spain, ſon of the preceding by Anne of Auſtria, was born at Madrid in 1578; of courſe he was in his 21ſt year when he ſucceeded to the crown. He had the character of a virtuous prince, but was very deficient in thoſe talents that ſeem neceſſary to the well-governing of a great ſtate. He almoſt immediately married Margaret of Auſtria; and as ſoon as James I. aſcended the Engliſh throne, overtures of accommodation were made on the part of Spain, which terminated in a peace between the two kingdoms in 1604. The war with the Dutch ſtates continued, but ſo little hope remained of a final recovery of theſe provinces, that a truce negociated with the United Provinces as an independent government was concluded in 1609. In the ſame year a meaſure was adopted which inflicted a deep wound on the population, the wealth, and the induſtry of Spain. This was the total expulſion of the Moriſcoes, of whom a great number was ſtill remaining in the ſouthern provinces, which they rendered rich and fertile: They were charged with being the enemies of Chriſtianity, and with holding a traiterous correſpondence with the Moors of Barbary, and other foes of the ſtate. The barons, their landlords, who regarded them as very profitable tenants, denied the truth of the charge. The influence of the clergy prevailed, and the Moriſcoes, to the number of 400,000, were expelled from all the provinces of Spain, upon a very ſhort warning, and under circumſtances of great injuſtice. An edict, conferring honour and exemptions upon all who would engage in agriculture, was intended to remedy the miſchiefs of this meaſure, but ſkill and induſtry are not to be created at the pleaſure of a miniſter, and Spain to this day feels the loſs of her ableſt cultivators. A double marriage between Philip's eldeſt ſon, the prince of Aſturias, and Iſabella, ſiſter to Lewis XIII. of France; and between this monarch and the infanta of Spain, concluded in 1614, was one of the great political events of this reign. Philip died in 1621, of a morbid melancholy, ſaid to have been occaſioned by the mal-practices of his prime miniſter; but others impute it to a circumſtance of court etiquette; a brazier placed ſo near as to incommode his majeſty could not be removed for want of the preſence of the proper officer, till he had received a ſerious injury from the heat. Univer. Hiſt.

PHILIP IV., king of Spain, ſon of the preceding, by Margaret of Auſtria, was born in 1605, and ſucceeded his father in 1621. He immediately gave the reins of government to his favourite the count d'Olivares, who was his confident and miniſter of his pleaſures. By his perſuaſions the young king aſſumed the title of Great, which few monarchs have leſs deſerved. Forming a ſtrong alliance with the emperor of Germany, he re-kindled a war in Italy, in the hope of eſtabliſhing the Spaniſh influence in that country, while the French were occupied with inteſtine troubles, which Olivares ſecretly fomented. The ſecret hoſtility between the two crowns terminated in open war in 1635, the events of which were in the beginning favourable to Spain; but fortune at length turned, and in addition to various diſaſters by ſea and land from the enemy, two very ſerious internal calamities diſtreſſed the Spaniſh court. A plan formed for aboliſhing the privileges of particular provinces, was tried in Catalonia with ſuch ill ſucceſs, that in a furious revolt the viceroy was killed, and the whole province broke out into open rebellion. In the ſame year, 1640, Portugal threw off the yoke of Spain, and placed the duke of Braganza upon the throne, which had been occupied by his anceſtors. This and other misfortunes induced the king to diſmiſs his miniſter, and Olivares was diſgraced. Affairs were little improved under the new adminiſtration. Maſſaniello's revolt at Naples, in 1646, augmented the confuſion; but on the other hand a proviſional treaty of peace ſigned with the Dutch, freed Spain from one of the moſt troubleſome wars it had ever experienced. The peace was finally ratified in 1648. Barcelona, with the greateſt part of Catalonia, were recovered in 1652; but the junction of Cromwell with France, the ſucceſſes of Blake againſt the Spaniards at ſea, and their defeats in the Low Countries, and on the frontiers of Portugal, rendered the Spaniſh court ſincerely deſirous of a general peace, and in 1659 the famous treaty of the Pyrenées was concluded. The kings of Spain and France had an interview in the iſle of Pheaſants, on the confines of the two kingdoms, where they ſigned the peace, and Lewis received for his bride the infanta, Philip's daughter. The war for the recovery of Portugal ſtill continued; but by a total defeat of the Spaniſh general in the plain of Montes Claros in 1665, the cauſe of Spain was rendered hopeleſs. Philip fainted away on receiving the news, and in the September of the ſame year he died, after a reign of 44 years. The prince did not want for talents, and would probably have done honour to his high ſtation, had he fallen into good hands while he was young; but an early introduction to licentious pleaſures, and ſubjection to an ambitious favourite, who diverted him from all attention to buſineſs, rendered his reign inglorious to himſelf, and diſaſtrous to his kingdom. Univer. Hiſt.

PHILIP V., king of Spain, born in 1683, was ſecond ſon of Lewis, dauphin of France, and bore the title of duke of Anjou. He ſucceeded Charles II., and was proclaimed king of Spain at Fontainebleau, and at Madrid in November 1700. He arrived in his new kingdom in the beginning

ginning of the following year, and married the daughter of the duke of Savoy. At firft every thing feemed to promife a quiet acceffion and profperous reign, but a ftorm was fecretly rifing, which foon diffipated thefe flattering appearances. Several of the European powers, jealous of the influence which France would acquire over the Spanifh counfels under a French prince, made a league to place the archduke Charles on that throne. Into this grand alliance entered England, Holland, and almoft all the German princes, with the emperor, and it was afterwards joined by Portugal and Savoy. Philip gave an opportunity for forming a party againft him in Spain, by a journey into Italy to appeafe a revolt in Naples, and to take poffeffion of the duchy of Milan. He was prefent with the duke of Vendome at the battle of Luzzara, where he gave proofs of great perfonal courage. Returning into Spain, he found that difaffection to his caufe had made alarming progrefs; and the archduke Charles was publicly declared king of Spain, at Vienna, in 1703. An Englifh fleet conveyed him the next year to Portugal, and he now found that he had an arduous conteft to fuftain for his crown. The war of which Spain then became the feat, was attended with various viciffitudes of fortune. Gibraltar was taken by a coup-de-main by the Englifh, and a formal fiege for its recovery proved fruitlefs, as all have done fince. In 1705 Barcelona was taken by the allies, and was thenceforth the feat of king Charles's government. The allied army penetrated to Madrid, of which it took poffeffion. Philip, however, very foon recovered the capital, which was much more attached to him than to his competitor. The war was continued with various fuccefs till 1710, when the duke of Vendome arrived from France to take the command, and his ability foon changed the face of affairs. This general, accompanied by Philip, made prifoners of general Stanhope and all his army, and defeated count Staremberg. From this time Philip maintained a decided fuperiority, and when, in 1712, the congrefs for a general peace was opened at Utrecht, Charles withdrew from Catalonia, and the crown of Spain was no longer contended for. Philip, on his part, figned an act of renunciation for himfelf and his fucceffors to all right of inheritance to the crown of France; and the ftates of the kingdom fettled the fucceffion to the Spanifh throne upon the male defcendants of Philip, in preference to the females, though nearer in blood. Peace was concluded in 1713; but Barcelona held out till taken by marfhal Berwick in 1714. Philip had gone through this conteft for a crown with a confiderable fhare of reputation, though it was evident, that he was rather formed to be governed than to govern. In military tranfactions he committed the whole direction to the general officers, contented with giving the fupport of his prefence. The affairs of Spain were foon put into the hands of the minifter Alberoni, the confident of Philip's fecond queen, Elizabeth Farnefe, princefs of Mantua. The politics of that enterprifing projector involved Spain in new troubles. He took poffeffion of Sardinia in 1717, and of Palermo in Sicily, and would have conquered the whole ifland, had not the neighbouring powers taken the alarm. A confederacy was formed againft him by France, England, and Holland: fir George Byng deftroyed the greater part of the Spanifh fleet, and Philip was obliged, in 1720, to part with his minifter Alberoni, as the condition of peace. Soon after this he fell into a morbid melancholy, which, without affecting his intellectual faculties, had fuch an effect upon his temper and habits of life, as denoted a total derangement. Though in perfect health, he would keep to his bed for months together, tranfacting bufinefs at hours the oppofite to thofe which he had ufually kept. He fometimes imagined that he was dead, and afked why they did not bury him. Nothing was found effectual in foothing his mind, and rendering him at all manageable, but mufic, and the celebrated finger Farinelli, who was retained about his perfon, became a moft important character at court. At length, in 1724, he abdicated the throne in favour of his eldeft fon Lewis. The young king dying in a few months of the fmall-pox, Philip was perfuaded to refume the fceptre. His melancholy in a great meafure difappeared, and he applied himfelf diligently to affairs of the ftate, efpecially to improving the adminiftration of juftice, and encouraging manufactures, arts, and fciences. In the war of 1733, he joined France againft the emperor and the infant Don Carlos, conquered Sicily and the kingdom of Naples, which were ceded to him at the peace of 1736. In 1739 a maritime war broke out with England, on occafion of the right of fearch claimed by Spain in the American feas. Philip did not live to fee the end of this, dying in 1746, at the age of 63, after a reign of 45 years. His character has been thus drawn: "If he was placed in a fituation out of the reach of danger, he quietly remained there; if circumftances brought him in the midft of the warmeft fire, he preferved the fame phlegm, and amufed himfelf with the fears of thofe about him. He was eafy with his fervants, familiar and good-humoured to thofe about him; but his qualities were rather paffive than active, and his attachments were more the refult of habit than fenfibility. He was devout; but his devotion confifted in minute punctilios; he was confcientious, and narrowly fcrupulous. Timid, referved, and taciturn in public, he obferved characters and actions with judgment and accuracy, but fuffered things to take their courfe." Univer. Hift.

Philip, duke of Burgundy, furnamed the *Good*, was born at Dijon in 1396. After the death of his father, in 1419, Philip, who fucceeded him to the dukedom, joined the party of the Englifh under Henry V., and affifted in carrying defolation through France, during the clofe of the reign of Charles VI. and the beginning of the reign of Charles VII. In 1435 he was reconciled to the king of France by the treaty of Arras, and became one of the moft powerful and wealthy fovereigns of his time, having united to the duchy of Burgundy almoft the whole of the feventeen provinces of the Low Countries. When the dauphin Lewis, afterwards Lewis XI., quarrelled with his father, and withdrew to the dominions of Burgundy, Philip gave him an hofpitable reception, but refufed to affift him in making war upon his father. The duke's fon, the count de Charolois, afterwards Charles the Bold, was of a fiery difpofition, and not likely to accommodate himfelf to the difpofition of their gueft. On the acceffion of Lewis, the duke and his fon were prefent at his coronation, and every thing feemed, at firft, to denote peace and amity, but fome perfidious conduct of Lewis caufed the count de Charolois openly to join in the "league for the public good," againft him, in which he was countenanced by his father, who refigned to him the adminiftration of his ftate. He died at Bruges in 1467, leaving behind him the character of a wife and generous prince, who had promoted the profperity of his fubjects. He inftituted the order of the Golden Fleece. Univer. Hift.

Philip, duke of Orleans, regent of France, the fon of Philip, brother of Lewis XIV., by Charlotte Elizabeth of Bavaria, was born in 1674. From a child he manifefted great quicknefs of parts, with a boundlefs curiofity, and a capacity for almoft every kind of acquirement. His preceptor, St. Laurent, a man of real principle and great merit,

merit, unfortunately died before his education was finiſhed, and he fell into the hands of the abbé Dubois, who entirely ſubverted his moral habits, and he gave himſelf up to open profligacy; yet he was naturally humane, frank, brave, and affable. He had a great ſhare of penetration and ſagacity, and would probably have made a ſhining figure in any kind of buſineſs, had not indolence and the love of pleaſure deſtroyed in him all conſtancy of purſuit, and firmneſs of character. His chief application was beſtowed on the arts, and he was a practiſer, as well as an amateur, of painting, muſic, chemiſtry, and mechanics. He made his firſt campaign, as a military man, in 1691, under marſhal Luxemburg; and in the following year commanded the reſerve at Steinkirk, where he received a wound. In the ſame year he married a natural daughter of the king by madame de Monteſpan, a degradation to which he was perſuaded by Dubois. After paſſing ſome years during peace in a round of pleaſures, and varied ſtudies, he was ſent, in 1606, to command in Piedmont the army that was beſieging Turin. When prince Eugene approached, for the purpoſe of raiſing the ſiege, it was the advice of the duke of Orleans to march out of the trenches to meet him; but the commander-in-chief was of a different opinion. In the rout that enſued, the duke received two wounds, and was obliged to recroſs the Alps in great diſorder. In the following year he went into Spain, and arriving immediately after the battle of Almanza, profited by that victory in the reduction of Valencia and Arragon, and took Lerida in Catalonia. A proſpect of the reſignation of Philip V. of Spain, to which we have already referred, induced the duke to engage in ſome intrigues, for ſecuring the crown of that country for himſelf. They were diſcovered, and his intentions defeated. Lewis, by his will, had nearly deprived him of all authority, though the power of the regency naturally fell to him; but ſoon after the monarch's death, the will was ſet aſide by the parliament of Paris, and the regent was eſtabliſhed in his full rights. He began his adminiſtration well, and ſhewed that his ideas of government were juſt and liberal; but an indolence, almoſt become natural to him, led him to devolve all the cares of his office to Dubois, the moſt unprincipled of men, and a total change from the manners and politics of the old court immediately took place. To bigotry and devotion ſucceeded open impiety: to form and decorum, eaſe and licentiouſneſs. A political connection was eſtabliſhed with the Engliſh cabinet under George I., which ſuited the perſonal intereſts of both the king and the regent. The former was conſcious that he was far from being firmly ſeated on his throne; and the latter had reaſon to apprehend that, in caſe of the death of the minor king, a claim would be advanced by Philip, king of Spain, notwithſtanding his ſolemn renunciations. Indeed Philip's miniſter, Alberoni, excited a conſpiracy in France, to deprive the duke of Orleans of the regency, and gain it for his maſter. This led France to join in a confederacy with the maritime powers, to defeat the projects of this miniſter, and remove him from his ſtation; which they effected. The regent gave all confidence to Dubois, whom he created counſellor of ſtate, and then miniſter and ſecretary for foreign affairs; after which, to the ſcandal of all order and forms of religion, he raiſed this libertine to the archiepiſcopal ſee of Cambray, and obliged the pope to create him cardinal. The derangement of the finances induced the regent and his miniſter eagerly to adopt the deluſive projects of the famous Law, (ſee the article,) which occaſioned an unheard-of ruin to vaſt multitudes, and many unjuſt and arbitrary proceedings, which rendered the government odious. Dubois died in 1723, and from that time the regent took the cares of prime miniſter into his own hands; but his indolent habits rendered him unfit for buſineſs, and he ſoon abandoned it to his ſecretaries of ſtate. Exhauſted by the viciſſitudes of public cares and private debaucheries, he died in December 1729, being in the 50th year of his age. The agreeable qualities of the duke have cauſed his memory to be treated with an indulgence to which he was not entitled. Vice, when allied with wit and good humour, is too eaſily pardoned. In the character of the duke of Orleans there was little reſpectable, to balance much that was contemptible, and even deteſtable. Duclos ſays of him, "Good and bad treatment, ſervices and offences, moved him ſlightly; he gave, but did not recompenſe; he readily pardoned, ſeldom eſteemed, and ſtill ſeldomer hated." He was, in truth, long before he died, ſunk in the groſſeſt debauchery, which proceeded to lengths that ſhocked even the licentious. He was ſuſpected of regarding his daughter, the ducheſs of Berry, with more than paternal fondneſs; at leaſt, it is certain that he initiated her in the looſeſt principles: and as a public man, he may be ſaid to have laſtingly injured the morals of the nation, and deſtroyed its credit.

Philip *Iſlands*, in *Geography*, two iſlands in the South Pacific ocean, diſcovered by captain Hunter in the year 1791, on his return from New South Wales to England. He deſcribes them as joined together, or nearly ſo, by a long ſandy ſpit, above water, which reaches for about two-thirds of the diſtance from the eaſtmoſt or largeſt iſland to the weſtmoſt, which is ſmall. A ſand bank above water encompaſſes the largeſt, and extends from the foot of the higher land about half a mile into the ſea. A few natives were ſeen on the ſhore as the ſhip paſſed by it. Theſe iſlands are dangerous to navigators in the night, on account of the ſandy ſpits which project from them: they were covered with ſhrubs, and had but few tall trees among them, and the land is low. The largeſt is in S. lat. 8° 6'. E. long. 140° 3'. They were computed to belong to the New Carolines, but they ſeemed to be wholly detached, and are about five miles aſunder. Captain Hunter called them Philip iſlands in honour of Arthur Philip, governor of New South Wales.

PHILIPPEAU, an iſland, 24 miles in circumference, ſituated in the N.W. part of lake Superior. N. lat. 48° 12'. W. long. 88° 58'.—Alſo, a bay of the gulf of St. Lawrence, near the ſtraits of Belleiſle. N. lat. 51° 20'. W. long. 55° 40'.

PHILIPPEVILLE, a town of France, in the department of the Ardennes, and chief place of a canton, in the diſtrict of Rocroy; 12 miles N.W. of Givet. It was anciently called "Corbigny," until Mary of Auſtria fortified it in 1577, when it received its preſent name, in honour of Philip II. king of Spain. The place contains 1202, and the canton 4880 inhabitants, on a territory of 155 kiliometres, in 13 communes.

PHILIPPI, Henry, in *Biography*, a learned Jeſuit, a native of Luxemburg, was born in the vicinity of St. Hubert's, in the Ardennes, in the year 1575. He commenced his noviciate in the order of Jeſus at the age of 21, and quickly ſurpaſſed all his contemporaries in the ſeveral departments of academical learning; but he was particularly verſed in ſcriptural hiſtory and chronology. Having been admitted to the degree of doctor of divinity, he taught philoſophy, ſcholaſtic divinity, and biblical literature, in the univerſities of Gratz, Vienna, and Prague. After this he was appointed tutor and confeſſor to Ferdinand III., king of Hungary and Bohemia; in whoſe ſervice he died, at Ratiſbon, in 1636, about the age of 61, while attending his royal pupil at the diet which elected him king of the Romans.

He was author of a great number of works, among which are the following: "Chronologica Synopſis ſacrorum Temporum," 1624; "Manuale Chronologicum veteris Teſtamenti," 1635; "Chronologiæ veteris Teſtamenti accuratum Examen," 1637, &c.

Philippi, in *Ancient Geography*, a town of Macedonia, at a ſmall diſtance towards the E. from mount Pangæus, near the ſea. Its firſt name was Credinas, and ſince Datus. It occupied the ſummit of a ſmall eminence. Philip, the father of Alexander, having taken poſſeſſion of it, fortified it and gave it his own name. The Romans eſtabliſhed in it a colony. It was ſituated on the great route from Theſſalonica. It is mentioned in the Acts of the Apoſtles. St. Paul preached here and wrought miracles; and addreſſed an epiſtle to its inhabitants. Some have thought that it was on a plain near this town that Brutus and Caſſius were defeated.

Philippi, or *Theſſaliæ Philippi*, the town of Thebes, in Theſſaly. This name might poſſibly have been given to a town bearing a different appellation. It appears, however, that the battle between Brutus and Caſſius on the one ſide, and Auguſtus and Mark Antony on the other, was fought here.

Philippi *Inſula*, an iſland of the Arabian gulf. Strabo.

Philippi, in *Geography*, a town of European Turkey, in Romania; 25 miles S. of Emboli.

PHILIPPIANS, *Epiſtle to the*. See Epistle.

PHILIPPICS, Philippicæ, φιλιππικοι λογοι, in *Literature*, a name given to the orations of Demoſthenes againſt Philip, king of Macedon; the deſign of which was to rouſe the Athenians to guard againſt Philip, whoſe growing power and crafty policy had endangered and ſoon after overwhelmed the liberties of Greece.

The Philippics are eſteemed the maſter-pieces of that great orator: Longinus quotes abundance of inſtances of the ſublime from them; and points out a thouſand latent beauties therein. In effect, that pathetic in which Demoſthenes excelled, the frequent interrogations and apoſtrophes with which he attacked the indolence of the Athenians, where could they be better employed? How much delicacy ſoever there be in the oration againſt Leptines, the Philippics have yet the advantage over it, were it only on account of the ſubject, which gives Demoſthenes ſo fair a field to diſplay his chief talent, we mean with Longinus, that of moving and aſtoniſhing. See ſeveral appropriate extracts in Blair's Lectures, vol. ii.

Dionyſius Halicarnaſſeus ranks the oration on the Haloneſe among the Philippics, and places it the eighth in order; but though the authority of that great critic be of no ſmall weight, yet that force and majeſty by which Cicero characteriſes the Philippics of Demoſthenes, ſeem to exclude the oration on the Haloneſe out of the number; and authoriſe the almoſt univerſal opinion of the learned, who reject it as ſpurious.

Libanius, Photius, and others, but above all the languidneſs of the ſtyle, and the lowneſs of the expreſſions, which reign throughout the whole, father it on Hegeſippus.

Philippic is alſo applied to the fourteen orations of Cicero againſt Mark Antony. It was Cicero himſelf that gave them this title in his epiſtle to Brutus; and poſterity have found it ſo juſt, that it has been perpetuated to our times.

Juvenal, Sat. x. calls the ſecond the *divine Philippic*, and witneſſes it to be of great fame, *conſpicuæ divina Philippica famæ*. That orator's intitling his laſt and moſt valued orations after the Philippics of Demoſthenes, ſhews the high opinion he had of them.

Cicero's Philippics coſt him his life; Marc Antony having been ſo irritated with them, that when he arrived at the triumvirate, he procured Cicero's murder, cut off his head, and ſtuck it up in the very place whence the orator delivered the Philippics.

PHILIPPINA, in *Geography*, a town of Mexico, in the province of Guatimala. N. lat. 12° 50′. W. long. 91° 30′.

PHILIPPINE, a town of Flanders, ſituated on an arm of the Scheldt, and ſtrongly fortified; 15 miles E. of Sluys.

Philippine *Bay*, or *Bahia de Cortes*, a bay on the S. of Cuba. N. lat. 22°. W. long. 83° 30′.

Philippines, or *Philippine iſlands*, a large group of iſlands in the Eaſt Indian ſea, diſcovered by Magellan or Magalhaens in 1521, and called by him the Archipelago of St. Lazarus, on one of which he loſt his life, after having taken poſſeſſion of them in the name of the king of Spain. They were afterwards called the Philippines in honour of that infamous tyrant Philip of Spain. The popular name of Manillas is, in the opinion of Mr. Pinkerton, preferable, as native and ancient. Philip II. ſoon after his acceſſion to the throne, founded a ſcheme for planting a colony in theſe iſlands, which had been neglected ſince the time of their diſcovery; and he accompliſhed it 1564, by means of an armament fitted out for New Spain. Manilla, in the iſland of Luzon or Luzonia, was the ſtation choſen for the capital of this new eſtabliſhment. The chief iſlands of this group are Luzon, the capital of which is Manilla, Mindanao, Palawan, Mindoro, Pani, Buglas or iſle of Negroes, Zebu, Leyt or Leita, and Samar or Samal. On the coaſt of Zebu is the ſmall iſle of Mactan, where the celebrated navigator Magellan was ſlain. See an account of theſe iſlands under their reſpective names. The other little iſlands might be counted by hundreds. This great and extenſive group preſents, in general, many volcanic appearances, and moſt of the iſles abound with lava and volcanic glaſs, ſulphur, and hot ſprings; or, at leaſt, thus they are deſcribed by the French writers. They preſent wild boars, deer, and uſeful animals of various kinds; and among vegetables the bread-fruit muſt not be forgotten, which fruit appears on the eaſtern coaſts of Sumatra, and thence extends its benefits through innumerable iſlands in the Indian and Pacific ocean.

Philippines, *New*. See Pelew *Iſlands*.

Philippines, *Company of the*, a commercial eſtabliſhment in Spain, which ſucceeded the Caraccas company, and abſorbed their capital. This company took its riſe in the year 1785, with a capital of 1,200,000*l*. and with valuable privileges granted to it for 25 years. Previouſly to this eſtabliſhment, two ſhips ſailed annually, one from Acapulco, a ſeaport of Mexico, and croſſing the Pacific ocean, carried the treaſures of America to the Philippines; the other, returning by the ſame courſe from Manilla, the capital of Luconia, came to Acapulco, where it was met by veſſels from Lima, loaded with cacao, quickſilver, and hard dollars; in barter for which the merchants ſent back china ware, ſpices, perfumes, ſilk, calicoes, muſlins, and printed linens, the produce of the eaſt.

When the Philippine company began its operations, this traffic ceaſed; and now, under the ſpecious idea of ſaving time, with freight and inſurance, required in conveying the gold and ſilver, but chiefly ſilver, of Peru and Mexico, by Europe to the eaſt, theſe precious metals are ſent directly weſtward to the place of their final deſtination, whilſt the moſt bulky and periſhable produce of the eaſt, to the ſame amount in value, is diverted from its former courſe, and

made

made to defcribe, in the oppofite direction, that fegment of the circle, which had anciently been traced by the filver and the gold.

The Philippine iflands, almoft innumerable, and caft up by volcanoes, are healthy, fertile, and, befide all the grains of Europe, produce gold, copper, iron, fhip-timber, hemp, alum, faltpetre, cattle, hides, fago, rice, raifins, cacao, fugar, tobacco, wax, fifh, and couries, which are the money of Hindooftan. Thefe, with the filver, indigo, and cochineal of America, the company barters with the merchants of Afia for muflins, cottons, filks, fpices, tea, quickfilver, and china ware, which, with the fuperabundant produce of the iflands, are now brought by the Cape of Good Hope to Europe, and are admitted under eafy duties into Spain with a drawback of one-third on their exportation.

But the hopes which this beneficial trading eftablifhment excited foon vanifhed, and like other monopolies, the advantages refulting from it became of no long duration.

PHILIPPISTS, in *Ecclefiaftical Hiftory*, a fect or party among the Lutherans; the followers of Philip Melancthon.

That reformer having ftrenuoufly oppofed the Ubiquifts, who arofe in his time; and the difpute growing ftill hotter after his death, the univerfity of Wittemberg, who efpoufed Melancthon's opinion, were called, by the Flacians, who attacked it, Philippifts.

PHILIPPOPEL, in *Geography*. See Filippopoli.

PHILIPPOPOLIS, in *Ancient Geography*, a town in the interior of Thrace, according to Ptolemy, who fays that it recognized Philip, the fon of Amyntas, for its founder or its reftorer. It was fituated on the Hebrus.—Alfo, a town of Arabia, mentioned in the acts of the council of Chalcedon.

PHILIPPOW, in *Geography*, a town of Lithuania; 40 miles W. of Grodno.

PHILIPS, Ambrose, in *Biography*, an Englifh poet, was born of a Leicefterfhire family in 1671. He was educated at St. John's college, Cambridge, where he obtained a fellowfhip, and took deacon's orders. He attached himfelf to the Whig party, and obtained an introduction to Addifon and Steele. He had already made himfelf known by his poetical compofitions, and in 1703 he dates a copy of verfes from Utrecht; but his fituation or object at that place is not known. In 1709 he was at Copenhagen, where he was probably in fome public capacity. From this place he wrote his much admired lines to the earl of Dorfet. On his return, he found his friends out of power, and he employed himfelf in tranflating Perfian tales for Tonfon the bookfeller. In 1712 he appeared as a dramatic writer, in his tragedy of "The diftreft Mother," which was acted with great applaufe at Drury-lane, and which is ftill in reputation as a ftock play. The literary diftinction that he had now obtained was probably the caufe of an exaggerated compliment from Tickell, which eventually expofed him to ridicule and mortification. That writer, in a paper of the Guardian upon poetry, made the paftoral pipe defcend in fucceffion from Theocritus to Virgil, Spencer, and Philips. Pope, who found his own juvenile paftorals undervalued, fent to the fame periodical paper a comparifon between his own and thofe of Philips, in which he ironically gave the preference to the latter. Addifon detected the purpofe, and the paftoral reputation of Philips was ruined. From this moment open hoftilities were declared between the two poets, envenomed by the double power of party and rivalry. At the acceffion of George I., Philips was made one of the magiftrates for the city of Weftminfter; and he applied to Addifon, then fecretary of ftate, for another place, who told him, that he was confidered as already provided for by his office as juftice; to which he indignantly replied, that "though poetry was a trade he could not live by, he fcorned to owe his fubfiftence to another that he ought not to live by." In 1718 he was editor of a periodical paper, called "The Freethinker," in which he had feveral refpectable coadjutors. It was printed collectively in three volumes, but has long fince been forgotten. After this he brought out two more tragedies, *viz.* "The Briton," and "Humphrey Duke of Glocefter," which were well received. In 1724 he accompanied, in quality of fecretary, his friend Dr. Boulter to Ireland, created archbifhop of Armagh. Here he enjoyed other emoluments, which enabled him to reprefent in parliament the county of Armagh. On his return to England in 1748, he found himfelf the furvivor of moft of his early friends and enemies. He died in the following year, at the age of 78. His poems were publifhed collectively in one volume, 1748; and they now make a part of the body of Englifh poetry. "The paftorals have more natural defcription than Pope's melodious imitations; but they are not excellent in this refpect: and the air of fimple rufticity thrown over them, while it gives no refemblance to real life, difgufts by meannefs and puerility. That the author, when he aimed at the elegance of cultivated verfe, could attain it, is proved by his two tranflations from Sappho, and his letter from Copenhagen, which are undoubtedly his beft performances: the latter is fcarcely furpaffed as a defcriptive piece." Johnfon's Lives of the Poets.

Philips, John, an Englifh poet, born in 1676 at Brampton, in Oxfordfhire, was the fon of Dr. Stephen Philips, archdeacon of Salop. He received his claffical education at Winchefter fchool, where he gained great reputation by his Greek and Latin exercifes. In 1694 he removed to Chriftchurch college in Oxford, where he fully maintained the claffical diftinction he had acquired, and obtained the efteem of feveral literary characters. In 1703 he became known to the public by his poem of "The fplendid Shilling;" and the reputation which he acquired by this effufion was the caufe of his being felected by Harley and St. John, the heads of the Tory party, to celebrate the victory of Blenheim, in competition with Addifon, the poet of the Whigs. His poem on this occafion did not add to his fame. His didactic poem on Cyder, in 1706, is his principal piece, and to this his name is chiefly affociated. It at once became popular, and raifed him to eminence among the poets of his time. He had meditated a poem on the "Laft Day," which he did not live to finifh. He died in February 1708, in the 32d year of his age, to the regret of his friends, to whom he was endeared by his blamelefs and benevolent character. A tablet was erected to his memory in the Hereford cathedral, where he was buried; and a monument was placed in Weftminfter abbey by lord chancellor Harcourt, with a long and claffical epitaph, compofed by bifhop Atterbury. The "Splendid Shilling" and the "Cyder" of this poet are read with pleafure. "In both, the Miltonic verfe and diction are imitated: the *firft*, for comic effect, by contrafting the folemnity of the ftyle with the levity of the fubject; the *fecond*, for the purpofe of elevating a topic taken from common life. Dignity and variety are likewife attempted to be given to the didactic poem, by a clofe imitation of the plan and manner of Virgil's Georgics, particularly in frequent digreffions, from which the writer ufually returns with much fkill to his proper fubject. On the whole, the piece is rather to be admired for its art and learning than its poetry: it has little either of grandeur or

beauty,

beauty, and Milton is copied rather in his faults than his excellencies."

PHILIPSBURG, in *Geography*, a town of America, in New Jersey, and county of Sussex, on the E. bank of the Delaware, opposite to Easton in Pennsylvania; 41 miles N.W. of Trenton.

Philipsburg, or *Philipstown*, a township of Dutchess county, New York, on the E. side of Hudson river, 19 miles above New York, containing 2754 inhabitants. This township has within it a silver mine, which yields virgin silver.

Philipsburg, a town and fortress of the duchy of Baden, in the bishopric of Spire, near the Rhine; formerly called "Udenheim." Here Protestants and Catholics enjoy a free exercise of their religion; five miles S.S.E. of Spire.

PHILIPSTADT, a town of Sweden, in the province of Warmeland, surrounded by lakes and mountains. It was built by, and held its charter of privileges from Charles IX., who called it after the name of his son, Charles Philip. In 1775 it was consumed by fire, and afterwards rebuilt; 30 miles N.E. of Carlstadt. N. lat. 59° 40′. E. long. 13° 27′.

PHILIPSTOWN, a post-town of Ireland, and the shire-town of the King's county, in the province of Leinster. It is a very small place, and has lost its former privilege of being represented in parliament, in consequence of the Union. It obtained its name from king Philip, husband of Mary, queen of England, who made this part of the county shire-ground in 1557. It is 38½ miles S.W. from Dublin.

PHILISTINES, in *Ancient Geography* and *History*, the name of a people of Palestine, who were descendants partly of the Casluhim and partly of the Caphtorim, who sprang from Mizraim, the son of Ham, who was the son of Noah. Their ancestors came originally from Egypt, and settled in Palestine, to which they gave their name. Their most ancient form of government was monarchical, and their first kings were denominated Abimelech; for such were the kings who were concerned in the transactions with Abraham and Isaac, which are recorded in the book of Genesis. But these first kings were under great limitations. The kings of the second race were distinguished by the appellation of Achish, though they also bore the name of Abimelech. During their best times, they resided at Gath: from this place the royal seat was removed to Ascalon; and from that city to Gaza. The Philistines appear to have had strong notions of liberty. They did not practise circumcision; and in their earliest times, they held adultery in the greatest abomination. They were a very warlike people; and they also distinguished themselves by their industry; but their character was very different at different periods. In the days of Abraham and Isaac, they were a righteous and hospitable nation; but a revolution afterwards took place in their government, religion and morals, so that they resembled other idolatrous nations, and practised similar enormities. They became in process of time exceedingly ambitious and arrogant, and their enmity to the Israelites was inveterate and irreconcileable. For their deities they entertained the most profound veneration, and they reposed in them an unbounded confidence. They were much addicted to trade. Their language differed little from that spoken by the Hebrews, so that these different people were able to converse together without much difficulty; and, without doubt, they had the arts and sciences in common with their ingenious and learned contemporaries, and perhaps some of them in greater perfection; for the invention of the bow and arrow is ascribed to these people. Their religion varied at different periods. Under their first race of kings, they used the same rites with the Hebrews. In succeeding times they became superstitious and idolatrous; and each of the principal or five cities had an idol of its own. Marna, or Marnac, was worshipped at Gaza; Dagon was the object of worship at Azotus; Bualzebub, or Beelzebub, was the god of Ekron; Derceto was the goddess of Ascalon; and Ashtaroth, or Astarte, was worshipped at Gath. For the celebration of their religious rites and festivals they erected large and spacious temples; and they presented their gods with the chief part of their spoil, carrying them about with them when they went to war.

This extraordinary nation came directly out of Egypt, and finding the Avims or Avites (Deut. ii. 23.) seated in a pleasant and fruitful land, and themselves strong enough to expel them, they made the attempt and succeeded. Besides the intercourse of their kings with Abraham and Isaac, to which we have already referred, we find no particular mention of them for a long series of years. Their ancient form of government was dissolved, the Israelites were the objects of their aversion, and they are represented under distinct jurisdictions, and at strife with the children of Israel. With Joshua they do not seem to have had any war, but after his death, they were deprived by the tribes of Simeon and Judah of three of their cities, *viz.* Gaza, Ascalon, and Ekron; of which, however, they afterwards obtained possession, either by grant or by conquest. About 120 years after the reduction of these three cities (B.C. 1305), the Philistines held the Israelites in subjection, till they were delivered by Shamgar, and they also suffered in common with the Israelites by the incursions of Zebah and Zalmunna, kings of Midian. In the days of Jephthah, they united with the Ammonites in oppressing the Israelites. They again reduced the Israelites, and kept them in subjection for forty years (B.C. 1137), and in the following year they took Samson prisoner, who rescued himself and killed 1000 of his adversaries. But their history is recorded in scripture, and it is needless for us to pursue it in a minute detail of the various events which it comprehends. Until the reign of David they maintained their independence; but he reduced them to a state of subjection, and made them tributaries to his throne. It may be also concluded, that having so often, and to so little purpose, engaged in bloody and destructive wars, they grew wiser, and rather applied themselves to commerce, and the arts of peace. Notwithstanding their vigorous opposition to successive kings of Israel, they afterwards courted the favour of Jehoshaphat, king of Judah, by a voluntary payment of the tribute, which had been imposed upon them by their conqueror David; and which, it seems, they had neglected to pay to some of Jehoshaphat's predecessors. In the year 888 B.C. they rebelled against Jehoram, the son of Jehoshaphat, invaded his kingdom, and rifled his palace, and carried their rage against him to such a height, as to exterminate all his family, except Athaliah, and her son Ahaziah, who had the good fortune to escape their fury. At this time they carried off a great number of captives, whom they sold to the Edomites, the worst enemies of the Israelites, next to themselves, and some to the Grecians, thus removing them to such a distance, that they could have little or no chance of visiting their native country again. This success is supposed to have been owing, in a great measure, to the assistance afforded them by the Arabians, who, at the same time, made war upon the Israelites, either separately, or in conjunction with the Philistines. Their success, however, proved unfortunate to them in the issue; for (807 B.C.) they were invaded by Uzziah, king of Judah, who dismantled Gath, Jabnah, and Ashdod, and built strong cities among them, in order to awe, and keep them

them in subjection. In the reign of Ahaz, perceiving the weak state of the kingdom of Judah, they again took up arms, and warred against Ahaz so successfully, as to repair the losses they had sustained in the time of Uzziah, his grandfather; for they reduced the cities of Bethshemesh, Ajalon, Gedaroth, Schochoh, Timnah, and Gimzo, with the territories belonging to them, and settled there; thus adding a large portion of the kingdom of Judah to their own country. This happened about the year 740 B.C. (2 Chron. xxviii. 18.) But they did not long retain this acquisition: for (713 B.C.) Hezekiah, the son of Ahaz, whom they had conquered, overran their whole country (2 Kings, xviii. 8.); and, at the same time, they were attacked by the Assyrians, in the reign of Sennacherib, who sent his general Tartan to reduce them. Their city Ashdod was besieged and taken by him (Isaiah, xxi. 1.); and thus they were reduced to the lowest ebb of misfortune. By their subjection to the Assyrians, they not only lost their liberty, but their country became the seat of a long and obstinate war. For Psammetichus, king of Egypt, being jealous of the growing power of the Assyrians, and apprehensive that Egypt might share the fate of its neighbour, undertook to drive them out of Palestine. With this view, he laid siege to Ashdod or Azotus (674 B.C.), which lasted 29 years before he could reduce it. From this time they were tributary to the great monarchies, as they succeeded each other. In the beginning of this slavery, they were miserably harassed by the Egyptians, who, desirous of making their barrier as strong as possible, seized on a great part of their country, and particularly on the city of Gaza. What became of them at last may be best learned from the threats of the prophets, and particularly Zephaniah, who paints their destruction in very lively colours: "Gaza shall be forsaken, and Askelon a desolation; they shall drive out Ashdod at the noon day, and Ekron shall be rooted up. Wo unto the inhabitants of the sea-coasts, the nation of the Cherethites! The word of the Lord is against you: O Canaan, the land of the Philistines, I will destroy thee, that there shall be no inhabitant; and the sea-coasts shall be dwellings and cottages for shepherds, and folds for flocks." Zeph. ii. 4—6. Joel, iii. Amos, i. Jerem. xlvii. Ezek. xxv. Zech. ix. 5. Anc. Un. Hist. vol. 1.

PHILISTUS, in *Biography*, an eminent historian of antiquity, was, according to some writers, a native of Naucratis, according to others of Syracuse. He was born about the year 431 B.C., and was sent to Athens for his education, where he studied under Isocrates and the poet Evenus. Fixing his abode at Syracuse, he promoted the schemes of Dionysius the elder, to overthrow the liberties of his country, and was placed by him in the important post of governor of the citadel. That prince connived at the criminal intercourse which Philistus maintained with his mother; but upon the discovery of a secret marriage, which he had contracted with the daughter of Dionysius's brother, the tyrant banished him. Philistus retired to Adria, where he employed his leisure in composing a history of Sicily and of the reign of Dionysius. He remained in banishment till after the accession of Dionysius the younger, when he was recalled upon the persuasion of those courtiers who were jealous of the influence acquired by the virtuous Dion, and his friend the philosopher Plato, who had been invited to the court of Syracuse. Philistus by his arts soon procured the banishment of Dion, and brought himself into high esteem by his tyrannical maxims. When Dion returned with an armed force to rescue his country from tyranny, Philistus was made admiral of the fleet to oppose him. An engagement ensued, in which the royal fleet was defeated, and Philistus was taken prisoner and put to death, in the year 357 B.C. He was a man of learning and abilities, but his memory has been stigmatized for the bad use he made of his talents. He was author of several works, but is chiefly famous for his "Antiquities of Sicily," and his "History of Dionysius the Elder;" and that of part of the reign of Dionysius the younger, in two books. In his style he was the imitator of Thucydides; his histories were long preserved in libraries, but no part of them has reached modern times.

PHILITIA. See PHIDITIA.

PHILIZERS, or PHILAZERS. See FILAZER.

PHILLIS, in *Ancient Geography*, a country of Thrace, in the vicinity of mount Pagæus.

PHILLYRA, a river of the Peloponnesus, in Arcadia.

PHILLYREA, in *Botany*, φιλλυρεα of Dioscorides, supposed to be so called from *Phillyra*, the mother of Chiron. The modern Greeks know this shrub under the name of φύλλικα, or φυλλίκι.—Linn. Gen. 10. Schreb. 13. Willd. Sp. Pl. v. 1. 42. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 19. Sm. Fl. Græc. Sibth. v. 1. 2. Prodr. v. 1. 3. Juss. 106. Tourn. t. 367. Lamarck Illustr. t. 8. Gærtn. t. 92.—Class and order, *Diandria Monogynia*. Nat. Ord. *Sepiariæ*, Linn, *Jasmineæ*, Juss. *Oleinæ*, Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, minute, permanent; its mouth four-toothed, erect. *Cor.* of one petal, funnel-shaped; tube scarcely any; limb in four deep, ovate, acute, recurved segments. *Stam.* Filaments two, opposite, awl-shaped, short, divaricated; anthers terminal, elliptical, simple. *Pist.* Germen superior, roundish; style simple, the length of the stamens; stigma thickish, cloven. *Peric.* Berry globose, of one cell. *Seed* solitary, globose, large, with a thin brittle skin.

Eff. Ch. Corolla in four nearly ovate segments. Berry superior, globose, single-seeded.

Obs. The thin coat of the seed, so different from the hard nut of a true *Olea*, appears sufficient to keep this genus distinct from that. Mr. Salisbury and Mr. Brown have, nevertheless, united them. See OLEA; where the word Calyx in the essential character is by mistake put for Corolla.

1. Ph. *media*. Olive-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 1. Ait. n. 1. (Phillyrea; Matth. Valgr. v. 1. 155. Ph. tertia; Clus. Hist. v. 1. 52. Ph. latiore folio; Ger. Em. 1395.)—Leaves elliptic-lanceolate, entire; rarely somewhat serrated.—Native of the south of Europe; very common on rocks, banks, and ruins in Italy, as on the Coliseum, and other ruins, at Rome, flowering from March to May. In our gardens it is a hardy evergreen, flowering in May and June, and was cultivated by the earl of Essex in 1597, according to the first edition of Gerarde. A bushy smooth *shrub*, with many straight, roundish, pale brown, leafy, wand-like *branches*. *Leaves* opposite, on short stalks; of a dull, scarcely shining green above; paler, opaque, and dotted, beneath; with a mid-rib and fine lateral veins: their usual length is about an inch and a half, their form elliptical, with a small point; the margin slightly revolute, for the most part quite entire, but some *leaves* are minutely and distantly toothed towards the point. There are, besides, several varieties in the shape of the *leaves*, which are occasionally more oblong or lanceolate, as well as in the length and direction of the *branches*. *Stipulas* none. *Flowers* small, yellowish-white, in little dense, short, bracteated, axillary *clusters*. *Fruit* globular, dark purple, the size of a small pea, bitter and nauseous.

2. Ph. *angustifolia*. Narrow-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 2. Ait. n. 2. Ger. Em. 1395. (Ph.

(Ph. quarta et quinta; Cluf. Hift. v. 1. 52.)—Leaves linear-lanceolate, entire; or nearly fo.—Native of Italy, Spain, and Portugal. It is fold in the markets at Lifbon to make brooms, and called *Lentifco*, according to a note of Lœfling's, in the Linnæan herbarium. This differs from the former merely in its narrower and fomewhat longer *leaves*, which are dotted, and occafionally toothed, precifely as in that fpecies, nor can we confider it as more than a variety, though kept diftinct, and even fubdivided into feveral varieties of its own, in the Hortus Kewenfis.

3. Ph. *latifolia*. Broad-leaved Phillyrea. Linn. Sp. Pl. 10. Willd. n. 3. Ait. n. 3. Sm. Fl. Græc. Sibth. v. 1. 2. t. 3. (Ph. fecunda; Cluf. Hift. v. 1. 52. Ger. Em. 1396.)——β; Ph. prima; Cluf. Hift. v. 1. 51. Ger. Em. 1600.—Leaves ovate, fomewhat heart-fhaped, ferrated; rarely entire; fometimes fharply toothed.—Very abundant in the fouth of Europe, on open hills, and as frequent as moft evergreens in our fhrubberies. Dr. Sibthorp confiders this as the identical φιλλυρεα of Diofcorides, being very common in Greece and its iflands. The *leaves* are of a dark fhining green, dotted beneath, of a broad ovate figure, about an inch long, pretty uniformly ferrated; in the variety β they are very fharply and ftrongly toothed, and fometimes rather elongated. The Ph. arbor Galloprovinciæ; Lob. Ic. v. 2. 132, appears to be an entire-leaved variety of this. Linnæus referred it to *media*, but it agrees with the common *latifolia* in the darker hue of the *leaves*, as well as their fhort broad figure. We have no doubt of *latifolia* and all its varieties being diftinct from the other two; the only queftion is whether they are diftinct from each other.

Phillyrea, in *Gardening*, contains plants of the hardy, evergreen, fhrubby kind, of which the fpecies cultivated are; the lance-leaved phillyrea (P. media); the narrow-leaved phillyrea (P. anguftifolia); and the broad-leaved phillyrea (P. latifolia).

Of the firft fort there are feveral varieties, namely, the privet-leaved and olive-leaved; which are of humbler growth, feldom more than eight or ten feet high; the branches of the firft are weaker, fpread wider, and are covered with a light brown bark: the leaves are ftiff, almoft two inches long, and half an inch broad in the middle, drawing to a point at both ends, and fit clofe to the branches; the flowers are in little axillary clufters, fmall and whiter. In the latter the branches are ftronger, and fpread out wider; the bark is of a lighter colour; the leaves are ftiff, fmooth, and entire, on very fhort footftalks, of a lucid green, and terminating in a point; the flowers in clufters, on pretty long peduncles, from the axils of the young branches, fmall and white. And in the Kew catalogue there are three other varieties mentioned: namely, the long-branched, which has long upright branches; the drooping, which has the branches hanging down and ftraddling; and the box-leaved.

In the fecond fort there is a variety termed rofemary-leaved, which is of humbler growth, feldom rifing more than four or five feet high, fending out flender, oppofite, ftraight branches, fparfedly difpofed; the leaves dark-green, ftiff, and entire; about an inch long, and not more than an eighth of an inch broad; feffile; the flowers are fmall, white, in clufters from the fide of the branches; the berries very fmall, rarely ripening in this climate. And in the Kew catalogue another variety is mentioned, under the name of dwarf phillyrea.

The third fort has alfo a variety, the prickly broad-leaved, which is as high as the fmooth one, fends out feveral ftrong branches, which grow erect, and are covered with a grey bark; the leaves are an inch and half long, and an inch broad, firm, of a lucid green, and ferrate, each ferrature ending in a fpine. And the Kew catalogue has another under the name of the ilex-leaved.

Method of Culture.—Thefe plants are capable of being increafed either from feeds or layers, but the latter being the moft expeditious method is chiefly preferred in this climate.

And the beft feafon for laying them down is in autumn, when the ground fhould be dug round the ftems of the plants intended to be laid, rendering it very loofe; then making choice of a fmooth part of the fhoot, a flit fhould be made in it upwards, in the manner practifed in laying carnations, bending the branch gently down to the ground, making a hollow place to receive it; and having placed the part which was flit into the ground, fo as that the flit may be open, it fhould be faftened down with a forked ftick that it may remain fteady, covering that part of the branch with earth about three inches thick, keeping the upper part erect. The layers muft be kept clean from weeds in the fpring and fummer following, as, if fuffered to grow up amongft them, they will prevent their taking root. In the autumn following, moft of the plants thus laid will be rooted, at which time they may be taken off, and carefully planted in a nurfery, where they may be trained three or four years in the manner they are intended to grow; during which time the ground fhould be dug between the rows, and be cut about the roots of the plants every year, to caufe them to ftrike out ftrong fibres, fo as to fupport a good ball of earth when they are removed. Their ftems fhould likewife be well fupported with ftakes, in order to make them ftraight, otherwife they are very apt to grow crooked and unfightly. When they have been thus managed three or four years, they may be removed into the places where they are defigned to remain. The beft time for this is the end of September, or beginning of October; but in the removing them their roots fhould be dug round; and all downright or ftrong roots, which have fhot out to a great diftance, be cut off, that they may have balls of earth preferved to their roots, otherwife they are liable to mifcarry: and when placed in their new fituations, fome mulch fhould be laid upon the furface of the ground to prevent its drying.

The plants fhould likewife be fupported with ftakes until they have taken faft hold of the earth, to prevent their being turned out of the ground, or difplaced by the winds, which deftroy the fibres that are newly put out; and greatly injure the plants.

They delight in a middling foil, which is neither too wet and ftiff nor too dry, though the latter is to be preferred to the former, provided it be frefh. The forts with fmall leaves are commonly two years before they take root when laid: therefore they fhould not be difturbed, as the raifing them out of the ground greatly retards their rooting.

In the feed method, the feeds fhould be fown in the autumn foon after they are ripe, as when they are kept out of the ground till fpring they do not grow the firft year. They fucceed beft when fown in pots or boxes filled with light loamy earth, and placed under a garden frame where they may be fcreened from hard frofts, but always expofed to the open air in mild weather. If the feeds are fown early in the autumn, the plants appear in the fpring; but if they fhould not come up, the pots fhould be plunged into the ground in an eaft border, where they may only have the morning fun, in which fituation they fhould remain the following fummer: during which time they may be conftantly kept clean from weeds, and in the autumn removed again under a frame for fhelter in winter, and the fpring following the plants will certainly come up, if the feeds were good. Towards the middle of April, the pots fhould be again plunged into the ground

ground on an eaſt border, to prevent the air from drying the earth through the pots, which is generally the caſe when the pots ſtand upon the ground; ſo that they muſt then be frequently watered, which ſhould not be practiſed to theſe plants where it can be avoided. In the autumn following the plants ſhould be carefully taken out of the pots and planted out in a nurſery-bed, covering the ſurface with old tan to keep out the froſt; and if the winter prove ſevere, they ſhould be covered with mats: afterwards they may be treated as thoſe from layers.

Theſe ſhrubs are ſo hardy as to thrive in the open air in this climate, and are never injured except the winters are very ſevere, which ſometimes cauſe their leaves to fall, and kill a few of the weaker branches, but theſe are repaired by new ſhoots the following ſummer; ſo that there are few evergreen trees which are hardier, or that more deſerve to be cultivated for the purpoſes of ornament.

The firſt and third ſorts and varieties are very proper to intermix with other evergreens of the ſame growth, to form clumps in pleaſure grounds and parks, or to plant round the borders of woods which are filled with deciduous trees, where in the ſummer time their dark ſhades make a fine contraſt with the brighter green leaves of the deciduous trees; and in the winter, when the latter are deſtitute of leaves, they have a fine effect. Theſe may be trained up to ſtems, ſo as to be out of the reach of cattle, and be planted in open places, where, if they are fenced againſt cattle till they are grown up, they may be afterwards expoſed. The others, which are of humble growth, ſhould be confined to gardens or other incloſures, where they may be ſecured from cattle, &c. They ſhould only have the irregular branches pruned in, occaſionally as they want it.

PHILO, a term originally Greek, formed of φιλος, *amicus*, *friend*, or *lover*; now uſed in compoſition in ſeveral words in our language.

PHILO, in *Biography*, ſurnamed *Biblius*, from Biblos, the place of his nativity, was a grammarian who flouriſhed from the reign of Nero to that of Adrian. He wrote various books in the Greek language, ſuch as "De Parandis et Deligendis Libris;" "De Urbibus;" De claris Viris;" and "De Imperio Adriani:" but he is chiefly known as the tranſlator of Sanchoniatho's Phœnician hiſtory into Greek, of which a few fragments only remain, that have exercifed the critical talents of ſeveral learned men. Moreri.

PHILO *of Byzantium*, an architect, who flouriſhed about 300 years before the Chriſtian era, wrote a treatiſe of machines uſed in war, which is printed with "Mathematici veteres," in 1693. There is alſo a piece attributed to him, entitled "De ſeptem Orbis Spectaculis," printed at Rome in 1640.

PHILO, a learned Jewiſh writer, who flouriſhed in the firſt century, and under the reign of Caligula, was of the ſacerdotal race, and brother to the chief magiſtrate of his nation at Alexandria, where he was born. He received his education at his native place, and diſtinguiſhed himſelf by his early proficiency in eloquence, philoſophy, and ſcriptural knowledge. He is ſpoken of by Euſebius as a man copious in ſpeech, rich in ſentiments, and eminent and ſublime in his acquaintance with the holy ſcriptures. He was particularly verſed in the Platonic philoſophy. It has been ſuggeſted that by attending to the nature of Jewiſh learning, and comparing it with the ſpirit of the Alexandrian, it will be perceived in what manner Philo ſtudied philoſophy. From the time of the Ptolemies, the uſe of allegories had been borrowed by the Jews from their Egyptian neighbours, and by the help of theſe, Platonic and Pythagorean learning was introduced among them, as the concealed and ſymbolical ſenſe of their own law. In this manner they were enabled to make what uſe they pleaſed of their ſyſtems, without appearing to be indebted to heathen philoſophers. Theſe ſyſtems likewiſe were adulterated with many dogmas from the oriental philoſophy, particularly on the ſubject of the divine nature. This philoſophy, which had been well received in Alexandria, Philo embraced, and he appears to have boldly interwoven the Platonic learning and opinions with the doctrines of the ſacred oracles, and aſcribed them to Moſes. It is alſo probable that he was, in part, influenced by the example of the Eſſenes and Therapeutæ, whoſe method of philoſophizing he imitated, though he did not adopt their manner of living: for he always ſpeaks of them in the higheſt terms of commendation. Philo was not ſo completely immerſed in philoſophical ſtudies as to neglect the cultivation of eloquence, and to withdraw his attention from civil affairs. On the contrary, he ſeems to have acquired a high reputation as an orator, and as a man of wiſdom and prudence in the conduct of important negociations: hence we find him placed at the head of a deputation ſent by his countrymen to Rome in the year 42, with the deſign of vindicating them from the calumnies with which they were loaded by the Alexandrians, and of defending their cauſe againſt Appian. It was on this occaſion he ſpeaks of himſelf as old and grey headed, and, therefore, his biographers have imagined he might be at that period about 60 years of age, or that he was born nearly twenty years before the commencement of the Chriſtian era. Though his miſſion proved fruitleſs, he committed the ſubſtance of his apology for the Jews to writing, and in it gave a favourable ſpecimen of his learning, talents, and integrity. By Euſebius, Jerome, and others, it is ſaid he came a ſecond time to Rome in the reign of Claudius, when he formed an acquaintance with St. Peter, and cultivated his friendſhip: and Photius affirms that he became a convert to the Chriſtian faith, and was baptized; but that afterwards, having met with ſome cauſe of offence, from motives of reſentment he renounced his creed. A very ingenious writer, the Rev. J. Jones, has, however, attempted to prove that Philo was the hiſtorian and apologiſt of Chriſt; of his followers, and of the goſpel. In a work entitled "Eccleſiaſtical Reſearches," publiſhed in 1812, he has entered very much at large into the enquiry, and in a ſubſequent volume, or "Sequel to the Eccleſiaſtical Reſearches," he has given "A ſummary or conciſe view of the arguments proving Philo and Joſephus to be Chriſtian writers." To theſe works we refer the reader, it being inconſiſtent with the limits of our article to enter into the argument. In Dr. Enfield's abridgment of Brucker's Hiſtory of Philoſophy, we have an account of the opinions held by Philo, and of his manner of blending the doctrines of Plato and Moſes: and in Fabricius and Cave the ſubjects of his various treatiſes, which have reached modern times, have been particularized. The firſt collection of them was publiſhed by Turnebus, in the oriental Greek, at Paris, in 1552, of which, in 1561, there was given a Latin verſion. They were afterwards publiſhed in Greek and Latin at Geneva in 1613, and at Paris in 1640: but the lateſt and moſt complete edition is that of London, in 1742, by Dr. Mangey, in two vols. folio.

PHILOCALIA, in *Ancient Geography*, a fortified place of Cappadocia, on the coaſt of the Euxine ſea, with a river of the ſame name. Pliny.

PHILOCANDROS, one of the iſlands of the Ægean ſea, called the Sporades, according to Pliny and Steph. Byz. Ptolemy places it among the Cyclades.

PHILOCRENE, a ſmall town of Aſia, in Bithynia.

PHILO-

PHILODEMI DE MUSICA, is the title of a work in Greek, recovered from the cinders of Herculaneum. The ſubject is muſic. At firſt it was reported to be a treatiſe on the art; then a panegyric; and laſtly a ſatire, which it turns out to be, of the moſt bitter kind.

The labour of unfolding the Papyrian rolls was begun more than 50 years ago. The ſubterraneous city of Herculaneum was diſcovered in 1742; and we find, from a letter of La Condamine, and another from Camillo Paderni, printed in the Philoſophical Tranſactions of our Royal Society, vol. xlix., that the work of unfolding this MS. was begun in 1749.

It was ſome time before the name of the author was diſcovered, and ſtill longer before it could be aſcertained of what country or ſect he was, or at what period he exiſted.

The name of Philodemus was, however, well known in Greece. Among others who bore that title, was a very ancient follower of Pythagoras, who was a native of Locris, in Magna Græcia; and two others more recent, one born in Greece, and the other in Aſia Minor.

Theſe muſt not be confounded with the author of a work on the ſubject of muſic, which was reſcued from the lava of Veſuvius, by being preſerved in the ruins of Herculaneum. Philodemus, the author of this work, was a philoſopher of the ſect of Epicurus, and a poet of conſiderable eminence. He is praiſed by Cicero; and Horace refers to one of his epigrams; nor has he been overlooked by Diogenes Laertius, or Strabo, who informs us, that he was a native of Gadera in Syria. He reſided at Rome, and was the acquaintance of Tully, and the tutor of Lucius Piſo, the conſul.

Cicero deſcribes him as a perſon of liberal manners, and a cultivated mind. His morals, however, were looſe; as appears by ſeveral of his poetical effuſions, which ſtill remain. Of his works, indeed, previous to the diſcovery of the literary treaſures in Herculaneum, only thirty-one of his epigrams were known to exiſt. The editors of theſe treatiſes have added two more to the number, and with a learned reſearch concerning Philodemus himſelf, have preſented his work to the literary world; and it is, undoubtedly, the moſt curious publication, on the whole, which has appeared ſince the revival of letters.

The work has been publiſhed more than ten years; but about the time of its iſſuing from the preſs, the arrival of the French at Naples prevented its circulation. And though printed in 1793, no copies had reached England till 1801; when the late reverend and learned Mr. Cratcherode procured poſſeſſion of two copies, one of which he ſent immediately to Oxford, and dying himſelf ſoon after, the other had been ſeen but by a few. In 1802 we obtained a copy; and as the work had never, to our knowledge, been reviewed, or otherwiſe noticed in our country; and being written on a ſubject which the new Cyclopædia embraces in all its branches, a production ſo curious ſeemed to demand particular notice among muſical articles; for which purpoſe it has been reſerved for ſeveral years in poſſeſſion of the editor to be introduced in its proper place.

The work, publiſhed in folio, in a moſt accurate and ſplendid manner, is dedicated to the king of Naples by the Herculaneum academicians.

Great praiſe is due to the editors for the ſagacity and erudition manifeſted in filling up the chaſms in the Latin tranſlation, and ſupplying the defective parts of the original, which have been injured by the fire or by unrolling.

Whoever is well read in the Greek writers on muſic that are come down to us, and in the different doctrines of the muſical ſects of antiquity, muſt perceive that the editors were well qualified for the arduous undertaking.

And though we are now no nearer knowing what the Greek muſic really was than heretofore, the curioſity of the learned muſt be conſiderably gratified by a fac-ſimile exhibition of the manners in which the ancient Greek volumes were written.

This work of Philodemus was publiſhed in confutation of another work on muſic, the author of which was dead before Philodemus was born. The author of it appears to have been Diogenes, not the Cynic, but the Stoic philoſopher of Babylon, ſo ſtyled becauſe he was born at Seleucia, a town near Babylon. He was a diſciple of Chryſippus. The Athenians ſent him on an embaſſy to Rome with Carneades and Critolaus, 155 years before Chriſt. Diogenes died at 88, after having recommended wiſdom during his whole life, as much by his conduct as diſcourſes. One day, while he was delivering a lecture againſt choler, exclaiming with great force againſt that paſſion, a young man ſpit in his face to try his patience. "I am not angry (ſays Diogenes) but I am in doubt whether I ought not to chaſtiſe ſuch brutal inſolence."

The work on muſic which Philodemus has attacked ſo furiouſly, was probably his περι φωνης, mentioned by Laertius.

Perhaps Diogenes, as is uſual with panegyriſts, aſked too much admiration of his favourite art, and Philodemus, like a true determined adverſary, grants too little.

There were perpetual diſputes about muſic in Greece, not only among profeſſors, but philoſophers. The editors of this ancient tract have defended muſic well againſt this pagan Αμουσος, who not only denies its miraculous powers, but its utility on any occaſion. However, Pythagoras, Plato, Ariſtotle, and Plutarch, among the ancients, and many wiſe and virtuous men among the moderns, ſuch as Bacon, Milton, Dr. Wallis, Arbuthnot, Monteſquieu, &c. have thought differently from the muſical atheiſt, Philodemus, and allowed that, of all the arts, "muſic is the only one that cannot corrupt the mind." For the reſt, we are much of the ſame opinion with Philodemus, as to a love for muſic being the attribute of a good heart; particularly when we reflect on the paſſions which Ptolemy Auletes, Nero, and our Henry VIII. had for the art; we are then very ready to relinquiſh the opinion of Shakſpeare and other poets on the ſubject.

The round aſſertions by Philodemus againſt muſic, are the following.

CHAP. I.

1. It does not produce ſuch effects in the mind, as can give riſe to nobler manners, or excite diligence.

2. In this all hearers are alike; their ſenſe of hearing is the ſame; but the difference in the effects of muſic ariſe from ſome previous operations, ſome preconceived opinions. The diſtinctions of the enharmonic and chromatic genera are owing to theſe opinions, and the operations to which they give riſe; thoſe who underſtand nature and her works, will derive ſatisfaction from the pleaſurable parts of muſic of every kind. Muſic is undoubtedly multiform; but ſtill it cannot infuſe the forms of manners, which approach to virtue.

3. Muſic demands a previous degree of knowledge. A mere ſimple modulation cannot rouſe the inactive mind, nor can it induce any diſpoſition to morals, which was not implanted by nature; neither can it calm the agitated mind, or guide it from one propenſity to another. Nor is muſic an imitative art, more than cookery. To the perception of the ear, enharmonic and chromatic are the ſame, and their mixtures are the ſame, their differences being only known to profeſſors.

CHAP.

Chap. II.

Whether music, per se, is proper for divine worship?

4. The gods do not demand the honour which we bestow: nature impels our mind to bestow it on them: hence the different ceremonies in different countries arose. Music, however, was never ordered by them: it is not music which is serviceable in worship, but rather public prayers: it is not known by tradition, that music was much employed by the ancients, and never, but by particular Greeks on particular occasions. In modern times it has become a trade, and is admitted as an essential part of religious ceremonies, and at the games, which was not the case in old times.

5. Even if we allow that the gods instituted spectacles and shows in honour of themselves; yet it does not follow that they ordained the addition of music.

Chap. III.

Whether music contributes to render more effective encomiastic and hymeneal poems, epithalamia, and threnodes.

6. Music gives no additional power to encomiastic poems: and at marriages is introduced merely as cooks add sauce, without increasing the real and genuine *good* of nuptials. The effect on these occasions is produced by the poems, not by the music; the passion of love is not assisted by the union of the two; nor can they really procure any alleviation to affliction when epicedia are performed.

Chap. IV.

On music at the games.

The music of the games is not universally commended; nor does it produce any universal benefit. The opinion of low and ignorant people I do not regard.

7. In the games the skill and art may please; but we should not miss it if the dance were removed from the drama; as it tends not to honesty nor honour; and as to the female dancers, no greater incitement to intemperance and licentiousness can be imagined.

Chap. V.

Whether music has in its nature any power of moving?

8. Whether the influence which the solemn music has at the Dionysiaca be, like the games, of divine original? The subject needs not discussion.

9. It is said, that as fire has in it a burning quality, so music has in it something that excites to action. Hence, observes the absurd definer, the rowers in vessels, and the reapers and the vine-dressers, worked to the sound of music. While the song is singing, however, the workmen rest. Should, then, according to the fable of Orpheus, should a musician stand by, and play, when a house is building?

10. He (that is Diogenes, the author of the treatise which Philodemus answers) asserts also, that not merely the mind, but even the body, is influenced by music; and that artificers are rendered more skilful by it; and that music had greater power over the mind than argumentative sentiments.—In modern times music is much neglected: poetry is still cherished and brought forward.

11. Music was never reckoned universally necessary as a study or pursuit; nor was Themistocles acquainted with it.

12. Music after entertainments, when the voice and the mind are disordered by wine, cannot stir up the hearers to enter into regular conversation. Nor is it of real utility in the education of children; as it is disputed what virtue takes its form in the mind according to the species of music.

Chap. VII.

Whether music contributes to love?

13. Music contributes nothing to the passion of love.

Chap. VIII.

What does music add to feasts?

14. The words of songs, and not the music, may animate and purify the minds of guests.

Chap. IX.

Whether music has any tendency to conciliate friendship?

[The answer to this question could not be recovered.]

Chap. X.

What is to be thought of the childish stories of Thales and Terpander?

18. The invitation of Thales to the Lacedæmonians, in order to settle a dispute, as ordered by the Pythian oracle, examined.

19. The calm produced was not by music, but by his admonitions, which might be sung.

Chap. XI.

Whether music ought to be recommended as contributing to religion.

20. What has been written about music, as contributing to divine worship, may be applied to various arts: the cook, the chaplet-weaver, the perfumer, the baker, the farmer, the painter, the architect, and statuary, may be supposed to serve the same cause with equal propriety.

21. The music adds little to the power of poetry, in celebrating the honour of the gods. Diogenes persuaded himself, that the gods are delighted, some with one song, and some with another, and that there are peculiar songs suitable to each of the divinities.

Chap. XII.

Whether music sharpens the intellects, and has any relation to other sciences?

22, 23. It is asserted, that music does not sharpen the mental faculties; and that it has only a slight relation to grammar. The assertion of ——— and his followers, about the connection of music with philosophy, is declared false.

Chap. XIII.

Whether music disposes the mind to virtue?

24, 25. When Diogenes asserts that music approaches nearly to true philosophy, is most serviceable in all the duties of life, and adds to every virtue; he trifles; as I have shewn in the third book of my Hypomnemata, or Commentaria. It is ridiculous to suppose, that any inarticulate sounds can dispose the mind to a speculative disposition, with respect to useful subjects.—If Plato had said that music was of advantage to justice, he would probably have assigned reasons for the assertion; but he only observes that justice bears an analogy to music; and asserts not that a musician is a just man, nor that a just man is a musician.

26. No man ever studied music in order to facilitate his road to the acquisition of virtues. When the poet and musician unite in the same person, the hearer's mind derives advantage from the sentiments, not from the rhythm of the verses, or the music to which they are sung.

Chap. XIV.

What is to be understood by the name of music?

It has been said that we have uncultivated minds, when we suppose that philosophers and thinking musicians imagine, that songs and rhythm, without significant words, impel to virtue, while mankind believe that language, aided by melody and rhythm, produce this effect. So Plato asserts: we contend not therefore with the ignorant, but with philosophers; moreover, we are surprised at the name of *musician* being given to an instrumental performer; and we are not willing to rank Pindar, Simonides, and all the lyric poets in the number of musicians.

[In this chapter Philodemus seems to write against some of his contemporaries, as well as Diogenes, Pindar and Simonides, who were musicians as far as they exhilarated the hearts of men; and poets, as far as their verses instructed mankind. This is an important chapter, but in a miserable state.]

Chap. XV.

Whether music corresponds with the celestial bodies?

[This chapter is so mutilated, that little of it can be understood. Philodemus, however, appears to ridicule the notion of Pythagoras, concerning the music of the spheres, which was heard only by the gods, and inaudible to mortal ears.]

Chap. XVI.

Whether music can change the affections of the mind?

31. [Philodemus contradicts what appears to have been advanced by Diogenes, concerning the power of music to lead the heart from vice to virtue. He seems to say, that this can be effected only by arguments; and that if such effects are produced on the stage, it is by the words, not the music; for harangues, without music, have achieved this; and if mere sounds could effect this change by the ears, that which pleased the smell or taste, might do the same by means of the rose, and the palate.]

Chap. XVII.

Whether music is of any real utility?

They are deceived who have asserted, that the art is of real utility to mankind in general. Those arts which benefit life, such as agriculture, weaving, architecture, are truly useful; which cannot be said of what merely delights. It does not appear that music corrects the failings of her own sons; nor would Damon have made such an assertion before the true court of the Areopagites, as he did before a fictitious one. The power of giving pleasure must not be confounded with utility; or else philosophy would perchance be regarded as inferior to music and many other arts.

Chap. XVIII.

Whether the gods invented music?

The gods did not invent music, but man, by his reasoning powers, taught himself singing. The powers of reasoning may invent and teach what is bad, as well as what is good. At any rate, music did not proceed from the gods more than any other art, nor does their worship demand its aid. Its exhibitions are not to be preferred in instructing mankind.

Chap. XIX.

For what purpose is music usually taught?

The professors of music have exalted this art, in order to augment their own consequence, though they are generally of low birth and poor.

[This last chapter is terribly mutilated, and difficult, if not impossible, to be understood.]

Riches and fame are derived from other professions; and public affairs are rather objects of study and attention than music.

[Philodemus seems to have written this treatise, in order to counteract any ill effects which might arise from the enthusiastic exaggerations of the virtues and powers of music, in the essay published by the Stoic Diogenes.]

PHILODOTUS, in *Zoology*. See Manis.

PHILÖE, or Philé, in *Geography*, an enchanting island of Egypt, on the Nile, in the vicinity of Assouan or Syene, of which, and also of its monuments, and of the cataracts in its neighbourhood, we have beautiful drawings in the second volume of Denon's Travels. This island is about half a league round, and was formerly inhabited in common by the Ethiopians and Egyptians. When Denon visited it, there were no inhabitants on the shore; on the approach of the French they had quitted it, and had retired to a second and larger island. At the island of Philöe, the Nile makes a bend, as if, says Denon, to come and visit this enchanting island, where the monuments are only separated by tufts of palm trees or rocks, that appear to be left merely to contrast the forms of nature with the magnificence of art, and to collect in one rich spot every thing that is most beautiful and impressive. As the Nile ceases here to be navigable on account of the cataracts, all the merchandise of the Ethiopian trade, which is landed at Philöe, must be transported by land to Syene, to be there re-embarked. Beyond Philöe the river is quite open and navigable. After Philöe had been attacked by the French, the whole population carried off, and the island left a perfect desert, Denon returned, and struck with the sumptuous appearance of its edifices, he concluded that it was to produce a similar effect upon strangers entering their territory, that the Egyptians had collected upon their frontier such a splendid collection of monuments. Philöe was the entrepôt of a commerce of barter between Ethiopia and Egypt; and wishing to give the Ethiopians a high idea of their resources and magnificence, the Egyptians had raised so many sumptuous edifices on the confines and natural frontier of their empire, Syene and the cataracts. The ruins in this island consist of a small sanctuary, formed by a portico of four columns, with very elegant capitals, to which had been added at a later period another portico, which was without doubt attached to the circumvallation of the temple. The most ancient part was more ornamented than the rest; the use made of it in the rites of the Catholic religion has impaired the original character, by adding square arched door-ways. In the sanctuary, close to the figures of Isis and Osiris, may still be seen the miraculous impression, as Denon calls it, of the feet of St. Anthony, or St. Paul the hermit. Within the space of 600 yards, there are seven or eight monuments, which, upon examination, appeared to have been constructed at different periods, by several nations, and to have belonged to different forms of religious worship. The union of these various edifices, each of them in itself regular, and crowded together in this narrow spot, formed an irregular group of most picturesque and magnificent objects. Denon could here distinguish eight sanctuaries or separate temples, of different dimensions, and built at different times; the limits of each had been respected in the construction of the succeeding ones, and thus the regularity of the whole had been impaired.

Besides the vast enclosure, particularly described by Denon, in which numerous temples were connected and grouped together by dwellings for the priests, there were two temples standing apart; the smaller of which was singularly beautiful, in perfect preservation, and so small, that it it almoſt excited the deſire of carrying it away. Within it were ſome remains of a domeſtic ſcene, which ſeemed to be that of Joſeph and Mary, and ſuggeſted the ſubject of the flight into Egypt, in a ſtyle of the utmoſt truth and intereſt. Beſides the Egyptian monuments, Greek and Roman ruins are found at the S.E. end of the iſland, which ſeemed to be the remains of a ſmall port, and a cuſtom-houſe; of which the wall of the façade is decorated with pilaſters and arcades of the Doric order; ſome ſtanding fragments of columns ſhew an open gallery, or a kind of portico in front; between theſe ruins and the Egyptian monuments, the ſur-baſe of a Catholic church may be remarked, which is built of antique fragments, mixed with croſſes and Greek ornaments of the later ages; for in theſe countries Catholiciſm has been too poor to remove entirely her own worſhip from the pomp of idolatrous temples. After having eſtabliſhed her ſaints in the face of the Egyptian deities, ſhe has often painted a St. John, or St. Paul, by the ſide of the goddeſs Iſis, and diſguiſed Oſiris into St. Athanaſius; or dilapidating the Heathen temples, ſhe has uſed the ready made materials in conſtructing her own edifices of religious worſhip.

PHILOLAUS, formed of φιλος, and λαος, *people*, in *Mythology*, a denomination under which Eſculapius was honoured in a temple at Aſopus, in Laconia.

PHILOLAUS, in *Biography*, a Pythagorean philoſopher, who flouriſhed about 375 years B.C. was a native of Crotona. He was a diſciple of Archytas, and a contemporary with Plato. He was the perſon by whoſe means it is ſuppoſed the Pythagorean doctrine was firſt divulged, for it was from him that Plato purchaſed the written records of that ſyſtem. Philolaus fell a ſacrifice to political jealouſy, for aiming, or for being ſuſpected of aiming, at the poſſeſſion of deſpotic power in the government of his country. Philolaus referred every thing that exiſts to mathematical principles. He taught that reaſon, improved by mathematical learning, is alone capable of judging concerning the nature of things; that the whole world conſiſts of infinite and finite; that number ſubſiſts by itſelf, and is the chain which by its power ſuſtains the eternal frame of things; that the monad is not the ſole principle of all things, but that the binary is neceſſary to furniſh materials from which all ſubſequent numbers may be produced; that the world is one whole, which has a fiery centre, about which the celeſtial ſpheres revolve; that all things are preſerved in harmony by the law of neceſſity, and that the world is liable to deſtruction both by fire and water; hence, and from other tenets, held by this philoſopher, he is ſuppoſed to have believed in two independent principles in nature, God and matter, and that it was from this ſame ſource that Plato derived his doctrine upon the ſubject. It has been ſaid, but without ſufficient authority, that to Philolaus ſhould be aſcribed the invention of that true ſyſtem of the world, which Copernicus afterwards revived. Enfield's Hiſt. Phil.

Philolaus taught the diviſion of the tone in muſic, by which the dieſis or leimma reſulted on one ſide, and on the other the apotome of near a quarter of a tone; the apotome is the reſidue of a tone major, after the ſciſſon of the leimma.

He called the number 8 *geometric harmony*, as comprehending all the ratios of ſimple concords; for the 6th minor being five to eight, has only 8 for its greateſt term, or rather as it contains the greateſt ſyſtem of three octaves, the ancients did not enumerate the minor.

PHILOLOGY, φιλολογια, formed from φιλος, and λογος, *lover of diſcourſe;* a ſcience, or rather aſſemblage of ſeveral ſciences, conſiſting of grammar, rhetoric, poetry, antiquities, hiſtory, and criticiſm; which ſee reſpectively.

Philology is a kind of univerſal literature, converſant about all the ſciences, &c. their riſe, progreſs, authors who have cultivated them, &c.

Philology makes what the French call the *belles lettres*, which ſee. In the univerſities it is alſo called *humanities*, or *humaniores literæ*.

Anciently, philology was only a part of grammar.

Eratoſthenes, library-keeper at Alexandria, was the firſt who bore the ſplendid title of Philologus, according to Suetonius; or that of *critic*, according to Clemens Alexandrinus. He lived under Ptolemy Philadelphus, and died in the 146th Olympiad.

PHILOMATHES, φιλομαθης, formed from φιλος, *lover*, and μανθανω, *I learn*, a lover of learning or ſcience.

PHILOMELA, in *Ornithology*. See CERTHIA *flaveola*.

PHILOMELIUM, in *Ancient Geography*, a town of Aſia, in the Greater Phrygia. Ptolemy and Strabo.

PHILONIUM, in *Pharmacy*, an opiate, or electuary, of which there are two kinds, the Roman, and the Perſian.

The Roman, called alſo the great philonium, took its name from the phyſician Philo, who invented it. It conſiſts of the ſeeds of henbane, pepper, opium, and other ingredients. It is uſed to promote ſleep, and againſt colds, colics, &c.

The Perſian philonium conſiſts of ſeveral ingredients, among which are opium, terra ſigillata, lapis hæmatites, caſtor, and ſaffron. It is uſed to ſtop hæmorrhages, dyſenteries, &c.

PHILONIUM *Londinenſe*, the name by which the medicine commonly called *philonium Romanum* has been formerly called in the London Diſpenſatory. The compoſition is alſo much altered, as well as the name, and was ordered to be made thus: take white pepper, ginger, caraway-ſeeds, of each two ounces, opium ſix drams, ſyrup of diacodium boiled to the conſiſtence of honey, three times the weight of all the reſt. The opium is to be diſſolved in a little wine, and then mixed with the ſyrup; after which the powders are to be ſtirred in, and the whole made into an electuary.

PHILOPATOR, φιλοπατωρ, formed from φιλος, *lover*, and πατηρ, *father*, in *Antiquity*, a title or ſurname, aſſumed by ſeveral of the kings of Egypt and Syria, importing, lover of one's father.

Ptolemy Philopator ſucceeded Ptolemy Euergetes; and had for his ſucceſſor Ptolemy Philometer. The Syrians had their Seleucus Philopator, Antiochus Philopator, &c.

PHILOPŒMEN, in *Biography*, the laſt great commander among the Greeks, was born at Megalopolis, in Arcadia, about the year 253 B.C. Having loſt his father at an early age, he was carefully educated by Caſſander, a noble Mantinean, and he received the inſtructions of two academic philoſophers, who inſtilled into his mind high principles of honour and patriotiſm. He had from a very early period a paſſion for military fame, and all the exerciſes of his youth were directed to the acquiſition of martial habits. When of an age to bear arms, he joined thoſe of his townſmen, who employed themſelves in incurſions upon the Laconian territory, in which expeditions he was the firſt to march out, and the laſt to return. The intervals of war he ſpent in hunting, and in the cultivation of his own eſtate. It was when he was about the age of thirty Cleomenes, king of Sparta, ſurpriſed Megalopolis by night; Philopœmen exerted himſelf with the utmoſt valour to drive him out again, and when he was unable to effect this, at the hazard of his life he covered the retreat of the inhabitants to Meſſene. After this he ſignalized himſelf in many great actions, engaged as volunteer in an inteſtine war raging in Crete, and on his return he was appointed by the Achæans to the command of the cavalry. By his zeal and activity he corrected many abufes which had gained ground in that body, and rendered it famous throughout Greece for fuperior courage and difcipline. In the year 210, he was raifed to the ftation of prætor or commander-in-chief of the Achæan league. After fpending fome months in improving the military fyftem of the Achæans, with refpect to their tactics and armour, he at length led them againft Machanidas, tyrant of Sparta, who was marching with a powerful army to invade Achaia. He met the enemy at Mantinea, an engagement enfued, and Philopœmen gained a complete victory. This noble exploit was commemorated by the Achæans, by a brazen ftatue placed in the temple of Delphi, reprefenting him in the attitude in which he ran his fpear into the body of the tyrant. Nabis, the fucceffor of Machanidas, defeated Philopœmen at fea, but he recovered this lofs in an action on land, took Sparta, razed its walls, and abolifhed the laws of Lycurgus. The Meffenians having revolted, Philopœmen marched againft them, but was taken prifoner by falling from his horfe. He was conveyed to Meffene, where the people, after the firft triumph on their fuccefs, were filled with compaffion, at the fight of one whom they had long confidered as a hero and benefactor, reduced to that wretched condition. He was inhumanly thruft into a fubterranean dungeon, and on the next day an affembly was convened to determine his fate. The people were inclined to favour him, but the fenate prevailed and carried a decree to put him to death. An executioner was accordingly fent to his prifon with a cup of poifon. As foon as the hero beheld him, he raifed himfelf with difficulty from the ground, and enquired whether Lycortas and his companions had efcaped; and being affured that they were all fafe, he replied, "then we are not entirely unfortunate," and calmly drank the poifon, which foon proved mortal. He died at the age of 70, in the year 183 B.C. His fate, which he fo little deferved, excited the grief and refentment of the whole Achæan league, and numbers flocked to join a force led by Lycortas to revenge his death. The Meffenian people opened their gates without refiftance, and put into his hands the authors of the deed, who were referved as facrifices to his manes. The afhes of the noble commander were carried in great pomp to Megalopolis, where funeral honours of every kind were paid to his memory. Moft of the cities of Greece alfo erected his ftatue, with infcriptions recording his great actions. Several years after his death, when Corinth was deftroyed by the conful Mummius, a Roman moved for the fubverfion of all his ftatues and monuments, as thofe of an implacable enemy of Rome. Polybius, however, in an eloquent harangue defended his memory, and the conful would not permit fuch a pofthumous infult to a truly great man. Plutarch. Univ. Hift.

PHILOPOLIS, in *Geography*, a fettlement of America, in Luzerne county, Pennfylvania, 12 or 14 miles W. of mount Ararat, and at the head of the weftern branch of Tunkhanock creek, about 45 miles S.E. of Athens, or Tioga point. N. lat. 41° 40′. W. long. 75° 33′.

PHILOSEBASTUS, φιλοσέβαστος, i.e. *a friend of Auguftus*, was a title affumed by feveral princes and cities, as a public teftimony of their attachment to any emperor. This title is found on the marbles of Cyzicum and in other infcriptions.

PHILOSOPHER, φιλόσοφος, a perfon well verfed in philofophy; or who makes profeffion of, or applies himfelf to, the ftudy of nature and morality.

When a race of felf-created preceptors arofe in Greece, who affumed the name of "fophifts," or wife men, their arrogant pretenfions gave great offence to fuch as were capable of diftinguifhing between real and counterfeit wifdom, and led them to adopt an appellation more fuitable to the character of men, who modeftly profeffed themfelves to be in the *purfuit*, rather than in the *poffeffion* of truth and wifdom, *viz.* that of philofophers. Cicero afcribes the invention of this term to Pythagoras, and gives the following account of the manner in which it was introduced. Every one knows, that among the Greeks there were feven eminent men, who have fince been univerfally denominated the "feven wife men" of Greece: that, at a ftill earlier period, Lycurgus, and, even in the heroic ages, Ulyffes and Neftor, were called wife men; and, in fhort, that this appellation has, from the moft ancient times, been given to thofe who have devoted themfelves to the contemplation of nature. This title continued in ufe till the time of Pythagoras. It happened, while this great man was at Phlius, that Leon, the chief the Phliufians, was exceedingly charmed with the ingenuity and eloquence with which he difcourfed upon various topics, and afked him, in what art he principally excelled; to which Pythagoras replied, that he did not profefs himfelf mafter of any art, but that he was a "philofopher." Leon, ftruck with the novelty of the term, afked Pythagoras, who were philofophers, and in what they differed from other men. Pythagoras replied, that, as in the public games, while fome are contending for glory, and others are buying and felling in purfuit of gain, there is always a third clafs of perfons, who attend merely as fpectators; fo, in human life, amidft the various characters of men, there is a felect number of thofe, who, defpifing all other purfuits, affiduoufly apply themfelves to the ftudy of nature, and the fearch after wifdom: thefe, added Pythagoras, are the perfons whom I call philofophers. Cicero Tufcul. Difp. l. v. c. 3.

This appellation, thus affumed merely through modefty, to intimate that even they who have made the greateft advances in knowledge, are rather to be confidered as "lovers of wifdom," than as "wife men," foon loft its original meaning, and was borne with as much haughtinefs and vanity, as if it had implied an exclufive right to the poffeffion of wifdom. "Some there are," fays Quintilian (Proœm. Inft.) "who, defpifing the occupation of an orator, have employed themfelves in prefcribing rules for the conduct of life; thefe have infolently affumed to themfelves the title of the *fole profeffors of wifdom*."

The fects of philofophers are very numerous; and their dogmata or tenets very contradictory.

Helmont, and fome of the chemifts, denominate themfelves *philofophers by fire*.

The alchemifts, and adepti, are frequently denominated *the philofophers*, by way of eminence.

PHILOSOPHER'S *Stone*, the greateft object of alchemy, is a long-fought-for preparation, which, when found, is to tranfmute or exalt impurer metals, as tin, lead, and copper, into gold and filver.

Some of the Greek writers in the fourth and fifth centuries, fpeak of an art, as being then known, of tranfmuting the bafer metals into gold; and towards the end of the thirteenth century, when the learning of the eaft had been brought hither by the Arabians, the fame pretenfions began to fpread through Europe. It is fuppofed that this art, called *alchemy*, was of Egyptian origin: and that when the ancient Greek philofophers travelled into Egypt, they brought back fome of the allegoric language of this Egyptian art, ill underftood, which afterwards paffed into their mythology. Alchemy was the earlieft branch of chemiftry, confidered as a philofophical fcience: in the other parts of chemical

chemical knowledge, facts preceded reafoning or fpeculation; but alchemy was originally fpeculative. See TRANSMUTATION.

The alchemifts fuppofed the general principles of metals to be chiefly two fubftances, which they called mercury and fulphur; they apprehended alfo, that the pure, mercurial, fulphureous, or other principles of which they imagined gold to be compofed, were contained, feparately, in other bodies: and thefe principles, therefore, they endeavoured to collect, and to concoct and incorporate by long digeftions; and by thus conjoining the principles of gold, if they could be fo procured and conjoined, it might be expected that gold would be produced. But the alchemifts pretend to a product of a higher order, called the *elixir*, the medicine for metals, the tincture, the philofopher's ftone; which, by being projected on a large quantity of any of the inferior metals in fufion, fhould change them into fine gold: which being laid on a plate of filver, copper, or iron, and moderately heated, fhould fink into the metal, and change into gold all the parts to which it was applied: which, on being properly heated with pure gold, fhould change the gold into a fubftance of the fame nature and virtue with itfelf, fo as thus to be fufceptible of perpetual multiplication; and which, by continued coction, fhould have its power more and more exalted, fo as to be able to tranfmute greater and greater quantities of the inferior metals, according to its different degrees of perfection.

There are three ways by which the alchemifts have attempted to arrive at the making of gold: the firft by feparation; for it is affirmed, that every metal yet known contains fome quantity of gold: only, in moft, the quantity is fo little, that it will not defray the expence of getting it out.

The fecond is by maturation; for the alchemifts hold mercury to be the bafis and matter of all metals; that quickfilver purged from all heterogeneous bodies would be much heavier, denfer, and fimpler, than the native quickfilver; and that by fubtilizing, purifying, and digefting it with much labour, and long operations, it may be converted into pure gold.

This method of maturation is only for mercury: the other metals it is ineffectual for, on two accounts: 1. Becaufe their matter is not pure mercury, but has other heterogeneous bodies adhering to it: And, 2. Becaufe the digeftion, by which mercury is turned into gold, would not fucceed in other metals, in regard thefe had not been long enough in the mines.

Weight is the individual and inimitable character of gold, &c. Now mercury, they fay, has ever fome impurities in it; and thofe impurities are lighter than mercury. Could thofe be purged quite out, as it does not appear to them impoffible but they might, mercury would be as heavy as gold: and what is as heavy as gold is gold, or at leaft might very eafily be made gold. See *Fixing of* MERCURY.

The third method is, that of tranfmuting, or of turning all metals readily into pure gold, by melting them in the fire, and cafting a little quantity of a certain preparation into the fufed matter, upon which the fæces immediately retire, are volatilized and burnt, and fo carried off; and the reft of the mafs is turned into pure gold. That which works this change in the metals is called the philofopher's ftone. See TRANSMUTATION.

Whether this third method be poffible or not, is very hard to fay. We have fo many teftimonies of it from perfons, who on all other occafions fpeak truth, that it is fomewhat hard to fay they are guilty of falfehood, even when they fay, that they have been mafters of the fecret. All required is, they fay, to do that by art, which nature does in many years and ages. For that as lead and gold do but differ little in weight, therefore there is not much in lead befide mercury and gold. Now, if I had any body which would fo agitate all the parts of lead, as to burn all that is not mercury therein; and had alfo fome fulphur to fix the mercury; would not the mafs remaining be converted into gold? There is nothing in nature fo heavy as lead, gold and mercury alone excepted. It is evident, therefore, there is fomething in lead that comes very near to gold. But in lead there is alfo fome heterogeneous matter different both from mercury and gold. If now nineteen ounces of lead be diffolved by the fire, and eight ounces be thus deftroyed, they argue that we fhall have the reft good gold; the ratio of lead to gold being as eleven to nineteen. If then the philofopher's ftone can purify the mercurial matter in lead, fo as that nothing fhall remain but the pure mercurial body, and you can fix and coagulate this, by means of fulphur, out of nineteen ounces of lead you will have eleven of gold. Or, if you reduce the lead from eighteen to fourteen, you will then have converted it into mercury; and if you farther purify this mercury to its proper ftandard, you will have gold; provided you have but a fulphur with which to fix and coagulate it. Such is the foundation of the opinion of the philofopher's ftone; which the alchemifts contend to be a moft fubtile, fixed, concentrated fire, which, as foon as it melts with any metal, does, by a magnetic virtue, immediately unite itfelf to the mercurial body of the metal, volatilizes and cleanfes off all that is impure therein, and leaves nothing but a mafs of pure gold. Many frauds and artifices have undoubtedly been practifed in this operation; and there might be political reafons why princes and others fhould encourage thofe who pretended a power of furnifhing this inexhauftible fource of wealth: but it would be wrong to cenfure as impoftors, all thofe who have declared themfelves convinced, from their own experiments, of the tranfmutability of bafe metals into gold. However, there are ftrong reafons to believe that the authors have been deceived themfelves by fallacious appearances. Mr. Boyle gives an account of a procefs, by which he imagines part of the fubftance of gold to have been tranfmuted into filver. (See MENSTRUUM *Peracutum.*) He alfo relates a very extraordinary experiment, under the title of the degradation of gold by an anti-elixir, which was publifhed in his own life-time, and fince reprinted in 1739. Hence many have been led to conclude in favour of the alchemical doctrine of the tranfmutability of metals. See an account of this experiment, with remarks upon it, by Dr. Lewis, in his Commerce of Arts, fect. xii. p. 297, &c.

King Henry VI. granted letters patent to certain perfons, who undertook to find out the philofopher's ftone, and to change other metals into gold, &c. to be free from the penalty of the ftat. 5 Hen. IV. made againft the attempts of chemifts of this nature. Pat. 34 Hen. VI. 3 Inft. 74. See ALCHEMY.

PHILOSOPHER'S *Tree*, a chemical preparation, called alfo *Arbor Dianæ*, Diana's Tree.

PHILOSOPHICAL, fomething that relates to philofophy.

PHILOSOPHICAL *Tranſactions.* See TRANSACTIONS.

PHILOSOPHIZING, the act of conſidering ſome object of our knowledge, examining its properties, and the phenomena it exhibits, and enquiring into their cauſes or effects, and the laws thereof; the whole conducted according to the nature and reaſon of things, and directed to the improvement of knowledge.

PHILOSOPHIZING, *Rules of*, *Regulæ Philoſophandi*, as eſtabliſhed by ſir Iſaac Newton, are, 1. That no more cauſes of a natural effect be admitted than are true, and ſuffice to account for the phenomena thereof.

This agrees with the ſentiments of moſt philoſophers, who hold that nature does nothing in vain; and that it were vain to do that by many things, which might be done by fewer.

2. Natural effects, therefore, of the ſame kind, proceed from the ſame cauſes. Thus, *e. gr.* the cauſe of reſpiration is one and the ſame in man and brute; the cauſe of the deſcent of a ſtone, the ſame in Europe as in America; the cauſe of light the ſame in culinary fire, as in the ſun; and the cauſe of reflexion the ſame in the planets as the earth.

3. Thoſe qualities of bodies which are not capable of being heightened, and remitted, and which are found in all bodies, where experiments can be made, muſt be looked on as univerſal qualities of all bodies.

Thus the extenſion of body is only perceived by our ſenſes, nor is it perceiveable in all bodies; but ſince it is found in all that we have perception of, it may be affirmed of all. So we find, that ſeveral bodies are hard; and argue that the hardneſs of the whole only ariſes from the hardneſs of the parts: whence we infer, that the particles, not only of thoſe bodies which are ſenſible, but of all others, are likewiſe hard. Laſtly, if all the bodies about the earth gravitate towards the earth, and this according to the quantity of matter in each; and if the moon gravitates towards the earth alſo according to its quantity of matter; and the ſea again gravitates towards the moon; and all the planets and comets gravitate towards each other: it may be affirmed univerſally, that all bodies in the creation gravitate towards each other. This rule is the foundation of all natural philoſophy.

PHILOSOPHY, Φιλοσοφια, the knowledge or ſtudy of nature and morality, founded on reaſon and experience.

Philoſophy owes its name to the modeſty of Pythagoras, who refuſed the title σοφος, *wiſe*, given to his predeceſſors, Thales, Pherecydes, &c. as too aſſuming; and contented himſelf with the ſimple appellation of φιλοσοφος, *quaſi* φιλος της σοφιας, *a friend or lover of wiſdom.*

Chauvin rather derives the name from φιλια, *deſire*, or *ſtudy*, and σοφια, *q. d. ſtudium ſapientiæ*; and ſays that Pythagoras, conceiving that the application of the human mind ought rather to be called *ſtudy* than *ſcience*, ſet aſide the appellation *wiſe*, and in lieu of it took that of *philoſopher*. (See the article PHILOSOPHER.) Which title, St. Auguſtine obſerves, took ſo well with other authors, that whoever excelled in any thing relating to wiſdom or knowledge had afterwards no other appellation. Accordingly Socrates, Plato, &c. ever refrained from the ſwelling title of ſophos.

By philoſophy we mean the knowledge of the reaſons of things, in oppoſition to hiſtory, which is the bare knowledge of facts: or to mathematics, which is the knowledge of the quantity of things or their meaſures.

Theſe three kinds of knowledge ought to be joined as much as poſſible. Hiſtory furniſhes matter, principles, and practical examinations, and mathematics complete the evidence. Philoſophy being the knowledge of the reaſons of things, all arts muſt have their peculiar philoſophy, which conſtitutes their theory: not only law and phyſic, but the loweſt and moſt abject arts are not deſtitute of their reaſons, which might uſefully employ the time of the ſtudious: and the advantages reſulting from this kind of employment has been amply manifeſted in the diſcoveries of modern times.

One great obſtacle to the progreſs of arts and ſciences has been the neglect of practice in ſpeculative men, and the ignorance and contempt of theory in mere practical men. What chimeras and abſurdities the neglect of experience and practice has produced, need not be mentioned; the miſchiefs ariſing from a neglected theory are not ſo obvious: yet certainly it retards the progreſs of arts. All invention or improvement muſt be either caſual or rational, including analogy or inference from ſimilar caſes, under the term rational. Now, although the foundations of arts have often been owing to ſome caſual diſcovery, as gunpowder, or the loadſtone, yet is this not to be truſted to alone. Improvements do not always flow from this ſource, but rather from the reflections of artiſts; and, if theſe reflections were rendered more diſtinct, more communicable, and eaſier to be retained, by the proper uſe of ſigns and other philoſophical helps, great advantages might be expected: it being certain, that philoſophical knowledge is more extenſive, and more ſure in the application; and, beſides, gives a pleaſure to the mind not to be expected from that which is merely hiſtorical.

It is to be obſerved, that the bare intelligence and memory of philoſophical propoſitions, without any ability to demonſtrate them, is not philoſophy, but hiſtory only. However, where ſuch propoſitions are determinate and true, they may be uſefully applied in practice, even by thoſe who are ignorant of their demonſtrations. Of this we ſee daily inſtances in the rules of arithmetic, practical geometry, and navigation; the reaſons of which are often not underſtood by thoſe who practiſe them with ſucceſs. And this ſucceſs in the application produces a conviction of mind, which is a kind of medium between philoſophical, or ſcientifical, and hiſtorical knowledge.

The ingenious author of the Analyſt has gone ſo far as to ſuggeſt, that mathematicians have no other conviction of the truth of the doctrine of fluxions.

We have ſaid that philoſophy is the knowledge of the reaſons of things. It may be aſked, what are the reaſons of things, or what is the explanation of phenomena or facts? An ingenious author tells us, that the explication conſiſts only in ſhewing the conformity any particular phenomenon hath to the general laws of nature; or, which is the ſame thing, in diſcovering the uniformity there is in the production of natural effects. This he thinks evident to any one whoever ſhall attend to the ſeveral inſtances in which philoſophers pretend to account for appearances. By a diligent operation of the phenomena within our view, we may diſcover the general laws of nature, and from thence deduce, though not demonſtrate, other phenomena; all productions of this kind depending on a ſuppoſition that the Author of Nature always operates uniformly, and in a conſtant obſervation of thoſe rules we take for principles; which we cannot evidently know.

If we take a view of the ſeveral phenomena, and compare them together, we may obſerve ſome likeneſs and conformity between them. For example, in the falling of a ſtone to the ground, in the riſing of the ſea towards the moon, in

coheſion

coheſion and cryſtallization, there is ſomething alike, namely, an union or mutual approach of bodies: ſo that any one of theſe, or the like phenomena, may not ſeem ſtrange or ſurpriſing to a man who has nicely obſerved and compared the effects of nature: for that only is thought ſo which is uncommon, or a thing by itſelf, and out of the ordinary courſe of our obſervation. That bodies ſhould tend towards the centre of the earth is not thought ſtrange, becauſe it is what we perceive every moment of our lives; but that they ſhould have a like gravitation towards the centre of the moon, may ſeem odd and unaccountable to moſt men, becauſe it is diſcerned only in the tides; but a philoſopher, whoſe thoughts take in a larger compaſs of nature, having obſerved a certain ſimilitude of appearances, as well in the heavens as the earth, that argue innumerable bodies to have mutual tendency towards each other, which he denotes by the general name attraction, whatever can be reduced to that, he thinks juſtly accounted for. Thus he explains the tides by the attraction of the terraqueous globe towards the moon, which, to him, doth not appear odd or anomalous, but only a particular example of a general rule or law of nature.

If, therefore, we conſider the difference there is betwixt natural philoſophers, and other men, with regard to their knowledge of the phenomena, we ſhall find it conſiſts not in an exacter knowledge of the efficient cauſe that produces them, for that can be no other than the will of a ſpirit; but only in a greater largeneſs of comprehenſion, whereby analogies, harmonies, and agreements are deſcried in the works of nature, and the particular effects explained; that is, reduced to general rules, which rules grounded on the analogy and uniformneſs obſerved in the production of natural effects, are more agreeable, and ſought after by the mind; for that they extend our proſpect beyond what is preſent, and near to us, and enable us to make probable conjectures, touching things that may have happened at very great diſtances of time and place, as well as to predict things to come; which ſort of endeavour towards omniſcience is much affected by the mind. Berkeley's Princ. of Hum. Knowledge, ſect. 104, 105.

Philosophy is a term uſed in various ſignifications among ancient and modern writers. In its *laxer ſenſe*, it ſignifies the love of truth: thus Plato frequently calls it *philalethia*.

In other places it ſignifies the knowledge of many things; thus Zeno calls philoſophy, κατάληψις, *comprehenſion*, becauſe comprehending all truth. Agreeable to which is Cicero's definition of philoſopher, that he is one who ſtudies to know the natures and cauſes of all things human and divine, and to attend to every good rule and method of life.

Philoſophy has been applied by many modern writers not only to all ſpeculative ſcience, but the term has been uſed ſo as to comprehend ſkill in municipal law, the knowledge of medicine, the art of criticiſm, and the whole circle of polite literature. The term has been even transferred to theology, ſo that the Chriſtian religion has been called ſacred philoſophy; and eccleſiaſtical doctors and monks have been denominated philoſophers.

Philosophy, in a *narrower ſenſe*, is frequently confined to ſome one ſcience, or branch of ſcience: *v. gr.* to logic, as we find it in Plato and Ariſtotle: to phyſics, or the knowledge of nature; in which ſenſe it was chiefly uſed in the Ionic ſchool: and to ethics, or the rules of morality: thus it is Clemens of Alexandria relates that among the Greeks there are philoſophers who hold diſputes about virtue.

Agreeable to this laſt application, Pythagoras defines philoſophy a meditation on death: by which, according to Plato and Clemens, is meant an abſtraction or retirement from the body: which Apuleius thus explains: a philoſopher is to ſtudy nothing ſo much as to ſet his ſoul at liberty from its correſpondence with the body: thus Cicero calls philoſophy, *ars vitæ*, and Seneca, *lex vitæ*: and thus Plutarch. Conſtancy, fidelity, and a ſound mind, are the real philoſophy; all the other parts of wiſdom, tending any other way, are prettineſſes and curioſities: and in this ſenſe it was that philoſophy chiefly flouriſhed in the ſchools of Socrates, afterwards called the *Academic ſchool*, and among the Stoics.

Philosophy, again, is frequently uſed by Pythagoras and Plato for methaphyſics, or the knowledge of God: which Plato calls the true philoſophy, others the *prima philoſophia*; and in reſpect of which, the Platoniſts call all other philoſophy, *nocturnal*, νυκτερινη φιλοσοφια.

Gale includes the ſeveral notions hitherto delivered, under this one general definition: philoſophy is the knowledge of things natural, moral, ſupernatural, and notional; originally granted by God to our firſt parents, and tranſmitted to us for the honour of the Creator, and the good of the univerſe.

The definition of Epictetus is alſo pretty comprehenſive: philoſophy, he ſays, conſiſts in three things; the practice of precepts, the reaſon of precepts, and the proof of precepts.

Brucker, in his "Hiſtory of Philoſophy," defines philoſophy to be that love of wiſdom, which incites to the purſuit of important and uſeful ſcience. Philoſophy diſcovers and teaches thoſe principles by means of which happineſs may be acquired, preſerved, and increaſed: wiſdom applies theſe principles to the benefit of individuals and of ſociety. "Knowledge which is applicable to no uſeful purpoſe cannot deſerve the name of wiſdom."

"Qui ipſi ſibi ſapiens prodeſſe nequit, nequicquam ſapit."

The ſources of that knowledge of truth which leads to the poſſeſſion of happineſs are reaſon and revelation. To inſtruct men in thoſe truths which God hath communicated to mankind by revelation is the province of theology; which ſee. To teach them ſuch truths, connected with their happineſs, as are capable of being diſcovered by the powers of reaſon, is the province of philoſophy. Theſe two provinces are perfectly diſtinct, and ought to be kept ſeparate, except where the one may occaſionally ſerve to caſt light upon the other. The leading offices of philoſophy, ſays Brucker, may be eaſily deduced from the general idea of its object. As the permanent enjoyment of real good is the end to be attained, it is the buſineſs of philoſophy to inveſtigate the nature of good, and the means by which it may be acquired, and ſo to form and improve the whole man, that he may arrive at the complete poſſeſſion of true felicity. The buſineſs of philoſophy will therefore be to cultivate the underſtanding, and direct its operations: to correct and meliorate the will and affections, by diſcovering thoſe objects that are diſcernible, comparing their reſpective claims, and ſhewing how they may be rendered moſt productive of happineſs; to enquire out the cauſes of natural appearances, and hence arrive at the knowledge of the Firſt Cauſe, under thoſe characters and relations that are moſt intereſting to mankind; to conduct men to ſuch an acquaintance with the properties of natural bodies, and their reciprocal actions, as ſhall enable them to apply the objects around them to their own convenience; and, finally, to aſſiſt them in inveſtigating the principles of ſocial virtue, and ſo provide them with ſuch rules of conduct as ariſe from mutual convenience and intereſt, from the natural ſentiments of juſtice and humanity, and from the voluntary engagements

engagements of civil ſociety. Dialectics, phyſics, natural religion, ethics and policy are thus comprehended under the general term philoſophy.

From this view of the ſubject it will appear, that a hiſtory of philoſophy is a hiſtory of doctrines, and of men. As a hiſtory of doctrines, it lays open the origin of opinions, the changes which they have undergone, the diſtinct characters of different ſyſtems, and the leading points in which they agree or differ; and it is therefore, in fact, a hiſtory of the human underſtanding. As a hiſtory of men, it relates the principal incidents in the lives of the more eminent philoſophers; remarks, particularly, thoſe circumſtances in their character or ſituation, which may be ſuppoſed to have influenced their opinions; takes notice of their followers, and their opponents; and deſcribes the origin, progreſs, and decline of their reſpective ſects. It is in this comprehenſive manner, that our learned author has undertaken to trace the hiſtory of philoſophy and philoſophers from the earlieſt records to the preſent time. And if we may judge of the execution of this important undertaking from the excellent compendium of it given in our own language by Dr. Enfield, it muſt have required immenſe labour of reſearch, and it has been rendered in a very high degree inſtructive and intereſting. Our readers will find that we have availed ourſelves of this valuable work in various articles of the Cyclopædia.

After fully and modeſtly ſtating the manner in which he has proceeded in the accompliſhment of his undertaking, the author points out the principal advantages that may be expected from an attention to the riſe and progreſs of philoſophy. We ſhall thus perceive the extent of our intellectual capacities, the cauſes of their perverſion, and the means by which we may avail ourſelves for avoiding error, and ſucceſsfully purſue without deviation the attainment of truth. The hiſtory of philoſophy ſerves as a regiſter of diſcoveries in the world of ſcience, and as a ſkilful guide towards unknown regions, whither future adventurers may with advantage direct their courſe. This will alſo ſerve to acquaint us with the general ſources of ſcience, with the names and characters of valuable authors, the ſubjects of their works, and the aſſiſtance that may be expected from them in ſcientific reſearches; ſo that the hiſtory of philoſophy is an important branch of the hiſtory of univerſal erudition.

The learned author divides the hiſtory of philoſophy into three periods; the *firſt* traces its riſe and progreſs from the earlieſt times to the eſtabliſhment of the Roman empire. The *ſecond* repreſents its ſtate among the Heathens, whilſt it flouriſhed under the emperors, which brings the hiſtory down to the ſixth century; and among the Jews, Saracens, and Chriſtians, from the commencement of the Chriſtian era to the time of the revival of letters. The *third* period relates the attempts which have been ſince made for the reformation and improvement of philoſophy, and deſcribes the various forms which it has aſſumed from the revival of letters to the laſt century. Thus the whole hiſtory of philoſophy is conſequently divided into *ancient*, *middle*, and *modern*. The *firſt* period comprehends the Barbaric and the Grecian philoſophy: the former including all thoſe nations, which before the time when the Grecian philoſophy paſſed over to the Romans, did not uſe the Greek language; the latter, all thoſe countries in which that language was ſpoken. The *ſecond* period exhibits the ſtate of philoſophy during the courſe of 1200 years among the Romans, the Orientaliſts, the Jews, the Saracens, and the Chriſtians. In the *third* period of this hiſtory we ſee the ſucceſsful efforts of philoſophy to riſe above the unwholeſome atmoſphere of tyranny, ſuperſtition, and bigotry, into the pure regions of freedom and truth; and find the ſeveral ancient ſects reviving, new and better methods of philoſophizing diſcovered, the chains of authority in ſome meaſure ſhaken off, and farther advances made in true philoſophy within the courſe of a ſingle century, than had before been made in a thouſand years. We have thus ſketched the plan of this valuable work for the information of our readers, and we ſhall refer them for particular details to the appropriate articles in the Cyclopædia.

Some have given the following appellations to the ancient philoſophy, under its ſeveral ſtages: philoſophy, ſay they, became *impious* under Diagoras; *vicious* under Epicurus; *hypocritical* under Zeno; *impudent* under Diogenes; *covetous* under Demochares; *voluptuous* under Metrodorus; *fantaſtical* under Crates; *ſcurrilous* under Menippus; *licentious* under Pyrrho; and *quarrelſome* under Cleanthes.

The ſeveral dogmata maintained by the ſeveral philoſophers are infinite: Cicero makes no ſcruple to aver, that there is nothing in the world, how abſurd ſoever, but has been maintained by one philoſopher or other.

From the firſt broachers of new opinions, and the firſt founders of ſchools, philoſophy has become divided into innumerable ſects; ſome ancient, others modern: ſuch are the Platoniſts, Peripatetics, Epicureans, Stoics, Pyrrhonians, and Academics; and ſuch are the Carteſians, Newtonians, &c. See the riſe, doctrines, &c. of each ſect under PLATONISM, PERIPATETICS, EPICUREANS, STOICS, PYRRHONIANS, ACADEMICS, CARTESIAN, NEWTONIAN, &c.

Philoſophy may be divided into two branches, or it may be conſidered under two habitudes, *theoretical*, and *practical*.

PHILOSOPHY, *Theoretical*, or *Speculative*, is that employed in mere contemplation, and terminating in it. Such is phyſics, which is a bare contemplation of nature, and natural things: and it is again uſually ſubdivided into three kinds, *viz.* pneumatics, phyſics or ſomatics, and metaphyſics or ontologia.

The firſt conſiders being, abſtracted from all matter: its objects are ſpirits, their natures, properties, and effects. The ſecond conſiders matter and material things: its objects are bodies, their properties, laws, &c.

The third extends to each indifferently: its objects are either body or ſpirit.

In the order of our diſcovery, or arrival at the knowledge of them, phyſics is firſt, then metaphyſics; the laſt ariſes from the two firſt conſidered together: after an acquaintance with God, ourſelves, and natural bodies, we come to conſider what is natural to them all, or the attributes that agree to all: and thus form a ſort of univerſal philoſophy, or doctrine *de ente* in general.

But in teaching, or laying down, theſe ſeveral branches to others, we obſerve a contrary order; beginning with the moſt univerſal, and deſcending to the more particular. And hence we ſee why the Peripatetics call metaphyſics, and the Carteſians pneumatics, the *prima philoſophia*. Others prefer the diſtribution of philoſophy into four parts, *viz.* 1. Pneumatics, which conſiders and treats of ſpirits. 2. Somatics, of bodies. The 3d, compounded of both, anthropology, which conſiders man, in whom both body and ſpirit are found. 4. Ontoſophy, which treats of what is common to all the other three.

Philoſophy may be divided into three parts, intellectual, moral, and phyſical; the intellectual part compriſes logic and metaphyſics; the moral part obtains the laws of nature and nations, ethics and politics; and, laſtly, the phyſical part

part comprehends the doctrine of bodies, animate or inanimate: theſe, with their various ſubdiviſions, will take in the whole of philoſophy.

Wolfius makes the three parts of philoſophy to be the doctrine of God, the human ſoul, and of bodies. However, when he ſubdivides, and comes to treat the ſeveral branches ſeparately, his diviſions readily come under the three heads, intellectual, moral, and phyſical, before mentioned. The doctrine of God, and the human ſoul, may be ranged under the ſame head, metaphyſics, the notion of the divine nature being formed from that of the human ſoul, excluding limitations and imperfections. Muſchenbroeck divides philoſophy into ſix parts, *viz.* pneumatics, or the doctrine of ſpirits; phyſics, whoſe object is the univerſe and the bodies contained therein; teleology, which explores the deſign and end of the exiſtence of all bodies, and of all their actions and changes, as far as human ſagacity can diſcover them; metaphyſics, which comprehends the general and abſtract natures and qualities of objects, containing ontology and coſmology, practical or moral philoſophy, which lays down rules for the right conduct of life, and the attainment of true happineſs; and logic, which unfolds the powers and directs the exerciſe of the intelligent and reaſoning faculty of the human mind.

Philosophy, *Practical,* is that which lays down the rules of a virtuous and happy life; and excites us to the practice thereof.

Practical philoſophy is properly ethics alone, or the method of leading a virtuous and happy life. Yet moſt authors divide it into two kinds, anſwerable to the two ſorts of human actions to be directed thereby; *viz.* 1. Logic, which governs the operations of the underſtanding. 2. Ethics, properly ſo called, which direct thoſe of the will.

Philosophy *of the Hindoos.* As far as regards metaphyſics and logic, it ſeems likely, from what little hath hitherto appeared, that the Hindoos have ſome very ancient and curious books expreſsly on thoſe branches of philoſophy, which would be valuable acquiſitions to the literature of Europe. Beſides regular treatiſes on theſe, as well as the other branches, moſt of their ancient and ſacred books diſcuſs ſcientific ſubjects, as well as religion and mythology. In the Veda itſelf, which may be called the Hindoo ſcriptures, this mixture is met with. One of the Vedas is aſſigned to a celeſtial phyſician; and one of its chapters is occupied with anatomy. (See Veda.) And under the article *Purana* of this work may be ſeen how miſcellaneous are the contents of the ſacred poems, bearing that common denomination. The antiquity of the Hindoo books is a diſputable point; but there ſeems good reaſon to believe that ſome of their philoſophical ſyſtems appeared in nearly their preſent form, earlier than the date of thoſe European philoſophers whoſe names diſtinguiſh theories very ſimilar to thoſe of the Hindoos. There is hence a promiſe of proof that a great portion of the learning of Greece and Rome was derived directly from India, as well as their mythology, or popular religion. It is this circumſtance chiefly, perhaps, that will render the introduction of faithful tranſlations of the Hindoo books ſo curious and intereſting to the literati of Europe; for few are ſo ſanguine as to expect from ſuch a ſource *much* really uſeful to us, in our preſent ſtate of human intellect and ingenuity. We ſay *much,* in order to abate the indulgence of any unreaſonable ardour of expectancy, that muſt of courſe end in diſappointment: while to affirm, that *nothing* uſeful is to be thence looked for, might favour of unbecoming arrogance.

The Hindoos are prone to a *triple* arrangement wherever it can be effected, and we find their principal ſyſtems of philoſophy claſſed under three heads, namely, 1. *Nyaya;* 2. *Mimanſa;* and 3. *Sankya;* under each of which words we have offered a brief outline of thoſe ſeveral theories. They are aſcribed to Godama, Jaimini, and Kapila, of which philoſophers, ſome account is given under their reſpective names. The above three theories are divided each into two parts; and excluſive of the works aſſigned to the authors of the ſyſtems, all ſubſequent works are ſimilarly named, according to the ſchool under which the prevalent tenets, that they uphold, may have dictated their arrangement. The ſame may be ſaid of the commentaries on the original or divided works, and on their imitators or diſciples. Theſe commentaries are claſſed under the denomination of *upaderſena,* and have become ſo voluminous as to obſcure, rather than explain, the works of the original philoſophers, which are very ſuccinct. The three ſchools are, as we have ſeen, divided into ſix; and may be aptly compared to the principal ſchools of the weſt, and their authors with our ancient fathers of philoſophy. We offer in one view the names and titles of each, and their correſponding theories; premiſing that, of courſe, differences, as well as coincidences, of various ſorts will be found, as the works of the Hindoo founders come to be more known. It is to their leading features only that the ſimilitude is intended to be applied, and in theſe it is often very ſtriking.

1.	1. Nyaya,	Godama,	Peripatetic,	Ariſtotle.
	2. Vaiſiſhika,	Kanada,	Ionic,	Thales.
2.	1. Mimanſa,	Jaimini,	Platonic,	Socrates.
	2. Vedanta,	Vyaſa,		Plato.
3.	1. Sankya,	Kapila,	Italic,	Pythagoras.
	2. Patanjali,	Patanjala,	Stoic,	Zeno.

Each of the above words or names has furniſhed an article in this work, and the enquirer is referred thereto for farther information.

Although moſt of the works claſſed in India under theſe ſeveral heads are recognized as comparatively orthodox, yet ſuch a range is occaſionally taken by the diſciples of all the ſchools, as to ſubject them to a charge of hereſy from opponents of others, and from the rigid of all theological ſects. Another claſs is, however, generally ſtigmatized with the epithets of materialiſts, atheiſts, &c., and indeed there are alſo three principal ſchools of this deſcription, ſubdivided in like manner as above mentioned, into ſix, generally called the atheiſtical ſyſtems. "All full," ſay the orthodox, "of indeterminate phraſes, errors in ſenſe, confuſion between diſtinct qualities, incomprehenſible notions, opinions not duly weighed, tenets deſtructive of natural equality, containing a jumble of atheiſm and ethics; omitting what ought to be expreſſed, and expreſſing what ought to be omitted; abounding in falſe, idle, and impertinent propoſitions."

We cannot detail either the tenets or the titles of ſuch works or ſyſtems. As a ſpecimen we refer to the article Nastick, the name of one of theſe ſchools, otherwiſe called Charvaka, from the name of its founder. See alſo under Boodh, Jaina, &c. articles thence referred to.

Philosophy, *Mental,* or the *Philoſophy of the Human Mind,* is that branch of ſcience which inveſtigates the laws of the human mind. Its object is to aſcertain the properties of the mind, the origin of its various modes of thought and feeling, the ways in which they operate upon each other, and the means by which they are to be cultivated or repreſſed.

Mental philoſophy is not uncommonly confounded with metaphyſics; and the abſurdities and fertile ſpeculations which have been claſſed under the latter, have been ſuppoſed by many to belong to the former. *Metaphyſics* (μετα τα φυσικα) comprehends all thoſe inveſtigations which have for their aim the properties, claſſification, and laws of ſuch objects of human thought as by ſenſation alone could not be brought under the notice of the mind; and it conſequently includes the philoſophy of the human mind; but it is obviouſly unjuſt to throw upon this branch of metaphyſics, the ſtigma which, if due to any, belongs to thoſe branches alone, which have no relation to our mental laws and operations. The ancient metaphyſics comprehended many objects which can ſcarcely be ſaid to lie within the ſphere of human knowledge, and which are rather to be conſidered as the reveries of imagination, than as the realities of intellect; but theſe the good ſenſe of the preſent day regards merely as objects of curioſity, notwithſtanding the efforts of the learned Harris and others to bring us back to all the philoſophical vagaries of antiquity. Excluding theſe, however, (with which the ſcience of metaphyſics is no more chargeable, than phyſical ſcience is with the vortices of Des Cartes,) we are diſpoſed to allow a high rank to a few only of thoſe objects of metaphyſical reſearch which do not juſtly claſs under the head of mental philoſophy. We regard them, in general, as only amuſing ſpeculations, which may ſerve to ſharpen the activity of the intellect; but we are no advocates for the young philoſopher ſpending his exertions upon them.

Whatever relates to the properties of the mind, to the operations of intellect and affection, is of high value in various points of view. The philoſophy of the mind, as Mr. Stewart juſtly remarks, abſtracted entirely from that eminence which belongs to it in conſequence of its practical applications, may claim a diſtinguiſhed rank among thoſe preparatory diſciplines which biſhop Berkeley has happily compared to "the crops which are raiſed, not for the ſake of the harveſt, but to be ploughed in as a dreſſing to the land."

The object of moral philoſophy is to ſhew men their duty, and the reaſons of it It teaches what regulation of the conduct and the affections is our duty, why it is our duty, and how it is to be acquired. It is ſufficient barely to ſtate theſe objects, to ſhew at once the ſubſerviency of mental to moral philoſophy. The foundations of the ſcience of morality can only be laid, with ſucceſs, on a judicious acquaintance with the principles of the mental conſtitution. We muſt know what are the affections in which moral excellence conſiſts, how they are to be formed and cultivated, and how oppoſing ones are to be repreſſed or exterminated. Even where morality reſpects the external conduct, the reaſons of it muſt be ſought, among other ſources, in our mental principles. How actions affect our own happineſs or that of others, can only be fully ſhewn by mental philoſophy, or by that experimental acquaintance with the phenomena of mind on which its laws are founded.

Nor leſs important is an acquaintance with the principles of our mental conſtitution to the buſineſs of ſelf-inſpection and ſelf-culture. "The philoſophy of the human mind, (ſays Mr. Belſham,) teaches man to know himſelf, and to improve, direct, and exert his intellectual faculties in a manner the moſt beneficial to himſelf and others. In particular, it impreſſes a juſt ſenſe of the dignity of our rational nature, and the great end of intellectual exiſtence; it directs to the beſt method of cultivating the mental powers, of preventing or correcting prejudice and error, and of enlarging the ſtock of uſeful knowledge. By analyzing the principles of action, and tracing the origin and progreſs of affection, habit, and character, it leads to the proper diſcipline of the heart, and ſupplies the moſt efficacious means of correcting all undue bias of ſelf-love, of reſiſting the motives to vice, of reſtraining the exorbitance of the paſſions, of cultivating virtuous principles, and of attaining that juſt and beautiful ſymmetry of the affections, that elevation of mind, and diſintereſtedneſs of character, which, when combined with vigour of intellect, and comprehenſion of views, conſtitute the true dignity and happineſs of man." Elements of the Philoſophy of the Mind, p. 2.

A ſound and comprehenſive acquaintance with the laws of our mental frame, is of incalculable utility in the buſineſs of education. It gives to thoſe who conduct it, correct views as to its objects. It ſhews the vaſt importance of early impreſſions, of early attention to the culture of habits and diſpoſitions. It points out the beſt means for forming thoſe characteriſtics of intellect and affection, which are eſſential to happineſs and uſefulneſs. On this point ſee INTELLECTUAL and MORAL *Education*; and alſo Mr. Stewart's Elements, Introd. part ii. § 1. The philoſophy of the human mind is to education, preciſely what medical ſcience is to the phyſician. A perſon who has ſtored up the maxims and recipes of former practitioners, and poſſeſſes an active diſcriminating mind, may do wonders without an acquaintance with the ſtructure and phyſiology of the human frame; but for one inſtance in which we find a perſon ignorant of medical ſcience judiciouſly employing means of cure judiciouſly choſen, we meet with thouſands in which the practice is unſteady, irregular, inconſiſtent, caſually perhaps beneficial, but more frequently injurious. And, at any rate, the moſt ſucceſsful of ſuch practitioners would certainly have been more regularly ſucceſsful, if they had poſſeſſed a ſound and extenſive acquaintance with the ſtructure and functions of the body, the nature of diſeaſes, the effects of certain ſubſtances upon the bodily ſyſtem, &c.

We might go on much farther in ſhewing the practical advantages of mental philoſophy; but we have already offered a few remarks on the ſubject in the laſt column of INTELLECTUAL *Education*, to which we refer our readers; and we ſhall only obſerve here, that an acquaintance with the principles of this important ſcience, enables us more correctly to appreciate the ineſtimable value of Chriſtianity, and the ſtrength of the evidences on which it is founded. It leads to the moſt intereſting concluſions reſpecting the worth of Chriſtian precepts, and the exalted nature of Chriſtian motives. It ſhews us how Chriſtianity "reconciles human nature to itſelf;" and it ſhews us that the truth of it reſts upon the well-known laws of the human mind. It directly farthers the cauſe of religion in general, by rendering more obvious the reaſons of the divine diſpenſations, and by the various diſplays of goodneſs and wiſdom which our mental phenomena preſent to us. It tends, beyond all other branches of philoſophical inveſtigation, "to correct, enlarge, and exalt our conceptions of the attributes and character of the Supreme Being, and to lay a foundation for the moſt rational and exalted piety."

We cannot even attempt to lay before our readers a complete ſyſtem of this important ſcience. However brief it might be made, if it were as comprehenſive as the ſubject requires, it would probably be conſidered as occupying a diſproportionate ſhare of our work. What we ſhall aim at is to give ſuch a view of the leading principles of our mental frame, as may aſſiſt to direct the thoughts of the inquirer into the right channel, and ſerve as a foundation for his own inveſtigations. In the ſtudy of mental philoſophy, our ſucceſs muſt ultimately depend upon the attentive examination of what paſſes within ourſelves; and it is only ſo far as the obſervations of others on the phenomena and laws of the mind are

are borne out by fuch examination, that we can feel a reafonable fatisfaction in their correctnefs.

As to the proper conduct of our philofophical enquiries, in inveftigating the laws of the human mind, we have great fatisfaction in referring to fome of the ftatements of Reid and Stewart. We regret to fee, in various paffages from the pen of the latter of thefe philofophers, when fpeaking of the principles of Hartley, a tone of cenfure, (fometimes bordering on contempt,) which is clearly founded on mifapprehenfion. This we fhall hereafter have occafion to notice more fpecifically. In feveral of Mr. Stewart's more general pofitions, we alfo widely differ from him. But the reader of this article will have opportunities of perceiving, that there are fome extenfive and highly important portions of his Elements, to which we can yield an entire approbation. Among other things we cordially agree with him in his wifh to feparate between important and well-afcertained truths, and principles which reft wholly on conjecture. "The metaphyfical opinions which we may happen to form refpecting the nature either of body or of mind; and the efficient caufes, by which their phenomena are produced, have no neceffary connection with our inquiries concerning the laws, according to which thefe phenomena take place." Without pretending to afcertain the bounds beyond which human intellect cannot pafs, it appears to us certain, that in the prefent ftate of mental philofophy, we can advance no farther with fafety or practical utility, than the regiftering and claffification of phenomena, the deriving from them thofe conclufions which may be regarded as general laws of the human mind, and the application of thefe laws to explain other phenomena, and to determine the probable refult of the operation of our mental principles, in cafes where the previous circumftances are known. The grand point in mental as well as in phyfical fcience is, to obferve correctly, to difcriminate accurately, and to generalize with caution.

When the attention of the mind is directed to its own ftates and operations, (whether thefe are directly intentional, femi-voluntary, or the refult of habit or external impreffion,) it is termed *reflection.* The capacity of reflection, on what paffes within us, is feldom perceived very early; and agreeably to the obvious order of nature, it ought not to be predominant till the world without us has furnifhed abundant materials for our mental operations: but Dr. Reid is certainly miftaken when he afferts (Intellectual Powers, eff. i. ch. 5.) that "the power of reflection upon the operations of their own minds *does not appear at all* in children." We have noticed it in a child of four or five years old, in fome very decifive cafes; and, in various other inftances, in children under ten or twelve. We are no advocates for the premature or exceffive culture of reflection; but the rudiments of the habit fhould be early *begun,* with a view to moral culture; and no one can doubt that mental philofophy can be fuccefsfully purfued, only where the attention of the mind can be directed inward, and its own thought and feelings, and modes of thinking and feeling, made the fubject of examination. Some at the commencement of their mental inveftigations may find this a tafk of great difficulty; but the more it is attempted, the more eafy it will become; and when the habit has been in any confiderable degree acquired, it will in various ways reward itfelf. It is this difficulty which fo generally operates to prevent the ftudy of the human mind. Though in fome refpects the mental philofopher has great advantage over the natural philofopher, (requiring, for inftance, no apparatus, no rare or expenfive fubftances to fubmit to examination,) yet the inveftigations of the former muft, from the very nature of their objects, be attended with obftacles which in no way affect the latter. The fleeting nature of our notions and feelings, and the extreme difficulty, in many cafes, of feparating the operations of thought from thofe of language, conftitute fome of the leading caufes which impede our fuccefs in this department of fcience; and thefe are made ftill more efficacious, by the difficulty of avoiding, in our explanations of mental phenomena, illuftrations derived from the objects of fenfation. Neverthelefs, the leading principles of the mind are not obfcure or difficult to be inveftigated; and where thefe are once fully eftablifhed, and the inquirer is guided by them in his refearches, he cannot but attain refults which will prove of great practical utility; while at the fame time he will find fources of intereft not furpaffed by any which prefent themfelves to the phyfical philofopher.

It might not be unattended with confiderable benefit to lay before our readers a connected view of the leading fyftems which have been adopted refpecting the operations of the mind; but it is not neceffary for our object; nor will the limits we muft fubmit to permit it. Thofe of our readers who are defirous of feeing the opinions of the principal metaphyficians, ancient and modern, on the fubject of our mental faculties, ideas, &c. will find a great fund of valuable information in Dr. Reid's Effays on the Intellectual Powers, efpecially in the fecond.

While we thus refer to Dr. Reid, we think it neceffary to ftate that we cannot accord with the leading features of his philofophy; and it is clear that he fell into the common error of regarding the hypothefis of vibrations, as an effential part of the Hartleyan fyftem. We regard it as an incumbrance on the fyftem; and we are fatisfied that no candid reader of the Obfervations on Man will fay that Hartley in any degree invefts it with the importance which he juftly attaches to the doctrine of affociation. It is *this* which conftitutes his fyftem; and it is *this* on which he refts his Rule of Life: and however groundlefs the hypothefis of vibrations may appear, or may really be, the grand law of affociation is in no way whatever affected.

Into the leading principles of the Hartleyan philofophy, Dr. Reid feems fcarcely to have entered. Indeed he was not likely to fee their force; for they reft upon a foundation diametrically oppofite to what he regards as the grand peculiarity of his own philofophical opinions,—that our perceptions neceffarily imply the belief of the prefent exiftence of the external objects of them, and that thefe are the *immediate* objects of perception. In endeavouring to overturn opinions from which abfurd conclufions have been unjuftly drawn, Dr. Reid has been led to deny what appears to us the moft obvious fact, (entirely independent of the theories of Locke and Hartley,) that there are in the mind objects of thought diftinct from the external caufes of their production. Numerous valuable obfervations are fcattered in various parts of Dr. Reid's writings; and the advanced ftudent of mental philofophy may read them with pleafure and profit; but as far as his opinions are founded upon the hypothefis that there are not in the mind any objects of its operations diftinct from thofe acts or operations, we cannot hefitate in pronouncing them vifionary in the extreme. If we had to choofe between two theories, the immaterial fyftem of Berkeley, and the non-ideal fyftem of Reid, we fhould be compelled to adopt the former; for we could fooner doubt the exiftence of external caufes of our fenfations, than we could the exiftence of our ideas. We are confcious of thoughts and feelings, of notions and conceptions, the objects of our mental operations, of recollection, affociation, comparifon, reflection, &c.: and we could as foon doubt our own exiftence as theirs. We admit that by the

the essential laws of the mind, if a human being have five senses, and the power of locomotion, the conviction will necessarily be produced in his mind, (let philosophy struggle against it as it will,) that there are external objects causing (or occasioning) his sensations. As conceptions, however, sometimes have the vividness of sensations, and in disordered states of the system are accompanied by the same belief, the possibility that all our notions of external objects are alike groundless might be admitted; but that we have such conceptions and sensations is an unquestionable fact.

Mr. Stewart, in his Chapter on Perception, appears to be extremely embarrassed between the leading principle of Dr. Reid, and the plain matter of fact. He virtually gives up that principle in various parts of his Elements; and he seems to hesitate respecting it where it unavoidably comes under review. Perhaps it is not unreasonable to conjecture, that had he been less conversant with the investigations of Condillac, he would have been more shackled by the restraints which his venerable and amiable instructor had thrown upon philosophical enquiry, and more turned from the true principles of the mind, by the bias which the strange opinion we have adverted to must necessarily have given to his researches. It was impossible for Dr. Reid to have received the doctrine of association, while he denied the existence of intellectual objects of thought separate from the acts or operations of the mind: and the influence of his principles, together with the unfortunate point of view from which Mr. Stewart considered the Hartleyan philosophy, are sufficient to account for the fact that this philosopher regards some of the most profound and successful investigations of our mental principles, as little better than reveries. See life of Reid, and elsewhere.

Locke was not sufficiently guarded in his modes of expression, and perhaps was not sufficiently precise in his notions respecting *ideas;* and he has given Dr. Reid some room for placing his opinions on a footing with the fantastic theory of Aristotle and his followers. We see, however, no adequate reason whatever to conclude that Locke believed in the hypothesis of Aristotle as to the nature of *sensations* and *ideas*, or that he meant in any way to represent them as the ancient metaphysician does his *sensible species*, *phantasms*, and *intelligible species*. Dr. Reid does, indeed, say, (Ess. i. ch. 1.) that Mr. Locke "tells us, that he means the same thing by it (*idea*) as is *commonly* meant by *species* or *phantasm*," (which, however, would in no way prove his referring to the proper *Aristotelian* meaning of those terms); but Locke says more than this; and though Dr. Reid's great candour of mind must have prevented his intentionally misrepresenting his meaning, yet our readers will agree with us in the opinion that he has done so most essentially, when we quote a passage (probably, indeed, the one referred to, and which Dr. Reid himself afterwards quotes) from the Introduction of his Essay, § 8. "I must here, in the entrance, beg pardon of my reader, for the frequent use of the word *idea*, which he will find in the following treatise. It being that term which, I think, serves best to stand for *whatsoever is the object of the understanding, when a man thinks*, I have used it to express whatever is meant by *phantasm, notion, species, or whatever it is which the mind can be employed about in thinking;* and I could not avoid frequently using it. I presume (continues our great philosopher) it will be easily granted me that there are such ideas in men's minds: every one is conscious of them in himself, and men's words and actions will satisfy him, that they are in others."—We cannot admit that Locke's principles as to the *nature* of our ideas, had any thing in common with those of the Platonists, or of the Peripatetics. He may resemble them in some of his term and *illustrations;* and in using the latter he has exposed himself to misapprehension and censure (see Reid's Ess. ii. ch. 4.), and probably has contributed to make obscurity more obscure. But while Dr. Reid has successfully combated the hypothesis of Aristotle and his followers, he has left the grand structure of Locke's philosophy uninjured. This has its foundation in human nature; and what Dr. Reid has advanced to overturn its fundamental axiom, (which we have just stated,) appears to us to be directly in opposition to the plainest principles of common sense. You think of a departed friend, and memory retraces a conception of his venerable form, as distinct as if his picture, as if he himself, were before you. You see him with the "mind's eye;" and you are not conscious of any impressions from external objects, though thousands of them have their images depicted upon the external organ of sight. You hear, in imagination, the tones of friendship with which he gave you the counsels of wisdom; you even hear the words in which he clothed them; and the sounds from without do not at all affect the mind. You think of his virtues, of the displays of his tender affection; and as memory with rapid glance carries you from one scene of goodness to another, you feel the emotions of gratitude, of respect, of love. And yet these conceptions, these notions, these feelings, are (if Reid be right) without existence; there are no such things; there is nothing but the mind and its operations, and the external objects on which its operations are employed!—Whether or not the organs of thought be material, with which the ideal system is in no way concerned, (but which, as the editor conceives, affords a strong presumption, that they are not material,) we cannot hesitate in maintaining, as a self-evident position, that the *objects* of the *percipient* principle and its *operations* are perfectly distinct.

The great principle of Dr. Reid's philosophy, is, in our apprehension, utterly untenable; it may, however, have contributed finally to exclude from mental philosophy the phantoms of the ancients, which alone he appears to us to have been combating. The Platonic doctrine of ideas is to be regarded as a system of philosophy respecting rather the divine than the human mind. It does not appear to have been the object of its founder to explain the origin of sensations and ideas. According to Plato (see Reid's Ess. i. ch. 1.) ideas were "eternal immutable forms or models, according to which the Deity, of an eternal matter, made every species of things that exists."—"The mind of man, in order to its being fitted for the contemplation of these eternal ideas, must undergo a certain purification, and be weaned from sensible things. The eternal ideas are the only object of science; because the objects of sense being in a perpetual flux, there can be no real knowledge with regard to them." The Alexandrian Platonists held that these ideas were not a principle distinct from the Deity, but the conceptions of things in the divine understanding.

Aristotle clearly had in view to explain the origin and nature of ideas and sensations. With the light we possess on the subject, his notions appear in some respects absurd enough; but taking into account the nature of the philosophy then in vogue, it must be admitted that they are at least ingenious. Plato's theories are more like the reveries of a poetic imagination, and are purely metaphysical: Aristotle attempts something like mental philosophy; for which see Phantasm.

It is easy to comprehend how a vigorous mind, like that of Aristotle, capable of forming distinct and vivid conceptions,

tions, and of making the objects of thought the subject of close contemplation, might fall upon this hypothesis. The laws of light and the nature of vision being so little understood, it was a natural error to suppose, from the analogy of the other senses, that the visual organ was affected by something coming off from the object, which produced an image or form of it in the mind; and as distinct images or conceptions of external objects can be reproduced without fresh sensations, it was equally natural for them to imagine that those images were the original immaterial forms somewhat refined by the agency of the mind itself. Aristotle had, probably, no definite notion of *ideas* derived from any other source than the sight. There are, in fact, very few who can form *conceptions* of any but *visible* objects; and Aristotle, habituated to deep reflection on the objects of knowledge, and the processes of his own mind, must have been less likely than others to form conceptions of sound: and as he could have known nothing of the way in which the more refined ideas are formed, by association, from a variety of simple ideas, often derived from the sensations of two or more senses, it was the most direct inference he could make, (as he supposed all ideas to have been derived from sensation,) that the most refined ideas were the forms or species spiritualized. Separate from the hypothesis as to the way in which the organs of sensation are affected, and the manner in which sensations are refined, there is a great deal of substantial truth in his theory; and if Dr. Reid had been less bent upon overturning the sceptical philosophy, he might have been led, even by Aristotle's notions, to some important conclusions on the subject of ideas, which he has now, in opposition to his own principles of common sense, utterly lost sight of. If we had only to choose from the non-ideal system of Reid, the immaterial system of Berkeley, and the species of Aristotle, we should prefer the latter, as on the whole most agreeable to what we, and, we presume, all men, feel and believe, as to what passes within us and without us.

While reflecting upon Dr. Reid's fundamental principle, which contributes so essentially to lead away the minds of his followers from perceiving the full extent and importance of the doctrine of association, we often feel disposed to imagine that we do not ourselves comprehend his hypothesis. But view it in what light we will, we are compelled to come to the same conclusion, that when opposing the ideal system of Locke, either his opinions are contrary to fact and common experience, or his statements are founded on merely verbal distinctions. At any rate, what he says against Locke's ideal system in no way affects our own; for what he terms *notions* and *conceptions* (Ess. ii. ch. 14, &c.) we regard as comprehending the whole round of the *ideas* of the understanding. And if his theory allows, (what we regard as an indisputable fact,) that it is possible for the mind to form a *conception* (or, if we might be allowed, by way of illustration, to call it a *picture*) of something which has no real existence in nature,—to dwell upon this conception till it acquires a degree of vividness and strength which shall make the mind, for the time, utterly unconscious of the external objects which affect the organs of sense,—and, in diseased states of the understanding, to believe it to be a sensation derived from an external object, and to think and act as if it were really such,—then the warmest advocate of that theory must, one would suppose, farther admit, that it leaves the Berkeleyan theory unaffected in its leading positions, and that the dictates of common sense and common philosophy here agree, that when the mind is thinking it thinks about something, and that that something is distinct from the operation of thinking, and may have no archetype in the whole round of spiritual or material substance. And if that point is conceded, it necessarily follows, that (though much remains in Dr. Reid's works which is truly valuable) his peculiar fundamental principle has a merely verbal importance, or is altogether groundless.

Mr. Locke had the great merit of establishing a position which lies at the foundation of mental and moral philosophy, that *there are no innate principles in the mind.* Like the doctrine of instincts, that of innate ideas could not but fall before an enlightened yet cautious examination of any mental principles. We are so constituted by the great Author of our frame, that in the circumstances in which mankind in general are placed, certain notions will be formed, and certain affections will spring up in the mind. If we are at once to rest satisfied with the fact, there is an end to philosophical investigation; if we call them innate or instinctive, we do worse; because in the one case we are only in ignorance, in the other we cover our ignorance with a delusive show of knowledge. Whilst, with philosophical caution to examine into the origin of them, we may be led to important and just conclusions; but if we cannot ourselves get to those conclusions, we ought not to throw impediments in the way of our successors in the walks of intellectual inquiry. We are, however, arrived at that period of mental progress, where these contented appeals to ignorance are deservedly neglected. Since the time of Locke, no philosopher, we believe, has ventured into the regions of darkness, to account for what his luminous principles at once explain; and in proportion as the doctrine of association is thoroughly understood in its full extent, will it be found unnecessary to resort to instinct, (in other words to an occult cause, occult in its nature and in its operations,) to account for our intellectual and moral phenomena.

We think it unnecessary to enter at all into the consideration of the hypothesis of innate ideas. Locke's Essay is probably accessible to all our readers; and we refer them to his introductory chapters, if they have any doubts on the subject. On the hypothesis of instincts we shall have occasion to say a few words hereafter; but we are satisfied that no one who goes along with us in our leading positions respecting the theory of association, will resort to a notion so destitute of all support from the acknowledged principles of the mind. If the law of association does not yet account for all the phenomena once referred to instinct, it clearly and satisfactorily explains so much, and by analogy affords a clue to so much more, that it is, to say the least, much more prudent to wait for farther light on the subject, than to put an end to inquiry, by maintaining that we have in any instance reached an ultimate *instinctive* principle, or mode of operation in the human mind.

Universal belief affords no infallible test of truth; but when it respects practical principles, it furnishes to the religious philosopher a presumption in favour of those principles, and will prevent him from too hastily deciding against them. Such belief presents a reasonable ground for supposing, that they originate in the laws of our frame, under the influence of circumstances common to all mankind; and where this is the case, the voice of nature may be justly regarded as the voice of God. And the same may be said respecting the natural affections. We perceive with pleasure that our ideas here coincide very much with those of Mr. Stewart (Phil. Ess. p. lxviii.), and we earnestly hope that that philosopher will complete his proposed investigations.

But such reasoning cannot affect the Berkeleyan philosopher. Indeed there are between him and the vulgar herd no common principles. All that he hears and sees is solely the world of his own mind; and he must either be consistent

beyond,

beyond, we ſuppoſe, poſſibility, or act utterly inconſiſtently with his own principles, if he uſe what we ſhould call his corporeal organs to increaſe his ſtore of ideas. If, however, he ſhould be guilty of ſuch inconſiſtency, as to think of this book as ſomething out of himſelf, marked with ſome material ſubſtance by a being like himſelf, ſo as to convey the ideas which another ſuch being has in his mind, we wiſh to ſuggeſt the following enquiries to him; and at any rate we ſuggeſt them for the ſatisfaction of thoſe who with ourſelves imagine that there are external objects, diſtinct from the mind itſelf, occaſioning its ſenſations.

In the firſt place, we wiſh to have a clear diſtinction preſerved between our inability to give a completely ſatisfactory reaſon for any opinion, and the abſolute groundleſsneſs of that opinion. Multitudes who believe in Chriſtianity might eaſily be puzzled by the acute ſceptic; and be unable to produce a correct reaſon for their belief though others could, and though in their own minds there were actually exiſting the rational grounds of ſuch a conviction. Next, in balancing between two inconſiſtent hypotheſes, we are to conſider not merely whether each will equally well account for one ſet of phenomena, but alſo whether there are any for which one will account and the other not. We do not deny that the mental philoſopher has not yet reached that complete analyſis of our internal principles, of our notions and feelings, as would enable him to point out, in all caſes, how each would be formed in the mind. He is not as yet able to ſhew in a completely unobjectionable manner, how the popular belief is produced; though we are of opinion that Condillac, in his Traité des Senſations, has afforded the means of making great progreſs towards it. But this does not prove the belief falſe. The opinion involves no abſurdity. It is not inconſiſtent with itſelf, or with any known phenomena. It accounts for all we know, at leaſt as well as the Berkeleyan hypotheſis. And, on the other hand, this hypotheſis is oppoſed by every ſenſation we experience from the touch, or from the other ſenſes, if it is accompanied with aſſociated ideas derived from the ſenſe of feeling; and if this be denied, it muſt be admitted to be utterly inconſiſtent with a phenomenon of vaſt extent; *viz.* that the exiſtence of external objects is doubted by none who are left to the dictates of plain good ſenſe, that it is expreſsly believed by all ſuch perſons, if they think at all on the ſubject, and that notions of external objects, *conſidered as ſuch*, are continually in the mind of every one.

The ſimple ſtate of the caſe is, that though it is *poſſible* that there may be no external world, occaſioning our ideas, &c., and though we cannot exactly explain the formation of the univerſal belief that there is; yet, on the other hand, the hypotheſis that there is, is perfectly accordant with all the known phenomena of the mind, and is neceſſary to account for one which the oppoſite hypotheſis can in no way acount for, and with which it is even directly inconſiſtent. If we can go no farther, we can at leaſt ſay that the human mind is ſo formed, that the belief in the exiſtence of external objects muſt ſpring up in it; that the practical belief in it cannot be deſtroyed without a derangement of the mental functions; and that even the ſpeculative belief in it will only give way to a mode of reaſoning, which introduced into real life would make human conduct full of abſurdity and danger. We muſt, however, again obſerve, that ſome progreſs has been made in ſhewing the ground of this belief; and that, admitting the exiſtence of external objects, it is not difficult to perceive how the principle of aſſociation muſt produce the belief, by combining the impreſſions produced on the mind through the organs of feelings, aided by the power of locomotion.

In what follows we ſhall therefore take for granted,

1. That there are external objects cauſing or occaſioning ſenſations.

2. That theſe objects do *not* ſend off from them immaterial forms, which, when conveyed into the mind, produce ſenſations, and are afterwards refined by our mental faculties into phantaſms, &c.: nevertheleſs,

3. That *there are objects of thought in the mind, diſtinct from the operations of the mind*, ſuch as conceptions, *e. g.* diſtinct from the operation of conception, and notions recollected, diſtinct from the act of recollection: and,

4. That none of theſe objects of thought are innate; but are all derived from ſenſation, or from reflection on the operations of our own minds.

The fourth reſts for its foundation on the leading principles of Locke's Eſſay. For proof of the ſecond, we refer to aſcertained facts connected with the ſtructure of the body, and the common principles of optics. The third we muſt leave to the reader's own conſciouſneſs. And the firſt we are contented to reſt upon univerſal belief, or, if the term be preferred, common ſenſe, in connection with the arguments juſt advanced on the ſubject.

I. *General View of the Faculties of the Mind.*—That, whatever it be, which thinks, and feels, and wills, is called *mind;* that part of the human being which thinks, and feels, and wills, is called the *human mind.*

We obſerve, without us and within us, numerous phenomena: the object of philoſophy is to deduce from them thoſe general laws, agreeably to which they are produced; and then to employ thoſe laws in the explanation of other phenomena. Mental philoſophy purſues the ſame method which has been ſo ſucceſsfully adopted in natural philoſophy; and as in phyſics, ſimilar phenomena are referred to the operation of ſome one cauſe or power, ſo in mental ſcience, thoſe phenomena which have all one common feature are referred to ſome faculty or property of the mind, by whoſe operation theſe phenomena are ſuppoſed to be produced. What is the nature of thoſe mental or phyſical powers, philoſophy does not profeſs to explain.

If we hold a luminous body before the eye, it produces ſome change in the ſtate of that organ, and this produces in the mind a feeling: this feeling is called a *ſenſation.* This name is alſo given to all thoſe other feelings which are produced in a ſimilar way, *viz.* owing to a change in the organs of ſenſe, whatever be the cauſe by which the change is produced. The general fact or law is, that ſenſations are produced by what affects the organs of ſenſe. Now to account for this fact, we infer that the mind is poſſeſſed of a power or capacity which we call *ſenſation*, or better, to avoid ambiguity, the *ſenſitive power.* This, then, is that power or capacity of the mind, by whoſe operation it receives ſenſations from things which affect the organs of ſenſe.

We know, as a matter of fact, that though ſenſations ceaſe ſoon after the exciting object is withdrawn, yet if they have been produced ſufficiently often or vividly, the cauſes of feeling, ſimilar in kind, remain in the mind; and thoſe ſimilar feelings can recur, when no change is produced in the organs of ſenſe. Theſe are called *ideas:* they are *the relics of ſenſations.* Such is the general law or fact. The operation, or act of retaining relics of ſenſations, may, with the ſtricteſt propriety, be termed *retention;* and to account for it, we infer that the mind poſſeſſes a power or capacity, which we may term the *retentive power.* This, then, is that power or capacity of the mind, by which it retains relics of ſenſations.

Again, it is an indiſputable fact, that theſe ideas, or relics of ſenſations, do not remain ſingle in the mind, but become

become connected with one another, so that the recurrence of one, or of its corresponding sensation, will bring on another; and that in certain cases they become so blended together, that the parts can scarcely be distinguished. Thus the word *orange*, either pronounced or thought of, will bring up the idea of the appearance of an orange. Again, the idea of the word *house* is accompanied by a certain feeling, which is altogether different from that which accompanies the idea of the word *ship*. If we think about it a little, we usually have the idea of a particular house recalled: this is a *simple idea* (or *idea of sensation*, or *conception*,) *connected* with other ideas, but not *combined* with them; but, in general, if the word occurs without the mind dwelling upon it, we may perceive an indistinct feeling, which is composed of a variety of simple ideas, received from a variety of those objects to which we give the name *house*. That the feeling is thus composed, we have a full right to assert, on an attentive consideration of the customary processes of the mind. Simple ideas may then be *connected* with other ideas; or they may blend and *coalesce* with other ideas, so as to form new ones, which are called *compound* or *complex ideas*. The general fact is, that connections and compositions take place among our ideas; and when thus connected or compounded, we say that they are associated together; and the connected or compounded group we call an *association*. To account for the formation of associations, we infer that the mind possesses a power or capacity of connecting or combining ideas, which may be called the *associative power*. This, then, is that power or capacity of the mind, by which it connects and compounds ideas.

Farther: it is obvious that without any external excitement of the nerves by which muscular motion is produced, the mind can produce such motion; in other words, that state of the motory nerves by which muscular motion is effected, can be produced by the mind. We do not here enquire how the mind learns to use its influence over the motory nerves; but state the fact, that muscular motion can be produced by the mind without external excitement. To account for this, we infer that the mind possesses a power or capacity of influencing the motory nerves so as to produce muscular motion, which may be called the *motive power*.

There is no term appropriate to those states of mind which produce the changes in the motory nerves requisite for muscular motion; and we are therefore so far free from a difficulty which has accompanied us when speaking of sensations and ideas. These terms, as most commonly used, imply that the consciousness of the mind is excited: but it appears to us an almost indisputable fact, that the mental organs, whatever they be, by whose action the consciousness is excited, are often in a state of activity without such excitement of the consciousness; in other words, that those changes, which, when accompanied with consciousness, are termed sensations and ideas, may take place, and produce an effect in the mental system, without exciting the conscious or percipient principle. In order to enter into the consideration of this fact, which in some points of view appears to us important, it will be necessary to consider somewhat more explicitly in what manner we employ the term *mind*, and to introduce some less customary terms in order to avoid ambiguity.

In the philosophical sense of the term *mind*, it seems to belong exclusively to the conscious or percipient principle, whatever that be; but in common language we certainly employ it differently: *e. g.* no one hesitates in saying, "such a man has an extensive store of knowledge in his mind;" but no one supposes that at any one time a man perceives, that is, is conscious of, all the parts of that knowledge. In the same manner, no one would hesitate in saying, "such a person has a great fund of valuable reflections for the conduct of life stored up in his mind, which he can produce whenever circumstances call for them;" but no one supposes that those reflections are always in the view of his mind, that is, that he is always conscious of them, that he always perceives them. All that can be meant in such cases is, that the causes of his ideas (that is, of his notions, conceptions, and feelings,) remain in the mind ready for excitement, when they produce ideas. Hence, then, the mind, in the common acceptation of the term, in which we use it, consists of two parts; the conscious or percipient principle, and the organized substance, which furnishes to the former the objects of its consciousness or percipiency. What the conscious or percipient principle is, is probably known to him only who formed it: we may believe consciousness or percipiency to be a property which is the necessary result of, or added to, a certain organized system of matter; or we may believe it to be a property of some substance essentially different from matter; and we apprehend it is not of very much consequence which opinion is adopted: but it seems indisputable, that in the present state of knowledge, we cannot obtain, on either side, more than a bare preponderance of probabilities. See on this subject the articles MATTER and SPIRIT.

That organized substance, which, without any farther medium, furnishes to the conscious or percipient principle the objects of consciousness or percipiency, may be called the *sensorium*. The parts of which the sensorium is composed, by whose changes, without any further medium, consciousness is excited, may be called the *mental organs*. By the mind we understand the whole together, the conscious or percipient principle, together with the sensorium; leaving it undecided, whether consciousness is a property of organized matter, or belongs to a substance essentially different from matter; and also, whether the sensorium be or be not the medullary substance of the brain. (See SENSORIUM.) Hartley, as is well known, adopts the affirmative in the latter case; and he supposes that the changes of the sensorium which affect the consciousness, are vibrations of the medullary substance. We consider this hypothesis as a clog upon, at least, the adoption of his grand system of association; and we should prefer the more general term *motions*, if we professed to decide respecting the nature of the sensorium: as we do not, we shall employ the still more general term *changes*, the term *affection* being already otherwise appropriated.

The changes in the sensorium or mental organs, which may excite the consciousness, may be called *sensorial changes*. Of these, some are produced by the impression of external objects on the organs of sense: these may be called *sensible changes*. Others, as we know by their effects, are producible without the presence of external objects: these may be called *ideal changes*, and are the relics of sensible changes. A third class comprehends those which are followed by muscular motion, and may be termed *motory changes*. Sensorial changes of each of these classes may take place without exciting the consciousness, as we shall soon endeavour to shew. When sensible changes are accompanied with consciousness, they are called *sensations*; when ideal changes are accompanied with consciousness, they are called *ideas*: and as sensible and ideal changes are principally important to us when accompanied with consciousness, and it is seldom necessary to distinguish between those which do and those which do not excite it, we shall not usually depart from the

the cuftomary nomenclature. We have no term appropriated to denote motory changes accompanied with confciousnefs: this deficiency probably arifes from the circumftance, that mufcular action is fo much an object of the fenfes, that, by affociation, it is referred to the moving mufcle, and not to the intermediate fibrous motions and fenforial changes. Thus, while writing, all the motion feems to be in the fingers, and in the fingers alone, though even the minuteft motion, except that which is produced by fome external ftimulus upon the motory nerve, neceffarily fuppofes motory changes of the fenforium, and fhould, fcientifically fpeaking, be referred to the fenforium, or mind.

To fhew that fenforial changes are not neceffarily accompanied with confciousnefs, we obferve, that the diminution of confciousnefs can be traced in its various ftages, from the ftate of active attention, to cafes where we have no reafon to believe that confciousnefs is excited, where yet we have good reafon to believe that there were fenfible changes, becaufe thofe effects are produced which we know are produced by fenfations, (that is, by fenfible changes of which we are confcious,) and, as far as we know, in no inftance without fenfible changes. The following facts will at leaft illuftrate this pofition, which we muft leave to the reader's clofe reflection on the procedures of his mind. Perfons much accuftomed to employ notes in finging, fometimes feel fo deeply interefted in the thoughts and feelings excited by the words they are finging, that though the notes continue to regulate their tones of voice, the fenfible changes are altogether unnoticed by them, they do not excite the confciousnefs. Again, many who have been long accuftomed to perform upon a mufical inftrument, and are able to play with eafe at firft fight, can, while playing, even a piece of mufic which they have not feen before, converfe and carry on a train of reafoning, and yet play correctly. The appropriate fenfible changes muft in fuch cafes be produced; for otherwife the proper motory changes which occafion the motions of the fingers could not; but they are not accompanied with confciousnefs: as foon as they are, attention to the converfation or train of reafoning is interrupted. In the fame manner, perfons accuftomed to read aloud, can continue to read aloud even what they have never read before, (provided the modes of expreffion be not peculiar,) with correctnefs, at leaft, and at the fame time have their thoughts clofely engaged on other fubjects. The moment their attention is called to what they are reading, their own train of thought is broken. When we are walking along a road, efpecially if it be familiar to us, our minds may be inftantly occupied in reflection or converfation, fo that the appearances of the road which direct our motions, fhall not, in the flighteft degree, excite the notice of the mind. That thofe appearances do direct us, and, of courfe, produce fenfible changes, though they do not excite the confciousnefs, is obvious; becaufe if we keep our fight from them, by clofing the eyes, by reading, &c. we are continually interrupted by a little trip or jar, unlefs the road is extremely fmooth, or extremely familiar to us. In this laft cafe, either the fenfible changes produced by the impreffions on the feet, direct the appropriate motory changes and confequent mufcular motions; or, one motory change is followed, owing to long affociation, by its next fucceffive motory change, and fo on.

We are fully aware that, in thefe ftatements, we fhall not meet with the concurrence of thofe who adopt Mr. Stewart's theory on the fubject, in his chapter on Attention; but it is, in opinion, abundantly more confonant with the laws of the mind, and more borne out by the clofeft reflection on our mental proceffes, to fuppofe that fenforial changes of different kinds may produce each other, without exciting the confciousnefs, than to imagine, with Mr. Stewart, that when the mind is moft deeply engaged upon a train of thought, it may at the fame time be continually paffing to impreffions produced by external objects on the organs of fenfe, and actually *willing* the motions with which thofe impreffions have been long connected; and all this, confeffedly, without our being able, in any degree, to retrace the change of attention, or the act of volition, in thofe cafes where the connection between the external impreffion and the mufcular motion is habitual, and the thoughts clofely occupied upon the internal object of attention. It not unfrequently happens that perfons, under the influence of very ftrong excitement of feeling, or deep engagement of thought, pace their chambers with rapid ftep, utterly unobfervant of every external object, and for the time utterly unconfcious of every thing but the immediate object of thought and feeling; and yet they never run againft the wall, but turn with as much correctnefs when they ought to turn, as if their attention were particularly directed to the objects around them. Now is it, we would afk, in any way conceivable, that though the entrance of a perfon into the room, the loud founds of carriages paffing, &c. would in no degree obtain their attention, the cuftomary impreffions from the walls, &c. fhould every moment have a portion of their attention, which muft on this fuppofition be *conftantly* fluctuating to them from its immediate object, and all this without leaving the flighteft trace in the memory. Innumerable impreffions are inceffantly produced on the corporeal organs of fenfation, (befides thofe of fight and hearing,) particularly on the organs of feeling, both from the action of external objects, and from the various perceptible motions of the bodily fyftem. Thefe we feldom notice, till fome circumftance or other particularly directs our attention to them. The moment this is the cafe, we have the appropriate fenfations; for inftance, thofe produced by the preffure of our feet on the ground, of our arm on the table, of our pen on the fingers, and of our clothes on various parts of the body, or by the mufcular motions attending refpiration, the beating of the heart, the twinkling of the eye, &c. Now if Mr. Stewart's theory were juft, thefe and every other impreffion which might, at any one time, produce fenfations, and which the mind really obferves, when its notice is from any caufe directed to them; all thefe muft be every inftant attracting its notice with inconceivable rapidity, and in an imperceptible degree, and this even when the mind is fo completely abforbed with its own contemplations, that a violent external impreffion could not divert its attention from them. As foon as Mr. Stewart's hypothefis is thus carried to its juft extent, it lofes every appearance of rational foundation; and fince it cannot be confiftently relinquifhed, (as far as we can perceive,) fo long as Dr. Reid's leading principle is retained, the abfurd conclufions to which it leads may be regarded as an additional proof that the principle itfelf is without foundation in the nature of the human mind. The fact appears to us to be, that the external impreffions do produce fenfible changes, juft the fame whether the attention of the mind is directed to them or not; that when the attention is fully occupied, if the fenfible changes are not fufficiently vivid to interrupt the train of thought, or are not clofely connected with other fenforial changes, they produce no farther effect than a tendency to a more eafy (if not more impreffive) recurrence from fimilar impreffions; that, in fhort, the mental fyftem is no farther affected by them; but that if other fenforial changes have been habitually

bitually connected with them, thefe will be produced by them, without the confcioufnefs of the mind being excited to the procefs. The refult may be mufcular motion; and in this cafe, (and fometimes by this only,) we have proof of the operation of the external impreffion on the mental organs.

If the reader's own experience or obfervation do not furnifh him with fatisfactory proof of our pofition, that fenforial changes may take place, (and if fo, very often do take place,) without exciting confcioufnefs, we are difpofed to think that the following fact, (ftated by Dr. Percival, in his Moral and Literary Differtations, p. 110.) may be refted upon as decifive. "Several years ago, the countefs of —— fell into an apoplexy about feven o'clock in the morning. Among other ftimulating applications, I directed a feather, dipped in hartfhorn, to be very frequently introduced into her noftrils. Her ladyfhip, when in health, was much addicted to the taking of fnuff, and the prefent irritation of the olfactory nerves produced a junction of the fore-finger and thumb of the right hand, the elevation of them to the nofe, and the action of fnuffing in the noftrils. When the fnuffing ceafed, the hand and arm dropped down in a torpid ftate. A frefh application of the ftimulus renewed the fucceffive effort; and I was witnefs to their repetition, till the hartfhorn loft its power of irritation, probably by deftroying the fenfibility of the olfactory nerves. The countefs recovered from the fit about fix o'clock in the evening; but though it was neither long nor fevere, her memory never afterwards furnifhed the leaft trace of confcioufnefs during its continuance."

The gradual diminution of the confcioufnefs of external impreffions is perceptible on various occafions. If we are obferving an extenfive profpect, a picture of the whole field of view is formed at once on the retina. We fuppofe it will generally be admitted, that whenever a vifual impreffion is thus produced, the intermediate organs convey fome notice of it to the mental organs. As a matter of fact, it is clear that till the attention is given to fome particular parts, we perceive the whole field of view with more or lefs impreffivenefs, according as the parts are more or lefs diftinctly and vividly delineated on the retina, and near the axis of vifion. By degrees the attention is drawn to fome particular object, or part of the profpect; and the confcioufnefs of impreffions on the external organ from the other parts is diminifhed. If the mind is clofely engaged in obferving that object, it may be, and often is, utterly unconfcious of any other: if the attention to it leffens, the other parts are perceived again; in other words, the mind again becomes confcious of the fenfible changes produced by the external impreffions; and this confcioufnefs is more or lefs diftinct, in proportion to the degree in which the attention is left unengaged by any particular object, and to the circumftances above ftated. It requires fome fkill in the exercife of reflection to obferve thefe, and fimilar proceffes of the mind. If the direction of the attention to them is attended with difficulty, the play of the mind is impeded, and the real ftate of the cafe is lefs perceptible. To obferve the operations of the mind fuccefsfully, we muft frequently obferve them, till the direction of the attention to them becomes eafy; and then we may often detect what is actually taking place, without any material interruption of it. What is wanting is facility and accuracy in obferving what paffes within us; and when early produced by mental and moral culture, the beft foundation is laid for fuccefs in the purfuit of mental fcience. The following may be to many a more familiar cafe than what we have above adduced. Suppofe any one in a room near a water-fall, a forge, or fomething elfe producing a uniform found, or fitting near a clock: if every thing befides is quiet, and the mind in that mufing ftate in which its own trains are lefs impreffive than the impreffions from external objects, the found is perceived, and more or lefs diftinctly, according as the attention is directed to it; and it is eafy to obferve the variations in the degree of the mind's notice of it, from the ftate of direct attention to that in which one can hardly tell whether it is noticed or not. We often may catch ourfelves at the very inftant that the confcioufnefs of the found is vanifhing altogether: and that it does fo, cannot be out of the experience of every reader. If his watch, at the moment of reading this, happens to be lying on his table, he now begins to hear its beat; and he continues to do fo in a greater or lefs degree, till his attention being again engaged with fome other object, the found lofes its impreffivenefs, and is altogether loft from the view of the mind.

We are aware that the facts in the preceding paragraph, and others fimilar to them, may to a certain degree be accounted for, by fuppofing that the mental organs ceafe to be affected by external impreffions, when the attention is given to any other object; that, in fact, the impreffions on the retina, for inftance, then only affect the ultimate organs of fenfation, (*i. e.* produce fenfible changes in the fenforium,) when the attention of the mind is not engaged on other objects. But it appears to us much more philofophical to fuppofe, that the intermediate and mental organs of fenfation are always affected in proportion to the degree in which the external organs are; and that the fole caufe of their not exciting the notice of the mind is, the greater degree in which it is given to fome other object of thought or fenfation. We cannot fuppofe that the mere diminution of attention to other objects, fhould renew the progrefs of that change in the organs of fenfation which begins in the external organ. It feems unreafonable, in itfelf confidered, to fuppofe that the attention of the mind to other objects fhould ftop the progrefs of the change which takes place in the organs of fenfation, (beginning at the external organs,) before the mental organs are affected; or that this progrefs fhould be renewed by the mere diminution of the attention to thofe objects. And at any rate, if impreffions on the external organs may, without exciting the confcioufnefs, be followed by mufcular motion, not originating in the mere external ftimulus, (as we fee abundant reafon to conclude,) then the point may be regarded as proved, that every affection of the external organ of fenfation produces a correfponding change in the intermediate and ultimate organs, and that the degree of attention given by the mind to the fenfible change, (the change in the fenforium or mental organs,) depends upon the comparative impreffivenefs of the change, arifing from various caufes, and particularly affected by the degree in which the attention is engroffed by objects of thought, feeling, or perception, not related to the fenfible change.

We have no wifh to carry our opinions on this fubject beyond the bounds of fact and experience; but we fee reafon to conclude that ideal changes alfo may take place without exciting the confcioufnefs. Here the difficulties are greatly increafed, becaufe we have no evidence of the exiftence of any mental changes, of which we are not confcious, except by their caufes and confequences. The following cafe, however, appears to us fatisfactory on this point. Every one who can add up a column of figures, knows the nature of the mental operation, becaufe it is learnt after the memory has acquired confiderable power. The fum of two or three figures is firft afcertained; the ideal change of that fum muft, of courfe, be in the mind; and with that fum is combined the next figure, and fo on. Now, then, there is the act of adding a number, the ideal change of which is in the mind, to another number of which there is a fenfible change, and there is the ideal change of the fum, and fo on, continually recurring; all this we perceive when we are adding up flowly. But perfons who are very familiar with fuch additions, will tell the refult, or final fum, apparently without an effort, apparently without the intervention of the mind, or any confcioufnefs of the operations and ideal changes which muft have paffed in the mind, before the refult could have been obtained. It will not, unfrequently, be found, that perfons very much habituated to thefe operations, can add up much more correctly, while they leave themfelves unconfcious of the operations and ideal changes, than when they direct the attention in any way to them; and what appears to us to fettle the point, as far as confcioufnefs is concerned, the fkilful accountant who, by conftant exercife, has become familiar with all the poffible combinations of fmall numbers, can go through a feries of additions, (and in one inftance which we have heard of, a complex feries, fuch as the addition of the columns of pounds, fhillings, and pence, at one operation,) and at the fame time clofely engage the attention upon fome other object; for example, can dictate to an amanuenfis.

As to motory changes, the fact is fo obvious, that mufcular actions, which muft have had their origin in the mind, (as being regulated by impreffions on the external organs of fenfe,) go on in long fucceffion, and with frequent variation, while, at the fame time, the attention is fully occupied by fome object of thought, that we are ready to fuppofe that nothing but its oppofition to a pre-formed hypothefis could lead a perfon to imagine that, in fuch cafes, the mufcular action excites the confcioufnefs. Such an immenfe variety of mufcular actions are continually taking place, in cafes in which volition was once concerned, without, in any perceivable degree, exciting the notice of the mind, and this is fo obvious a fact, and fo fatisfactorily accounted for by the Hartleyan philofophy, that however plaufible the counter confiderations of that really eminent philofopher Dugald Stewart (fee Elements, ch. ii.), we cannot fuppofe that his hypothefis can gain admiffion where the operations of the affociative power are thoroughly underftood.

It feems to us not impoffible that the whole of thofe fenforial changes which are not modified or occafioned by the re-action of the fentient principle, *might* take place without *mind* in the ufual philofophical fenfe of the term. We do not, of courfe, mean, that there could be *fenfations*, or *ideas*, or *voluntary motions* without mind; but that the correfponding fenforial changes (fenfible, ideal, or motory,) might, in all other inftances, except what we have juft excluded, have been produced, and the *mechanifm* of the mind, have, in fome meafure, gone on, without percipiency. And when we confider the wonderful phenomena of life, growth, and re-production, which are brought about by the delicate material ftructure of plants and animals, we feel no difficulty in allowing, that *thus far* the material part of the human fyftem is fufficient to account for the phenomena, not of *thought*, but of the *immediate occafions* of thought. The immediate *mechanifm* of fenfation, of ideas, of affociation, and of motion, we would refer to the fenforium; and we might fuppofe the fenforium to be material; but there is fomething beyond this. The fenfitive change is not a fenfation; the ideal change is not an idea; thefe imply percipiency and thought; thefe imply *mind* in the ftricteft fenfe; and the percipient principle is the mind itfelf. The motory change might be produced by its mechanical connection with different fenfitive or ideal changes; but this is not volition; volition is a property of the *mind*.

We excepted the fenforial changes occafioned or modified by the re-action of the percipient principle. As far as fenfible changes merely are concerned, the exception is of little confequence; for in *receiving* thefe, the mind has little to do. Exercife and attention may increafe the fufceptibility and vigour of the external organs, and the fenfible changes may confequently become more lively and vigorous; and the effect of any fenfible change upon the mental fyftem will, in a great degree, depend upon the attention which the mind gives to it; but we fee no adequate room to doubt, that whenever the external organ is affected, a correfpondent change takes place in the fenforium, whether it affect the percipient principle or not, *i. e.* whether or not it become a fenfation. The cafe, however, is different refpecting ideal changes, and the affociations which take place among them. In the firft place, were it not for the attention of the mind to the fenfible changes, few of them, comparatively fpeaking, would be retained; and then none of thofe affociations could be formed, in which the mind, properly fo called, has any fhare, none arifing from the perception of various relations, from intentional combinations, from acts of reafoning, volition, &c.; all would be mere mechanifm, exquifite and perfect in its nature, yet ftill nothing but mechanifm.

We have fometimes been inclined to confider the fenfitive, retentive, and affociative powers, "as the elementary powers of the mind, to the operation of which all *intellectual* phenomena may be referred" (fee INTELLECTUAL *Education*, col. 2.); but farther reflection on the claffification of our intellectual phenomena and their mental caufes, induces us to extend the number of our intellectual powers. We ftill fee no reafon to hefitate in fuppofing that thofe elementary powers are fufficient to account for all the phenomena of memory, conception, and fancy; and there cannot be a reafonable doubt that the operations of the affociative power have great influence among our other intellectual phenomena; but we fully agree with Mr. Stewart, in the opinion which he has ftated in different parts of his works, that it is injurious to the progrefs of mental fcience to fimplify mental principles too far. We are fatisfied that he has not gone far enough; that under the fettering reftraints of Reid's principles, he is contented to reft with various extenfive claffes of our mental phenomena as ultimate facts, where the operations of the affociative power afford an explanation equally clear and important; but the ftudent of Hartley fhould alfo ftudy the writings of Mr. Stewart; in many, and thefe the moft valuable parts, they are perfectly confiftent with Hartleyan principles; where his views are inconfiftent with them, we have feldom feen reafon to follow him, but there are cafes in which he furnifhes a falutary check upon the tendencies which the full adoption of thofe principles can fcarcely fail to give the ardent inquiring mind, unreftrained by the caution of experience, and fuppofing them omnipotent becaufe their inadequacy has not been fuggefted by oppofing fyftems, or by the actual application of them to the phenomena of thought. If the mentalift is fo little able to think and judge for himfelf, that he muft implicitly imbibe his philofophy from another, we fhould greatly prefer his adopting the fyftem of Hartley to that of the fchool of Stewart; becaufe the former, though imperfect, and in fome degree incorrect, is radically and extenfively true, and leads to the moft important practical principles for the regulation of the affections and the conduct of life; but where there is the bafis of a found and independent underftanding, to ftudy the principles of an anti-Hartleyan, as Mr. Stewart at laſt compels us to call him, cannot fail to produce a greater approximation to the truth. As far as phenomena go, thoſe which he has detailed furniſh important materials for the Hartleyan to try his own philoſophy upon. His reaſonings, where they do not involve his firſt principles, it is impoſſible to examine without perceiving that they mark a highly cultured and refined underſtanding, under the guidance of that moral worth which never fails to clear away numerous miſts from the mind. Thoſe firſt principles can ſcarcely fail to appear to the unbiaſſed inquirer as inconſiſtent with human nature as with the Hartleyan doctrines. His invectives and groundleſs inſinuations againſt Hartley, will ſerve as an exerciſe of his diſciples' candour. His practical maxims for the conduct of the underſtanding in the ſearch after truth will often afford a valuable guidance in the proceſſes of philoſophical inveſtigation. And his happy talent of illuſtration, his ſimple elegance of ſtyle, his general perſpicuity of reaſoning and expreſſion, muſt excite in the mind of the Hartleyan the paſſing wiſh, "would he were one of us!" till he recollects that the intereſts of truth muſt eventually be moſt promoted by having ſuch an opponent.

Having made this digreſſion, we will go on ſomewhat farther. This article may be read by ſome who have hitherto paid but little attention to the ſubject. If they will allow us to give them the direction of ſome experience, we would recommend, firſt, the peruſal of this article as a kind of outline of the leading features of this moſt important branch of philoſophy. Next, or with it at the reſpective references, the 5th, 6th, and 7th chapters of Mr. Stewart's Elements. They may then proceed with great advantage to the ſtudy of Locke's Eſſay, and Hartley's Obſervations, leaving out of the latter, at their firſt peruſal of it, all the parts relating to the hypotheſis of vibrations, or taking Dr. Prieſtley's abridgment. They will then be prepared for the examination of any other works on mental philoſophy, to which their own taſte, or accidental circumſtances, may direct them. In Mr. Belſham's Elements they will find a very judicious ſummary of the principal topics of metaphyſical inquiry connected with the philoſophy of the mind, together with references to the principal writers who have diſcuſſed them; and we wiſh here to mention that there may be ſome paſſages in this article, principally, we believe, in the ſection on the *Claſſes of Connections*, which we have derived from that work without acknowledgment; to Hartley it is needleſs ſpecifically to acknowledge our obligations. Beſides the works which we have occaſionally referred to, with approbation, we muſt recommend to our readers Tucker's Light of Nature purſued. There are few works on abſtract ſcience ſo calculated to call into exerciſe the powers of inveſtigation, and to ſharpen the penetration of the underſtanding. The author is diffuſe, and not unfrequently far from preciſe in his modes of expreſſion; and it is not always eaſy to aſcertain his drift; but his manner, even in the moſt abſtruſe parts, is ſo lively, his illuſtrations ſo numerous and ſtriking, and yet ſo original and appropriate, and his obſervations in themſelves conſidered ſo ſtrongly marked by good ſenſe, that philoſophy is obliged to be continually on her guard, to prevent being carried on unawares to concluſions which, in her more ſober moments, ſhe muſt reject. In a variety of inſtances he has found the truth; and where he is leſs ſucceſsful, he ſchools his reader to activity, acuteneſs, and vigour of thought. Paley, in the Preface to his Moral Philoſophy, expreſſes his great obligations to him; and it is not too much to ſay, that that eminently uſeful writer owed a great deal, not only of his matter, but of the moſt attractive part of his manner, to him. In preparing this article, the writer of it has not been able to avail himſelf much of this Light of Nature purſued; but he wiſhes to acknowledge his obligations to that work for an important diſtinction in the acceptations of the term *mind*, which he had for ſome time been verging to, but had not reached, till he met with it there. Will the reader excuſe his ſtating the procedure of his mind on the ſubject? About ſix or ſeven years ago, he was engaged in ſome mental inveſtigations, which led him to attend to the fact that operations which would be univerſally conſidered as belonging to the mind, might go on without exciting the conſciouſneſs. It admitted of an eaſy explanation upon the hypotheſis of vibrations; but he wiſhed to found no opinion on that hypotheſis. He had occaſion to ſtate the fact under different aſpects; but could find no words but *ſenſations* and *ideas;* and to ſpeak of theſe as exiſting without conſciouſneſs, appeared a contradiction in terms. In the unguarded uſe of both by Prieſtley, Tucker, &c. and of the latter in one or two inſtances by Hartley, he had ſome juſtification; but he perceived it was inadequate. Regarding conſciouſneſs as the eſſential principle of mind, he felt great perplexity on the ſubject of theſe operations which he could not but believe to be juſtly referred to the mind. In examining Tucker for juſtification of an extended application of the terms *ideas* and *ſenſations*, he met with a diſtinction between the popular and philoſophic acceptation of the term *mind*, which gave a ſatisfactory modification to the reſults of his own inveſtigations. (See Light of Nature, ch. vii.) The appropriate term *mental organs* founded on this diſtinction he has alſo taken from Tucker, without going ſo far as that writer does in determining their nature.

If, in uſing the terms *ſenſorium* or *mental organs*, we ſhould be ſuppoſed, by any reader, to involve any unfounded hypotheſis, we have only to obſerve, that we adopt them ſolely to give ſome degree of preciſion to our notions on the ſubject; and that he may leave them out, if he will allow us to uſe the term *mind* in its looſer acceptation, and ſay that ſenſible changes are thoſe changes in the mind which, when they have the notice of the percipient principle, are termed *ſenſations*, and ſo on in the other caſes. We cannot allow that this phraſeology involves any *hypotheſis;* but is founded on an extraordinary, but in our apprehenſion well aſcertained, fact, in our mental conſtitution.

We were going, ſeveral paragraphs back, to obſerve that the characteriſtic phenomena of judgment, reaſoning, and reflection, do not appear to us capable of explanation by the laws of ſenſation, retention, and aſſociation; and theſe claſſes of mental operations cloſely connected, and in ſome caſes perhaps not diſtinguiſhable, we would arrange under the general head of *Underſtanding*, which, much as Hartley does, we would define the faculty of the human mind by which we contemplate ſenſations and ideas, conſidered as ſuch, and the various operations of the mind, diſcern the relations which exiſt among the objects of perception and thought, purſue truth, and aſſent to, or diſſent from, propoſitions.

With the views which we have ſtated in this 1ſt diviſion of the preſent article, we ſhall, in the ſubſequent diviſions, conſider the leading faculties of the mind in the following order.

II. *Senſitive Power.*
III. *Retentive Power.*
IV. *Aſſociative Power.*
V. *Motive Power.*
VI. *Memory.*
VII. *Imagination.*
VIII. *Underſtanding.*

I. *Of the Senfitive Power.*—The brain is a foft pulpy mafs, of a whitifh colour on the infide, occupying all the cavity of the fkull. Minute differences are obfervable in the fubftance of the brain, in different parts of it; but it is unneceffary to enter upon a ftatement of them here. (See BRAIN, and its dependent articles.) The fpinal marrow is the continuation of the loweft part of the brain, which paffes through the great opening of the fkull down the hollow of the back bone. From the brain and fpinal marrow proceed the nerves, which at firft are fine fibres of the fame fubftance with the brain; thefe fibres meet, and form foft white pulpy cords, which afterwards fpread themfelves over various parts of the body, by fplitting into innumerable and exceedingly minute branches. Anatomifts count forty pair of nerves (for they come off in pairs though they afterwards feparate); of which nine or ten only come from the brain at the bottom of the fkull, and the reft from the fpinal marrow. Thofe from the brain are diftributed to various parts of the head; thofe from the fpinal marrow are diftributed over the trunk and extremities. See NERVES.

The external organs of fenfe, the nerves, and the brain, in which, for brevity, we include the whole medullary fubftance, are the corporeal organs of fenfation. All, as we are at prefent conftituted, are neceffary to fenfation. If the external organ is deftroyed, no fenfation can be produced; where there are no nerves, there is no fenfation; where the nervous branches are moft numerous, there is moft fenfation; if the nerve be deftroyed, fenfation cannot be produced from thofe parts to which the nerve belongs, which are farther from the brain than the injured parts. The brain is the ultimate organ of fenfation of which we have any knowledge. All the nerves terminate in the brain. If the brain is compreffed, fenfation is fufpended. If the brain is confiderably injured, fenfation ceafes.

There is, in like manner, confiderable reafon to fuppofe that the brain may be the immediate organ of ideas. If the brain is difeafed, many of the phenomena of thought are altogether changed. If the brain is compreffed, thought is fufpended. If the brain is materially injured, ideas ceafe.

So alfo the brain appears to be the primary organ of all motions which are not produced by the immediate action of external objects upon the mufcles. The mufcles are the immediate organs of motion. (See MUSCLE.) The mufcles confift of flefhy fubftances, and generally alfo of tendon. The tendons faften the mufcles to the bones; and the flefhy parts, by their contractions, produce the motions of the bones. Into the flefhy parts of the mufcles, numerous nerves enter; they are diffufed over their furface, and within their fubftance. Thefe nerves, as before-mentioned, terminate in the brain; they are the intermediate organs of voluntary motion between it and the mufcles. If a nerve be compreffed or punctured, motion is produced in the mufcle over which that nerve is diftributed. If a portion of that nerve be cut, or otherwife deftroyed, voluntary motion can no longer be produced in that mufcle over which it was diftributed. If the brain be touched with any inftrument, or cauftic be applied to it, the mufcular fyftem undergoes the moft violent contortions. If the fpinal marrow be compreffed, the power of voluntary motion is fufpended in thofe mufcles which receive their nerves from the back. If the brain is confiderably injured, all power of voluntary motion ceafes.

Some of our readers may hope that we are now going to give fome hypothefis on the nature of thofe changes in the corporeal organs which occafion or accompany fenfation, idea, and voluntary motion. We have, however, none to give. If our object were different, we fhould lay before them Hartley's hypothefis of vibrations, with the arguments for and againft it; but we cannot convince ourfelves that it has any thing to do with mental philofophy. All that appears to us important, in the prefent ftate of our knowledge refpecting the connection between the mind and the body, we have already ftated: no hypothefis as to the phyfical occafions of thought can, yet, really explain the operations of thought. If there muft be fome hypothefis, connected with the doctrine of affociation, we recommend the reader to affume Hartley's hypothefis, employing the term *vibrations* merely to denote the changes, whatever they be, in the ultimate material organs of the mind, which occafion or accompany the various exercifes of the percipient principle. We do not think he will gain much by it; but it will do lefs harm than by defining the nature of thofe changes. On the hypothefis of vibrations, the reader may confult Reid and Belfham. The latter has given a luminous ftatement of the arguments for and againft it. We learn from Dr. Aikin's General Biography (Hartley), that Haller maintains that it is totally incompatible with the nature of the nerves and medullary fubftance. (See Haller's Elementa Phyfiologiæ, vol. iv. fect. 8. art. Conjecturæ, § 4.) Refpecting the part of the brain moft intimately connected with the mental functions, feveral curious facts are ftated in a paper by M. de la Peyronnie, fubjoined to Jurain's French tranflation of Hartley's firft volume, (1755,) taken from the Memoirs of the French Academy of Sciences. The opinion of that author, founded on his facts, is, that the *corpus callofum* is the feat of the foul. We have no opportunity of knowing what Dr. Ferriar may have urged againft this opinion in the Manchefter Tranfactions.

The *external Organs of Senfation* are ufually claffed under five heads, fight, hearing, feeling or touch, fmell, and tafte. The fenfe of feeling might probably be divided, with convenience, into two or three; becaufe the claffes of fenfations which are referred to this fenfe differ confiderably in themfelves, and in the external caufes producing them. But the common arrangement is fufficient for our purpofe.

The prefent article, and the next following, have unexpectedly been configned to the writer of thofe on Education. If he had forefeen this circumftance, he would have made references to this article from INTELLECTUAL and MORAL *Education*. As it is, he has, in feveral parts of thofe articles, introduced obfervations which would otherwife have had place here; and though it would be eafy to reftate them with confiderable amplification, yet his limits being neceffarily confined, he prefers referring to thofe articles, for fuch obfervations as may be neceffary for his prefent purpofe.

To perceive the influence of each fenfe in forming our notions and feelings, it is neceffary carefully to diftinguifh between the mere fenfation, and thofe ideas which are, by affociation, fo connected with it, as to appear at firft view a part of the fenfation. When the fenfation, produced by an external object, is fo clofely united with ideas derived from other fenfes, or from the fame fenfe in different circumftances, that the whole fhall appear to be one feeling, apparently derived immediately from the external impreffion, the whole together, the fenfation and affociated complex idea, is called a *perception*. For farther illuftration, fee INTELLECTUAL *Education*, chap. ii. col. 3, 4. The change of fenfations into perceptions, furnifhes fome very important inftances of the operation of the affociative power; and without an acquaintance with the influence of affociation in making fenfations at once bring complex ideas into the view of the mind, it is impoffible to underftand the real nature of perception. It clearly was not underftood by Dr. Reid;

nor

nor indeed was it poffible for him to enter into the diftinction between fenfation and perception, without calling in the agency of affociation; and as we have already hinted, he could not receive the doctrine of affociation, when his fundamental pofition rendered the exiftence of this principle impoffible. By long exercife, the operations of perception become fo intimately united with fenfations, that, in numerous cafes, the fenfation is with great difficulty diftinguifhed from the affociated idea; and it is not to us at all furprifing, that a man of fuch cool and fteady character of mind, fhould not have been able to difcriminate between the fenfation and, in his cafe, the *unvarying* affociated ideas, fince he had not acquired an infight into the formation of ideas by affociation, and had even brought himfelf to deny the exiftence of any *objects* of our mental operations feparate from the external objects of fenfation. He faw that the Berkleyan hypothefis was contradicted by the obvious dictates of common fenfe, and being unaided by the principles of affociation, he had no refource but to make the fenfation introduce the belief of an external caufe of it, by inftinct, or a kind of infpiration.

1. *Senfe of Feeling.*—When the mind has connected the complex ideas derived from the touch, with the vifible appearance of objects, the fight is then indefinitely the moft ufeful channel of knowledge refpecting external objects; but in the earlieft ftages of the intellectual progrefs, the touch is the moft ufeful; in fact, as man is formed, it is then abfolutely neceffary to render the fight productive of moft of its prefent utility. The fenfe of feeling differs from the other fenfes, in belonging to every part of the body, external or internal, to which nerves are diftributed. The term *touch* is moft correctly limited to the fenfibility which is diffufed over the furface of the body. The touch exifts with the moft exquifite degree of fenfibility, at the extremities of the hands and in the lips. The fenfe of touch is thus very commodioufly difpofed, for the purpofe of encompaffing fmaller bodies, and for adapting itfelf to the inequalities of larger ones.

The fenfations acquired by the fenfe of feeling, are thofe of heat, hardnefs, folidity, roughnefs, drynefs, motion, diftance, figure, &c.; and all thofe corporeal feelings which arife from a healthy or difeafed ftate of the nerves, and of the part of the body to which they belong.

The pains of this fenfe are more numerous and vivid than thofe derived from any other fenfe; and therefore the relics of them affociating and coalefcing with one another, conftitute the greateft fhare of our mental pains. On the other hand, its pleafures being, in general, faint and rare, in comparifon with others, and particularly thofe of the tafte, have but a fmall fhare among the rudiments of the mental pleafures. The fexual feelings of a corporeal nature, however, when under due regulation, do undoubtedly contribute, in more advanced periods, to the compofition of fome refined mental feelings; and for fome very important remarks refpecting the origin and influence of thefe defires, we beg to refer to Hartley's 73d propofition.

The touch is the original medium of our knowledge refpecting the real qualities of fubftances, and indeed is the fole medium by which we gain a knowledge of external objects as fuch. It is by the touch, and originally by the touch alone, aided by the power of mufcular motion, that we diftinguifh our own bodies from other objects that furround us, and from the impreffion which every one has, that the objects which affect the fight, the hearing, &c. are external. When we touch a fenfible part of our bodies, we have fenfations conveyed to the mind through two nervous branches; when we touch any other body, we have only one fenfation. For fome interefting and often fatisfactory fpeculations as to the influence of different fenfes in forming our ideas refpecting external objects, fee Condillac's Traité des Senfations. Mr. Stewart appears to have been led by that work to fome remarks at the clofe of his chapter on Perception; and we do not hefitate in faying, that thofe remarks entirely overthrow the fundamental principle of Dr. Reid's theory of perception, by which he imagined he had demolifhed the vifionary hypothefis of Berkeley. See PERCEPTION.

The notion that external objects give us the fenfations of found, tafte, fight, and fmell, is fo continually forced upon us by the fenfations of touch, aided by the power of mufcular motion, that there probably was never found a perfon who doubted of the exiftence of the external world as the caufe of his fenfations, except from the influence of philofophical fpeculation. Some very acute thinkers have, indeed, given up the belief of an external world as the caufe of their fenfations; but their opinion never did, nor never can, gain much ground; for it is inconfiftent with the perceptions, which, by the conftitution of our frame, are neceffarily formed from continually recurring fenfations. The philofophic Berkeley, and a late writer, Mr. Drummond, are the chief fupporters of this curious, but to fay the leaft, unimportant opinion. If it were allowable to leave every thing out of confideration, but the occafional vividnefs of our vifual conceptions, and the indifputable fact that fenfations are merely affections of the mind, it might be very difficult to refift the acutenefs of their reafonings; but we are fully fatisfied, that they would never have come to their curious conclufions, if their object had been to inveftigate the fources of that belief which we doubt not they had themfelves, except in the moments of abftract fpeculation; and if they had paid more attention to the influence of the fenfe of feeling (aided, of courfe, by mufcular motion) in the formation of our perceptions. They would then have regarded it as infinitely more probable that this almoft irrefiftible conviction is a well-grounded one, than that every human being is almoft every moment of his life labouring under a delufion by the very conftitution of his nature, for which no fuppofable end can be affigned, and which muft therefore be inconfiftent with the known attributes of the Supreme Being.

Some philofophers have fuppofed, that it is owing to the exquifite delicacy of feeling which exifts in the hand, together with the exquifite mechanifm by which it is applied, that man poffeffes fuch fuperiority in knowledge over the lower claffes of animals. It cannot be juft to attribute to this caufe alone his mental fuperiority: but, indifputably, as man is conftituted, it is effential to the degree of fuperiority now poffeffed; and we obferve, that tribe of animals poffeffes the greateft degree of what may be called human wifdom, which has the fenfe of touch moft perfect; the flexible organ at the end of the elephant's trunk anfwering fome of the purpofes of the human fingers. See INTEGUMENTS.

2. *Senfe of Tafte.*—This fenfe, and that of fmell, are nearly allied to the fenfe of feeling. They are, however, properly diftinguifhed from it, becaufe they have each a peculiar organ, and are each affected by peculiar properties of bodies. The chief organ of tafte is the tongue; and it is fitted for its office, by the numerous extremities of nerves which are lodged along its furface, and particularly at the top and fides. Hartley confiders this fenfe as extending to the other parts of the mouth, and through the throat, and the other parts of the alimentary duct. Taken in this comprehenfive acceptation, the fenfe of tafte conveys

veys to the mind fenfations not only of flavours, but of hunger and thirft.

In order to produce thofe fenfations of tafte which are derived from the tongue, its nervous extremities muft be moiftened; and the action of eating generally produces the effufion of a fluid from different parts of the mouth, which anfwers the purpofe of exciting the tafte and affifting the digeftion.

The tafte undergoes fome remarkable changes in paffing from infancy to old age. Sweets generally grow lefs and lefs agreeable, and fometimes even difagreeable, and at laft naufeous. Aftringent, acid, and fpirituous liquors, which difpleafe at firft, afterwards become highly grateful. Even bitter and acrid fubftances firft lofe their offenfive qualities, and after a fufficient repetition give a relifh to our aliment. And many particular articles of food or medicine, become either extremely pleafant or difgufting, from affociations with fafhion, joy, hope of advantage, hunger, the pleafures of cheerful converfation, &c. or with ficknefs, vomitings, gripings, fear, forrow, &c. Thefe changes are partly in confequence of the ufual effect of cuftom on the organs of fenfation, both external and internal, *viz.* to diminifh the vividnefs of fenfation; and partly owing to the influence of affociation. This operates, Hartley thinks, principally in the following method. The pleafant and painful impreffions which particular foods and medicines make upon the ftomach, always either accompany the tafte, or follow it in a fhort time; and by this means an affociation is formed, whereby the direct pleafantnefs or naufeoufnefs of the tafte is enhanced, if the impreffions upon the tongue and ftomach be of the fame kind, or diminifhed, and perhaps overpowered, and even converted into its oppofite, if they be of different kinds. In like manner, a difagreeable tafte, by being often mixed with a pleafant one, may at laft become pleafant alone, and *vice verfa*: hunger and fatiety may alfo, by being joined with particular taftes, contribute greatly to augment or abate their relifh. It may alfo be obferved here, that the defire of particular foods or liquors, is often directly excited by their affociated circumftances, and this, in fome cafes, more than by their taftes, or even when their taftes are nearly, if not altogether, become indifferent; and it is very common for thefe circumftances, particularly the fight or fmell of the food or liquor, to prevail againft men's better judgments, directing them to forbear, and warning them of the mifchiefs likely to arife from felf-indulgence.

The pleafures derived from tafte are very confiderable; and the power of yielding pleafurable fenfations ufually accompanies the tafte through the whole of life. Hence it is reafonable to infer, that its pleafures conftitute one grand fource of the mental pleafures, that is, of thofe which can be felt without the direct intervention of fenfation. They leave their relics in the mind; and thefe combine together, with other relics of pleafurable fenfations, and they form feelings which often connect themfelves with objects which have no immediate connection with the objects of tafte. To this fource Hartley traces the principal origin of the focial pleafures; and there cannot be a doubt, that the pleafures of tafte are the chief original fource of the filial affections. (See MORAL *Education*, col. 22, 23.) It appears that one end of the long continuance of the pleafures of tafte, is to fupply continual acceffions to the mental pleafures; but, without a doubt, the principal object is to make that a fource of pleafure which is neceffary to felf-prefervation. The pains of tafte are much lefs numerous than thofe of feeling. They are only fuch as are neceffary to prompt to avoid exceffive abftinence or gratification, and to prevent the employment of improper food. "The moft common of thefe painful impreffions is that from excefs, and the confequent indigeftion. This excites and fupports thofe uneafy ftates, which attend upon melancholy, fear, and forrow."

3. *Senfe of Smell.*—This fenfe is very nearly allied to that of tafte; and indeed many of thofe pleafurable fenfations which are ufually referred to the tafte, (as being received during the act of eating and fwallowing,) really belong to the fmell. The external organ of fmell is a membrane or fkin, overfpread with nerves, which line the internal cavity of the noftrils, and the furface and cavities of the bones which join the noftrils. This is affected both by the odorous particles which proceed from external fubftances through the nofe, and by thofe which come from the fubftances which are eaten; for there is a communication between the nofe and the back part of the mouth.

The pains of fmell are obvioufly defigned to affift us in the proper choice of food; and alfo to prompt us to avoid fuch noxious vapours, as may render the air injurious to health and life. It appears alfo, that offenfive odours, in various circumftances, contribute to generate the fenfe of fhame, decency, &c. The pleafures of fmell have a direct connection with thofe of tafte: it is only neceffary, therefore, to add to what has been faid refpecting the latter, that the pleafures of fmell which arife from the various productions of nature, have a confiderable fhare in the formation and vividnefs of fome of our mental pleafures; and, in particular, of thofe which arife from the view of rural objects and fcenes, and from the reprefentations of them by poetry and painting.

4. *Senfe of Sight.*—The organ of fight is a globular body, which contains within it tranfparent fubftances fitted to form on the back part of it, a picture of the object of fight. The examination of an ox's eye will give a pretty accurate idea of the general ftructure of the human eye. We fee in front a horny tranfparent fubftance, called *cornea*. Next to this is a watery fluid, called *aqueous humour*, in which the *iris* floats like a delicate curtain, with an aperture in the middle, called the *pupil*. Behind the iris we find a folid body, with two furfaces of different convexities, called the *cryftalline lens*. Next to this is the *vitreous humour*, a jelly-like tranfparent fubftance, which fills the ball of the eye. The *retina* confifts of exceedingly minute fibres from the optic nerve, which are fpread over the whole of the back part of the inner furface of the eye. Behind the retina is a mucous fubftance, which in the human eye is of a dark colour, and ferves to imbibe the rays of light which pafs through the retina, fo as to prevent the confufion which would arife from the reflection of them. The retina is the immediate organ of fight. The rays of light proceeding from every vifible point of the object of fight, enter the eye through the cornea, and pafs through the pupil: they are refracted by the three humours of the eye, fo as to form upon the retina an exquifitely beautiful and diftinct, though minute, picture of the object. A tolerable idea of the formation of the picture may be obtained, by carefully cutting off the back coating of an ox's eye, and holding behind it a piece of paper to receive the picture of fome luminous object. For a minute account of the ftructure of this organ, fee EYE.

What effect is produced upon the optic nerve by the formation of this picture upon the retina, is not certainly known: it is fufficient for our prefent purpofe, that, by means of the nerve, &c. the impreffion, of whatever nature it be, is communicated to the mental organs, and produces in them thofe effects, which, when they excite the confcioufnefs, are called fenfations.

The picture on the retina is inverted; and yet it does not appear that the vifual fenfation conveys the notion of the object being inverted, even when unaided by the ideas derived from the touch. The firft efforts of children to grafp, &c. afford no indication that the object appears to them inverted; and we are not aware that the rectification of this vifual impreffion is among the leffons which the blind have to learn when they have been reftored to fight. When the kitten playing before the mirror fees her own image, and ftrikes her paw againft it, (before fhe is wife enough to try, like Lee Boo, to look behind it,) fhe aims as if fhe perceived the image in the direct pofition: her image appears at the bottom of the glafs, and, we will fuppofe, on the right fide of it; and there fhe ftrikes; though in the picture on the retina it appears at the top, on the left. The efficacy of affociation to correct the influence of the inverted picture, by the ideas derived from the touch, we could in no way doubt; but, notwithftanding the ftatements of fome optical and metaphyfical writers, we are fatisfied that the mind does not fee objects inverted, though the impreffion upon the retina, if the immediate object of the mind, muft, of itfelf, produce this notion. The nervous fibres of which the retina is compofed, may change their relative pofition before they reach the brain; or the mental organs of touch and thofe of fight may have fuch a relation, (of fituation, if corporeal,) that the fenfations of pofition in this refpect fhall correfpond. Whatever may be the real caufe, however, the fact clearly is, that the inverted picture on the retina does not produce a fenfation of the object as inverted; and that by the vifual impreffions alone, the erect object is perceived as erect. The landfcape or portrait painter can, by long habit, feparate the vifual fenfation from the perception, and fee the objects of fight as they would appear on an uniform furface; but we never heard that he was able to fee them inverted, which he muft fometimes do, in the courfe of his abftract attention to the vifual fenfation, if, as appears to be commonly thought, the vifual impreffion of itfelf, feparate from the ideas derived from the touch, conveyed to the mind the notion of objects as being in an inverted pofition. Even the profound Hartley has paffed over this circumftance without adequate confideration.

If the fenfation produced by the object of fight be confidered unblended with the relics of other fenfations, we find that it is merely what can be communicated by a minute picture on the retina. The fenfation of colour can be thus communicated, and this is the only fenfation which can be confidered as appropriate to the fight. The fenfation of figure can be communicated, but only of figure in two directions, length and breadth; for the picture on the retina can have only thofe two dimenfions. The fenfation of magnitude can alfo be thus communicated, but not of real magnitude; for a fenfation of real magnitude cannot be conveyed by a picture which is almoft indefinitely fmaller than the real object. To ufe the illuftration of Adam Smith: "If you fhut one eye, and hold immediately before the other a fmall circle of plain glafs, of not more than half an inch in diameter, you may fee through that circle the moft extenfive profpects, lawns, and woods, and arms of the fea, and diftant mountains. You are apt to imagine that the vifible picture, which you thus fee, is immenfely great and extenfive; but it can be no greater than the vifible circle through which you fee it. If, while you are looking through the circle, you could conceive a fairy hand and a fairy pencil to come between your eye and the glafs, that pencil might delineate upon that little glafs, the outline of all thofe extenfive lawns, and woods, and arms of the fea, and diftant mountains, in the dimenfions in which they are feen by the eye." Again, it is obvious, that however large or however fmall the field of view, the picture occupies an equal extent upon the retina. Similar obfervations might be made with refpect to diftance. The organ of fight can convey only that fenfation of diftance which may be produced by a minute picture on the retina; that is, nothing but the fenfation of the diftances of the different parts of the picture, which may bear no proportion to the real diftances, and can only be in two directions. Similar things may be faid of motion, that is, change of pofition. The vifual fenfation of motion is merely that produced by the motion of different parts of the picture on the retina.

The fact is, that not the objects themfelves, but the picture formed upon the retina, is the immediate object of the fight. Without the fenfe of touch it is probable that the picture would never have conveyed ideas of real figure, magnitude, motion, or pofition; ftill more, that it would never have conveyed the idea, that external objects produced the picture. Of colour it does convey fenfations which do not receive correction from the touch, and which, can be acquired by the fight alone. Perfons completely blind have been known to diftinguifh objects of one colour from thofe of another, but this is by the feel of the furfaces of thofe objects. If they have never at all poffeffed fight, though they may fpeak of colours, and diftinguifh coloured objects, and even have a remote idea of the caufes of our fenfations of colours, yet they can have no fenfations, nor confequently ideas of colours. Mr. Locke mentions a blind man, who faid, that he imagined the colour of fcarlet refembled the found of a trumpet.

The limits here ftated of the direct power of the fenfe of fight, may appear ftrange to thofe who have not been accuftomed to diftinguifh between the fenfation, and the perception of which the fenfation forms a part. We feem to have an immediate fenfation, by means of the fight, of the real fituation and magnitudes, &c. of objects; but what has been before ftated is an indifputable fact. The cafe is, the compound ideas formed from the fenfations of touch, in connection with certain vifual fenfations, are fo early formed, and fo early connected with thofe vifual fenfations, that we have no recollection of the fimple ideas of fenfation, or of the formation of the compound ideas: indeed, as active agents, we have no concern in the formation of our perceptions. There are, however, numerous circumftances which prove the point; the moft fatisfactory are thofe attending the obtaining of the fight, at a period when recollection can regifter the fenfations. One fuch cafe fell under the obfervation of the able Chefelden, and we fhall ftate fome of the principal circumftances of it. Mr. Chefelden couched a youth of thirteen years of age. When he was allowed to ufe his fight, all objects appeared to him alike to touch his eyes, as the things which he felt touched his fkin. He confidered folid bodies as planes differently coloured; and when he had learned to diftinguifh folids by their appearances, he was greatly furprifed, when examining the pictures of folids, to find all the parts plane and fmooth like the reft; he afked which of his fenfes deceived him, his fight or his feeling? Being fhewn a miniature of his father, which was painted on a watch cafe, he at once perceived that it was a reprefentation of his father, but expreffed great furprife that fo large a countenance could be contained in fo fmall a fpace, it appeared to him as impoffible as for a pint to contain a hogfhead. Mr. Ware publifhed, in the Philofophical Tranfactions of 1800, a cafe which feemed to militate greatly againft Mr. Chefelden's conclufions: Mr. Ware's patient from the firft had

had ideas of diſtance and form. But Mr. Ware himſelf furniſhes a ſolution of this difficulty; for we find, from his paper, that his patient had always been able to diſtinguiſh light and vivid colours from ſhade.

Senſations of colours are, in the early parts of life, very vivid, and aſſiſt conſiderably in the formation of our mental pleaſures; but the other ſenſations derived from this ſenſe are principally important to us, as being by aſſociation the ſigns of the ideas derived from the touch; and, from their diſtinctneſs, well calculated to ſerve as the connecting bond of union, and to bring thoſe ideas again into the view of the mind. The viſual ſenſations, of themſelves conſidered, are ſeldom the objects of reflection; we ſeldom even think of them; and while we appear to give to the viſible appearances of objects our minuteſt attention, we are, in fact, attending only to the tangible qualities of which the viſible appearance is the ſign. Were it not, therefore, for aſſociation, the ſight would be of little more uſe to us than a beautiful picture of objects with which we have no concern. But conſider its value in connection with aſſociation; and it muſt be regarded as the moſt perfect and the moſt permanently valuable of all the ſenſes. The information obtained by the touch is acquired ſlowly; and the ſenſations muſt be continually repeated, in order to acquire information reſpecting new objects; but the ſight takes in a vaſt variety of objects, and, almoſt at a glance, can diſtinguiſh moſt that is neceſſary to be known reſpecting them. Its ſenſations recall the paſt impreſſions derived from the touch; and at once ſuggeſt the ſize, the ſhape, the diſtance, of their various objects. "If a man," ſays Reid, "were by feeling to find out the figure of the peak of Teneriffe, or even of St. Peter's at Rome, it would be the work of a life time." Beſides, its diſcovery reaches farther than the touch could carry us; it enables us to range through the vault of heaven, and determine the motions of the heavenly luminaries. It traces in the countenance the workings of the mind; it diſplays the paſſions and affections of the ſoul. With aſſociation it is every thing. Without it, it would be uſeleſs as the bright fleeting viſions of ſleep.

5. *Senſe of Hearing.*—The ſenſe of ſight is affected by rays of light proceeding from the different objects to the retina. The ſenſe of feeling is affected by the contact of its various objects with the body, or by the vigorous or unſound ſtate of the parts of the body. The ſenſe of taſte is affected by certain particles of ſubſtances which are diſſolved by the ſaliva, and thus brought into contact with the organs of taſte. The ſenſe of ſmell is affected by particles which various ſubſtances are continually ſending into the air, and which impreſs the membrane which lines the cavity and bones of the noſe. The ſenſe of hearing is affected by the pulſations or vibrations of the air, which are cauſed by its own expanſion, or by the vibrations of ſounding bodies. Theſe pulſations, or vibrations in the air, are called ſounds, as are alſo the ſenſations which they produce. The organ of hearing is much more complicated, and much leſs underſtood, than that of ſight. We ſhall here give a very general account of it, and refer thoſe who wiſh for further information to the article Ear. The external ear collects and modifies ſounds; and by a long channel communicates them to the internal ear. This conſiſts, in the firſt place, of what is called the drum of the ear, which is a ſmall cavity, cloſed towards the opening of the ear by a delicate membrane. In the drum are three or four very ſmall bones, furniſhed with muſcles and joints. From the drum are ſeveral openings, one of which is to the mouth; the others communicate into different receſſes of the ear. One of theſe leads into the labyrinth, which conſiſts, firſt, of a ſmall irregular cavity, next of three ſemicircular canals, and laſtly, of a winding ſpiral canal, not unlike ſome ſea-ſhells. All theſe parts of the cavity are lined with a very delicate membrane, and filled with a watery fluid, which conveys to the portions of the nerve in contact with it, the vibrations received from the membrane which ſeparates the labyrinth from the drum of the ear. The vibrations of the air act upon the drum, and thus ſet in motion the ſeries of ſmall bones in the cavity of the drum: theſe communicate the vibrations to the membrane which ſeparates the drum from the labyrinth; and this, as before-mentioned, produces vibrations in the watery fluid, in the ſeveral parts of the labyrinth, and conveys to the nervous branches, which line the labyrinth, the vibrations originally produced on the drum. The mechaniſm is complicated, but what we underſtand muſt increaſe our reverential admiration of the ſkill which produced it.

There are colours which of themſelves, without aſſociated ideas, are agreeable to the ſight; and it is reaſonable to believe that there are ſounds which of themſelves, without aſſociated ideas, are agreeable to the ear. This is authorized alſo by direct experience. All moderate and tolerably uniform ſounds pleaſe young children; and during the whole life, various combined and ſimple ſounds give pleaſure to the mind without any reference to the aſſociated ideas. Hence it appears that the pleaſures of hearing aid conſiderably in the formation; or at leaſt in the increaſe of the mental pleaſures: indeed, in connection with thoſe of ſight they conſtitute nearly the whole of the pleaſures of ſublimity and beauty.

It is a well known fact, that the ideas left by the ſenſations of ſight are the moſt vivid and diſtinct of any: next to theſe are thoſe produced by the ſenſation of hearing. Few can form a diſtinct, certainly not a vivid, conception of the feel of any ſubſtance which has preſented ſenſations through the medium of the touch, and not many more can of a taſte, or of a ſmell, though thinking of particular taſte produces conſiderable effuſion of the ſaliva. Of objects of the ſight we are able to form conceptions, which often approach in vividneſs and diſtinctneſs to the original ſenſations, and which ſometimes overpower thoſe actually preſent in the mind, ſo as in many caſes to lead to the belief of a real object, and conſequently to lead to the belief of apparitions, &c. Few, we believe, poſſeſs the power of forming conceptions of ſounds nearly equal in vividneſs and diſtinctneſs with the original ſenſation; but they are frequently perceptible. After we have heard muſic, or converſed much with a perſon, trains of audible ideas frequently paſs in the mind. So, when we are thinking or reading ſlowly and carefully, we can generally trace the relics of the audible impreſſions of the words ſuggeſted by the thoughts or the ſight of the letters; that is, we have faint conceptions of the ſounds of theſe words.

The neceſſity of hearing to man, conſidered as a ſocial being, is obvious; its importance to him, conſidered as a being whoſe pleaſures and pains are by degrees to be purely mental, is not inferior. The means of knowledge are greatly diminiſhed by the loſs of ſight, but the loſs of ſight only impedes the progreſs of the mind from ſenſation to thought and feeling. Thoſe who have never heard have much greater diſadvantages to undergo. Their deficiencies can never be fully ſupplied. Words, as Hartley ſuggeſts, are highly important, and even neceſſary to the full improvement of intellect, and the enlargement of the affections; and, therefore, the ear is of much more importance to us, as ſpiritual beings, than the eye.

General Obſervations reſpecting the Senſitive Power.—We ſhall

ſhall conclude this diviſion of our article with a few general remarks on ſenſation, on moſt of which we ſhall not enlarge, as we have already anticipated them in INTELLECTUAL and MORAL *Education*.

1. Senſations are the rudiments or elements of all our ideas, that is, of all our thoughts and feelings, excepting the ideas of conſciouſneſs. See INTELLECTUAL *Education*, col. 2.

2. Conſidering man as an intellectual being, the correctneſs and extent of his perceptions are of the firſt moment: theſe are, in fact, the materials of all knowledge reſpecting external objects; and in the early ſtages of mental culture are the only objects of the underſtanding. See INTELLECTUAL *Education*, col. 3, and alſo col. 4, 5.

3. Senſations are to be conſidered not only as the original materials for the various operations of intellect, but as the ſources of all the mental pleaſures and pains. See MORAL *Education*, col. 21.

4. Conſidering man as a being of feeling and affection, it is requiſite, during the early part of life, to keep the inlets of ſenſations in a fit ſtate for receiving them, and not to check the pleaſures of ſenſation, or to impoſe its pains, except where an enlightened regard to the welfare of the individual requires it. See MORAL *Education*, col. 22.

5. The grand law of ſenſible pleaſures and pains is, that by frequent repetition they loſe their vividneſs. This is a law to which may be traced various important facts connected with the moral culture. (See MORAL *Education*, col. 51. *On the Conſcience*, § 11.) Whatever be the peculiar mode by which impreſſions from the objects of ſenſe are tranſmitted through the nerves to the brain, it appears decidedly probable, that the difference between pleaſurable and painful ſenſations conſiſts, as far as reſpects the ſenſations themſelves, in degree only: that pain has the ſame cauſe as pleaſure, except that it acts more intenſely. "All pleaſure," as Hartley remarks, "appears to paſs into pain by increaſing its cauſe, impreſſion, duration, ſenſibility of the organ, upon which it is impreſſed, &c.: thus an agreeable warmth may be made to paſs into a troubleſome or burning heat, by increaſe or continuance; and the ſame thing holds, with reſpect to friction, light, and ſound." Hence, ſince repetition diminiſhes the vividneſs of the ſenſation, (provided there be no increaſe in the exciting cauſe, or in the ſenſibility of the organ, &c.) great pain will, by repetition, gradually ſubſide into pain leſs intenſe; pains may be converted by repetition into pleaſures; and pleaſures may be converted into indifferent ſenſations. This progreſs may be obſerved in the effects of ſpirituous liquors, or any other ſtimuli which ſtrongly affect the organs of taſte. There is, probably, no caſe in which the taſte of ſpirituous liquors would originally be otherwiſe than diſagreeable. By degrees the repeated uſe of them bring the ſenſations which they occaſion within the limit of pleaſure. Even then a conſiderable increaſe of the quantity taken would heighten the ſenſations to the limit of pain: but ſuppoſe the pleaſurable portion continued without increaſe, the repeated uſe of it diminiſhes the vividneſs of the pleaſure, till at laſt the ſenſation produced is completely indifferent. We here adduce the fact merely as illuſtrative of the general principle.

6. We have already ſtated, that the original ſenſible pleaſures derived from the taſte and ſmell are very numerous, and far exceed the pains: that the original ſenſible pleaſures derived from the ſight and the hearing are alſo numerous, while the original ſen ble pains are few: and that the original ſenſible pleaſures derived from the ſenſe of feeling are leſs intenſe than the pains derived from that ſenſe, which are more numerous and vivid than all the other ſenſible pains united. From this account we ſhould be led to infer, that the pains of ſenſation are very far exceeded by the pleaſures of ſenſation. This will be ſtill more evident when we recollect that the pleaſurable ſenſations are thoſe of conſtant occurrence; the painful ſenſations much more rare. In the early part of life, moſt ſenſations that are not painful are pleaſurable; and the pleaſurable ones are continually recurring. The eye and the ear ſeem to convey ſcarcely any thing but pleaſurable ſenſations to the infant mind: the taſte and ſmell are continually pouring in their pleaſures, ſeldom mixed with pain: the feeling, when the body is healthy, "when life is felt in every limb," is alſo continually adding to the ſtock of pleaſurable ſenſations thoſe derived from the glow of health, and the active motions of childhood. To balance all this, there are, in ſome few caſes, frequent pains of body; but more frequently the pains ariſing from ill health are of rare recurrence, and the artificial ſenſible pains are ſtill leſs frequently received. Such is the matter of fact: and if we conſider the cauſe of the pleaſures and pains of ſenſation as differing only in degree, we ſhall readily admit, that, on the whole, the pleaſures far exceed the pains: for the ſenſible pains being produced by an exceſſive action of the organs of ſenſation, common impreſſions will not produce them; and ſhould they become very frequent, they will, agreeably to the grand law of ſenſation already ſtated, gradually diminiſh in vividneſs, and at laſt come within the limit of pleaſure.

III. *Of the Retentive Power*.—Whatever be the effect produced on the mental organs by the impreſſions on the organs of ſenſe, that effect can be renewed, though in general with diminiſhed vigour, without a repetition of the ſenſible impreſſions. In other words, ſenſible changes produce a tendency to ſimilar changes, which can be repeated without the repetition of the external impreſſions, and may thus be called *ideal changes*. Leſs generally, ſenſations leave relics behind them, which can be perceived without the agency of the external organs of ſenſation, and which are called *ideas*. The power or capacity of the mind, by which tendencies to ideal changes are retained, may be called the *retentive power*.

That tendencies to a repetition of ſenſorial changes are thus formed, that ideas are thus retained, might be referred to the operation of the ſenſitive power, and in the human being they certainly depend upon the ſame organic cauſes, whatever thoſe be. But in many animals it is decidedly probable, that ſenſations leave no relics behind them: and in man there are, with equal probability, numerous impreſſions from external objects which leave no relics behind them; though we feel conſtrained to add from conſtant experience, that in many inſtances, where ſenſations have left no ideas ſufficiently determinate to be recalled by voluntary recollection, or preſented again to the mind by aſſociation, a recurrence of the ſenſations afford decided proof that they have left relics behind them, for we at once perceive that we have experienced them before. This we apprehend, however, is only where the ſenſible changes have in the firſt inſtance obtained ſome degreee of attention. We are not aware of any ſatisfactory proof that they leave any relics behind them where they have not excited the conſciouſneſs. On the whole, it appears probable that ſenſible changes, and even ſenſations, may be produced without leaving relics behind them. And it is certain that theſe relics of ſenſations may re-appear, without impreſſions from external objects. Hence it appears preferable to conſider the receiving of ſenſations, and the retaining of ideas, as two ſeparate though intimately connected operations, and as implying two

two feparate powers or capacities of the mind. This is not done by Hartley, who appears to refer both to fenfation; and it has fubjected him to fome unfounded animadverfions of the great northern philofopher. Speaking of the phenomena of memory as not to be entirely explained by the laws of affociation, Mr. Stewart fays, "The affociation of ideas connects our various thoughts with each other, fo as to prefent them to the mind in a certain order; but it prefuppofes a faculty of retaining the knowledge we acquire." Of this Hartley was perfectly aware; and he has accordingly a diftinct propofition (p. 8.) on the production of ideas.

Without the retentive power, it is obvious that man would be a being of mere fenfation, little if at all fuperior to the loweft orders of the animal creation, and inferior to many of them. The retentive power provides materials for the agency of the affociative power. Without the former, the latter could not be called into exercife; and without the affociative power, the relics of fenfation, (the effects of the retentive power,) would be of no utility. The operations of the retentive power can fcarcely, however, be feparated from thofe of the affociative power; and thefe together conftitute the compound faculty called memory, for fome account of which we refer our readers to a fubfequent part of this article. We introduce the fubject here, merely in reference to the generation of ideas.

We have faid that the receiving fenfations, and the retaining the relics of them, probably depend upon the fame organic caufes, whatever they be. In fome inftances fenfible changes perceptibly continue after the fenfible objects are removed. Two or three facts, which every one muft have noticed or may notice, will illuftrate this principle. If a piece of ftick be burnt at one end, and the lighted end be turned quickly round in a circle, the luminous point will appear to the eye as a complete luminous circle; the changes of the optic organs continuing, till the image of the luminous point returns to any given point of the retina. Again, the fenfible changes produced by found, perceptibly continue after the external caufe ceafes. If a founding body be ftruck very rapidly with a ftick, we do not perceive any interval; and, as Hartley well obferves, the moft fimple founds which we hear, being reflected from the neighbouring bodies, confift of a number of founds fucceeding each other at different diftances of time, according to the diftances of the reflecting bodies, though, owing to the effect of each on the auditory organs continuing fome little time after the actual impreffion on the external organ, the founds appear to be exactly fynchronous. The fenfible changes produced by the other fenfes, alfo continue fome time after the impreffions which have been made upon them. If a hard body be preffed upon the palm of the hand, it is not eafy to diftinguifh for a few feconds, whether it remains or is removed. And taftes continue to be perceived, long after the fapid fubftance is removed. This laft circumftance may, however, be accounted for on the fuppofition that the fapid part of the fubftance is not removed; which, without doubt, is often the fact.

This play of the organs (which, however, is perhaps rather to be referred to the external than to the mental organs,) give rife, in the cafe of vifion, to a number of very fingular and interefting phenomena, by fome philofophers called *ocular fpectra*. A confiderable variety of them are ftated by Dr. R. Darwin of Shrewfbury, at the end of the fecond part of Darwin's Zoonomia. We fhall felect a few of the moft ftriking.

Place about half an inch fquare of white paper on a black hat, and looking fteadily on the centre of it for a minute, remove your eyes to a fheet of white paper; after a fecond or two, a dark fquare will appear on the white paper, which will be feen for fome time. A fimilar dark fquare will be feen in the clofed eye, if light be admitted through the eyelids. So after looking at any luminous body, of a fmall apparent fize, as the fun, for inftance, for a fhort time, fo as not much to fatigue the eyes, this part of the retina becomes lefs fenfible to fmaller portions of light: hence when the eyes are turned upon any lefs luminous parts of the fky, a dark fpot is feen refembling the fhape of the luminous body. To the fame caufe Dr. R. Darwin afcribes thofe dark-coloured floating fpots, which are eafily perceptible when the eyes are a little weakened by fatigue, and during illneffes attended with great debility. He fays, that as thefe fpectra are moft eafily difcernible when our eyes are weakened by fatigue, it has frequently happened that people of delicate conftitutions have been much alarmed at them, fearing a beginning decay of their fight, and thence have fallen into the hands of ignorant oculifts. They are not, however, he obferves, the preludes to any difeafe; and it is only from our habitual inattention to them, that we do not perceive them on all objects every hour of our lives. As the nerves of very weak people, he continues, lofe their fenfibility by a fmall duration of exertion, it frequently happens that fick people, in the extreme debility of fevers, are perpetually employed in picking fomething off from the bed clothes, owing to their miftaking the caufe of thefe dark fpots. An Italian artift, a man of ftrong abilities, relates, that having paffed the whole night on a diftant mountain, with fome companions and a conjuror, and performed many ceremonies to raife the devil, on their return in the morning to Rome, looking up when the fun began to rife, they faw numerous devils run on the tops of the houfes as they paffed along. So much were the fpectra of their weakened eyes magnified by fear, and made fubfervient to the purpofes of fraud or fuperftition.

Again: make with ink on white paper a black fpot, about half an inch in diameter, with a tail about an inch in length, fo as to refemble a tadpole. Look fteadily at this fpot for about a minute; and on moving the eye a little, the figure of a tadpole will be feen on the white part of the paper, which figure will appear whiter or more luminous than any other part of the paper. This Dr. R. Darwin brings as one proof, that when the retina has been fubjected to a lefs excitement, it is more eafily brought into action by being fubjected to a greater. A furface appears black, in confequence of its abforbing all the rays of light; that part of the retina, therefore, which is unemployed while looking at the fpot, is afterwards more fenfible to the light than the other parts, and is capable of being brought into action by the red rays, which penetrate the eye-lids. A familiar fact will equally well illuftrate the principle. If, when the light is pretty ftrong, we look fteadily for a fhort time at a window, the wood or lead-work of which is dark coloured, on turning the fight immediately afterwards to a white wall, we have a diftinct figure of the window with the panes dark and the wood-work luminous. Upon the fame principle Dr. R. Darwin accounts for the following circumftance. A writer in the Berlin Memoires obferves, that when he held a book, fo that the fun fhone upon his half clofed eye-lids, the black letters which he had long infpected became red. There is a fimilar ftory told by Voltaire of a duke of Tufcany, who was playing at dice with a general of a foreign army; and believing that he faw red fpots on the dice, apprehended that fome dreadful events were about to take place, and retired in confufion. The obferver, after looking for a minute on the black fpots of

a die,

a die, in a bright day, and carelefsly clofing his eyes, would fee red fpots correfponding to the black fpots on the die; and if they were intenfe from the fatigue or weaknefs of the optic organ, thofe appearances would continue, and on looking on the die would be fuppofed to be upon it, juft as perfons in a very weak ftate (as has been already ftated) often fee black fpots, which they refer to the bed-clothes.

We have ftated, that the capacities of fenfation and retention probably depend upon the fame organic caufes, whatever they may be. Dr. Darwin, in his Zoonomia, reprefents ideas as the animal motions or configurations of the organs of fenfe. (Sect. iii. 4. 1.) The more advanced ftudent of mental philofophy, may derive much ufeful information from the perufal of that fingular work; but we know no writer on the fubject whofe views can be received with more doubt and hefitation than Darwin's. He generalizes with extreme rapidity; and often feems to be much more defirous to urge every thing that can be advanced with any plaufibility in fupport of his ftrange hypothefes, than to try them by the touchftone of fact and experience. His peculiarities of nomenclature are extremely perplexing, and in various cafes very injudicious; and the number of them is fo great, that they often interfere with the ftatement of the triteft obfervations. We meet with remarks, which prefent a novel and impofing appearance, and we very frequently find, when we have taken the pains to interpret them into common language, that their novelty and importance confifted merely in their Darwinian drefs. But what we moft object to, is, that his nomenclature is fo completely founded upon his theories, that when he is ftating acknowledged truths, his expreffions convey a meaning beyond them, and the whole import of them, according to his ufe of the terms employed, derives an apparent credibility from the correctnefs of them according to their ufual acceptation.

Dr. Darwin employs the term *idea*, fo as to include the mental changes produced by impreffions on the external organs of fenfe, and alfo thofe which can be reproduced without the intervention of external impreffions; in other words, as including fenfations and ideas. And of both he maintains, that they are contractions, motions, or configurations of the fibres, which conftitute the immediate organ of fenfe. (Sect. ii. 2. 7.) It requires little acquaintance with the principles of mental philofophy, to furnifh a fatisfactory anfwer to all the arguments he adduces for his unaccountable theory; and as it is extremely improbable, that any one will be inclined to adopt it without more proof than its author has been able to collect, we do not think it neceffary to enter into any minute confideration of it. It is not only clogged with difficulties, which at once outweigh every prefumption in its favour, but it has no advantage of any kind to recommend it. It accounts for no phenomena, which do not admit of an eafy and, in general, preferable folution without it. We are not, however, prepared to maintain, that, in cafe of vivid conceptions, thofe mental changes, which take place without external impreffions, are never attended with changes in the external organs, correfponding to thofe by which the original fenfible changes were produced; in other words, that conceptions, *i. e.* vivid ideas of fenfation, are never attended with changes in the external organs correfponding to thofe, by which the original fenfations were produced. When we have ftrong vifual conceptions, it *appears* as though we faw with our bodily eyes, juft as if fenfations were produced by external objects. If we were not aware of the efficacy of affociation, in the acquired power of referring fenfations to the part of the body from which they were derived, we fhould confider it as a fact decidedly proved by the feelings of which we are confcious, that when with the mind's eye we fee an abfent friend, there is a correfponding picture formed upon the retina, by the re-action of the changes in the mental organs. The effort to form fuch conceptions is, we think, diftinctly felt in the eyes; and the writer of thefe remarks obferves in his own cafe, that the effort is principally perceived in that eye, which he knows from experience to have the greateft vifual power. We refer to this circumftance, however, merely as a curious fact. It does not appear, admitting that the perception of which we are fpeaking is not the refult of affociation, that it enables us to account better for even the greater diftinctnefs of our vifual conceptions; for if the external organ be thus affected, it muft be in confequence of the very conceptions for which it might be fuppofed to account. If any vifual ideal changes, *i. e.* vifual conceptions, are attended with correfponding affections of the retina, the effect on the fentient principle is to be attributed to the former, not to the latter; all that could reafonably be admitted, is, that in confequence of the affection of the external organ, the conception might be rendered more vivid, fo as to approach nearer to the ftate of the original fenfation. But we need not refort to this opinion, to account for the diftinctnefs and vividnefs of our vifual conceptions. It is a general and well known principle, that when the retentive power is vigorous, *diftinct and vivid fenfations produce, by fufficient repetition, diftinct and vivid ideas.*

Still, when we recollect the general influence of ftates of mind upon the nervous fyftem, and the known fact that certain fenforial changes do affect particular nerves, fo as to produce mufcular motion, and farther take into account the feeling to which we have already referred, of which we prefume others alfo are confcious, we are inclined to think it probable, that conceptions, or vivid ideas of fenfation, may be attended with affections of the external organs of fenfation, fimilar to thofe which furnifhed the materials for thofe conceptions. Hartley's opinion, prop. 59, that an impreffion made upon one eye alone by a fingle object, may propagate itfelf to the other, and there raife up an image almoft equal in vividnefs to itfelf, and that, confequently, when we fee with one eye only, we may have pictures in both eyes, confiderably correfponds to this hypothefis. But whatever be the fact, we do not perceive that it affords any adequate ground for the fuppofition, that ideas cannot exift without affections of the external organs, from which the original fenfations were derived; nor the fhadow of a reafon for the Darwinian hypothefis, that fuch affections are the ideas themfelves. Their effects on the mind muft be produced in the common feat of fenfible, ideal, and motory changes.

Though we do not think it in any way neceffary to enter into any particular examination of this fundamental metaphyfical pofition of the Zoonomia, we wifh to notice one ftatement which Darwin has adduced in fupport of it; fince, if correct, it would furnifh a very fingular phenomenon, connected with the exercife of the retentive power. He fays, (fect. iii. 4. 4.) that "where the organ of fenfe is totally deftroyed, the ideas which were received by that fenfe feem to perifh along with it, as well as the power of perception." If this be fo, (and it muft, if his hypothefis be true,) we muft indeed be merely creatures of fenfe, and can never expect to attain refinement of intellectual ideas, or of affections. But what are his proofs? A gentleman, who had been totally deaf for nearly 30 years, had forgotten the pronunciation of words, and, "what is much to the point," he always, in his dreams, imagined that people

converfed

converfed with him by figns or writing, and never that he heard any one fpeak to him. "From hence it appears," adds the amufing theorift, "that with the perceptions of founds he has alfo loft the ideas of them; though the organs of fpeech ftill retain fomewhat of their ufual habits of articulation." We prefume that our readers will not think Darwin's hypothefis required to account for this deaf man's dreams; but to make them give fupport to the hypothefis, it fhould have been added, that this was always the cafe from the firft moment of his total lofs of hearing; and to afford any proof of it, it fhould farther have been fhewn, that from that period he never had any recollections (we do not mean diftinct conceptions, but fimple recollections, diftinct or indiftinct) of founds articulate or inarticulate. Refpecting the ideas of fight, Darwin adduces the following ftatement. "I have had the opportunity of converfing with two men, who had been fome years blind: one of them had a complete gutta ferena, and the other had loft the whole fubftance of his eyes. They both told me that they did not remember to have ever dreamt of vifible objects, fince the total lofs of their fight." Upon fuch facts as thefe the author builds his hypothefis. Did he afcertain that thefe men, with the total lofs of fight, loft at once all their vifual conceptions? Did the well-known voices of their domeftic relatives ceafe to recall their vifible appearance? Did they at once forget the features which they had long viewed with delight? Thefe might gradually fade from their memories; and by degrees they might be unable to picture to their minds objects with which their affections were moft clofely affociated. But we fee no room whatever to fuppofe that this was the immediate effect; and unlefs it were, the theory which their *dreams* are adduced to fupport muft be pronounced "bafelefs as the fabric of a vifion."

If we appealed to the common experience of thofe who have loft their fight from ordinary caufes, we fhould doubtlefs be told by the difciples of Darwin, (if fuch there be,) that their cafes were not in point, as their immediate organs of vifion might not be entirely deftroyed; and though we fhould not hefitate to predict the reply of thofe whofe cafes are clearly in point, we have no facts to ftate, and leave the matter, therefore, to the reader's obfervation, with one farther remark. It is indifputable that our ideas of folidity, and of real figure and diftance, are principally derived from the fenfe of touch: is there any reafon whatever to imagine, that when a man has both his arms fhot off, he at once lofes all thofe notions of folidity, figure, &c. with which the organs of touch have fupplied him, and which affociation alone enables the fight to communicate? Does he ceafe to perceive at once, that thofe objects, which his unaided fight would reprefent merely as a beautiful picture on a furface, are in reality folid bodies at various diftances from the eye, becaufe he has loft the organs by which he derived the ideas, now fo firmly connected with the vifual impreffion, as apparently to make a part of the fenfation of fight?

Though fomewhat out of place here, we muft add, that the ideas we have advanced refpecting the poffibility of fenforial change, (fenfible, ideal, and motory,) proceeding without exciting the notice of the mind, derive confirmation from the ftatements of Darwin on the catenation of motions (fect. xvii. 2.); and we particularly wifh to refer our readers to his ingenious (and, in general, juft) remarks on the progrefs of fuch catenations, in the cafe of a perfon learning mufic. The principles on which they are founded may be feen in Hartley's 21ft propofition; but Darwin has given a more detailed view of the progrefs of the tranfition from voluntary to automatic actions, and at the fame time has introduced feveral remarks, which illuftrate fome peculiar procedures of the mind, claffing under the operations of memory.

IV. *Of the Affociative Power.*—This principle, if not the fole caufe of all our mental phenomena, except the original production of fenforial changes and tendencies to them, has fome effect in the origin and modification of all of them. It is owing to this important principle that fenfations become the figns of thoughts and feelings, by which means man becomes a focial being; that the whole mental furniture of perceptions, notions, affections, paffions, fentiments, emotions, &c. is formed from the fimple relics of fenfation; that man, from mere fenfation, rifes to intellect; that he becomes capable of reflection, and of action. In fhort, whatever mental operation we attend to, except at the very earlieft period of mental culture, we find affociation the caufe of its production, or intimately concerned in it.

The fact of the connection which exifts between many of our fenforial changes had long been known; but it had generally been referred to the memory. Mr. Locke appears to have been the firft who employed the principle of affociation to account for aberrations of judgment and feeling, and for cuftomary connections of ideas; but he does not feem to have been at all aware that all our ideas, except thofe of confcioufnefs, and thofe which are produced by mere repetitions of uncompounded fenfible changes, *i. e.* ideas of fenfation, or fimple ideas, are, in reality, formed by the influence of the fame principle, either alone, or under the guidance of the underftanding; that all our affections, and our mental pleafures and pains, are nothing more than the relics of fenfation, varioufly combined by affociation. It feems that Mr. Gay, a clergyman in the weft of England, was the firft who endeavoured to fhew the poffibility of deducing all our paffions and affections from affociation: but his remarks on this fubject, as Dr. Prieftley obferves, amount to little more than conjecture. Thefe, however, led Dr. Hartley to direct his thoughts to it, and by a union of great talents, and of folid acquirements in moral fcience, in natural philofophy, aud in a profeffional knowledge of the human frame, with a mind unobfcured by felfifh tendencies, he was enabled to bring into one extenfive fyftem the progrefs of the mind from its firft rudiments of fenfation, through the maze of complex ideas and affections, to fhew how man rifes from fenfation to intellect. As Dr. Hartley expected, his work remained for a confiderable time almoft unnoticed. Tucker (A. Search) was obvioufly acquainted with it, and owed much to it; though he feldom fpeaks of Hartley but to laugh at him, in reference to his hypothefis of vibrations: and about the time when he began his Light of Nature, the firft volume of the Obfervations, as we have already ftated, was tranflated into French; but it does not feem to have attracted the notice of the French metaphyficians, either at the time or fince. Dr. Prieftley had the merit of bringing Hartley's fyftem forward to the public attention; and the celebrity which he had acquired among different claffes of the philofophic world was favourable to his object. About thirty years after the publication of the original work, he publifhed an abridgment of it; in which he left out the deductions from the principal theory refpecting the rule of life, the truth of Chriftianity, &c. (in fome refpects, we think, very unfortunately), and as much as he could of the hypothefis of vibrations. Since that time the fyftem of Hartley has been rapidly gaining ground in South Britain; and it is now, probably, pretty generally adopted by thofe who think clofely on the fubject. In North Britain, owing partly to theological and metaphyfical prepoffeffions, and not lefs, perhaps, to Dr. Prieftley's rough and unjuftifiably fevere attack upon three of the Scotch philofophers,

fophers, whofe mental and moral character ranked high among their countrymen, the principles of Hartley have made but little progrefs. The philofophical fyftems of Scotland have been fomewhat modified by it; but thofe who rank the higheft feem little inclined to admit it in its full extent. However, the writings of Dugald Stewart fhew that he has done fomething towards clearing the way, and the lectures of the profeflor of moral philofophy at Glafgow muft do more; and we fee reafon to hope, that when the prefent generation has paffed away, the true principles of mental fcience will gain a firm hold there, as well as in South Britain. We earneftly wifh for the extenfive adoption of the Hartleyan fyftem; becaufe, while it fatisfactorily explains a vaft variety of the moft important mental phenomena, it furnifhes the beft guide in the moral and mental culture of the mind. The value of the Obfervations on Man will in fome meafure be perceived from thofe portions, or abftracts of it, which we have introduced into this article; and we fhall think ourfelves happy, if we fhall have fucceeded in making the way fmoother for a judicious acquaintance with that profound and invaluable work, for fuch of our readers as have not previoufly paid much attention to the fubject. We hope that the philofopher juft referred to will excufe this public notice of him. The writer of this article had the great benefit of attending his clafs about fourteen years ago; and he feels grateful to him for the advantages he enjoyed there, both for the acquifition of valuable mental and moral knowledge, and for the aid and encouragement afforded by that liberal and enlightened profeffor, in the free exercife of the underftanding on fome of the moft important objects of its attention. Unfettered by any fyftem, though, probably, not altogether free from the influence of early biaffes towards the Scottifh philofophy, he fhewed his ftudents by example, as well as by precept, and the exercife of their intellectual powers, in what way they ought to purfue philofophical truth; and if ever they faw reafon to differ from him, they never failed to admire his candour, and to refpect his found and difcriminating judgment.

We have already ftated, that the affociative power has two grand modes of operation, *connection* and *compofition.* It is not eafy to keep thefe diftinct; but in many cafes it is practicable, and often tends to precifion in our reflections and reafonings. In what we fhall advance refpecting the operations of this power, we fhall keep this diftinction fomewhat in view. We fhall ftate, firft, the claffes of connections which exift among our fenforial changes; and, fecondly, fome of the principal laws of connections; we fhall then proceed to detail fome of the leading facts relative to compofitions, and the formations of our compound notions and feelings. It might be the moft regular method to begin with compofitions; becaufe connections are formed not only among fimple fenforial changes, but among thofe alfo which are compounded; in other words, not only among fenfations, fimple ideas and fingle mufcular actions, but alfo among thofe which have been blended together into complex ftates: and we fhall fometimes have occafion, in what we ftate relative to connections, to fuppofe fuch compofitions actually formed. On the other hand, connections are much more obvious, and more eafily comprehended, than compofitions; and a ftatement of fome facts refpecting the former will lead to an eafier acquaintance with the latter.

"That one thought is fuggefted to the mind by another," fays the elegant and philofophic Stewart, "and that the fight of an external object often recalls former occurrences, and revives former feelings, are facts which are perfectly familiar, even to thofe who are leaft difpofed to fpeculate concerning the principles of their nature. In paffing along a road which we have formerly travelled in the company of a friend, the particulars of the converfation in which we were then engaged, are frequently fuggefted to us by the objects we meet with. In fuch a fcene, we recollect that fuch a particular fubject was ftarted; and in paffing the different houfes, and plantations, and rivers, the arguments we were difcuffing when we laft faw them, recur fpontaneoufly to the memory. The connection which is formed in the mind between the words of a language, and the ideas they denote; the connection which is formed between different words of a difcourfe which we have committed to memory; and the connection between the different notes of a piece of mufic in the mind of a mufician; are all obvious inftances of the fame general law of our nature. The influence of fenfible objects in reviving former thoughts and former feelings, is more particularly remarkable. After time has, in fome degree, reconciled us to the lofs of a friend; how wonderfully are we affected the firft time we enter the houfe where he lived. Every thing we fee, the apartment where he ftudied, the chair upon which he fat, recall to us the happinefs we enjoyed together; and we fhould feel it a fort of violation of that refpect which we owe to his memory, to engage in any light or indifferent difcourfe when fuch objects are before us." So, again, every one muft have noticed the connections which exift between our thoughts or fenfations and mufcular actions. A performer looks at the notes of his book, and the appropriate motions of his hands and fingers follow with immediate fucceffion. While we are writing, the thoughts we wifh to communicate fuggeft the appropriate words, and thefe, with an almoft inftantaneous fucceffion of motions, are written on the paper before us. We are perhaps more ftruck with this in writing fhort hand than long; the characters appear as the reprefentatives of our thoughts, almoft without knowing how they are made.

All thefe facts are obvioufly nothing elfe than cafes of thofe connections which are formed, by the operation of the affociative power, among our fenforial changes; in other words among our fenfible, ideal, and motory changes; in other words, again, but lefs generally, among our fenfations, ideas, and motory changes. We fhould, in fome refpects, prefer, in what follows, employing the terms *fenfible changes* and *ideal changes*, rather than the terms *fenfations* and *ideas;* becaufe thefe imply confcioufnefs, which we have before ftated is not neceffarily excited by the operations of the fenfitive and affociative powers: we fhall, however, content ourfelves with requefting the reader to bear in mind, that whatever may be faid refpecting connections among fenfations and ideas, might be ftated more generally refpecting connections among fenfible and ideal changes. Whatever the fenforium be, or whatever be thofe changes of it which excite the confcioufnefs, it is, we conceive, among thofe changes that connections and compofitions take place.

1. *Claffes of Connections.—Firft:* a *fenfation* may be affociated with other *fenfations*, with *ideas*, and with *motory changes*.

A *fenfation*, after having been affociated a fufficient number of times with another *fenfation*, will, when impreffed alone, excite the fimple idea correfponding with that other fenfation. Thus the names, fmells, taftes, &c. of external objects, fuggeft the idea of their vifible appearance; and the fight of them fuggefts their names, &c. In the fame manner, a word half pronounced excites the idea of the whole

whole word; the mention of the letters *a*, *b*, fuggefts the idea of *c*, *d*, &c.; the fight of part of an object fuggefts the idea of the whole; and the fight of one object, recalls the vifual idea of other objects which have been uniformly or very frequently feen with it. Innumerable other inftances might be given with little trouble; but we fhall mention only one other, which may affift fome of our readers in accounting for certain cafes of apparitions. L. was one day haftily paffing by a room in which a very excellent friend had ufually fat, in a particular chair, and in a particular part of the room. His thoughts at the time were employed on fome object which did not excite deep attention; and the fight of the chair raifed in his mind a vivid vifual idea of his friend as fitting in that chair. The friend had been dead fome weeks, and L. involuntarily came back for another vifion, but without effect. Such vifual ideas and fimilar ideas derived from the other fenfes, particularly the hearing, are by Dugald Stewart called conceptions; and where they are vivid and eafily excited, they frequently lead thofe who are inattentive to their fenfations, to fuppofe that they actually faw and heard, at a particular time, what they did not fee or hear.

Senfations become connected with *ideas*, fo that the repetition of the fenfation will excite the connected idea. Of this cafe of connections, the following will ferve as examples. Words affociated with ideas will readily excite them, even when very complex; the words *hero*, *philofopher*, *juftice*, *benevolence*, *truth*, and the like, whether written or pronounced, immediately call up with precifion the correfponding idea. The hearing of a particular national tune, is faid to overpower the Swifs foldier in a foreign land with melancholy and defpair; and it is therefore forbidden in the armies in which they ferve. The found recalls various heartfelt recollections; the idea of the tranquillity and freedom of their country, of the home from which they are torn, and to which they may never return. What trains of interefting thought and feeling are ufually called up in the mind by the fight of the fcenes of early pleafure, where paffed thofe years when novelty gave charms to every fenfation, every employment of the faculty, when hope prefented no profpects but what were decked in "fancy's fairy froftwork," and prefent joys precluded all regret for the paft.

Senfations may be connected with *mufcular action*, that is, with thofe fenforial changes which are followed by mufcular action; fo that the fenfation will excite the mufcular action, without the intervention of that ftate of mind which is called will. A perfon automically, that is, without any volition, turns his head towards another who calls him by his name. When the hand of another is rapidly moved towards the eye, we fhut the eye without thinking about it, or even being confcious of it. When copying from any book, if a perfon is very familiar with the employment, the appropriate motion of the fingers immediately follows the impreffion produced by the appearance of the word. In the fame manner the vifible impreffion derived from mufical notes regulates the motions of the performer. "While I am walking through that grove before my window," fays Darwin, "I do not run againft the trees or the branches, though my thoughts are completely engaged on fome other objects:" the fenfible impreffions produced by the objects around, excite in the fenforium the appropriate connected motory changes, and thefe the action of certain mufcles.

Secondly: ideas may be connected with *fenfations*, with *ideas*, and with *motory changes*.

An *idea* affociated a fufficient number of times with a *fenfation*, will excite the fimple idea belonging to that fenfation. Thus the ideas, whether fimple or complex, which have been fufficiently affociated with names, excite the ideas of their refpective names. Hence it is that we find ourfelves continually thinking in words; that is, the trains of ideas which pafs in our minds, are accompanied with their correfponding expreffions, when thofe expreffions are familiar to us: and it may be remarked, that the habit of thinking in words, is one which contributes greatly to accuracy and facility of thought, and therefore one which the young reafoner will do well to cultivate. Thofe who are habituated to reafoning, find their trains of reafoning fo generally clothed in words, and words fo neceffary to their intellectual operations, that the words are what they moft attend to; and fome have even gone fo far as to fuppofe, that *general* reafoning is concerned merely about words, and not about ideas. They feem to lie under a fimilar error, with thofe who imagine that the vifible appearance of objects is all we attend to, when we fpeak of magnitude, fhape, &c.; whereas the fact is, that the vifible appearance is nothing more than a fymbol, which ferves to introduce the connected complex idea into the mind, and to keep its parts connected: and this is the grand end of words in general reafoning. We are confcious while we are thinking, of employing the relics of audible fenfations; we feem to have faint fenfations of found paffing in the fenforium; but it appears probable that thofe who have long loft the ufe of their hearing, and have generally employed fight as the inlet of knowledge, have a train of vifual, inftead of audible conceptions. All, however, which we particularly wifh to have noticed here, is, that thefe things afford inftances of the connections of ideas with fenfations, fo that the idea introduces the fimple idea belonging to that fenfation.

Next, an *idea* affociated with an *idea*, whether notion or feeling, will excite that idea. Thus the idea of benevolence will excite that of merit; of courage, that of honour; of great talents, that of refpect; of cruelty, that of horror; of meannefs, that of contempt.

Again, an *idea* affociated with a *motory change*, will excite that motory change, and its confequent mufcular action. Thus, the defire to perform a particular action will produce the correfponding voluntary motion of the limbs; joy produces a pleafing caft of countenance; fear excites trembling; and horror, diftortion. In the fame manner when we are employed in committing our thoughts to writing, the idea of the words which we intend to commit to paper, if the character be not peculiar, or novel, will immediately fuggeft and be followed by the appropriate motions of the fingers, and this without the intervention of volition, fometimes without even the confcioufnefs of the motory changes, or of the mufcular actions produced by them. So alfo in fpeaking, unlefs fome difficult pronunciation occur, the mufcular actions requifite for the formation of the founds follow immediately the conception of the words, without the intervention of the will.

Thirdly: motory changes, and their correfponding mufcular actions, may be connected with *fenfations*, with *ideas*, and with other *motory changes*, and their correfpondent mufcular actions.

Mufcular actions may be affociated with *fenfations;* that is, when mufcular actions have been fufficiently long affociated with fenfations, the repetitions of the mufcular action alone will excite the fimple idea belonging to that fenfation. Thus, the action of dancing will bring to mind the conception of the mufic with which it has been often accompanied. Again, children often accuftom themfelves to particular motions of the limbs, while committing to memory, or while repeating

repeating what they have learnt; and thofe mufcular actions in many inftances become neceffary to their correct, and ready recollection, and even to their recollection at all. Addifon, fays Mifs Edgeworth, reprefents with much humour the cafe of a poor man, who had the habit of twirling a bit of thread round his finger; the thread was accidentally broken, and the orator ftood mute.

So again, *mufcular actions* may be affociated with *ideas;* that is, when mufcular actions have been fufficiently long affociated with ideas, thofe mufcular actions will excite thofe ideas, whether notions or feelings; thus dancing will introduce cheerfulnefs into the mind. So particular mufcular actions have, from habitual connection, a tendency to excite certain trains of thought or ftates of mind: thofe who have been accuftomed to one pofture while ftudying, find it difficult to ftudy fo well in other poftures; and perfons who, while engaged in deep meditation, have been accuftomed to any little motions of body, find the continuance of thofe motions requifite for the continuance of their abftraction of mind. It is upon this principle, that certain poftures of body have a tendency to produce thofe feelings which all fhould have when addreffing the Supreme Being. The cafes, however, in which mufcular action introduces ideas, either fimple or compound, are much lefs numerous than thofe in which fenfations and ideas introduce mufcular actions. In fact it is not the ufual order of affociation; and befides, it is fometimes very difficult to fay what effect is produced by the mufcular action itfelf, and what by the fenfations which generally accompany mufcular action. In the next cafe the point is clearer.

Mufcular actions become connected with other *mufcular actions,* that is, the motory changes which produce the one, with thofe which produce the other; fo that the former may introduce the latter without the intervention of the will. If different mufcular actions are produced together, they are called *fynchronous;* if one immediately follows the other they are called *fucceffive;* and the affociation is, in like manner, termed fynchronous or fucceffive. The motions of the hands when a perfon is playing upon the pianoforte, the motions of the hands in weaving and in fpinning, and various other mufcular actions which will readily fuggeft themfelves to the reader, may be ftated as inftances of *fynchronous* affociations of mufcular actions. The motions of the organs of fpeech, in reading or fpeaking, of the feet in walking, and of the fingers in writing, are inftances of fucceffive affociations of mufcular actions.

Thefe nine cafes of the affociation of fenforial changes are comprehended by Hartley in the following general theorem: "If any fenfation A, idea B, or mufcular motion C, be affociated for a fufficient number of times with another fenfation D, idea E, or mufcular action F, it will at laft excite, *d*, the fimple idea belonging to the fenfation D, the very idea E, or the very mufcular action F." The fenfation itfelf cannot of courfe be re-excited, becaufe that depends upon the prefence of the object of the fenfe; but fometimes, as in the inftance already ftated, the fimple idea belonging to a fenfation is fo vivid, that it equals, if not furpaffes, the original fenfation; that is, any fenfible change, and its fimple ideal change, are the fame in kind, differing only in vividnefs, and fometimes equal in that refpect. It may alfo be well to obferve here, that when Hartley and his difciples fpeak of mufcular actions clinging together, they obvioufly mean, that the motory changes of the fenforium become connected together, and not, as fome writers feem to have fuppofed, and indeed as their words imply, that the motions of mufcles are connected without any intervention of the mind, taking the term in the popular fenfe. It is true the Hartleyan fuppofes that volition has nothing to do in the affociation when complete, though originally perhaps concerned in the formation of it; and alfo that the affociation may go on without even exciting the concioufnefs; but we know of none who fuppofe that the mental organs, (the mind in the popular fenfe,) are lefs concerned in the connections among mufcular actions, than in thofe among fenfations and ideas. All the fenforial changes may and do become connected together; and, as we apprehend, the one may produce the other, and fo on, without the concioufnefs being excited; but no external impreffion, which does not act by ftimulating or impelling the moving mufcle, can produce mufcular action without the action of the mental organs; and in like manner, no mufcular action can produce another mufcular action, (except what may be termed mere phyfical motion, fuch as might be produced by any foreign body mechanically acting upon the mufcular fyftem,) without the action of the mental organs. The whole of the connection is mental, and we think if this idea be kept in view, and employed in the explanation of the Hartleyan phrafeology refpecting connections among mufcular actions, that it will remove fome of the difficulties which are felt refpecting this part of the Hartleyan fyftem, and fhew that the objections which have been urged againft it, arofe from an incomplete idea of it.

2. *Laws of Connections.*—We now proceed to our fecond object, *viz.* to point out and illuftrate fome of the leading laws of that clafs of affociations which we term connections; premifing that many of the obfervations which follow are, as the reader will readily perceive, equally applicable to that clafs which we term compofitions. Thefe laws regard, 1. The ftrength of connections; 2. The difunion of connections; 3. The formation of connections by means of immediate links, which we may call the law of transference; and 4. Habitual biafes to particular kinds of connections.

(1) *The Strength of Connections.*—The ftrength and durability of connections, depend partly upon the degree of attention with which the connected fenforial changes have been attended, and partly upon the frequency with which they have recurred in connection: lefs generally, partly upon the vividnefs of the connected ideas, and partly upon the frequency with which the connected ideas, or mufcular actions, have recurred in connection. We may adduce, as an illuftration of the former caufe of ftrength and durability, that circumftances of a light and trivial nature, which have occurred while our minds were occupied with fubjects of great intereft, form no connection with the concurring train of ideas, even if the attention were, for a time, drawn off by the former. For inftance, fuppofe we were attending to an interefting difcourfe, if our attention were for a moment called off by the coughing of a perfon near us, the train of thought fuggefted by the fermon would form no connection with the caufe of the interruption, and it would pafs in the mind without the idea of the interruption being produced. But fuppofing a poor man to have fallen down in a fit of apoplexy, the circumftance would ftrongly intereft our fympathy and excite our attention; many feelings would be brought into active exercife; and the ideas which were at that time in the view of the mind, would probably ever after prefent with them thofe of the fcene which fo ftrongly affected us. Hence the importance, that thofe who have the care of education, fhould feize the happy moments when circumftances have peculiarly interefted the mind, to connect with them thofe related acts of prudence, benevolence, and piety, which, fo introduced, may have a lafting effect in regulating the difpofition; but which brought in a form lefs interefting, would have no permanent bond of union, and

and would soon be obliterated. Hence, too, the importance of inftilling into the mind thofe principles which are defigned to have a conftant operation among the thoughts and feelings and actions of life, in fuch a form that they fhall become connected with thofe thoughts and feelings which have already a firm hold in the mind; and thus be brought into view, and excited into action much more frequently and uniformly.

The effect of frequent recurrence, in producing ftrength and durability of affociation, may be beft explained by the affociations which take place between words and their correfponding ideas. Thefe connections are not, in general, attended with any particular caufe of affociation, except frequency of recurrence, and therefore they are the moft unexceptionable inftances. Now, other things being equal, we find that thofe words which are moft frequently called up in the mind, in connection with the ideas to which they belong, have a clofer connection with thofe ideas; that is, the idea fuggefts the word and the word fuggefts the idea, with greater certainty, and the affociation is more permanent. The following remarks of Dr. Percival will illuftrate this general principle. "Slight paralytic affections of the organs of fpeech, fometimes occur without any correfponding diforder of the other parts of the body. Hence the effort to fpeak fucceeds the volition of the mind flowly and imperfectly, and words are uttered with faltering and hefitation. Thefe are facts of common notoriety: but I have never feen it remarked, that in thefe local palfies, the pronunciation of proper names is attended with peculiar difficulty; and that the recollection of them becomes very obfcure, or is entirely obliterated; while the recollection of perfons, places, and things, remains unchanged. This confirms the theory of affociations, and at the fame time admits of an eafy folution by it. For as words are arbitrary marks, and owe their connection with what they import to eftablifhed ufage, the ftrength of this connection will be exactly proportioned to the frequency of their recurrence, and this recurrence muft be more frequent with general than with fpecific terms."

Befides thefe two univerfally operating caufes of the ftrength and durability of affociations, it is proper to obferve, that they depend alfo upon the predifpofition of the mind, the habitual bias of thought and feeling, and the prevailing caft of the affociations already formed. This may in part be refolved into the firft caufe,—the degree of vividnefs of the connected ideas; but in part it muft be confidered as feparate. Where there are affociations of a contrary tendency, the production of the new affociation implies the deftruction of the old one, and this is one reafon why perfons who have paffed the prime of life, feel it fo exceedingly difficult to acquire new affociations diffimilar from thofe already formed. Hence it is that all thofe improper biafes of thought and feeling which oppofe the beft regulation of thought and feeling, fhould be carefully fhunned; all thofe affociations carefully prevented, which lead the mind away from God and duty, or which fimply check the reception of thofe which accord with the dictates of religion. They do more than directly injure by their own exiftence; they injure alfo, and this in no fmall degree, by preventing the formation of thofe affociations which directly prompt to the courfe which duty points out.

An acquaintance with thefe principles leads us to the direct method of confirming affociations which are effential to our well being; fuppofe, for inftance, the connection of a regard to the will of God, with the conduct: we fhould endeavour to connect as much as poffible thofe pleafurable feelings which have a tendency to ftrengthen the links of union; we fhould cultivate the connection by frequently, and, indeed, continually bringing it into action; and we fhould carefully cultivate thofe related ftates of mind which have a tendency to fofter and ftrengthen the connection. To avoid weakening it, we fhould be careful not to introduce any contrary trains of ideas; for inftance, we fhould never connect feelings of ridicule with any thing connected with religion, and fhould carefully avoid thofe breaks in the affociation which will follow neglect in its cultivation. And it is a moft fatisfactory idea, that if vicious affociations may be formed fo ftrong as to lie beyond the power of the individual to annihilate them, virtuous affociations may alfo be formed fo vigorous and permanent as to bid defiance to time and to temptation. Thefe fhall furvive the wreck of nature, and fhall adorn the mental fabric, when this world, and all its forrows and enjoyments, fhall be no more.

(2) *The Difunion of Connections.*—As connections are neceffarily formed, and frequently without any volition on the part of the individual, by the before mentioned circumftances, it is another very important law of the affociative power, that thefe connections are not indeftructible. We obferve, then, that an affociation may be deftroyed, either by the formation of other contrary affociations, or by the repetition of it being in fome way or other prevented. We have already given one inftance of this principle, in MOR. *Ed.* col. 49, to which we refer our readers: and as in that cafe, fo in numerous others where an affociation unfortunately exifts in the mind unfavourable to the formation or exercife of good difpofitions, it may be weakened, (gradually, indeed, but certainly weakened,) and at laft deftroyed by the fteady culture of oppofite affociations. That conduct to which pious benevolence prompts, may acquire fo attractive an appearance, that ideas of difficulty, of pain, of ridicule, which may have been attached to it, and which may have impeded its exercife, will gradually give way to thofe which the divine approbation affords, of prefent peace and future happinefs. But there is not always time for this flow procedure. It may be neceffary for individual happinefs, that the baneful affociation fhould be deftroyed without one repetition of it to confirm its power. To the general culture of oppofite affociations, muft then be added, a fteady careful prevention of the introduction of the connected ideas. Situations muft be avoided, words difufed, company fhunned, which have a known tendency to introduce a train of thoughts leading to the firft link of the chain which we wifh for ever feparated.

When we hold it out as a grand law of affociation, that connections may be difunited by forming oppofing affociations, and by preventing their repetition, we would by no means reprefent it as in general an eafy, or as in all cafes a practicable tafk. When affociations have been long formed, and often repeated, particularly where they accord with the general bias of the mind, they often bid defiance to the moft ftrenuous exertions of the individual. If he could for a long time prevent their repetition, and fuccefsfully cultivate oppofing ones, the moft inveterate affociations would by degrees loofen their power; but when affociations have been ftrengthened for a long period of time, by being frequently brought into play, and connected with other active affociations, and at the fame time accord with the prevailing difpofition of the mind, the prevention of their repetition, and the culture of oppofing affociations, are fcarcely practicable. Thefe things may be viewed in various lights; fome gratifying to the mind; fome which muft urge every thoughtful perfon to fhun the formation and culture of thofe affociations which he muft fome time or other wifh to break. While they teach us to be affiduoufly careful to prevent all fuch, they alfo fhew us that thofe which we muft wifh to cherifh

may,

may, as well as others of a contrary character, become invincible; and while they direct those who have the care of the young, carefully to cultivate those tendencies to feeling and action, which may serve as a check upon improper associations,—while they direct them carefully to prevent those which may acquire a despotic rule in the mind to the destruction of peace and virtue,—they also diminish the anxiety which we are sometimes prone to feel, when we find ourselves unable to mould them exactly to that standard of thought and feeling which we wish.

Numerous are the associations, particularly of a speculative nature, which yield to the influence of time and change of circumstances. In many instances, the destruction of the association depends upon the efforts of the individual, but in the greater number it is occasioned without his direct efforts, by the increase of his knowledge, by circumstances preventing the recurrence of the association, or by the formation of contrary associations upon more solid grounds. But that they *may* be broken, should never be allowed as a reason for the formation of improper associations; for the difficulty is frequently great, in many instances insuperable, except by such discipline, such peculiar concurrences of circumstances, as fall not to the lot of every individual. The association between certain motives and that state of mind which we call volitions formed in early life, and strengthened by frequent repetition, is frequently found so indissoluble, that it leads the unhappy individual to act against his better judgment, and the destruction of his corporeal, and even of his mental energies, produced by his conduct, prevents those exertions for his release which he wishes to make, but has not the power to attempt. In every mind, more or less, circumstances generate desires and passions, these generate volition, and volition produces action. How few are there, who have attained the power of voluntarily separating passion and volition, or rendering them less connected, or of repressing those passions which were previously invariably connected with the circumstances which gave them origin. In all men the train of thought is partly involuntary: how few are there, who are capable of directing their associations into one channel by the exertion of volition, and employing them in one definite way; of destroying improper associations, and of forming new ones, actuated by a view to the claims of duty, and to their improvement in wisdom and virtue. How frequently do we see others, and self-knowledge will shew us repeated instances which come home to our own bosoms, in situations where they act against their better judgment;—a situation which is so forcibly described by the Apostle, "For that which I do I allow not; for what I would, that I do not; but what I hate, that I do." This we can easily account for upon the principles of association. He who is in such a situation, may be convinced that certain actions are wrong; that they will infallibly injure his future happiness; that they must embitter his present enjoyment: but his conviction comes too late. The object which promises the gratification of some or other of his powerful principles of action, presents itself to his mind; it strongly prompts his desires and passions; the association between these and volition is perhaps of very long standing, confirmed by repeated exercise, not counteracted, or but weakly, by any contrary associations, or by any exertion of the individual; it cannot be overcome but with extreme difficulty; the mind sinks under the trial; and the commission of the action tends to strengthen the association, to render the mind still more the slave of vice and misery. The picture unhappily is not too highly drawn; and though the habit may not be so deeply fraught with misery, few are those who can say that they have not one confirmed habit, which they would wish to change, or at least to weaken. And to those who have made the attempt to destroy any habitual connection between external impressions and desire, or between desire and volition, the difficulties cannot have appeared trifling.

(3) *The Law of Transference.*—We now proceed to state and to explain that important law of association, agreeably to which associations are formed by means of intermediate links. We must here request our readers to bear in mind, that we use the word idea in the wide sense in which it is employed by Hartley, to denote every internal feeling except sensation, whether simple or compound, whether or not accompanied with pleasure or pain. The law to which we have referred may be thus stated. One idea may become connected with a second, by means of their mutual connection with a third; and, where it is not necessary to attend to this third or intermediate idea, the more the connection between the first and second is confirmed, the less will the third be perceptible; so that when the association becomes completely fixed, the intermediate idea is often lost entirely from the view of the mind. The absence of the intermediate idea is often so complete, that its ever having been present can only be discovered by tracing the progress of the connection between the extremes: and in certain cases, where the association has been long in a perfect state, the difficulty may become so great, that we are inclined to admit the supposition of an intermediate link, only because we can trace it in other similar cases, and perhaps in the very same connections in other individuals, whose habits are less fixed. This law, or mode of operation of the associative power, meets us at almost every step of our reflection at what passes within us. It may be termed the law of transference, and we shall state it again in another form. Let A, B, and C, represent three ideas, simple or compound, pleasurable, painful or indifferent. If A is connected with B, and B with C, A may be transferred to C, (through their mutual connection with B,) and be recalled by it, without B being present in the mind.

This is an exceedingly important and constantly operating law of association. It is thus that numerous, almost innumerable phenomena are produced, which at first sight appear inexplicable, upon any known principles, and which therefore are referred to instinct; that is, they are supposed to result necessarily from the conformation of the mind, without the operation of any acknowledged faculty of the mind. Such are the belief in what is called self-evident truths; the pleasures derived from objects which do not affect the mind by direct sensations, disinterested affections, &c. Whenever we meet with the word instinct applied to the human mind, we are to consider it simply as an appeal to ignorance; and though it seems often to be held out as the solution of a difficulty, it is, in fact, nothing more than saying, the feeling, or whatever else it be, springs up we know not how, we know nothing of its origin, progress, or exercise. The term instinct explains nothing; and though it is conveniently used with respect to the minds of brutes, of which we can learn nothing with certainty, yet when applied to the human mind, respecting whose operations we may often gain correct ideas, it is worse than saying nothing, for it stops investigation, by a pretence of knowledge. It is true we cannot trace many links in the chain of cause and effect: but as far as the great Creator has furnished us with powers, we need not be afraid to employ them, while their employment is conducted with judgment and caution. We do not say that all those feelings which we are apt to call instinctive, can, in the present state of our knowledge, be completely analyzed and traced to their origin; but while so many can, (so many too which in no respect differ from those which we cannot

cannot account for, except in the opportunity which we have of accounting for them,) we have a full and fair right to expect, that as attention to mental fcience increafes, thefe difficulties will diminifh, and that by degrees the whole of our mental furniture, except ideas of confcioufnefs, will be traced, as we can trace a great part of it, to fenfations, retained by the retentive power, and combined and varioufly modified by the affociative power. We have no objection to the term *natural* feelings, &c. rightly explained. We underftand by it thofe feelings, &c. which in all cafes, where there is not fomething peculiar in the individual, will fpring up in the mind, in confequence of the influence of generally occurring circumftances, upon the powers with which the great Former of the mind hath endowed it. For inftance, the parental feelings, the filial feelings, &c. are natural feelings: in all cafes where there is not fomething wrong in the individual, thefe feelings will fpring up in his mind in confequence of the influence of generally occurring circumftances upon the powers with which the mind is endued. So alfo, a great variety of other feelings, which, with the ftricteft propriety, may in this fenfe be termed natural. Some objection, however, lies againft another word often ufed in a fimilar way. Such feelings are faid to be *implanted*. If the word be underftood to mean nothing more than what fome do mean when they ufe it, that the feelings, &c. fpring up in the mind with the fame certainty as though they had made a part of the original ftructure of the mind, all is well. But if it be underftood to mean, that thefe feelings do form a part of the original ftructure, then it implies the fame cutting of the Gordian knot, the fame appeal to ignorance, which is implied in the ufe of the word *inftinctive*. If, however, we can reftrict its fignification, we may ufe it without injury. Let it mean no more, than that the feelings, &c. to which it is applied, are the neceffary refults from thofe powers which the Supreme Being has implanted in us; in fact, let it have the fame general meaning as *natural*, with rather more force, denoting the *neceffity* of their arifing from the powers which are given us; and we fhall not be giving way to thofe erroneous views which we muft unlearn before we can acquire truth.

We need not go far for inftances which will explain the law of transference. Suppofe a perfon acquiring another language, the French, for inftance. He learns the meaning of a French word by means of the correfponding Englifh word: by degrees, as the French word becomes familiar to him, it is underftood without the Englifh word being thought of. Here the fignification, (that is, the idea connected with the word,) may be called A, the Englifh word B, and the French word C; by frequent connection between A and C, by means of B, A is transferred to C, *i. e.* the fignification is transferred to the French word, fo that B, the Englifh word, is no longer wanting to form the link of union. When a young perfon has acquired fome facility in conftruing French, he generally reads his French work in Englifh; but when he has acquired a pretty complete knowledge of the language, he reads it in French, that is, he underftands it without the intervention of the correfponding Englifh words. Thofe who are converfant with fhort hand, can read it without thinking of the long hand; yet they learnt the former through the medium of the long-hand words. Thofe who have long learnt to read, and who read much to themfelves, feldom think of the found of the words when they are reading in this manner. When we are pretty familiar with a fubject, a fingle glance of the eye over a page of a clear printed book, will convey to us an idea of its contents, when perhaps not a fingle word has particularly attracted our attention, when certainly there has not been time for the mind to think of the found of the words. We do not recommend this habit of reading for young perfons, but fimply ftate a fact which is very ufeful and convenient to the mind when it has gone through fufficient difcipline of accuracy, &c. Now it is obvious, that in almoft all cafes, perfons learn to underftand written words through the medium of fpoken words. One more inftance, and we have done with mere illuftration. Thofe who are familiar with writing never think of the printed word, unlefs any particular circumftance call it to the mind. Yet there are few inftances in which the written word is not connected with the fpoken word, by means of the before learnt printed letters or word.

We now proceed to fhew the application of this law, in explaining certain phenomena of belief, and the origin of the difinterefted affections. We are not now to attempt the explanation of the formation of the complex feeling which we call belief, nor of thofe complex ftates of mind which we call affections; but fuppofing them formed to explain fome facts refpecting them, that is, to fhew how thefe facts accord with the general law of affociation which we have been ftating. Belief is transferable from the fteps of the reafoning to the refult of that reafoning. Suppofe a propofition depends for its truth upon a great number of other propofitions, if as we go along every ftep is believed to be true, and every connection of one ftep with another appears to be a juft one, the feeling of belief is fucceffively transferred from one ftep to another, till at laft we come to the refult, the propofition which we wifh to prove, and the feeling will be connected with this, and will remain with it, when all the fteps by which its truth was fhewn are entirely loft from the view of the mind. Every one admits this; and every one who has gone through the procefs knows it to be fo. There are almoft innumerable inftances in which we find the feeling of belief connected with ideas, without our being able at once to fay, or even to fay at all, how we acquired the connection. In this inftance fome philofophers refer to certain inftinctive principles, by which we are neceffarily led to believe, without any further reafon than that our mental conftitution compels. But, we repeat it, we need not refort to fuch hypothefes; they do great injury by checking the refearches of the intellects, and, in fome cafes, by leading people to fuppofe opinions well founded, which have no further ground than an almoft accidental, or, at any rate, unjuft transfer of belief, by means of what was itfelf perhaps entitled to no belief. There are certain refults of reflection and obfervation which we call experience, and it is generally wife to truft to them. But before a man yields to his experience, in oppofition to the clear evidence of others, or to well founded and well connected reafonings, he fhould confider what experience is, and on what ground he has connected belief with it. He will find that belief is not a neceffary attendant upon his experience, but that it has been connected with it by means of intermediate links, which might themfelves have no fatisfactory claim to belief. For inftance, if a man has not obferved accurately, or has not a correct judgment, his experience may not be worth any thing, nor entitled to any belief. Now, in many cafes it is almoft impoffible to recall the intermediate links, in order to prove to ourfelves the correctnefs of our experience, and yet we muft act upon it; this fhews the importance of cultivating in early life thofe habits of cool judgment and accurate obfervation, which fhall give us a full right to believe, and to act upon our belief in the refults of reflection and obfervation. But fome truths, it may be thought, have a neceffary connection with belief. We admit that there are truths which are fo accordant with all the grounds of belief, that

that they inftantaneoufly excite the belief of thofe who have had the opportunity of knowing thofe grounds; but no further. You immediately believe, that $2 \times 2 = 4$; and you would think that man deftitute of common fenfe, who denied it, or who did not immediately admit it. Yet we are well convinced that the belief is formed gradually in confequence of a number of external impreffions; or, to ftate it more familiarly, by frequently counting in the early part of childhood. We perhaps have not the power of difcovering the exact fteps by which we have ourfelves proceeded to the belief of this truth, but we can obferve them in others, and we can trace them in ourfelves, in fimilar circumftances. Belief in fuch truths is often formed through the medium of parental authority, or that of inftructors, and it is probable that, in many inftances, children know no more why $12 \times 12 = 144$, than that they find it fo in their multiplication tables; but even where it has been formed by trials of the truth, thofe trials are generally forgotten, and the truth alone is remembered. We fhould gladly enlarge more on thefe points, but what has been already faid will probably anfwer the two purpofes which we have in view, to fhew the operation of affociation in transferring belief; and in leading to the inference that belief ought not to be regarded as a *proof* of truth; and yet, that the being unable to point out all the grounds of belief, is not of itfelf any reafon why that belief fhould be given up.

A few remarks on the oppofite opinions which have been entertained refpecting the difintereftednefs of the human mind, will be found in MORAL *Education*, col. 27, 28. It is only by reference to the operations of the affociative power, that the real ftate of the cafe can be thoroughly underftood or explained; and we regard the explanation which the theory of affociation affords, of the origin of affections, and their progrefs from their felfifh character towards difintereftednefs, as intitling it to the higheft rank among the difcoveries of philofophy,—whether we confider the immenfe variety of mental phenomena for which this principle accounts, or the vaft importance of its application to moral culture.

When an affection has arrived at its moft complete ftate, in which it has no farther end than its own immediate object (that is, when the object is defired for its own fake), the affection may be termed difinterefted; but as this term has already a more confined application, and it would thus be applied not only to the worthy but to the baneful affections, (fo that we fhould be compelled to fpeak of difinterefted cruelty, difinterefted avarice, &c.) we fhall, for want of a better appellation, term thofe affections which are in their ultimate ftate, *ultimate affections*. Premifing this, we fhall endeavour to explain the progrefs of an affection, from the ftate in which the object of it is a mean, to that in which the object of it becomes the fole end, that is, in which it is an ultimate affection.

The moft fimple inftance is the love of money. Money is firft an object of pleafurable feeling, merely as a means of procuring other things which are regarded as objects of defire. For a moment we may fometimes think of it, as having fome intrinfic value independently of its utility as a means; but we may fatisfy ourfelves that this is not the cafe, by obferving how little it is an object of intereft to children who have not heard much about it, or feen it employed, or employed it themfelves. A child is perhaps pleafed with a piece of money as a plaything, but nothing farther; and children fometimes advance confiderably far in life before they feel its value. E, a boy feven years old, was prefented by his father with half a crown, as a reward for a very fuccefsful and perfevering effort: he was delighted with the approbation which was fhewn him; and as far as the money was a mark of that approbation it pleafed him; but obvioufly nothing farther. In fmall families, children generally learn the value of money early: and we therefore mention the preceding circumftance as an illuftration of what we have juft faid, that originally it is merely defired as a mean. As perfons advance in life, money is continually found to be the means of a great number and variety of the fources of prefent enjoyments; hence pleafurable feelings are continually connected with it, and it becomes more and more an object of defire. In this ftage of the progrefs of the love of money, it is defired as the means of procuring certain pleafurable feelings, without reference to the objects by which thofe pleafurable feelings are directly produced; and even in this ftate of it we find an inftance of the law of transference: the pleafurable feelings refulting from the objects procured, or to be procured, by money, are affociated with the money itfelf, without reference to thofe objects. To revert to one of the modes in which the law was propofed; the pleafurable feelings which purchafable objects produce, the idea of thofe objects, and the idea of money, are the three fets of ideas. Money procures the object; the object the pleafurable feeling: hence the pleafurable feeling becomes connected, by means of the intermediate links, with money; and hence money becomes an object of defire, without any reference to the means of gratification which it procures. Here, to ufe the other ftatement, the pleafurable feelings may be reprefented by A; the objects which produce them, by B; and the money which procures thofe objects, by C: by frequent connection between A and C, by means of B, A is transferred to C; that is, the pleafurable feelings are transferred to the idea of money, and confequently to money itfelf, and are called up by it without any reference to B, the objects by which thofe pleafurable feelings were originally excited. The law of transference may, in this inftance, and in many others, be carried one ftep farther. In the ftate to which we have advanced, money is defired on account of the pleafurable feelings with which it is connected; but by degrees the defire is transferred from thofe pleafurable feelings to money itfelf; and money is loved for itfelf, without any reference to thofe pleafurable feelings. This is fo important a fact in our mental conftitution, that we deem no apology neceffary for endeavouring fo much at length to point out its application. In this laft ftage of the affection, A is the defire excited by B, the pleafurable feeling excited by C, the idea of money; by means of B, A, the defire, is transferred to C, the idea of money; and thus money comes to be defired for itfelf without any reference to the pleafurable feelings which it is the means of procuring. In this ftate the defire of money is become an ultimate affection; it is no longer defired as a means, but as an end; it is defired on its own account. Some remarks on the peculiarities and checks of this affection, will be found in a fubfequent part of our article.

Illuftrations of a fimilar kind might be offered, refpecting the filial, the fraternal, and even the parental affections; and it might be fhewn that they are only gradually difinterefted; but that, at the fame time, the natural tendency is to difintereftednefs, and that it is only where difintereftednefs is oppofed by the culture of wrong affections, affections which, when in their ultimate ftate, are ever felfifh, and by neglect of thofe which are in all their ftages worthy, and which haften the moral progrefs almoft indefinitely, that the mind ftops at partial difintereftednefs, or finks into confirmed felfifhnefs. We have already, however, in MORAL *Education*, col. 9, &c. and 28, &c. given an outline of the

origin

origin and progrefs of the filial affections, and of the formation of difinterefted benevolence; and we would requeft our readers, before they proceed, to perufe our remarks on the latter point, as affording decided illuftration and explanation of the law of transference, by which *means become ends*. With the fame view we fhall here add, that the defire of doing good may itfelf be fometimes loft from the view of the mind, in attention to the means of doing it. Some of our readers, probably, take an active intereft in the welfare of inftitutions for the benefit of the poor and afflicted. Thefe inftitutions were planned by benevolence, and benevolence ftill prompts the fupport of them. It is the defire of doing good which has led to the frequently returning exertions which are made to keep them in vigour; but we have no doubt that the welfare of one or other of thefe inftitutions will often be found to be an object of the mind, without reference to the good it does. The mind rejoices in its fuccefs, without thinking of the benefit which will refult from it. As foon as the attention is directed to its beneficial effects, the mind dwells upon them as the ultimate fource of its fatisfaction; but they were not immediately in its view. Whether or not we have been fuccefsful in leading our readers to feel the force of the affertion by this illuftration, we are confident of the fact, that the means of doing good very often themfelves become ends; and that the defire of their fuccefsful furtherance, which was originally felt for them, merely on account of the good known or imagined to refult from them, is at laft felt without reference to that good; though, on the other hand, it would by degrees, though perhaps not very foon, decay, if it were fatisfactorily proved, that the means of the hoped-for-good were, and muft be, wholly inefficacious.

But there would be no end to illuftrations of this law if we were to trace it out in all its operations. We are continually loving things becaufe ——, and afterwards loving them for themfelves alone. It extends to the love of duty in general, without any reference to particular branches of it. All the pleafurable feelings which thefe produce, and all the tendencies and difpofitions to the practice of them, by degrees become connected with the idea of duty in general, which is a fact derived from the ideas of particular branches of duty. Hence duty in general becomes an object of defire and exertion, becaufe parts of it are defired and purfued on their own account; and this haftens the progrefs of a difinterefted love of duty in general. But leaving this out of the queftion, a great variety of confiderations make it an object of choice; and if it be purfued as a means to obtain the object in view with fufficient fteadinefs, and for a fufficient length of time, by degrees it is purfued as an end, and duty is then loved for itfelf.

In oppofition to thefe views, as to the progrefs of the affections towards difinterefteduefs, it may be urged that children are often more difinterefted than perfons who have had fome experience in life. Our ideas on this point we have already had occafion to ftate; and we wifh to refer the reader to them. See Moral *Education*, col. 43.

No one can, with juftice, think lefs highly of the exertions of difinterefteduefs, becaufe it can be fhewn to arife from a meaner origin. Ought we not rather to admire the height which has been gained by a fteady ufe of the general means of worth, and by a right employment of the difcipline of Providence? Is his conduct lefs lovely, who has gone through the trial, and brought from it difinterefteduefs which prompts to efforts of the nobleft kind for the good of others? The opinion that the mind is originally difinterefted, may be pleafing in fome points of view; but in others it is the contrary: it diminifhes the value of the character where it exifts, for conftitutional difinterefteduefs could have no more merit than the poffeffion of good fight; and it damps the efforts of the mind to acquire difinteretteduefs. Thofe who find themfelves deficient, who difcover feelings which difinterefteduefs cannot approve, have, on the principles which we have been aiming to illuftrate, the beft encouragement in their endeavours to transfer their affections from felf. Thefe principles lead, too, humbly and gratefully to acquiefce in every means which Providence may appoint to difcipline the mind, and to purify it from all that can debafe. In fhort, they point the view to the higheft excellence, and direct to the means of attaining it.

(4) *Habitual Biaffes.*—We now proceed to the laft of thofe laws of affociation which we propofed to notice; and in what we fhall advance on the fubject, we fhall make a free ufe of Mr. Stewart's Elements.

The leading feature of the operations of the affociative power is, that when two or more ideas are prefented to the mind together, or in clofe fucceffion, they become connected with one another, or blended together; fo that the one, when recalled to the view of the mind, is accompanied with the other. But we muft not limit its exercife to this operation: it not only connects ideas, when they are thus prefented together to the mind, but is the caufe of the introduction of ideas with one another, which have never before been prefented together to the mind. An object, which has never before been prefented to the mind, may excite numerous ideas or trains of ideas; while another may continually occur, without exciting a fingle idea. And the fame object will affect different perfons differently, fo that in the mind of one it will excite trains of thought, while in another it will only produce a momentary impreffion; and in different perfons, too, the fame object will excite different trains of thought; and in the fame perfon, at different times, different effects will be produced. Now all this depends upon the habitual or accidental biaffes to particular kinds of connections, produced either by the original tendencies of the mental conftitution, or, more ufually, by the particular culture of the individual's mind, owing to direct inftruction, or to the effect of circumftances, operating without any intention either on his part or on that of others.

The earlieft bond of union between objects of thought is their being prefented to the mind together, or in clofe fucceffion, through the medium of fenfation. This is owing to the objects of fenfation being connected in time or place; or, in other words, owing to the relation of contiguity in time and place exifting between thefe objects. This caufe of connection among our ideas is what neceffarily has the earlieft efficacy in forming thofe connections; becaufe it does not prefuppofe, as every other does, the exiftence of other ideas in the mind, or the exercife of attention to other relations which exift among them. Children affociate ideas almoft entirely by this bond of union: perfons of uncultivated minds, in the fame manner, ufually have their ideas connected by the fame bond of union; contiguity of time and place of the objects of fenfation producing impreffions on the mind at the fame time, or in clofe fucceffion: and more or lefs it is a connecting link, or caufe of connection, in every one, in every period of life.

We might, *à priori*, calculate upon its high importance in the mental ftructure; and as a matter of fact, it is the foundation of all experience and philofophy, and, at the fame time, the fource of numerous prejudices. It is the fource of numerous prejudices, by leading us to expect continued conjunction in time or place, where the conjunction was

was only occaſional; and thus to ſuppoſe a real and permanent connection between objects, which had only accidental and temporary connection. Hence unenlightened experience of the paſt will fill the mind, in numberleſs inſtances, with vain expectations, or with groundleſs alarms, concerning the future: hence the regard which is paid to unlucky days, to unlucky colours, to the influence of the planets, &c.; apprehenſions which render human life, to many, a continual ſeries of abſurd terrors. But this principle of connection among our ideas is alſo the foundation of all experience and philoſophy; for the grand object of philoſophy is the knowledge of thoſe laws which regulate the ſucceſſion of events; ſo that from the paſt we may be enabled to anticipate the probable courſe of the future, and to regulate our conduct accordingly: and, therefore, it is of the firſt importance that the connections of time and place ſhould have a ſtrong power over the mind. Experience is of a more limited nature, but has the ſame object, to anticipate the probable courſe of events, ſo as to make the paſt ſubſervient to the conduct of the future; and by rendering contiguity, in time, one of the ſtrongeſt principles of connection in our minds, the wiſe author of our frame has conjoined in our thoughts the ſame events which we find conjoined in our experience, and has thus accommodated, without any effort on our part, the order of our ideas to that ſcene in which we are deſtined to act.

Upon the connections eſtabliſhed by this principle all other connections are founded. Some of the moſt ſtriking are thoſe which ariſe from the relations of ſimilarity, of contrariety, of cauſe and effect, of means and end, of premiſes and concluſion.

Next to the relation of contiguity in time and place, that of ſimilarity is moſt univerſally operative. It does not depend upon an active exertion of intellect, but ariſes ſpontaneouſly from the mental conſtitution. Similarity implies partial identity of ſenſation; and hence an object, when firſt preſented to the mind, frequently recalls the idea of that which has ſome parts of its component ſenſations the ſame. Thus, when we ſee a face which conſiderably intereſts us, we are often led to recollect the face of ſome other perſon, in conſequence of the impreſſions from each agreeing in ſome particulars. In the ſame manner, when the circumſtances of one event are in ſome reſpects the ſame with the circumſtances of another, which had before fallen under our notice, ſo far there is a recurrence of the ſame impreſſions, and that, by the more general law of aſſociation, recalls the remaining circumſtances.

This cauſe of connection among our ideas, like that of contiguity of time or place, is of the greateſt importance, and at the ſame time liable to be greatly miſuſed. Without it, the experience of the paſt would be of no utility to us; for the ſame ſet of circumſtances never occurs twice. If there be ſufficient ſimilarity to recall the paſt, it now anſwers the purpoſe of exciting the expectation of what occurred in ſimilar circumſtances, that is, of bringing the experience of the paſt to bear upon the preſent. But as ſimilarity is only partial ſameneſs, if it be not accompanied with ſome diſcrimination, conſequences will be expected that will never happen, and concluſions, which will miſlead, will be formed without any juſt foundation.

Ideas are connected together, not only in conſequence of their ſimilarity, that is, ſameneſs in ſome of their component parts, but frequently alſo from ſimilarity in the ſounds expreſſing them. It is upon this circumſtance that the art of punning is founded; an art which may be innocent in itſelf conſidered, but which, when made much an object, leads from ſenſe to ſound, and prevents us from carefully examining the arguments and differences of things, on which alone reaſoning can be founded. So much indeed is a habit of punning at variance with habits of thought and ſober reflection, that the whole current of thought will ſometimes be diverted from its proper channel, by ſome word, in which the thought is expreſſed, recalling, by ſimilarity of ſound, ſome other which calls up its own train of thought. A good pun may ſometimes be conſidered as an exerciſe of the judgment; but more uſually it is merely an exerciſe of the aſſociative power, in this particular principle of connection, ſimilarity in ſound; and, therefore, it would be wiſe in young perſons to check the deſire to obtain an acquiſition, which is of little value, becauſe almoſt every one may acquire it, and which muſt check the culture of other more valuable principles of aſſociation.

Another fertile principle of connection is contrariety, which connects together ideas which are totally, or in many reſpects, oppoſite to each other. This, however, is more the reſult of attention and habit, than thoſe of contiguity in time or place, and ſimilarity. Some perſons are particularly diſpoſed to it, others have little tendency to it. It frequently appears to ariſe from the natural tendency of the mind to change from one ſet of feelings, which are in ſome way or other diſpleaſing, to others which may be pleaſing; and very often ſerves to illuſtrate reaſoning, but particularly to give intereſt and force to a deſcription of natural ſcenery, or a delineation of character.

The other principles of connection which we mentioned are more refined, and are the reſult of culture. A perſon who has been more accuſtomed to philoſophize, or to reaſon, than to follow the airy flights of wit or poetic fancy, connects his ideas by the principles of cauſe and effect, of means and end, of premiſes and concluſion. When a phenomenon is ſtated to his mind, it almoſt involuntarily brings forward ideas, which ſerve to account for the phenomenon: we do not mean that the mind invariably brings forward the right ideas, but ſimply thoſe which anſwer the wants of the individual, by ſerving to account to him for the phenomenon. In like manner, when an end is propoſed, the train of thought is concerned about the means, which are often ſuggeſted, though the object itſelf was never before in the view of the mind. All theſe relations doubtleſs produce their effect by minute and almoſt imperceptible ſameneſſes in the particular object now in the view of the mind, and ſome one which before has been, and which has been connected, by ſome cauſe or other, with the cauſe or means by which it was produced, or to be produced; but it is convenient to ſpeak of them as diſtinct from the more obvious relations, becauſe they imply different culture of the mind, and lead to ſuch widely different effects. Now any one of theſe connecting principles may, by habit, be ſtrengthened to ſuch a degree, as to give us a command over all the different ideas in our mind, which have the given relation to each other; ſo that when any one in the claſs occurs to us, we have almoſt a certainty that it will ſuggeſt the reſt. As this appears to be an indiſputable fact reſpecting the influence of aſſociation, we may ſtate it in the following general form:—When an idea is preſented to the mind, either by ſenſation or aſſociation, bearing certain relations, either in itſelf or in its effects on the mind, with another idea already in the mind, the latter is recalled by the former, and becomes connected with it; and the aſſociation, thus produced, is ſubject to the ſame laws with thoſe which are formed, owing to the contiguity in the times of the reception of the aſſociated ideas.

3. *Reſpecting the* COMPOSITION *of Ideas*.—Another grand law, or mode of operation, of the aſſociative power, is that

that by which ſimple ideas are formed into compound or complex ideas; in other words, more generally, by which ſimple ſenſorial changes are combined and blended together. In the conſideration of this moſt important and extenſive principle, we ſhall derive moſt of our ſtatements from thoſe of Hartley; diveſting them, however, of thoſe peculiarities of expreſſion, which depend for their correctneſs upon the truth of the poſitions that the medullary ſubſtance of the brain is the ſenſorium, and that ſenſorial changes are *vibrations* of the medullary ſubſtance.

In order to explain this law of aſſociation, it is neceſſary to take a view of the modes in which ſimple ideas, or ideas of ſenſation, may be aſſociated.

Caſe 1.—Let the ſenſation A be often aſſociated with each of the ſenſations B, C, D, &c.; that is, at certain times with B, at certain other times with C, and ſo on: it is evident, from what has been before ſtated, that A, when produced alone, will raiſe *a*, *b*, *c*, *d*, &c. (the ſimple ideas of ſenſation correſponding reſpectively with A, B, C, D, &c.) altogether; and conſequently will aſſociate them together. If *a*, *b*, *c*, *d*, &c. are diſtinct in all their parts, then, in the firſt inſtance, they will be merely *connected*, ſo as to make a *group*, which may be repreſented by $a + b + c + d$, &c.; but if they are not diſtinct in their parts, they more or leſs run into each other, ſo as to form a complex *cluſter*, which may be repreſented by *a b c d*, &c. Now the more frequently the group $a + b + c + d$ occurs in connection, the more cloſely the ſingle ideas are united; and unleſs any one has a peculiar degree of vividneſs, they will by degrees appear to the mind as one idea; and unleſs the notice of the mind is particularly directed to the circumſtance that it is compoſed of parts, it appears as much a ſingle idea, as originally each of the parts would have done, if the attention had been directed to them ſingly. And, in like manner, the more the cluſter *abcd* occurs in combination, the more completely the parts coaleſce, ſo that by degrees they form a complex idea, the parts of which are ſcarcely diſtinguiſhable.

Caſe 2.—If the ſenſations A, B, C, D, &c. be aſſociated together, according to various combinations of twos, or even of threes, fours, &c., then A will raiſe up $b + c + d$, &c.; alſo B will raiſe up $a + c + d$, &c.; and compound or complex ideas will be formed of thoſe combinations, preciſely as was before ſtated in the caſe of ſenſations, each ſingly aſſociated with another ſenſation. It may happen indeed, in both caſes, that A may raiſe a particular idea, as *b*, preferably to any of the reſt, in conſequence of its being more frequently aſſociated with *b*, or of the greater novelty of the impreſſion of the correſponding ſenſation B rendering it more vivid, or of ſome peculiar tendency in the ſenſorium to excite *b*, or of ſome other cauſe; and in like manner that B may raiſe *c* or *d* preferably to the reſt. However, all this will at laſt be over-ruled by the recurrence of the aſſociations, ſo that by degrees any one of the ſenſations will excite the ideas of the reſt at the ſame inſtant and therefore aſſociate them together.

Caſe 3.—Let A, B, C, &c. repreſent ſucceſſive ſenſations, occurring in contiguous, ſucceſſive inſtances; A will raiſe *b*, *c*, *d*, &c.; B will raiſe *c*, *d*, &c: and though the ideas do not riſe preciſely in the ſame inſtant, yet they come nearer and nearer together than the ſenſations did in their original impreſſion; ſo that theſe ideas are at laſt aſſociated ſynchronouſly, as they were from the firſt ſucceſſively.

Caſe 4.—All compound impreſſions, A + B + C + D, &c., or A B C D, &c., (according as they are received by different organs, or the ſame,) after ſufficient repetition, leave behind their compound ideas $a + b + c + d$, &c., or *a b c d*, &c., which recur every now and then by means of thoſe ſenſations or ideas, with which the whole compound, or any one or more of the parts A, B, C, D, &c. have been aſſociated. Now in theſe recurrences of compound ideas, the parts are farther aſſociated and more intimately united to one another, agreeably to what has been already obſerved, ſo as to form a compound or complex idea, which will appear to the mind as one ſingle idea. As the ſame cauſes produce the recurrence of the compound ideas, in whatever way the union was firſt produced, the ſame remarks may be made under each of the caſes as have been under this and the firſt caſe, reſpecting the cauſes and effects of ſuch occurrence.

On the whole it is evident, that the ſimple ideas of ſenſation muſt run into cluſters and combinations by aſſociation; and that each of theſe will, at laſt, coaleſce into one compound or complex idea. It appears alſo from obſervation, that many of our mental or intellectual ideas, (that is thoſe in which no particular idea of ſenſation is perceptible,) ſuch as thoſe which belong to the heads of beauty, honour, moral qualities, &c., are, in fact, thus compoſed of parts which by degrees coaleſce into one complex idea. And as this coaleſcence of ſimple into complex ideas is thus evinced both by the principles of aſſociation and by obſervation, ſo it may be illuſtrated and farther confirmed, by the ſimilar coaleſcence of letters into ſyllables and words, in which aſſociation is likewiſe a chief inſtrument.

If the number of ſimple ideas which compoſe the complex one be very great, it may happen that the complex idea ſhall not appear to bear any relation to its component parts, nor to the external ſenſes by which the original ſenſations were received. The reaſon of this is, that each ſingle idea is overpowered by the ſum of all the reſt, as ſoon as they are all intimately united together. Thus in very compound medicines, the ſeveral taſtes and flavours of the ſeparate ingredients are loſt and overpowered by the complex one of the whole maſs; ſo that it has a taſte of its own, which appears to be ſimple and original. Thus alſo white appears, and is vulgarly thought to be, the ſimpleſt of all colours, while yet it really ariſes from a certain mixture of the ſeven primary colours in their due ſhades and proportions. And, to reſume the illuſtration above-mentioned, to one unacquainted with the arts of reading and writing, it would not appear probable, that the great variety of complex ſounds in language, are to be analyſed into a few ſimple ſounds. One may hope, therefore, that by purſuing and perfecting the doctrine of aſſociation, we may ſome time or other be enabled to analyſe all the vaſt variety of complex ideas, which paſs under the names of ideas of reflection, (excepting thoſe of conſciouſneſs,) abſtract ideas, deſires, affections, &c. into their ſimple component parts, that is, into the ſimple ideas of ſenſation of which they are formed. The complex ideas here ſpoken of, are generally excited by words or viſible objects; but they are alſo connected with other external impreſſions, and depend on them as ſymbols. In whatever way we conſider them, the trains of them which are preſented to the mind ſeem to depend upon the then preſent ſtate of the body, the external impreſſions, and the remaining influence of prior impreſſions and aſſociations, taken together.

As ſimple ideas of ſenſation run into complex ones by aſſociation, ſo complex ideas run into complex combinations, which Hartley terms *decomplex ideas*. But here the varieties of the aſſociations, which increaſe with the complexity, hinder particular ones from being ſo cloſe and permanent between the complex parts of decomplex ideas, as between the ſimple parts of complex ones."

The

The ſimple ideas of ſenſation are not all equally and uniformly concerned in forming complex and decomplex ideas; but, on the contrary, ſome occur much oftener than others: and the ſame holds good of complex ideas, conſidered as the component parts of decomplex ideas. And innumerable combinations never occur at all in real life, and conſequently are never aſſociated into complex or decomplex ideas. Juſt as in language, ſome letters, and combinations of letters, occur much more frequently than others; and ſome combinations never occur at all. Farther, as perſons, who ſpeak the ſame language, have, nevertheleſs, a different uſe and extent of words, ſo though mankind in all ages and nations agree, in general, in their complex and decomplex ideas, yet there are many particular differences in them, and theſe differences are greater or leſs, according to the difference or reſemblance, in age, conſtitution, education, profeſſion, country, period, &c., that is, in their impreſſions and aſſociations.

When ſenſations and ideas, with their moſt common combinations, have been often preſented to the mind, a train of them of conſiderable length, may, by once occurring, produce ſuch a tendency to recurrence, that they may recur, without the previous cauſe, in nearly the ſame order and proportion as in this ſingle occurrence. For ſince each of the particular ſenſations and ideas is familiar, little more will be wanting for their recurrency than a few connecting links; and even theſe may, in ſome inſtances, be ſupplied by former ſimilar inſtances. Theſe conſiderations, when duly unfolded, ſeem to explain the chief phenomena of memory; and it will be eaſily ſeen from them, that the memory of adults, and of proficients in any ſcience, ought to be much more ready and certain, than that of children and novices, as it is found to be in fact.

As many words have complex ideas annexed to them, ſo ſentences, which are collections of words, have collections of complex ideas, that is, have decomplex ideas annexed to them. And it happens in moſt caſes, that the decomplex idea belonging to any ſentence, is not compounded merely of the complex ideas belonging to the words of it, but that there are alſo many variations, ſome oppoſitions, and numberleſs additions. Thus propoſitions, in particular, excite, as ſoon as heard, the feelings of aſſent or diſſent; which conſiſt chiefly of additional complex ideas not included in the terms of the propoſition. And it would be of the greateſt uſe, both in the ſciences and in common life, thoroughly to analyze this matter, to ſhew in what manner and by what ſteps, that is, by what impreſſions and aſſociations, our aſſent and diſſent, both in ſcientific and moral ſubjects, are formed.

4. *Reſpecting the* VIVIDNESS *of complex ideas, and the mental pleaſures and pains in general*.—It is reaſonable to ſuppoſe, that ſome ideas may be as vivid as any ſenſation excited by the direct action of objects upon the external organs of ſenſe. For complex ideas may conſiſt of ſo many parts, and theſe may ſo alter and exalt one another, that the ſenſorial change, whatever that be, may be as great as can be produced by any ſingle external impreſſion. And we know as a matter of fact, that mental pains are ſometimes ſo acute, as to counterbalance, and even altogether remove the attention from, the moſt excruciating pains, which are merely thoſe of ſenſation. This proceſs may be aſſiſted and accelerated by the mixture of vivid ſenſations among the ideas, by the ſenſibility of the mental organs, by a prediſpoſition to a particular claſs of ideas, &c.

It is on theſe principles, in connection with the general operation of the aſſociative power, that we are enabled to account for the exiſtence of intellectual or mental pleaſures and pains, that is, thoſe in which no particular ſenſible pleaſure or pain is perceptible, which form a diſtinct and moſt important claſs of feelings. The relics of ſenſible pleaſures and pains, that is, of pleaſurable or painful ſenſations, unite and coaleſce in the ſame manner as other ideas; and variouſly connected and blended together, they conſtitute the whole of thoſe internal feelings, which we term paſſions, affections, emotions, &c.

In almoſt every ſtep of our inveſtigations in mental philoſophy, we are perplexed by the ſcantineſs of language, and ſtill more by the want of preciſion with which the words we poſſeſs are employed. It is much more eaſy to point out faults than to correct them; but it appears to us likely to promote the object in one department, if the two claſſes of ideas, the relics of ſenſations, *viz.* thoſe which are pleaſurable, and thoſe which are indifferent, or, more properly, which belong to the underſtanding, were denominated, the latter *notions* and the former *feelings*. Popular language would, in great meaſure, bear us out in this appropriation; but at leaſt in the commencement of our ſtatements we were obliged to employ the word feelings in a more general ſenſe, *viz.* for every ſenſorial change accompanied with conſciouſneſs, becauſe we have no other word in the language comprehending ideas and ſenſations: henceforwards, however, we wiſh to appropriate the word *feelings* to thoſe complex ideas, which are either pleaſurable or painful, ſo as to correſpond with Hartley's denomination "intellectual pleaſures and pains," including, as he does, the affections and paſſions. We muſt however remark, that we decidedly prefer the term *mental* to *intellectual*, when ſpeaking of the feelings. The underſtanding is uſually oppoſed to the feelings; but mental is properly oppoſed to corporal; and though the bodily pleaſures or pains, that is, thoſe of ſenſation, are in reality pleaſures and pains of the mind, yet having the external organs as their ſources, there is an obvious ground of diſtinction between them and the feelings, in which ſenſation has no immediate ſhare. To theſe feelings the term *ſenſations* is too often applied. Senſations may properly enough be termed feelings; but the term *ſenſations* ſhould be confined to thoſe feelings which are produced independent of the aſſociative power, by affections of the organs of ſenſe.

It appears from what has been already ſtated, that the mental pleaſures and pains may be equal to, or greater or leſs than, the ſenſible ones, according as each perſon unites more or fewer, more vivid or more languid ideas, in the formation of the mental pleaſures or pains.

It is of the utmoſt conſequence to religion and morality, that the mental feelings ſhould be analyzed into their ſimple component parts, by reverſing the ſteps which concur to form them. For thus we may learn how to cheriſh and improve good ones, and to check and root out ſuch as are miſchievous and immoral; and how to ſuit our manner of life, in ſome tolerable meaſure, to our intellectual and religious wants. And as this holds good in reſpect of perſons of all ages, ſo it is particularly true and worthy of conſideration in reſpect of children and youth. The word is indeed ſufficiently ſtocked with general precepts for this purpoſe, founded on experience; and whoſoever will follow theſe faithfully, may expect good general ſucceſs. The doctrine of aſſociation, however, when traced up to the firſt rudiments of underſtanding and affection, unfolds ſuch a ſcene as cannot fail both to inſtruct and alarm all thoſe who have any degree of intereſted concern for themſelves, or benevolent concern for others.

Our original bodily ſtructure, and the impreſſions and aſſociations which affect us in paſſing through life, are ſo much

much alike, and yet not the fame, that there muft be both a great general refemblance among mankind in refpect of their mental pleafures and pains, and alfo many particular differences.

Some degree of fpirituality, that is, that ftate of mind in which the pleafures and pains are not fenfible, is the neceffary confequence of paffing through life; and the fenfible pleafures and pains muft be transferred by affociation more and more every day, upon things which of themfelves afford neither pleafure nor pain.

Let the letters *a*, *b*, *c*, *d*, *e*, &c. reprefent the fenfible pleafures, and *x*, *y*, and *z*, the fenfible pains, fuppofing them to be only three in number; and let us fuppofe all thefe, both pleafures and pains, to be equal to each other in degree. If now the ideas of thefe fenfible pleafures and pains be affociated together, according to all the poffible varieties, in order to form mental pleafures and pains, it is plain that pleafure muft prevail in all the combinations of feven or more letters; and alfo that when the feveral parts of thefe complex pleafures are fufficiently blended by affociation, the pains which enter into their compofition will no longer be diftinguifhed feparately, but the refulting mixed and complex pleafures will appear to be pure and fimple ones, equal in quantity to the excefs of pleafure above pain, in each combination. Thus affociation would convert a ftate, in which pleafure and pain are both perceived by turns, into one in which pure pleafure would alone be perceived; at leaft would caufe the beings, who were under its influence to an indefinite degree, to approach to this laft ftate nearer than by any definite difference. Now, though the circumftances of mankind are not the fame with thofe here fuppofed, yet they bear a great refemblance to them, during that part of our exiftence which is expofed to our obfervation: for our fenfible pleafures are far more numerous than our fenfible pains; and though the pains are in general greater than the pleafures, yet the fum total of the latter is probably greater than that of the former; whence the remainder, after the deftruction of the pains by the oppofite and equal pleafures, will be pure pleafure.

The mental pleafures and pains are as real as the fenfible ones; being, in fact, nothing but the fenfible pleafures and pains varioufly mixed and blended together. They are alfo all equally of a factitious and acquired nature; and we muft, therefore, eftimate all of them equally, by their magnitude, permanency, and tendency to produce others.

The fenfible pleafures and pains have a greater tendency to deftroy the body than the mental ones; for they are of a particular local nature, and fo affect the organs which convey them: and the deftruction of any one confiderable part of the body is the deftruction of the whole, from the fympathy of the parts. On the other hand, the mental pleafures and pains, being collected from all quarters, do not much injure any organ particularly, but rather bring on an equable gradual decay of the fyftem. This, however, is upon the fuppofition that they are not exceffive; for exceffive defires or emotions, even if of a refined nature, have a direct tendency to injure the mental fyftem generally, and efpecially to bring on that derangement of it, which is clofely related to infanity, even if it do not bear the name.

Thefe principles afford fome pleafing prefumptions; fuch as, that we have a power of fuiting our frame of mind to our circumftances, of correcting what is amifs, and improving what is right: that our ultimate happinefs appears to be of a fpiritual, not corporeal nature; and, therefore, that death may not ftop our progrefs, but forward us in the purfuit of our true end; that affociation tends to make us all ultimately fimilar; fo that if one be happy, all muft: and, laftly, that affociation may alfo be fhewn, by a direct argument, as well as by this indirect one, to contribute to introduce pure ultimate fpiritual happinefs in all.

5. *Of the Affections, &c.*—We have already faid as much refpecting the nature of the *affections*, *paffions*, *emotions*, and *difpofitions* in general, (fee MORAL *Education*, col. 24.) as we fhould find neceffary for our prefent purpofe; and we folicit the perufal of thofe obfervations in this place. They are followed by a ftatement of the leading principles refpecting the origin and progrefs of the affections, &c.; and though we adduced them, in the article referred to, with a fpecific reference to the proceffes of education, we believe they will be found to include all that it might have been defirable to introduce in the prefent cafe. The remarks and illuftrations founded on thofe principles, which we have fubjoined to them, have a more peculiar application to the immediate object of that article; but we venture to recommend the perufal of them to the ftudent of mental philofophy, as having a clofe connection with his purfuit. Prefuming upon our reader's reference to the account we have given of the nature of our mental feelings, and to the leading principles refpecting them, we fhall proceed to offer fome obfervations refpecting the divifion and claffification of our feelings.

The lateft writer on the arrangement and explanation of the feelings is Dr. Cogan, in his Philofophical Treatife on the Paffions; and his work is the beft which is acceffible, to the Britifh public at leaft. Of his valuable treatife we have already given an ample account under the article PASSION; and we here cite again particular paffages that occur under that article, in order to give our readers a better opportunity of forming a competent judgment of our remarks. Dr. Cogan ufes the term *paffions* with much greater latitude than what we have affigned to it, in the paffage above referred to; and we think he is not fortunate in fo doing. This generic term, *feelings*, limited to *mental* feelings, as diftinct from *fenfations*, might perhaps have fupplied its place, in thofe cafes in which he has employed it in its wideft acceptation. But as to the more limited fenfe, to which he appears to wifh to confine it by his definition, it is not calculated to bring into view thofe extraordinary workings of the mind, to which alone we would limit the term. We agree with him, that the term *paffion* fhould convey an idea of the *paffivenefs* of the mind, when under its influence, as far as it relates to that influence; but we conceive that this paffivenefs is not the prominent feature of a paffion.

But we will quote this philofopher's explanation of paffions, and alfo of emotions; refpecting which laft we have alfo to regret our differing confiderably from him. "The term paffion," he fays, p. 6, "may with ftrict propriety be ufed, and ufed exclufively, to reprefent the *firft feeling*, the *percuffion* as it were, of which the mind is confcious from fome impulfive caufe; by which it is wholly acted upon, without any efforts of its own either to folicit or efcape the impreffion." We fhould have little objection to fuch a limitation of the term, if we had any other to exprefs thofe peculiar ftates of excitement to which we have applied it, and we apprehend more agreeably to its common acceptation. The fact is, that though common language fupplies a confiderable variety of difcriminating terms for the purpofes of mental philofophy, and particularly for the department of intellect, we ftill want feveral to mark the various fhades and diverfities of feeling, which are now, to the deftruction of all accuracy, claffed under one or two general heads, and diftinguifhed only by their generic appellation. A great deal will be effected when thofe terms, which we already

already have, become more fettled and limited in their application.

But to proceed with Dr. Cogan's explanation of the term *emotions*. "The ftate of abfolute paffivenefs, in confequence of any fudden percuffion of mind, is of fhort duration. The ftrong impreffion, or vivid fenfation, immediately produces a re-action correfpondent to its nature, either to appropriate and enjoy, or to avoid and repel the exciting caufe. This re-action is very properly diftinguifhed by the term *emotion*. The fenfible effect produced at the firft inftant, by the caufe of the paffion, greatly agitates the frame: its influence is immediately communicated to the whole nervous fyftem; and the commotions excited in that, indicate themfelves both by attitudes and motions of the body, and particular expreffions of countenance. Thefe effects are fuch univerfal concomitants, that no very important change in the ftate of the mind can take place, without fome vifible change of a correfpondent nature in the animal economy. Emotions, therefore, according to the genuine fignification of the word, are principally and primitively applicable to the fenfible changes and vifible effects which particular paffions produce upon the frame, in confequence of this re-action, or particular agitation of mind." The term, *emotions*, therefore, Dr. Cogan, though he more commonly employs it in a much lefs exceptionable fenfe, clearly regards as denoting "the external marks or vifible changes produced by the impetus of the paffions upon the corporeal fyftem;" but he ftates that it "is fometimes expreffive of lively fenfations," or rather feelings, "which do not produce vifible effects in any degree proportionate to their feelings;" and that it "is frequently employed to mark the firft impreffion which particular objects make upon fufceptible minds, whether they remain concealed or not." The fact appears to the writer of this article to be, that though the term may be applied to the vifible effects of inward feelings, yet that this is only becaufe they are regarded as the figns or confequences of mental emotions; and that the concomitance of the ufual vifible effect is fo far from being effentially neceffary, that in many individuals of ftrong feelings, placed under habitual reftraint as to the expreffion of them, the moft powerful internal emotions have little or no perceptible external effect. To entitle feelings to the appellation of *emotions*, we conceive that they muft arife and proceed in the mind, without any direct exertion, (if attended with which, they have been well termed the *workings* of the mind,) and they muft be accompanied with fome degree of excitation. When the excitement is very powerful, and the caufe painful, the emotions produced might be more appropriately termed *agitations:* we fhould fpeak of the emotions of forrow, the agitations of defpair; the emotions of maternal folicitude, the agitations of terror, &c. *Rapture* denotes a ftrongly excited ftate of mind, producing lively emotions, arifing from a pleafurable caufe.

The arrangement of our feelings muft be in a great meafure determined by the object in view. If this be, to take the feelings as they are, in their compound ftate, and to arrange them fo as to fhew their relationfhip and tendency to affect one another, having in view the phenomena rather than the caufes of them, we fhould be inclined to give a decided preference to Dr. Cogan's elegant, and, in feveral refpects, fatisfactory claffification: but if the object be to trace them to their fources, in order to fhew how they are generated, directly or indirectly, from the relics of fenfations, and how they are modified by the various combinations of them, which, as has been already obferved, is of the higheft moral importance, Dr. Hartley's arrangement muft have the preference, having been exprefsly formed with that fpecific view.

The outline of Dr. Cogan's arrangement (fee the article PASSION) is thus ftated by himfelf (p. 53.): "When the nature of the exciting caufe is more accurately afcertained, it will be found to refpect either the *felfifh* or the *focial* principle: hence arife two important diftinctions, forming two different claffes. In each clafs, the predominant idea of a *good*, and the predominant idea of an *evil*, will conftitute two different orders. The leading paffions and affections under each order point out the *genera*. The complicated nature of fome of the paffions, and other contingent circumftances, may be confidered as conftituting *fpecies* and *varieties* under each characteriftic *genus*." Befides the feelings which he thus arranges, (comprehending, with one remarkable exception, all which can with accuracy be termed either paffions or affections,) there is a clafs of feelings, exerting their influence indifcriminately in paffions of the moft oppofite characters, which with great propriety he terms *introductory emotions:* thefe are the feelings of *furprife*, excited by the apparent novelty of the object, or by the unexpectednefs of its introduction; of *wonder*, arifing from apparent intricacy or embarraffment; and of *aftonifhment*, arifing from what is vaft and incomprehenfible. We agree with Dr. Cogan, that the popular, as well as philofophical ufe of the term *emotions*, renders it peculiarly appropriate to thefe feelings; and we feel it neceffary to add to our account of emotions in MORAL *Education*, that the term is employed to denote fimilar ftates of excited feeling, whether or not introduced by the exercife of the affections: and this extenfion of the term is requifite for the employment of it in connection with fome of the objects of tafte, as we think it is ufed by Mr. Allifon. At the end of the laft preceding paragraph but one, we have endeavoured to exprefs ourfelves with lefs limitation.

Although we have already given a concife fketch of Dr. Cogan's claffification under the article PASSION, to which head the plan upon which this Cyclopædia is conducted led us naturally to refer it, we fhall here, with a view to the more convenient introduction of our remarks on this part of his fyftem, be under a neceffity of retracing part of the ground which has been occupied by a preceding article. The importance of the fubject renders it needlefs to make an apology to our readers for a repetition, without which the difcuffion of this interefting branch of mental philofophy would have been partial and incomplete. The definitions, unlefs otherwife intimated, will, we truft, be found to be a correct reprefentation of at leaft the fubftance of thofe given by Dr. Cogan.

Clafs I.—Feelings relating to *Self-love*. *Order* 1.—Feelings excited by the idea of *good* (1) in *poffeffion*. *Joy* is the vivid delight arifing from the immediate reception of fomething peculiarly grateful to the mind, and ufually depending upon a fudden impulfe. *Gladnefs* is an inferior degree of joy. *Cheerfulnefs* is an emotion of ftill gentler influence, often infpired by very trivial circumftances in perfons of a lively difpofition, and free from anxious care. [Here, befides an employment of the term *emotion*, which very little accords with Dr. Cogan's own explanation of it, we have to obferve, that *cheerfulnefs* is rather a *ftate of mind*, than an *emotion;* though it may occafionally be attended with emotions peculiar to itfelf, and ftill more frequently predifpofes to pleafing emotions: it appears to us peculiarly to denote that tranquil healthful frame of mind, in which it is alive to the gentler feelings of pleafure, and is free from all tendency to gloomy or otherwife painful trains of of thoughts.] *Mirth* is a higher degree of cheerfulnefs, generally excited by what is facetious or ludicrous. [This feeling may in many cafes have a near alliance to cheerfulnefs ; but the wildeft mirth is often found where cheerfulnefs is utterly unknown.] If the good be not tranfitory or evanefcent, we remain under the influence of contentment, fatisfaction, or complacency. *Contentment* expreffes the acquiefcence of the mind in the portion of good we poffefs. *Satisfaction* denotes a pleafing ftate of mind, exceeding that communicated by fimple contentment. *Complacency* (p. 66.) is full and continued fatisfaction, connected with a confiderable degree of approbation, arifing from the perception of fome kind of excellence. Dr. Cogan's remarks here are peculiarly interefting and valuable. *Pride* is that exalted idea of our ftate, qualifications, or attainments, which exceeds the boundaries of juftice, and induces us to look down upon inferiors with fome degree of unmerited contempt. *Vanity* is that fpecies of pride, which, while it prefumes upon a degree of fuperiority in fome particular articles, fondly courts the applaufe of every one within its fphere of action, feeking every occafion to difplay fome talent or fuppofed excellence : (fee MORAL *Education*, col. 38.) *Haughtinefs* is an overt act of pride, manifefted by fome action or expreffion, indicative of unmerited contempt of others. *Arrogance* indicates itfelf by fome particular claims to precedency, or marks of diftinction and refpect from thofe whom pride confiders its inferior in ftation or character, or by impertinent pretenfions to an equality with fuperiors.

" Thefe indications of falfe complacency," continues Dr. Cogan, p. 72. " in their mildeft influence may be placed with ftrict propriety among the *affections :* upon fudden occafions they rife into *emotions ;* and fometimes, particularly when connected with anger, from a fuppofed infult or neglect, they poffefs every characteriftic of *paffion*." We notice this obfervation, partly as according much more with the explanation we have endeavoured to give of the laft two claffes of feeling, than with Dr. Cogan's own, and partly to add one farther remark on the divifion of our feelings. The term *affection* may be employed to denote any mental ftate in which the mind is *affected* with pleafure or pain by external impreffions, or by its own ideas; and it may fometimes be convenient thus to employ it ; but between this very wide acceptation, and that which we have already ftated in MORAL *Education*, col. 24, and which we know not how to extend, without lofing its peculiar import, there is a term wanting, to denote thofe feelings or ftates of mind, which (though fometimes the rudiments of emotions and paffions) have a more permanent habitual character, where yet the feelings of love or hatred cannot be traced as component parts. Thus, we know not how to regard pride as an affection, unlefs we ufe the term in its wideft acceptation : pride confifts in too high thoughts of ourfelves ; and for the complex ftate of feeling with which fuch thoughts are accompanied, and which give them habitual influence among our motives to action, we want a generic appellation. Similar remarks might be made refpecting the feelings of contentment, cheerfulnefs, forrow, melancholy, &c. In many cafes the term *difpofition* would anfwer the purpofe ; but our prefent nomenclature is clearly inadequate to difcriminate all the claffes of our feelings.

I. *Order* 1. (2) Feelings relating to *Self-love*, excited by the idea of *good* in *expectancy*. *Defire* is that influential effect which the perception of good or evil produces within us, in confequence of which we feek to obtain the one and avoid the other. *Wifhes* are inactive defires, in cafes where no expectations can be formed, no efforts made. A wifh may refer to *paft* fcenes or to *impoffibilities*, where defire is totally inapplicable. [Dr. Cogan's view of the *varieties* of defire is too brief for much abridgment : it includes fome of the religious feelings.] *Hope* is the encouragement given to defire ; the pleafing expectancy that its objects fhall be obtained.

I. *Order* 2. Feelings relating to *Self-love*, which are excited by the idea of *evil*. (1) Feelings arifing from actual loffes and difappointments, which clafs under the head of forrow. *Sorrow* expreffes a mental fuffering under the privation of fome good which we actually poffeffed, or concerning which we entertained a pleafing expectation. *Grief* is fometimes confidered as fynonimous with forrow ; and in this cafe we fpeak of the *tranfport* of grief : at other times it expreffes more filent, deep, and painful feelings, fuch as are infpired by domeftic calamities. When the mind is very deeply impreffed with a fenfe of calamity, for a continuance, and the attention cannot by any means be diverted from it, the fubject is in a ftate of *melancholy*. Sorrow is often diverfified by being blended with other feelings. Sometimes it affumes the appearance of *difcontent* and *diffatisfaction ;* the one, chiefly produced by an humiliating comparifon of our fituation with thofe of others ; the other by a partial accomplifhment of our ardent wifhes. Where the difappointment is great, efpecially when referred to the agency of others, diffatisfaction becomes *vexation* or *chagrin ;* all implying irritation as well as forrow. *Impatience* is alfo a mixture of forrow and anger, under the immediate fenfation of fomething irkfome, or at the caufes of unpleafant delay. *Repining* is forrow united with fome degree of refentment, where the mind dares not break forth into ftrong expreffions of anger. *Patience* is a calm acquiefcence in a ftate in which we experience uneafinefs or fuffering. *Refignation* adds a fubmiffive difpofition refpecting the intelligent caufe of our uneafinefs. *Humility* is a degree of habitual forrows, or painful apprehenfions, concerning our moral or intellectual deficiencies.

We obferve here the influence of too great a defire to generalife in the claffification of our feelings. Humility may fometimes be nearly allied to forrow ; but it furely is not neceffarily fo. He who is confcious of having fpared no exertions in the cultivation of his mind, may feel a tranquil humility in contemplating his own inferiority, without any difcontent or forrow ; the pious mind may take delight in contemplating its infinite inferiority, to the great object of its adorations ; and fo on. *Humility* is the difpofition which leads us to think lowly of ourfelves : where it is a fteady influential difpofition, it is productive of tranquil emotions, fometimes even of fatisfaction at the fuperiority of others : where it is attended with the confcioufnefs of wrong caufes of inferiority, forrow muft blend with it ; but an humble fenfe of our own intellectual and moral qualities is fo clofely allied to contentment, and fo effectually preferves us from the painful and uneafy emotions of pride, that humility, in its habitual character, is more nearly related to happinefs than to mifery. *Humiliation* feems moft correctly to ftand for that feeling which Dr. Cogan denominates humility. (On humility, as oppofed to pride and vanity, fee PHILOSOPHY, *Moral*.) In the fubfequent divifion, Dr. Cogan fpeaks of his having arranged *remorfe* under the head of forrow. There is a remarkable deficiency of that and the related feelings, (at leaft in the fecond edition, to which alone we have the power of referring,) and we will endeavour to fupply it. *Penitence* denotes the forrow we feel at

the

the confcioufnefs of paft tranfgreffions or neglect of duty When the feelings of penitence poffefs fo much influence in the mind, as to excite it to fteady refolutions of amendment, and to effectual efforts after reformation, both in the affections and conduct where wrong, they may be denominated *repentance*. *Contrition* feems to exprefs a more permanent ftate of forrow at the recollection of paft fins and failures, in which the mind is deeply humbled, and the fpirit wounded, often giving a tinge of melancholy to the trains of thought and feeling. It does not exclude the hope of final acceptance; but it indulges not the rapture of affurance. It is clofely allied to humility; and may often be confidered as a mixture of humility and penitential forrow. *Remorfe* is the corroding uneafinefs and diftrefs of mind, which accompanies the recollection of glaring breaches of duty, which have been followed by irreparable injuries, efpecially to the welfare of others. It does not neceffarily lead to repentance; where it does, the hope which this infpires, foothes and reduces the feelings to contrition.

I. *Order* 2. (2) Feelings arifing from *felf-love*, relating to *apprehended* evil. The generic feeling of this divifion is *fear*, produced by the immediate apprehenfion of fome impending evil, either of lofs or difappointment. *Confternation* is a ftrong foreboding of tremendous evils which are likely to follow misfortunes already experienced; and it chiefly refers to alarms excited by fome general calamity of incalculable extent. *Abject fear* feems to be infpired chiefly by the idea of an irrefiftible power in its caufe. *Terror* roufes to defend or efcape. *Dread* is a degree of permanent fear; an habitual and painful apprehenfion of fome remote evil. *Defpair* is the permanent fear of evil, without any mixture of hope. *Remorfe* (Dr. Cogan fays) "has been already placed under forrow; but whenever it is connected with a fear of punifhment, it deferves a place under this paffion alfo, which greatly increafes its agonies." *Cowardice* is that habitual difpofition which difqualifies for oppofing dangers and difficulties. *Pufillanimity* is terrified at mere trifles, or imaginary dangers. *Timidity* is a lefs reproachful term, employed when there is fome apology from fex, tender years, or feeblenefs of frame. *Doubt*, confidered as a feeling, and diftinct from fimple deliberation, is that comfortlefs ftate which is occafioned by the uncertainty of an event, and the predominancy of fearful apprehenfion refpecting it. *Irrefolution* reprefents the mind as fluctuating between hope and fear, in cafes where it ought to determine. *Shame* is a painful fenfation occafioned by the quick apprehenfion that reputation and character are in danger. *Modefty* may be deemed an habitual folicitude; not to offend againft any fpecies of decorum. [This folicitude is the confequence of the feelings of modefty, not modefty itfelf. We do not however know how to improve upon our bafis.] In oppofition to fear are *fortitude*, which expreffes that firmnefs of mind which refifts dangers and fufferings; *courage*, which is active fortitude; and *intrepidity*, which denotes a courage perfectly undaunted.

I*. *Order* 2. (3) Feelings arifing from the *immediate perception* of evil, relating to the conduct which appears to deferve reprehenfion. *Anger* is a ftrong paffion or emotion, impreffed or excited by a fenfe of injury received, or in contemplation. Anger in the excefs of its violence is termed *rage*. *Wrath* is a violent and permanent anger. *Refentment* is a lower degree of wrath. *Indignation* is refentment, againft conduct which appears peculiarly unworthy. (See alfo Clafs II. Order 2. (2.) *Peevifhnefs* is a flighter degree of anger, perpetually recurring to irritable perfons from trifling caufes.

Clafs II. Feelings derived from the *focial principle*. *Order* 1. Thofe excited by *benevolence*, in which *good* is the predominant idea. (1) Refpecting *good defires* and *difpofitions*. *Benevolence*, or *good-will*, is the love or defire of the good of others. *General benevolence* relates to all beings rendered capable of enjoyment; *philanthropy* to the whole human race indifcriminately. *Affection*, in the moft limited fenfe of the term, denotes the habitual attachment and benignant difpofitions, which the mind experiences in connection with the domeftic relations, various degrees of confanguinity, and particular friendfhips. *Sympathy* is an inward feeling, which harmonifes with the condition and feelings of its object. *Compaffion* is a benevolent forrow, at the fufferings or approaching mifery of others. *Mercy* is that dignified compaffion which induces us to fupprefs refentment, to pardon offences, or mitigate punifhment, as far as difcretion may admit. *Commiferation* denotes fympathy for forrows, for which there is no apparent remedy. *Pity* is nearly allied to commiferation and compaffion; but it is more frequently applied to particular circumftances in the ftate of the object, rather than his immediate feelings. *Generofity* prompts us to beftow favours which may require facrifices from us, but are not called for by any particular pretenfions on the part of the object of them. *Liberality* is a fpecies of generofity, chiefly applied to free donations, or to fubduing unfavourable prepoffeffions refpecting the opinions of another. *Charity* in its original import is fynonimous with *love*; it fometimes expreffes a difpofition to favourable judgments of others; at other times it denotes beneficence to the poor. *Condefcenfion* defignedly waves fuppofed perfonal advantages to relieve an inferior from painful feelings.

II. *Order* 1. (2) Feelings derived from *good opinion*. *Gratitude* is a pleafant affection, excited by a lively fenfe of benefits received or intended, or even by the defire of being beneficial. *Thankfulnefs* refers to verbal expreffions of gratitude; yet, "a heart full charged with thankfulnefs," is equally correct and expreffive. *Admiration* is that act of the mind, by which we difcover, approve, and enjoy fome unufual fpecies of excellence, whether intellectual or moral. [We doubt whether Dr. Cogan is borne out by the recent ufage of our beft writers, in this reftriction of the term. He intentionally leaves the more ancient ufage, which gave it nearly the latitude which its derivation allowed; and it is well to give greater precifion to the ufe of terms; but the word appears to be juftly applied to excellence of every fpecies, even where there is no explicit reference to intellectual or moral qualities; we admire a beautiful profpect, without reference to the wifdom of him who caufed its beauty. And with the *difcovery* of the excellence admired, *admiration* has nothing to do. We would define it to be a lively pleafurable feeling, arifing from the perception of excellence.] *Efteem* is the value we place upon fome degree of worth. It is higher than fimple *approbation*, which is a decifion of the judgment. *Refpect* is that favourable impreffion, which the goodnefs of a character has made upon the perfon contemplating it, united with a fhare of good fenfe. *Approbation* is the feeling attending the perception of any valuable moral quality. *Efteem* is the affection entertained towards an individual, whofe character is marked by thofe virtuous and amiable difpofitions which have no neceffary connection with the higher qualities of the underftanding. The judgment may approve; but its decifion is not itfelf approbation; this is more properly the feeling confequent on the approving decifion. *Refpect* relates to the higher moral qualities, which indicate confiderable ftrength of underftanding. *Veneration* is a higher degree of refpect, in which the mind appears to be more forcibly ftruck with

wifdom,

wisdom, connected with the sterner virtues. *Awe* is an impression made by a lively idea of power, modified by circumstances or qualities, which suggest the idea of safety. *Reverence* relates to superiority in moral endowments, connected with awe at intellectual powers, and a consciousness of our own comparative deficiencies. The complacential feelings are liable to abuse, and give rise to *fondness*, which indicates attachment to whatever belongs to us, or is immediately connected with us, far beyond its intrinsic merit; and to *partiality*, which is an excess of personal attachment, inclining to such a favourable opinion of the motives, conduct, and general merit of its object, as is inconsistent with the justice due to others.

II. *Order* 2. Feelings excited by *displacency*, in which *evil* is the predominant idea. Dr. Cogan uses *displacency* in preference to *malevolence*, as it does not include what the latter always implies, the idea of ill-will. (1) Displacency indicated by *malevolent desires and dispositions*. "*Hatred* expresses the disposition we entertain concerning, or the manner in which we are affected by, the contemplation of what we suppose to be an evil." *Malevolence* is hatred directed towards persons, leading to wish and do them ill. *Malignancy* or *malignity* expresses a disposition which cherishes inveterate hatred, and employs every means of injury: the former seems applied to radical depravity; the latter to indications of it in temper and conduct. *Malice* expresses the dispositions of inferior minds to execute every purpose of mischief within their abilities. *Envy* is the painful sensation excited by the view of something desirable in the state and situation of another, which self-love wishes to appropriate: it entertains a degree of sorrow that the good contemplated should escape ourselves, and of anger that it should fall to the share of another. *Rancour* is a degree of malice which preys upon its possessor. *Cruelty* is the disposition which delights in the contemplation or infliction of absolute misery. *Censoriousness* is a disposition to find fault with the conduct, sentiments, or motives of others. *Prejudice*, when used alone, denotes the disposition to prejudge the character, conduct, or motives of another, to his disadvantage, without having the proper evidence before us. *Dislike* is a species of hatred divested of all ill-will towards the object of it, and of every wish for his unhappiness. *Ingratitude* is an insensibility to benefits received, arising from stupidity, culpable inattention, or pride. *Apathy* is a stagnation of the social feelings. A second species of malevolence relates to those occasional and more transient fits of ill-will, which are excited by particular provocations, and which are not totally repugnant to the benevolent affections. These are indicated by anger, and its various modifications. (See Class I. Order 2, (3), for *Anger*, *Rage*, *Wrath*, and *Resentment*.) *Revenge* is an insatiable desire, prompting to sacrifice every consideration of pity and humanity to the principle of vindictive justice, deriving pleasure from the infliction and contemplation of the misery of its object. *Suspicion* is a comfortless state of doubt respecting the conduct and character of another. *Jealousy* is a painful apprehension of rivalship in cases that are peculiarly interesting to us.

II. *Order* 2. (2) Displacency indicated by *unfavourable opinions* of conduct and disposition. *Horror* is that very strong and painful feeling, which is excited by the view or contemplation of something peculiarly atrocious in the conduct of another. It may also be excited by the extremes of agony, mental or corporeal. *Indignation* expresses a strong and elevated disapprobation of mind, which is inspired by something flagitious in the conduct of another. *Contempt* is a more calm and deliberate affection of the mind, whose objects are meanness of character, perverseness of conduct, and radical imbecility, where it ought not to exist. *Disdain* is such a degree of contempt as precludes any commerce with the party despised. *Irrision* expresses the feeling inspired by any peculiarity of sentiment, disposition, or conduct, which we deem an offence against some acknowledged law of congruity or propriety, but which is not of sufficient magnitude to excite anger, or any of its ramifications. Its objects are the whimsical and absurd.

In various parts of Dr. Cogan's analytical survey, of which we have now given the outline, he introduces moral and philosophical remarks of a highly interesting nature, respecting the effects produced on the corporeal and mental system, by the various feelings which he describes; and the second part of his work consists of observations on the laws of excitement, the causes which create a diversity in our affections, and the influence of the passions. The whole deserves the attention of every philosophical inquirer, and will be found of great moral service to the reflecting mind. "It may with justice be advanced," says Dr. Cogan, (Pref. p. iv.) "that the history of ourselves, in this department, is of much greater utility than abstruse speculations concerning the metaphysical nature of the human soul, or even the most accurate knowledge of its intellectual powers: for it is according as the passions and affections are excited, and directed towards the objects investigated by our intellectual natures, that we become useful to ourselves or others; that we rise into respectability, or sink into contempt; that we diffuse or enjoy happiness, diffuse or suffer misery."

Though Dr. Cogan's arrangement is in many respects satisfactory, two leading objections lie against it, which we shall notice, with a view to those who may follow him in his track. The first is, that there is no distinct appropriate class for those feelings which respect the *religious* principle. We are the more surprised at this, since the writings of Dr. Cogan clearly designate him as a religious philosopher. If it were desirable to discriminate feelings of the same general nature, according as they respect the selfish or the social principle, the very peculiar effect produced upon them, by the direction of them to the Supreme Being, entitled them, when so directed, to a separate division. The consequence has been, that the religious feelings, as such, are but very cursorily considered: some are omitted, such as *faith* and *trust*; and at least one is introduced in an unhappy situation, we mean that of *resignation*, which can scarcely be said to operate upon the principle of self-love. This, however, is a defect which may be easily supplied; but the radical inconvenience of the arrangement arises from the primary divisions, which cause the separation of feelings generically the same, or the repetition of them, under each class. There is no broadly marked distinction in many of the feelings, in consequence of their respecting the selfish or the social principle. The feelings of sorrow, for instance, do not *essentially* differ in their character, whether the cause of grief be wholly personal, or be such as to excite deep but disinterested sympathy. It would, we are satisfied, have been but to drop the primary division, and to consider each class of feelings under its various modifications; under each species pointing out the characteristic differences produced by the change of objects, whether personal, social, or religious. The selfish and the social principles so continually run into each other, that every attempt to found a distinct classification upon them, however beautiful the arrangement may appear in theory, must be attended with great embarrassment in the application of it.

Hartley's arrangement is two-fold: first, the passions or affections in general; and, secondly, the passions and affections, as excited by different classes of mental pleasures and pains.

pains. He appears to ufe the terms paffions and affections as fynonimous; and he employs them with a latitude which we cannot confider as by any means expedient. Refpecting the latter object, we fhall have an opportunity of fpeaking under the different claffes. We fhall here briefly ftate his arrangement of the general paffions and affections.

As all the paffions arife from pleafure and pain, Hartley obferves, the firft and moft general diftribution is into love and hatred; *i. e.* we may term all thofe affections of the pleafurable kind, which objects and incidents raife in us, *love;* and all thofe of the painful kind, *hatred*. When thefe are excited to a certain degree, they put us upon a variety of actions, and may be termed *defire* and *averfion;* underftanding by this laft word an active hatred. *Hope* and *fear* are the attendants upon defire and averfion. Thefe affect us more or lefs, according to the more or lefs frequent recurrency of the pleafing and painful ideas, the greater or lefs probability of the expected event, the greater or lefs diftance of time, &c.; the power of affociation difplaying itfelf every where in the agitations of mind excited by thefe paffions. *Joy* and *grief* are love and hatred exerted towards an object which is prefent. After thefe are over, and the object withdrawn, there generally remains a *pleafing* or *difpleafing recollection*, which recurs with every recurrency of the idea of the object, or of the affociated ideas, and keeps up the love or hatred. In like manner, the five grateful paffions, love, defire, hope, joy, and pleafing recollection, all enhance one another; as do the five ungrateful ones, hatred, averfion, fear, grief, and difpleafing recollection. And the whole ten, taken together, Hartley confiders as comprehending all the general paffions of human nature.

6. *Of the Will.*—The will is that ftate of mind which is immediately previous to, and caufes thofe exprefs acts of memory, imagination, judgment, and bodily motion, which are termed voluntary. This is nearly Hartley's account of it in his Introduction; and it is the leaft exceptionable we know of. He afterwards fays (prop. 89.) "the will appears to be nothing but a defire or averfion fufficiently ftrong to produce an action that is not automatic, primarily or fecondarily. At leaft it appears to me that the fubftitutions of thefe words for the word *will*, may be juftified by the common ufage of language. The will is, therefore, that defire or averfion which is ftrongeft for the then prefent time." As he confiders all love and hatred, all defire and averfion as generated by affociation, he of courfe refers the will to the fame origin.

The fubject is truly difficult; and is not a little perplexed by the various theories which have been invented refpecting the voluntary powers: and Hartley appears to us far from fuccefsful. Indeed it would probably have been beft to leave the matter entirely to every one's own confcioufnefs, with his firft account of it. The will certainly affumes different complexions, according to the nature of the motives influencing it; fometimes it is a fimple determination of the underftanding, at other times it is the refult of the affections, paffions, &c. The caufes influencing the will, with the variations in their influence, the connection of it with action, mental or corporeal, its influence over the trains of thought and feeling, &c. open a wide field for inveftigation equally interefting and important: and we regret that circumftances do not permit us to enter upon it. And to this fuggeftion to the inquirer, we wifh to add another: Whether the feeling termed *defire* is generated by affociation from the relics of fenfation. We have fometimes thought it neceffary to admit a fimple elementary principle in the human mind fuch, that if its intellectual faculties could be fully developed without experiencing any pleafures or pains, a cafe which is of courfe utterly impoffible as man is conftituted, the communication of pleafurable feeling would immediately excite defire. But, upon more mature reflection, we are decidedly inclined to believe, that, aided by the exercife of the underftanding, the operation of the affociative power on the relics of fenfations, is fully adequate to the production of *defire*. Our doubts have been fimilar, and alfo our prefent views, refpecting *belief*. We would attempt an analyfis of thefe principles of our mental conftitution, but find our materials as yet too imperfect; and we refer to the fubject chiefly to excite to it the attention of thofe who take an intereft in fuch fpeculations. When Newton made his immortal difcoveries refpecting the grand phyfical principle of nature, it muft have appeared to his immediate fucceffors that there was little more to be done in natural philofophy, fo far as refpects the direct phenomena of attraction; thofe who know any thing of the progrefs of aftronomy fince that period, and particularly of the extent of the application of the law of gravitation to the apparent irregularities of the planetary motions, muft perceive that the field opened by Newton affords abundant room for the exercife of the moft vigorous intellect: and in the infinitely varied and complicated phenomena of mind (important as is the difcovery of the grand law occafioning or affecting them all, and extenfive as is Hartley's application of it), there is ftill fcope for the unremitting exertion of the higheft powers of the underftanding, to obferve, to analyfe, and to explain them. But we will proceed from what we think he has not fully inveftigated to his *practical* obfervations, in which his principles always fhine refplendent. We fhall here extract, without alteration, the remarks of that nature from his 89th propofition. The reader, who is unacquainted with his Obfervations, will perceive in them the ufual characteriftics of his ftyle; great fimplicity feldom rifing above neatnefs, and feldom failing to reach it, and perfpicuity fcarcely ever interrupted, except by that compreffion and profundity of thought which require a conftant effort of clofe attention till the mind is familiarized to his inveftigations.

"Since the things which we purfue do, when obtained, generally afford pleafure, and thofe which we fly from affect us with pain, if they overtake us, it follows that the gratification of the will is generally attended or affociated with pleafure, the difappointment of it with pain. Hence a mere affociated pleafure is transferred upon the gratification of the will; a mere affociated pain upon the difappointment of it. And if the will was always gratified, this mere affociated pleafure would, according to the prefent frame of our natures, abforb as it were all our other pleafures; and thus, by drying up the fource from whence it fprung, be itfelf dried up at laft: and the firft difappointments, after a long courfe of gratification, would be intolerable. Both which things are fufficiently obfervable, in an inferior degree, in children that are much indulged, and in adults, after a feries of fuccefsful events. Gratifications of the will without the confequent expected pleafure, and difappointments of it without the confequent expected pain, are particularly ufeful to us here. And it is by this, amongft other means, that the human will is brought to a conformity with the divine; which is the only radical cure for all our evils and difappointments, and the only earneft and medium for obtaining lafting happinefs.

"We often defire and purfue things which give pain rather than pleafure. Here, it is to be fuppofed, that at firft they afforded pleafure, and that they now give pain on account of a change in our nature and circumftances. Now, as the continuance to defire and purfue fuch objects, notwithftanding withſtanding the pain ariſing from them, is the effect of the power of aſſociation, ſo the ſame power will at laſt reverſe its own ſteps, and free us from ſuch hurtful deſires and purſuits. The recurrency of pain will at laſt render the object undeſirable and hateful. And the experience of this painful proceſs, in a few particular inſtances, will at laſt, as in other caſes of the ſame kind, beget a habit of ceaſing to purſue things, which we perceive by a few trials, or by rational arguments, to be hurtful to us upon the whole.

"A ſtate of deſire ought to be pleaſant at firſt from the near relation of deſire to love, and of love to pleaſure and happineſs. But in the courſe of a long purſuit, ſo many fears and diſappointments, apparent or real, in reſpect of the ſubordinate means, and ſo many agitations of mind paſſing the limits of pleaſure, intervene, as greatly to checquer a ſtate of deſire with miſery. For the ſame reaſons, ſtates of averſion are checquered with hope and comfort."

For ſome extracts from Dr. Reid on the will, ſee Div. VIII. § 2. of this article, near the end.

We ſhall only add here, as a farther ſuggeſtion for the inquirer, that rudiments of mental deſire are to be ſought in the uneaſy ſenſations attending the mere corporeal appetites when not ſupplied ſoon enough, the pleaſure ariſing from their gratification, and the aſſociation early formed between thoſe pleaſures and the means of gratification: they muſt, therefore, be ſought for in the infant at the breaſt; but in obſerving for this purpoſe, we muſt carefully diſtinguiſh between mere mechanical motion, and that in which the percipient principle is concerned.

7. *Of the Claſſes of Intellectual Pleaſures and Pains, with ſome Account of their Origin.*—The intellectual pleaſures and pains are arranged by Hartley in ſix claſſes. Perhaps the arrangement, and certainly the appellations, of the claſſes, are not unexceptionable; but ſo much light is thrown upon this part of our mental ſtructure by the analyſis of them given by Hartley, and it is ſo much eaſier to find fault than to improve, that we ſhall probably do beſt by taking the arrangement, and, with a few paſſing remarks, the appellations, as we find them, and by laying before our readers ſuch a ſpecimen of his analytical inveſtigations as may lay a ſolid foundation for correct notions on this important point, and lead them to ſeek for further information in his Obſervations. The intellectual pleaſures and pains are; 1. Thoſe of *imagination*, ariſing from natural or artificial beauty or deformity. 2. Thoſe of *ambition*, ariſing from the opinions of others concerning us. 3. Thoſe of *ſelf-intereſt*, ariſing from the poſſeſſion or want of the means of happineſs and ſecurity from, or ſubjection to, the hazards of miſery. 4. Thoſe of *ſympathy*, ariſing from the pleaſures and pains of others. 5. Thoſe of *theopathy*, ariſing from the conſideration of the attributes of the Deity, and the relation in which we ſtand to him. And 6. Thoſe of the *moral ſenſe*, ariſing from the contemplation of moral beauty and deformity.

In p. 89, Hartley ſeems to conſider the above as the order in which the intellectual pleaſures and pains are generated: if ſo, he is certainly in an error. The elementary principles of ſympathy have an earlier origin than thoſe of imagination or ambition; and thoſe of the moral ſenſe than the theopathetic feelings. Taking the claſſes each as a whole, he is probably right; but their reciprocal influences on each other begin too early to allow of any nice diſtinction between them. Indeed the mental feelings generally run into and modify one another ſo much that they baffle all minute accuracy in arrangement. Even in the departments of natural hiſtory and phyſical ſcience this is the caſe; and the difficulty might, *à priori*, be expected to be much greater in the claſſification of our mental phenomena.

In connection with the pleaſures of imagination, we wiſh to mention Mr. Alliſon's Eſſays on the Nature and Principles of Taſte, as a work of very great merit, which, while it can ſcarcely fail to be highly intereſting to all who are habituated to think on what paſſes within them, furniſhes ample illuſtration of the principle of aſſociation. It may not, perhaps, be erroneous to ſay, that if he had conſidered that principle in all its bearings, he would occaſionally have written differently; but he has done ſo much, that the Hartleyan muſt view him as a fellow-labourer. We do not recollect that he, any where, refers to Hartley; *perhaps* (but we think not) he may view his inveſtigations in the ſame light with his friend Mr. Stewart; but we do not heſitate in believing, that both he and Mr. Stewart owe much more to Hartley than the latter would be willing to allow. We muſt alſo refer our readers, in this connection, to the ſecond part of Mr. Stewart's Philoſophical Eſſays; and to various parts of the 5th chapter of his Elements.

(1) *Of the Pleaſures and Pains of Imagination.*—This claſs of feelings may be diſtinguiſhed into ſeven kinds, the *pleaſures* ariſing from the *beauty of the natural world*; from the *works of art*; from the liberal arts of muſic, painting, and poetry; from the *ſciences*; from the *beauty of the perſon*; from *wit and humour*; and the *pains* which ariſe from groſs *abſurdity*, *inconſiſtency*, or *deformity*. As the pleaſures of the firſt claſs admit of the moſt ſimple analyſis, we ſhall ſelect this as a ſpecimen.

The pleaſant taſtes and ſmells, and the fine colours of fruits and flowers, the melody of birds, and the grateful warmth or coolneſs of the air in the proper ſeaſons, transfer the relics of theſe pleaſures upon rural ſcenes, which riſe up inſtantaneouſly ſo mixed with each other, and with ſuch as will immediately be enumerated, as to be ſeparately indiſcernible. If there be any object in the ſcene calculated to excite fear and horror, the naſcent ideas of theſe magnify and enliven all the other ideas, and by degrees paſs into pleaſures, by ſuggeſting the ſecurity from pain. In like manner the grandeur of ſome ſcenes, and the novelty of others, by exciting ſurpriſe and wonder, that is, by making a great difference in the preceding and ſubſequent ſtates of mind, ſo as to border upon, or even enter into, the limits of pain, may greatly enhance the pleaſure.

Uniformity and variety, in conjunction, are alſo principal ſources of the pleaſures of beauty, being made ſo partly by their aſſociation with the beauties of nature, partly by that with the works of art, and with the many conveniences which we derive from the uniformity and variety of the works of nature and of art; they muſt therefore transfer part of the luſtre borrowed from the works of art, and from the conveniences they afford, upon the works of nature. Poetry and painting are much employed in ſetting forth the beauties of the natural world, at the ſame time that they afford us a high degree of pleaſure from other ſources; hence they blend ſome or other of the relics of thoſe other pleaſures with thoſe of natural beauty. The many amuſements which are peculiar to the country, and whoſe ideas and pleaſures are revived in a faint degree by the view of rural ſcenes, and ſo mixed together as to be ſeparately indiſcernible, further augment the pleaſures ſuggeſted by the beauties of nature. To theſe we may add the oppoſition between the offenſiveneſs, dangers, and corruption of populous cities, and the health, tranquillity, and innocence, which the actual view, or the mental contemplation of rural ſcenes introduces; and the pleaſures of ſociality and affection which have many connections with them; and thoſe pleaſures which the opinions and encomiums of others reſpecting natural beauties produce in us, in this, as in other caſes, by means

of

of the contagioufnefs obfervable in mental as well as in bodily difpofitions. It is alfo to be remarked that green, which is the moft agreeable to the organ of fight, is the moft general colour of the vegetable kingdom, that is, of external nature; but at the fame time with fo many varieties, that it lofes little or none of its effect in producing pleafure, which it would do if it were all of the fame tint. Thofe perfons who have already formed high ideas of the power, knowledge, and goodnefs of the Author of nature, with fuitable affections, generally feel the exalted pleafures of devotion upon every view and contemplation of his works, either in an explicit and diftinct manner, or in a more fecret and implicit one; hence part of the general indeterminate pleafures here confidered, is deducible from the pleafures of theopathy.

The above may be confidered as the principal fources of the beauties of nature to mankind in general. Inquifitive and philofophical perfons have fome others arifing from their peculiar knowledge and ftudy of natural hiftory, aftronomy, and philofophy in general; for the profufion of beauties, ufes, fitneffes, elegance in minute things, and magnificence in great ones, exceed all bounds of imagination; and new fcenes, and thofe of unbounded extent, feparately confidered, ever prefent themfelves to view, the more any one ftudies and contemplates the works of God.

Upon the whole the reader may fee that there are fufficient fources for all thofe pleafures of imagination which the beauties of nature excite in different perfons; and that the differences which are, in this refpect, found in different perfons, are fufficiently analogous to the differences of their fituations in life, and of the confequent affociations formed in them. Thofe who are clofely attentive to what paffes within them, may alfo, when contemplating the beauties of nature, frequently difcern the relics of many of the particular pleafures here enumerated while they recur in a feparate ftate, and before they coalefce with the general indeterminate aggregate; and this verifies the account here given. It is alfo a confirmation of it, that an attentive perfon may obferve great differences in the kind and degree of the relifh which he has for the beauties of nature in different periods of his life; efpecially as the kind and degree will be found to agree in the main with the foregoing account. To the fame purpofe it may be obferved, that thefe pleafures do not cloy very foon, but are of a lafting nature when compared with the fenfible ones; fince this follows naturally from the great variety of their fources, and the evanefcent nature of their conftituent parts.

(2) *Of the Pleafures and Pains of Ambition.*—The opinions of others concerning us, when expreffed by correfponding words or actions, are principal fources of happinefs or mifery. The pleafures of this kind are ufually referred to the head of honour, the pains to that of fhame. We are here to enquire by what affociations it is brought about that men are folicitous to have certain particulars concerning themfelves made known to the circle of their friends and acquaintance, or to the world in general; and certain others concealed from them; and alfo why all indications that thefe kinds of particulars are made known, fo as to produce approbation, efteem, praife, &c. or diflike, cenfure, contempt, &c. occafion fuch exquifite pleafures as thofe of honour, or fuch intenfe pains as thofe of fhame. Thefe particulars may be claffed under four heads: *external* advantages or difadvantages; *bodily* perfections or imperfections; *intellectual* accomplifhments or defects; *moral* ones, that is, virtue or vice. We fhall, as before, felect the analyfis of one of thefe claffes of the feelings of ambition.

The intellectual accomplifhments and defects which occafion the feelings of ambition, are fagacity, memory, invention, wit and learning; and their oppofites, folly, dulnefs, and ignorance. Now it is evident that independent of the intrinfic value of the former clafs, and difadvantage of the other, the circumftance of their being made known to others, refpectively produces certain privileges and pleafures, or fubjects to inconveniences and pains. It follows, therefore, that every difcovery of this kind to others, alfo every mark or affociate of fuch difcovery, will, by affociation, raife up the relics of thofe privileges and pleafures, or inconveniences and pains refpectively; and thefe being gradually blended together, and united with thofe with which each repetition of the producing caufe is accompanied, afford in each inftance a peculiar compound pleafure or pain, which, by the cuftom of our language, has the word *honour* or *fhame* refpectively connected with it.

This general account will apply to each of the four claffes of the feelings of ambition; but the feelings of honour or fhame connected with this particular clafs, require a more minute analyfis. A great part, perhaps the greateft, is derived from the high ftrained encomiums, applaufes, and flatteries, paid to talents and learning, and the outrageous ridicule and contempt thrown upon folly and ignorance, in all the difcourfes and writings of men of genius and literature; thefe perfons being extremely partial to their own excellencies, and carrying the opinion of the world along with them by the force of their abilities and eloquence. It is alfo to be obferved, that, in the education of young perfons, and efpecially of boys and young men, great rewards are conferred, in confequence of intellectual abilities and attainments, and great punifhments follow negligence and ignorance; which rewards and punifhments being refpectively affociated with the words expreffing praife and cenfure, and with all their other circumftances, transfer upon praife or cenfure compound vivid relics of thofe pleafures and pains.

In like manner all the kinds of honour and fhame, by being expreffed in words and fymbols which are nearly related to each other, enhance each other; thus, for inftance, the careffes which are given to a child, when he is dreffed in fine clothes, prepare him to be much more affected with the careffes and encomiums beftowed upon him when he has been diligent in getting his leffon; and, indeed, it ought to be remarked, that the words and phrafes of the parents, governors, fuperiors, and attendants, have fo great an influence over children, when they firft come to the ufe of language, as inftantly to generate an implicit belief, a ftrong defire, or a high degree of pleafure. Unlefs very improper treatment has been practifed, they have at that early period no fufpicions, jealoufies, recollections or expectations of being deceived or difappointed; and therefore a fet of words expreffing pleafure of any kind which they have experienced, put together in almoft any manner, will raife up in them a pleafurable ftate, and the oppofite words a painful one. Whence it is eafy to fee, that the language expreffing praife or blame muft inftantly, from the mere affociations connected with the feparate words, put them into a ftate of hope and joy, or of fear and forrow. And when the foundation is thus laid, praife and blame will keep their influences, from the advantages or difadvantages attending them, though the feparate words fhould lofe their particular influences, as they manifeftly do in our progrefs through life.

The honour and fhame arifing from intellectual accomplifhments, do often, in learned men, after a time, deftroy in a great meafure their fenfibility in refpect of every other kind of honour and fhame; which feems chiefly to arife from their converfing much with books and learned men,

men, fo as to have a great part of the pleafures which they receive from fuch intercourfe clofely connected with the encomiums on abilities and learning, and to hear all terms of honour applied to them, and the keeneft reproach and the moft infolent contempt caft upon the contrary defects. And as the pleafures which raillery, ridicule, and fatire afford to the by-ftanders, are very confiderable, fo the perfon who is the object of them, and who begins to be in pain upon the firft flight marks of contempt, has this pain much enhanced by the contraft, the exquifitenefs of his uneafinefs and confufion rifing in proportion to the degree of mirth and infolent laughter in the by-ftanders; fo that it happens that very few perfons have courage to ftand the force of ridicule, but rather fubject themfelves to confiderable bodily pains, to loffes, and to the anxiety of a guilty mind, than appear foolifh, abfurd, fingular, or contemptible to the world, or even to perfons of whofe judgment and abilities they have a low opinion.

(3) *Of the Pleafures and Pains of Self-intereft.*—Self-intereft may be diftinguifhed into three kinds; *grofs* felf-intereft, or the purfuit of the means whereby the pleafures of fenfation, imagination, and ambition are to be obtained, and their pains avoided; *refined* felf-intereft, or the explicit, deliberate, feeking for ourfelves of the pleafures of fympathy, theopathy, and the moral fenfe, and a like explicit endeavour to avoid their pains; and *rational* felf-intereft, or the explicit purfuit of our greateft happinefs, without any partiality to any particular kind, or direct or indirect means of happinefs.

The love of money may be confidered as the chief fpecies of grofs felf-intereft, and in an eminent manner affifts in unfolding the mutual influences of our pleafures and pains, with the factitious nature of our intellectual ones, and the doctrine of affociation in general, as well as the particular progrefs, windings, and endlefs redoublings of felf-love. For it is evident at firft fight, that money cannot naturally and originally be the object of our faculties; no child can be fuppofed to be born with a love of it; yet we fee that fome fmall degrees of this love rife early in infancy; that it generally increafes during youth and manhood; and that at laft in fome old perfons it fo ingroffes and abforbs all their paffions and purfuits, as that from being confidered as the reprefentative ftandard and means of obtaining the commodities which occur in real life, it fhall be efteemed the adequate fymbol and means of happinefs in general, and the thing itfelf, the fum total of all which is defirable in life. But we have already faid fo much on the origin and progrefs of this affection, (fee Div. IV. 2. (3), that we fhall here only attend to the checks which, in the courfe of life, ufually prevent the love of money from acquiring that power, which, without fuch reftraint, would overcome all the particular defires on which it is founded.

Firft, then, it is checked by the ftrong defires of young perfons, and others after particular gratifications; for thefe defires, by overpowering their acquired averfion to part with money, weaken it gradually, and confequently weaken the pleafure of keeping it and the defire of obtaining it; all which are clofely connected together in this view; notwithftanding that the laft, *viz.* the defire of obtaining, and confequently (in an inverted order) the pleafure of keeping, and the averfion to part with, are, in another view, ftrengthened by the defires of particular pleafures to be purchafed by money. And this contrariety of our affociations is not only a means of limiting certain paffions, but it may be confidered as a mark fet upon them by the Author of nature, to fhew that they ought to be limited even in this life, and that they muft ultimately be annihilated every one in its proper order. Secondly, the infignificance of riches in warding off death and difeafes, and, in many cafes, fhame and contempt alfo, and in obtaining the pleafures of religion and the moral fenfe, and even thofe of fympathy, ambition, imagination, and fenfation, firft leffen their value in the eftimation of thofe who reflect, and afterwards affign to them a very low rank among the means of happinefs. Thirdly, the eager purfuit of any apprehended fource of happinefs, fuch as fame, learning, &c. leaves little room in the mind for avarice or any other foreign end.

Thefe confiderations not only account for the limitation fet to the love of money, but for the various apparent inconfiftencies and peculiarities obfervable in it in different individuals. Thus profufenefs, with refpect to fenfual and felfifh pleafures, is often joined with avarice; covetous perfons are often rigidly juft in paying, as well as exacting, and are fometimes generous where money is not immediately and apparently concerned; they have alfo moderate paffions in other refpects, and for the moft part are fufpicious, timorous, and complaifant; and the moft truly generous, charitable, and even pious perfons are highly frugal, fo as to put on the appearance of covetoufnefs, and even fometimes and in fome things to border upon it. We alfo fee why the love of money muft in general grow ftronger with age, and efpecially if the particular gratifications, to which the perfon was moft inclined, become infipid or unattainable; why frequent reflections upon money in poffeffion, and the actual viewing of large fums, ftrengthen the affociations by which covetoufnefs is generated; and why children, perfons in low life, and indeed moft others, are differently affected towards the fame fum of money in different forms, gold, filver, notes, &c.

The love of money is univerfally deemed a more felfifh paffion than the purfuit of the pleafures of imagination, honour, or fympathy; yet all are generated by affociation from fenfible pleafures, having their origin in felf; all in their feveral degrees tend to private happinefs, and all are in certain cafes purfued coolly and deliberately from the profpect of obtaining private happinefs by them. The reafons why the love of money has in fo peculiar and decided a manner the fhame of felfifhnefs connected with it, appear to be as follow. The pleafures which it produces are nearly, and in general completely, of a folitary nature, and fhun participation. As far as money is deemed a means to the accomplifhment of fome ufeful purpofe, it ceafes to be defired on its own account, and then its pleafing affociations are communicable; but the love of money, as an end, is exclufive to the individual poffeffor. And in addition to this it is obvious, that in general it is not only confined to the individual, but prevents others from receiving the advantage which it might procure to them. The pleafures of fympathy, on the other hand, confift in doing good to others; thofe of ambition are fcarcely attainable in any other way; and thofe of imagination are not only capable of a very extenfive communication, but are moft perfect when enjoyed in company. Farther, a regard to felf frequently recurring muft denote a pleafure felfifh; fo that if any, even of the moft generous pleafures, and fuch as at firft fight have no immediate relation to felf-intereft, be purfued in a cool deliberate way, not from the mere impulfe of prefent inclination, but from the opinion that it will afford pleafure; they muft be referred to felf-intereft. Now money has fcarcely any other relation to pleafure, than as an evident means; fo that after it has acquired the power of pleafing inftantaneoufly, the intermediate fteps and affociations muft frequently appear; and hence it forces on the mind a more conftant reference to its tendency to promote the

the happineſs of the individual poſſeſſor. The other pleaſures have in general a far greater ſhare of indirect aſſociations with previous pleaſures; and acquire the power of gratifying, not ſo much from being the manifeſt cauſes of other gratifications, as their moſt common adjuncts; whereas money is generally the moſt viſible of all cauſes.

Honour, power, learning, and many other things, are however purſued in part after the ſame manner, and for the ſame reaſons as riches; namely, from a tacit ſuppoſition, that the acquiſition of every degree of theſe is treaſuring up a proportional degree of happineſs, to be produced and enjoyed at pleaſure. And the deſires of each of theſe would, in like manner, increaſe perpetually during life, did they not curb one another by many mutual inconſiſtencies, or were not all damped by the frequent experience and recollection, that all the means of happineſs ceaſe to be ſo, when the body or mind ceaſe to be diſpoſed in a manner proper for their reception. It is alſo worthy of obſervation that riches, honours, power, learning, and all other things which are conſidered as means of happineſs, become means to each other in a great variety of ways; thus transferring upon each other all the aſſociated pleaſures, which they collect from other quarters, and approaching nearer and nearer perpetually to a perfect ſimilarity and ſameneſs with each other, in the inſtantaneous pleaſures which they afford when purſued and obtained as ends. It appears likewiſe, that all aggregates of pleaſure thus collected by them all, muſt, from the ſtructure of our frame, and of the world which ſurrounds us, be made at laſt to centre and reſt upon him who is the inexhauſtible fountain of all power, knowledge, goodneſs, majeſty, glory, property, &c.; ſo that even avarice and ambition are, in their reſpective ways, carrying on his benevolent and all-wiſe deſigns. And the ſame thing may be hoped of every other paſſion and purſuit; one may hope that they all agree and unite in leading to ultimate happineſs and perfection. However, they differ greatly in their preſent conſequences, and in their future ones, reaching to certain intervals of time indefinite and unknown to us, and thus becoming good or evil, both naturally and morally, in reſpect of us and our limited apprehenſions, judgments, and anticipations. And yet one may humbly hope that every thing muſt be ultimately good, both naturally and morally.

(4) *Of the Pleaſures and Pains of Sympathy.*—The ſympathetic affections, or thoſe by which we feel when others feel, may be divided into four claſſes; thoſe by which we *rejoice* at the *happineſs* of others, thoſe by which we *grieve* for their *miſery*, thoſe by which we *rejoice* at their *miſery*, and thoſe by which we *grieve* at their *happineſs*. Of the firſt kind are *ſociality*, *good will*, *generoſity*, and *gratitude*; of the ſecond, *compaſſion*, and *mercy*; of the third, *moroſeneſs*, *anger*, *revenge*, *jealouſy*, *cruelty*, and *malice*; and of the fourth, *envy*. It is eaſy to be conceived that aſſociation ſhould produce affections of all theſe four kinds; ſince in the intercourſes of life, the pleaſures and pains of one perſon are in various ways intermixed with, and dependent upon, thoſe of others, ſo that compounds of their relics are excited in all the poſſible ways, in which the happineſs or miſery of one perſon can be combined with the happineſs or miſery of another; *viz.* in the four above-mentioned. We have already entered ſo much at length into the riſe and progreſs of the benevolent affections, (ſee Div. IV. 2. § 3. and MORAL *Education*,) that we deem it moſt expedient to give here the analyſis of the third claſs, thoſe by which we *rejoice* at the *miſery* of others, previouſly ſtating Hartley's application of the terms above mentioned. *Sociality* is the pleaſure we take in the company and converſation of others, particularly of our friends and acquaintance. *Good-will* (or *benevolence* in its more limited ſenſe) is that pleaſing affection which engages us to promote the welfare of others to the beſt of our power. *Generoſity* is that modification of benevolence which diſpoſes us to forego great pleaſures, or to endure great pains for the benefit of others. *Gratitude* is that modification of benevolence which ariſes from the paſt reception of favours, leading to make every practicable return of good to our benefactor. *Compaſſion* is the uneaſineſs which a man feels at the miſery of another. *Mercy* is compaſſion exerciſed towards one who has forfeited his title to happineſs or the removal of miſery by ſome demerit, particularly againſt ourſelves. *Moroſeneſs* is that diſpoſition which leads us to be diſſatisfied with the efforts of others for our comfort, to be diſpleaſed at their innocent enjoyments, and to feel a pleaſure in impoſing reſtraints upon their ſatisfaction. *Anger* is a ſudden ſtart of paſſion, by which men wiſh and endeavour harm to others. *Revenge* prompts to inflict and rejoice in evil, in return for evil real or ſuppoſed. *Malice* deliberately wiſhes the miſery of others. *Cruelty* diſpoſes men to take delight in inflicting pain, and in contemplating miſery. *Jealouſy* ariſes from the ſuſpicion of a rival in the affections of a perſon of the other ſex. *Envy* is the diſpoſition by which we conſider the good things poſſeſſed by others as a diminution of our own happineſs, and grieve at their enjoyment of them.

Moroſeneſs, *peeviſhneſs*, *ſeverity*, &c. are moſt apt to ariſe in thoſe perſons who have ſome real or imagined ſuperiority over others, which either magnifies their failures of duty, or at leaſt renders the individual very attentive to ſuch failures. Bodily infirmities and frequent diſappointments, by making the common intercourſes of life inſipid, and enhancing ſmall injuries; delicacy and effeminacy, by increaſing the ſenſibility both of body and of mind with reſpect to pain and uneaſineſs; luxury, by producing unnatural cravings, which claſh not only with the like cravings of others, but alſo with the common courſe and conveniencies of life; and, in ſhort, all kinds of ſelfiſhneſs have the ſame effect upon the temper. The ſevere ſcrutiny which perſons ſincerely penitent for paſt departures from duty make into their own life, and the rigid cenſures which they paſs on their own actions, are often found in proud and paſſionate tempers to raiſe ſuch indignation againſt vice, as breaks out in an undue ſeverity of language and behaviour with reſpect to others; and this eſpecially if they ſeem to themſelves to have overcome all great vices, and are not yet arrived at a due ſenſe of the many latent defects ſtill remaining in them. And this is much increaſed by all opinions which repreſent the Supreme Being as implacable towards a part of his creatures, and this part as reprobate towards him. By all which we may ſee, that every thing which makes diſagreeable impreſſions on our minds, at the ſame time that our fellow creatures are preſent with us in ſenſation or in idea, and eſpecially if theſe be connected by the relation of cauſe and effect, &c. will in fact produce in us moroſeneſs or peeviſhneſs. This follows from the doctrine of aſſociation, and is alſo an evident fact. It is likewiſe a ſtrong argument for cheerfulneſs and the pleaſures of innocent moderate mirth.

Anger and *revenge* may be analyſed as follows. The appearance, idea, approach, actual attack, &c. of any thing from which a child has received harm, muſt, by the law of aſſociation, raiſe in his mind the relic of that harm. The ſame harm often ariſes from different cauſes, and different harms from the ſame cauſes; theſe harms and cauſes have an affinity with each other, and thus they are variouſly mixed and blended together, ſo that a general confuſed idea of harm, with the uneaſy ſtate of the nervous ſyſtem, and the conſequent activity of the parts, are raiſed up in young children upon certain appearances and circumſtances. By degrees the denials of gratifications, and many intellectual aggregates, with all the ſigns and tokens of them, raiſe up a like uneaſineſs by the law of aſſociation; and thus it happens, that when any harm has been received, any gratification denied, or other mental uneaſineſs occaſioned, a long train of aſſociated relics of painful impreſſions enhance the diſpleaſing feeling, and continue it much beyond its natural ſtate. This is the naſcent ſtate of the paſſion of anger, in which it is nearly allied to fear, being the continuance of the ſame internal feelings quickened on the one hand by the actual painful or uneaſy impreſſion, but, on the other, moderated by the abſence of the apprehenſion of future danger. By degrees the child learns, from obſervation and imitation, to uſe various muſcular exertions, words, geſtures, &c. in order to ward off or remove the cauſes of uneaſineſs or pain, and ſo goes on multiplying perpetually, by further and further aſſociations, both the occaſions of anger and the expreſſions of it; and, in particular, aſſociates the deſire of hurting another, with the apprehenſion or actual receiving of harm from that other. As perſons grow up to adult age, and diſtinguiſh living creatures from things inanimate, rational and moral agents from irrational ones, they learn to refer effects to their more ultimate cauſes; and thus their reſentment paſſes from the inanimate inſtrument to the living agent, eſpecially if this latter be rational and moral. When the moral ideas of juſt and unjuſt, right and wrong, merit and demerit, have been acquired and applied to the actions and circumſtances of human life, in the manner to be hereafter deſcribed, the internal feelings of this claſs have great influence in increaſing or moderating our reſentment.

Cruelty and *malice* are the genuine and neceſſary effects of anger indulged and gratified. They are moſt apt to riſe in proud, ſelfiſh, and timorous perſons, thoſe who conceive highly of their own merits, and of the conſequent injuſtice of all offences againſt them, and who have an exquiſite feeling and apprehenſion in reſpect of private gratifications and uneaſineſſes. The low and unhappy condition of thoſe around him, gives a dignity to a man's own; and the infliction of puniſhment, or mere ſuffering, ſtrikes a terror, and ſo affords ſecurity and authority. Add to theſe, the pleaſures ariſing from gratifying the will, and perhaps ſome from mere curioſity, and from the rouſing an obdurate callous mind to a ſtate of ſenſibility. Thus we may perceive how nearly one ill paſſion is related to another; and that it is poſſible for men to arrive at laſt at ſome degree of pure cruelty and malice.

(5) *Of the Pleaſures and Pains of Theopathy.*—In order to form juſt ideas reſpecting the origin and nature of the theopathetic affections, it will be deſirable to ſhew what aſſociations are formed with the word *God*, and with the equivalent and related terms and phraſes. Many of the actions and attributes of men are in common language applied to God; and it is probable that children, in their firſt attempts to decypher the meaning of the word, ſuppoſe it to ſtand for a man whom they have not ſeen; and their viſible conceptions connected with the term, will, therefore, be that of a human form. When they hear or read that God reſides in heaven, (that is, according to their conceptions, among the ſtars,) that he made all things, that he ſees, hears, knows, and can do all things, vivid ideas which ſurpriſe and agitate the mind are raiſed up in it; and if they have made ſome progreſs in intellect, they will feel great perplexity in their endeavours to realize ſuch ideas to themſelves; and this perplexity will add to the vividneſs of the ideas, and altogether will transfer to the term *God* and its equivalent, ſuch ſecondary ideas as may be referred to the heads of magnificence, aſtoniſhment, and reverence. When children hear that God has no viſible ſhape, that he cannot be ſeen, &c., it adds much to their perplexity and aſtoniſhment, and at the ſame time deſtroys many of their former ideas; ſtill, however, ſome viſible ideas of the heavens, the throne of God, &c. ſeem to remain. When a child hears that God is the rewarder of good actions, and the puniſher of evil actions, and that the moſt exquiſite future happineſs or miſery, deſcribed under a great variety of particular emblems, are prepared by him for the good or bad reſpectively, he feels ſtrong hopes or fears riſing alternately in his mind, according to the judgment which he paſſes upon his own actions, founded partly upon the previous judgment of others, and partly upon an imperfect moral ſenſe or conſcience begun to be produced in his mind. At different periods of this progreſs, thoſe ideas which have ariſen from his filial relation, unite and blend with all the ideas previouſly connected with the term God, in conſequence of the frequent application of the term Father to the Supreme Being; and there cannot be a reaſonable doubt, that the notions and feelings which he has formed towards his earthly parents at firſt form a conſiderable ſhare in, and for a long period afterwards tend to modify, thoſe belonging to the term God. On the whole, therefore, it is probable, that among Jews and Chriſtians, children begin with a definite viſible conception attached to the word; that this is by degrees obliterated without any thing of a ſtable preciſe nature ſucceeding in its room; and that by further degrees, a great variety of ſtrong mental affections recur in their turns when they think of God.

The affections exerted towards God may be claſſed under two general heads, *love* and *fear:* to the former may be referred *gratitude*, *confidence*, and *reſignation*, alſo *enthuſiaſm*, which may be conſidered as a degeneration of it; to the latter, *reverence*, which is a mixture of love and fear, alſo *ſuperſtition* and *atheiſm*, which are degenerations of it.

The *love* of God, with its related affections, is generated by the contemplation of his bounty and benignity, as theſe appear from the view of the natural world, the declarations of ſcripture, or a man's own obſervation and experience reſpecting the events of life. It is ſupported and much increaſed by the conſciouſneſs of upright intentions and ſincere endeavours, with the conſequent hope of future reward; and by prayer, vocal and mental, public and private, inaſmuch as this gives a reality and force to all the ideas before ſpoken of. Frequent converſation and reading, in which the devout affections are excited, have great efficacy alſo from the infectious nature of our diſpoſitions, and from the perpetual recurrency of the appropriate words, and of their ſecondary ideas, firſt in a faint ſtate, afterwards in a ſtronger and ſtronger perpetually. The contemplation of the reſt of the divine attributes, his omnipotence, omniſcience, eternity, omnipreſence, &c. have alſo a tendency to ſupport and augment the love of God, when this is ſo far advanced as to be ſuperior to the fear: till then, theſe wonderful attributes enhance the fear ſo much, as for a time to check the riſe and growth of the love. Even the fear itſelf very much contributes to the generation and augmentation of the love, and in a manner greatly analogous to the production of other pleaſures from pains. And indeed it ſeems that, notwithſtanding the variety of the ideas and feelings which contribute to this affection, there is ſo great a reſemblance among them, that they muſt languiſh by frequent recurrency, till ideas of an oppoſite nature, by intervening at certain ſeaſons, give them freſh life.

On this theory, the love of God is evidently deduced in part from directly intereſted motives, *viz.* from the hopes of a future reward; and partly from motives or ſources of it, in which direct explicit ſelf-intereſt does not appear, but which

which may be traced up to it ultimately. However, after all the sources of this affection have coalesced together, it becomes as disinterested as any other. It appears also that this pure disinterested love of God may, by a concurrence of a sufficient number of sufficiently strong associations, arise to such a height as to prevail over any other of the desires, interested or disinterested.

Enthusiasm may be defined, a mistaken persuasion in any person that he is a peculiar favourite with God, and that he receives supernatural marks thereof. The vividness of the ideas of this class easily generates this false persuasion in persons of strong imaginations, religious ignorance, and narrow understandings, especially where the moral sense is but imperfectly formed, by giving a reality and certainty to all the reveries of a man's own mind, and confirming the associations in a preternatural manner. It may also be easily contracted by contagion, as daily experience shews; and indeed more easily than most other dispositions, from the lively language used by enthusiasts, and from the great flattery and support which enthusiasm gives to pride and self-conceit.

The *fear of God* arises from a view of the evils of life, the threatenings of the scriptures, the sense of guilt, the infinity of the divine attributes, and from prayer, meditation, and conversation, and reading on such subjects. When confined within proper limits, it is *awe, veneration,* and *reverence;* when excessive, or not duly regarded, it degenerates either into *superstition* or *atheism. Superstition* may be defined a mistaken opinion concerning the severity and punishments of God, magnifying them with respect to ourselves or others. *Atheism* is either *speculative,* which denies the existence of a God; or *practical,* which is the neglect of him, where a person thinks of him seldom, or with reluctance, and pays little or no regard to him in actions, though he does not deny him in words. Both kinds in Christian countries seem to proceed from an explicit or implicit sense of guilt, and consequent fear of God, sufficient to generate an aversion to the thoughts of him, and to the methods by which the love might be generated, and yet too feeble to restrain from guilt; and it is the tendency of all pain to prevent the recurrence of the circumstances which produced it. On the religious affection in their early stages, see MORAL *Education,* IV.

(6) *Of the Pleasures and Pains of the moral Sense.*—There are certain dispositions of mind, with the actions flowing from them, which when a person believes himself to be possessed of, and reflects upon, a pleasing consciousness and self-approbation rise up in his mind, exclusively of any direct explicit consideration of advantage likely to ensue to himself from the possession of those dispositions: in like manner, the view of them in other persons raises up a disinterested love and esteem for those persons. And the opposite qualities and actions are attended with the condemnation both of ourselves and others. This is in general the state of the case, but there are many particular differences, according to the particular education, disposition, professions, sex, &c. of each person. The general agreement and particular differences in our ideas of right and wrong, and consequent approbation and disapprobation, seem to admit of an analysis and explanation from the following particulars.

First: Children are for the most part instructed in the difference and opposition of virtue and vice, and have some general descriptions of the virtues and vices with which they are particularly concerned. They are told that the first are good, pleasant, noble, beautiful, fit, worthy of praise and reward, &c.; the last odious, painful, shameful, worthy of blame, punishment, &c. So that the painful and displeasing associations, previously annexed to those words in their minds, are, by means of that confidence which they place in their parents and instructors, transferred to the virtues and vices respectively. And the mutual intercourses of life have the same effect, in a less degree, with respect to adults, and those children who receive little or no instruction from others directly. Virtue is in general approved, and set off with all the encomiums and honourable appellations which any other thing admits of; and vice loaded with censure and reproaches of all kinds, in all good conversation and books. And this happens oftener than the contrary, even in bad ones: so that as far as men are influenced in their judgments by those of others, the balance is on the whole on the side of virtue.

Secondly: There are many immediate good consequences which attend upon virtue, and many ill consequences upon vice; and this during the whole progress of our lives. Sensuality and intemperance subject men to diseases and pain, to shame and anxiety: temperance is attended with ease of body, freedom of spirits, the capacity of being pleased with the objects of pleasure, the good opinion of others, the perfection of the senses, and of the mental and corporeal faculties, &c. Anger, malice, and envy, bring returns of anger, malice, and envy from others, with injuries, reproaches, fears, and perpetual disquietudes; and in like manner, good will, generosity, compassion, are rewarded with suitable returns, with the pleasures of sociality and friendship, and with high encomiums. And when a person, by the previous love of man, is qualified to worship God in any measure as he ought, this affords the sincerest joy and comfort; while, on the contrary, the neglect of God, or practical atheism, murmuring against the course of providence, fool-hardy impiety, &c. are evidently attended with great anxiety, gloominess, and distraction, as long as any traces of morality or religion are left upon the mind. Now these pleasures and pains are often recurring in various combinations, and being variously transferred upon each other, from the great affinity between the several virtues and their rewards, and the vices and their punishments, will at least produce a general mixed pleasing consciousness, when we reflect upon our own virtuous affections or actions; a sense of guilt and anxiety, when we reflect upon the contrary; and also raise in us the love and esteem of virtue, and the hatred of vice in others.

Thirdly: The many benefits which we receive immediately from the piety, benevolence, or temperance of others, or which have some obvious connection with them, and the mischiefs resulting from their vices, lead us to love or hate the persons themselves by association, and then to love and hate the virtues and vices themselves; and this without regard to our own interest, and whether we view them in ourselves or others. The love and esteem of virtue in others is much increased by the pleasing consciousness which our own practice of it affords to the mind; and, in like manner, the pleasure of this consciousness is much increased by our love of virtue in others.

Fourthly: The great suitableness of all the virtues to each other, and to the virtue, order, and perfection of the world, impress a very lovely character upon virtue; on the contrary, self-contradiction, deformity, and mischievous tendency of vice, render it odious, and the object of abhorrence to all who reflect on the subject. The terms which are employed to denote the pleasures of the imagination, are employed in connection with virtue; and all the associated feelings, attached to the terms, are consequently associated with virtue, adding greatly, therefore, to the pleasures derived from the contemplation of an act of sublime virtue.

Fifthly:

Fifthly: The hopes and fears of a future life are themfelves pleafures and pains of a high nature. When a fufficient foundation has been laid by a practical belief of religion, by thoughts of death, by the lofs of friends, by corporeal pain, by worldly difappointments and afflictions, for the formation of ftrong affociations of the pleafures of thefe hopes with duty, and the pains of thefe fears with fin, the repetition of thefe affociations will at leaft make duty itfelf a pleafure, and convert fin into a pain, and give luftre and deformity to all their refpective appellations. And thefe affociations will gradually become fo ftrong, that the exprefs recollection of the hopes and fears of another world will vanifh from the view of the mind.

Sixthly: All meditations upon God, and all the expreffions of the feelings of our minds towards him, by degrees transfer all the perfection, greatnefs, and gloriousnefs of his natural attributes upon his moral ones, that is, upon moral rectitude. By thefe means we fhall learn to be merciful, holy, and perfect, becaufe God is fo; and to love mercy, holinefs, and perfection, wherever we fee them.

Hence it appears that all the pleafures and pains of our nature, thofe of fenfation, imagination, ambition, felf-intereft, fympathy, and theopathy, as far as they are confiftent with each other, with the conftitution of our minds, and with the courfe of the world, produce in us a moral fenfe, and lead to the love and approbation of virtue, and to the fear and abhorrence of vice. This moral fenfe, therefore, carries its own authority with it, inafmuch as it is the fum total of all the reft, and the ultimate refult from them. When it has advanced to confiderable perfection, a perfon may be made to love and hate merely becaufe he ought; that is, the pleafures of moral beauty and rectitude, and the pains of moral deformity and unfitnefs, may be transferred, and made to coalefce almoft inftantaneoufly. After this profound analyfis of the moral fenfe from Hartley, it may appear like prefumption to refer to MORAL *Education*, III. The view there may, however, perhaps be ferviceable to fome, in connection with the early cultivation of it.

8. *Intellectual Perceptions or Ideas of Confcioufnefs.*—We have now fhewn the means by which a vaft variety of complex ideas, whether notions or feelings, are generated by the affociative power from the fimple relics of fenfations, or from thefe varioufly combined; and Hartley is of opinion, that by fimilar means are formed all the notions and feelings of the mind. We have ourfelves expreffed a fimilar opinion in MORAL *Education*, col. 21; but there is one clafs of ideas which we do not feel able to refer to the operation of the affociative power on the fimple ideas of fenfation, or any combinations of them. We reflect upon what paffes within us, and we perceive not only objects of thought, but certain operations of the mind upon them by which they are varioufly modified. We can not only direct the mind's eye to thefe operations when actually taking place, but we can form recollections of them when they are at an end: we not only perceive them as they are paffing, but we can recall notions of them long after they have ceafed; we can reafon about them, and, what is more, we can think of them, and, without their recurrence, can retrace impreffions derived from attending to them when they were going on. And, in like manner, with refpect to the various feelings and ftates of mind, we can not only direct the attention of the mind to them at the time, but we can think of them after other feelings and ftates of mind have been introduced; we can remember how the mind was affected by them; and can form recollections of them, which may be almoft entirely deftitute of the pleafure or pain which made part of them; in other words, we can form notions of them, which can be recalled, diftinct from the feelings or ftates of mind themfelves. Senfations, and the combinations of their relics, may be properly confidered as furnifhing the *occafions* for thefe notions which the mind forms by attention to its own ftates and operations; but the notions could never, as far as we can perceive, have been formed without fuch exercife of reflection, by any operation of the affociative power on ideas of fenfation, or the moft complex compounds of ideas derived from them. The term intellectual perception aptly expreffes the power of the mind to perceive the operations of feeling and intellect; and as the term perception is in common ufe to exprefs not only the power, but the refult of its exercife, we might conveniently denote the notions we form of our mental ftates and operations, by the term *intellectual perceptions;* we think it better, however, to term them, in reference to an appropriate fignification of the term confcioufnefs, already adverted to, *ideas of confcioufnefs.*

The readers of Locke will at once perceive that we here refer to a clafs of thofe ideas which that philofopher ftiles *ideas of reflection;* and we fhould not have departed from his nomenclature, if we had not thought it unneceffary to apply the term to many of thofe notions which he refers to this clafs of our ideas, and to avoid error from the extent already given to his term, we prefer the employment of another.

Hartley is eminently fuccefsful in the analyfis of the mental *feelings;* it appears to us that he has eftablifhed the derivation of them all from fenfation by the agency of the affociative power. Refpecting this grand clafs of our ideas, he has left nothing for future inquirers but to purfue the method he has adopted; to trace the various modifications of feeling to their lefs complex feelings, and to fhew how thefe arife from the relics of fenfible pleafures and pains; to trace out the influence of external circumftances, corporeal temperament, and the operations of intellect upon them, and their mutual influence upon each other. Refpecting the notions of the underftanding, a great deal yet remains to be done. Hartley has given a clue to the formation of a great variety of them; and has fhewn the application of his principles to a fufficient number to prove their great extent and importance; but after repeated reflection we feel compelled to admit that the ideas of the underftanding which we have fpoken of under this head, cannot be referred to fenfations as their origin, though, without fenfations, they could not have exifted, fince there would otherwife have been nothing to call forth the operations of the mind from attention to which thofe notions are derived.

Thefe ideas of confcioufnefs are obvioufly fubject to the general operations of the affociative power. They can be connected with other ideas, fo as to be introduced among our trains of thought agreeably to the common principles of affociation; and combinations of thefe ideas can be formed, fo as to produce general, or abftract, notions of various mental ftates or operations, including the common qualities in which they agree.

With refpect to our more refined and complicated notions, there is a wide field for highly important analytical inquiry; to fhew from what impreffions their rudiments are formed, and by what proceffes they have been combined and modified. Much is done in the formation of our notions by the unintentional exercife of the affociative power, and by what may be termed accidental impreffions derived from external objects; but much muft alfo be referred to the voluntary exercife of the intellect.

V. *Of the Motive Power.*—In our general view of the primary mental faculties, we ftated as an obvious fact, that without

without any external excitement of the nerves by which muſcular motion is produced, the mind can produce ſuch motion, in other words, that ſtate of the motory nerves by which muſcular motion is effected can be produced by the mind. To account for this fact, we infer that the mind poſſeſſes a power or capacity of influencing the motory nerves, ſo as to produce muſcular motion, which may be called the motive power. Even ſuppoſing that the ſenſorial changes by which muſcular motion is followed, whatever they may be, are of the ſame nature with thoſe produced by external impreſſions on the organs of ſenſe, (Hartley, p. 15.),—and admitting, what appears certain, that it is owing to the aſſociative power that ideas, and ſometimes that ſenſations, produce motory changes of the ſenſorium,—ſtill we muſt infer the exiſtence of a motive power, otherwiſe ideas and ſenſations could not be the exciting cauſe of muſcular motion: in other words, whatever be the mental cauſes of muſcular motion, that motion, if it begin from the mind, implies that the mind poſſeſſes the power of which we ſpeak, ſeparate from the cauſe of ſenſations, of ideas, and of the connections among them. Indeed this appears to be generally admitted, but the operations of the motive power are uſually referred to the head of will.

A great number of the phenomena of muſcular motion are explicable by the laws of aſſociation, and as far as we perceive, they can only be explained by them. There are five claſſes of muſcular motion: 1. Where it is produced by ſome foreign excitement of the muſcular ſyſtem, without the intervention of the mind, in which caſe it may be termed *involuntary*. 2. Where it is produced by ſenſations, or ſenſible changes, without volition, or any other aſſociated ſenſation, idea, or motion, having been concerned in the connection between ſenſation and motion, it is termed *automatic* in the Hartleyan nomenclature. 3. Where it follows the ſtate of mind called will directly, and without our perceiving the intervention of any other idea, or of any ſenſation or motion, it may be termed *voluntary* in the higheſt ſenſe of this word. If the intervention of other ideas, or of ſenſations and motions, all of which we ſuppoſe to follow the will directly, be neceſſary, it is imperfectly voluntary; yet ſtill it is termed voluntary in popular language, if it follow certainly and readily upon the intervention of a ſingle ſenſation, idea, or motion, excited by the power of the will. 4. If more than one of theſe be required, or if the motion do not follow with certainty and facility, it is to be eſteemed leſs and leſs voluntary, ſemi-voluntary, or ſcarce voluntary at all, agreeably to the circumſtances. 5. Where the motion has been voluntary, but is become automatic by the influence of the aſſociative power, it is termed by Hartley *ſecondarily automatic*. With the firſt of theſe claſſes, mental philoſophy has little or nothing to do. As to the ſecond, till more is known reſpecting the nature of thoſe changes which take place in the ſenſorium, the mentaliſt can do little more than ſtate the fact; but it muſt be obſerved, that automatic motions are not to be found pure, except in the motions of the new-born infant, or ſuch as are excited by ſome violent irritation or pain. The third and fifth claſſes afford farther illuſtration of the doctrine of aſſociation; and we ſhall ſelect from the Mental Principia, with ſome alterations, ſuch ſtatements as will ſuffice to explain the progreſs of muſcular motion from automatic to voluntary, and from voluntary to ſecondarily automatic.

The moſt ſimple inſtance of this progreſs, is in the action of graſping. The fingers of young children bend upon almoſt every impreſſion which is made on the palm of the hand, thus performing the action of graſping in the original *automatic* manner. After a ſufficient repetition of the motions which concur in this action, the ſenſorial changes preceding them are ſtrongly aſſociated with different ideas, the moſt common of which probably are thoſe excited by the ſight of a favourite plaything or other object which the child is uſed to graſp and hold in his hand. He ought therefore, according to the doctrine of aſſociation, to perform and repeat the action of graſping, upon having ſuch a plaything, &c. preſented to his ſight: and it is a known fact that children do ſo. Here the action is imperfectly automatic. By purſuing the ſame method of aſſociation, we may ſee how, after a ſufficient repetition of the proper aſſociations, the ſound of the words *graſp, take hold*, &c., the ſight of the nurſe's hand in a ſtate of contraction, the recollection of a hand in that ſtate, and innumerable other aſſociated circumſtances, that is, ſenſations, ideas, and motions, will produce the action of graſping; till, in conſequence of the action being found to anſwer certain purpoſes which are wiſhed for, that ſtate of mind, which we may call the will to graſp, is generated, and ſufficiently aſſociated with the action to produce the requiſite muſcular motions inſtantaneouſly. The action is therefore *perfectly voluntary* in this caſe; and by the innumerable repetitions of it in this perfectly voluntary ſtate, it at laſt acquires a ſufficient connection with ſo many ſenſorial changes, either ſenſitive, ideal, or motory, that, whether or not they are ſo vivid, or ſo accordant with the ſtate of mind at the time, as to obtain the notice of the mind, it follows them in the ſame manner as originally automatic actions do the correſponding ſenſations, that is, it becomes *ſecondarily automatic*. In the ſame manner may all the actions performed by the hands be explained; all thoſe which are very familiar in life, paſſing from the original automatic ſtate, through the ſeveral degrees of voluntarineſs, till they become perfectly voluntary, and then repaſſing through the ſame ſtages in an inverted order, till they become ſecondarily automatic on many occaſions, though ſtill perfectly voluntary on ſome occaſions, *viz.* whenſoever an expreſs act of the will is concerned.

A more intereſting, but much more complicated caſe, is that of the employment of the organs of ſpeech, for which, however, we muſt refer our readers to Hartley's Obſervations, p. 21, or Prieſtley's Abridgment, p. 33; and ſhall merely ſtate a caſe from Hartley, illuſtrating the tranſition from voluntary actions into ſuch as are ſecondarily automatic.

Suppoſe a perſon who has a perfectly voluntary command over his fingers, to begin to learn to play upon the piano forte. The firſt ſtep is to move his fingers from key to key with a ſlow motion, looking at the notes, and exerting an expreſs act of volition in every motion. By degrees the motory changes become connected with each other, and with the impreſſions of the notes, by the influence of the aſſociative power, the acts of volition becoming leſs and leſs expreſs all the time, till at laſt they become evaneſcent and imperceptible. For an expert performer will play from notes, or from ideas of them, or from the connection of the ſeveral complex parts of the decomplex motions, ſome or all, and at the ſame time carry on a quite different train of thoughts in his mind, or even hold a converſation with another. Whence we may conclude, that the paſſage from the ſenſible, ideal, or motory changes which precede, to thoſe motory changes which follow, is as ready and direct, as from the ſenſible changes to the original automatic motions correſponding to them; and, consequently, that there is no intervention of the state of mind called will. At least, the doctrine of association favours this: and the fact shews that there is no perceptible intervention, none of which we are conscious. See also Darwin's Zoonomia, sect. xvii. 2.

We may hence understand in what manner the first rudiments are laid of that faculty of *imitation* which is so observable in young children. They see the actions of their own hands; they hear themselves pronounce. Hence the impressions made by themselves on their own eyes and ears become associated circumstances, and consequently must, in due time, excite to the repetition of the actions. Hence like impressions made on their eyes and ears by others will have the same effect; or, in other words, they will learn to imitate the actions which they see, and the sounds which they hear. Imitation is a great source of the exercise of the voluntary power; and makes all the several modes of walking, handling, and speaking, &c. conformable to those of the age and nation in which a person lives; and in particular to those of the persons with whom he converses. Besides the two sources of it just mentioned, it has many others; some of these are, the resemblance which children perceive between their own bodies with all the functions of them, and those of others; the pleasures they experience in and by means of all imitative motions; the directions and encouragements given them on this head; the high opinions which they form of the power and happiness of adults, and their consequent desire to resemble them in these and all their associated circumstances. Imitation begins in various kinds of voluntary actions about the same time; and increases, not only by the sources alleged, but also by the mutual influence of every instance of it over every other, so that the velocity of its growth is for some time greatly accelerated. It is of the greatest consequence to children in their attainment of accomplishments, bodily and mental. And thus every thing to which mankind have a natural tendency, is learned much sooner in society than the mere natural tendency would produce it; and many things are learned so early, and fixed so deeply, as to appear parts of our nature, though they may be mere derivatives and acquisitions.

VI. *Of the Memory.*—The memory is defined by Hartley to be that faculty by which traces of sensations and ideas recur, or are recalled, in the same order and proportion, accurately or nearly, in which they were once actually presented. The rudiments of memory are laid in the perpetual recurrency of the same impressions, or groups of impressions. These, by the operations of the retentive power, leave traces or relics; and by the operation of the associative power, these are united in the order in which they were presented to the mind. Now, the single sensible impressions, and small groups of them, being few in comparison of all the large groups, they recur the most frequently, so as sooner to produce the elements of memory.

Suppose a person to have so far advanced in life as to have acquired all these elements; that is, that he has ideas of the common appearances and occurrences of life, under a considerable variety of subordinate circumstances, which would readily recur to his mind by slight causes, he will be thus easily enabled to retrace other occurrences; for these will consist either of the old impressions variously combined, or of new ones in some way or other connected with them. This may be exemplified and explained by the circumstance, that it is difficult to remember even well known words which have no connection with each other; and still more so words which are neither familiar, nor formed according to familiar analogies; but that, on the other hand, persons acquainted with any branch of science or of art, very easily retains facts connected with it which were previously unknown. The recollection of ideas is also greatly aided by the connection of words, both with them and with the original impressions; for words being, from the constant use of language, familiar to persons of moderate mental culture, even in various combinations, they are easily retained, and most materially assist in producing the recurrence of the corresponding ideas. And thus when a person is relating a past fact, the ideas do in some cases suggest the words, and in others, the words suggest the ideas. Hence illiterate persons, other things being equal, do not remember nearly so well as others. Hence also the importance, contrary to the views of education which a few years ago were so fashionable, of teaching the young to remember words as well as things; for in most cases, as words serve as the bond of ideas, ideas will be loose and floating in the mind unless connected with words.

The difference between ideas and sensations principally consists in the greater vividness and distinctness of the latter; but cases are known to occur, in which visual conceptions are so vivid and distinct, that they are mistaken for actual sensations. This is particularly the case when, in consequence of disease, the system is peculiarly susceptible of excitement; and sometimes when the mind is very much absorbed in contemplating its own ideas, so that the impressions from external objects produces little effect upon it. It is a fertile source of those ideas respecting apparitions which are so prevalent among persons of physical sensibility, without that culture of the intellect, which would enable them to attend to their own thoughts and manner of thinking. Such lively recollections of past impressions may, however, be usually distinguished from sensations, by allowing the attention to relax so that they may cease to be forcibly detained as objects of consciousness; when it will in general be easily perceived that the mind loses sight of them; whereas it can lose sight of impressions from external objects only by fixing the attention upon ideas, or by corporeal motions of some kind or other. These remarks might, perhaps with greater propriety, have been made under the head of imagination, because it is seldom that in such cases the vivid conceptions recur in the exact (or nearly exact) order of actual impression, which is the essential difference between the trains of imagination and those of memory: they are, however, referrible to either class of phenomena.

Ideas of recollection differ from those of imagination, principally in the readiness and strength of the associations; but partly, and in many cases almost entirely, by the connection of the former with known and allowed facts, by various methods of reasoning appropriate to the peculiar circumstances of the case, and by recollecting that we had before considered them as recollections, &c. All persons are at one time or other at a loss to know whether trains of vivid ideas, succeeding each other readily and rapidly, are ideas of recollection or of imagination, that is, mere reveries: and the more they agitate the matter in their minds the more does the reverie appear like a recollection. Persons of irritable nervous systems are more subject to such fallacies than others; and insane persons often impose upon themselves in this way, *viz.* by the vividness of their ideas and associations, produced by bodily causes. The same thing often happens in dreams.

The vividness and readiness of recollected trains is also one

one grand means of afcertaining the dates of facts; for as this diminifhes (other things being equal) in proportion to the period which has elapfed fince the reception of the ideas, and the formation of the affociations, if the vigour of thefe be diminifhed, we refer them to a more remote period, in proportion to that diminution; and if by any caufe it be kept up, the diftance of time appears diminifhed. Thus it is, if any interefting event, the death of a friend, for inftance, have been often recollected or related, till we come to make oral or mental calculations, it appears to have happened but yefterday, as we term it. However, from this circumftance, we are often apt to confound events, as to the order of time, referring them to more recent or remote periods, according to the ftrength and vigour of the ideas and affociations, or the contrary. In general we judge of the period of events by affociated circumftances, particularly by vifible permanent memorials. And hence it happens, that illiterate perfons have often great difficulty in affigning periods to events with any tolerable accuracy. Our readers, when they take fuch things into account, and confider how difficult it muft in moft cafes be for illiterate perfons, who have frequently changed their employments, to refer fuch changes to any fpecific dates, will not feel unwilling to admit, that the prefumption formed againft the reputed murderers of Mr. Steele, in confequence of their incorrect ftatements, as to their places of employment four years before their trial, fhould have weighed very little in the decifion againft thofe unhappy men.

We diftinguifh a new place, perfon, &c. from one which we remember, in a manner fimilar to that in which we diftinguifh recollected ideas, and thofe of imagination; by the greater vividnefs of the impreffion, and the ftrength and readinefs of the affociated circumftances. If we doubt whether we have before feen a perfon who is newly introduced to us, we try to recall fome affociated circumftance, fuch as the time and place where we may be fuppofed to have feen him; and if this prove erroneous, we immediately infer, that our doubt arifes from fome refemblance which he has with fome one whom we then or there faw, or with fome one whofe face is familiar to us.

The memory of children is imperfect, becaufe the elementary rudiments of memory are not fufficiently fixed by the retentive power, nor their ufual groups fufficiently formed in the mind. They are alfo imperfect in the ufe of thofe words, and other fymbols, which fo materially aid the recollection; and in particular they are found very deficient in arranging facts in the order of time, judging moft frequently from the vividnefs of their recollections, and not having the ufe of thofe denotements of time, on which the memory principally depends for accuracy in this branch of recollection. In old perfons, whatever be the part of the fyftem on which the retentive power depends, that power is moft materially diminifhed, as alfo the fenfitive power, while the affociative power has, in their habitual direction of it, been ftrengthened in its operations. Hence new impreffions can fcarcely be received, and feldom are retained; while the parts which are received and retained excite old trains of affociations, rather than continue thofe which were recently impreffed. When old perfons relate the incidents of their youth with great precifion, it is rather owing to the recollection of many preceding recollections and relations, than to the recollection of the thing itfelf.

Memory depends greatly upon the ftate of the brain. Concuffions and other diforders of the brain, excefs in fenfual pleafures, and the ufe of fpirituous liquors, impair it; and it is recovered by degrees, as the caufes which affected the brain are removed. In like manner, dreams which happen in a peculiar ftate of the brain, *viz.* during fleep, vanifh as foon as vigilance, a different ftate, takes place; but if they be recollected immediately upon waking, and thus connected with a ftate of vigilance, they may be remembered.

When a perfon defires to recollect a thing that has efcaped him, fuppofe the name of a vifible object, he recalls the vifible idea, or fome other affociate, again and again by a voluntary power, and thus at laft brings in the required affociation and idea. But if the defire be very great, it changes the ftate of the mental organs, and has an oppofite effect; fo that the defired idea does not recur till all has fubfided, and perhaps not even then.

The excellence of memory confifts partly in its ftrength and accuracy of retention, partly in the readinefs of recollection. The former principally depends on the ftrength and accuracy of perception in attention to our fenfations, and partly upon the affociative faculty; the latter depends entirely upon the ftrength and peculiar biaffes of the operations of that power. The intellectual faculties depend greatly upon the memory; hence, though fome perfons may have ftrong memories with weak judgments, yet no man can have a ftrong judgment with a weak original power of retaining and remembering. Before we conclude our view of this faculty, we beg leave ftrongly to recommend to our younger readers, efpecially if they poffefs a philofophic caft of mind, an attentive perufal of the very ufeful and interefting chapter of Dugald Stewart on this fubject, particularly thofe parts which relate to the improvement of the memory; and to thofe in particular, who are in any way concerned in the work of education, we hope we fhall be excufed, when we recommend the perufal of the feventh divifion of INTELLECTUAL *Education*, on this faculty. See MEMORY and MNEMONICS.

VII. *Imagination.*—In the ufe which Mr. Stewart makes of the term imagination, it includes the fancy, and (as he himfelf ftates) is in no refpect a diftinct power, but compounded of feveral others. "It includes," he fays, "*conception* or fimple apprehenfion, which enables us to form a notion of thofe former objects of perception or of knowledge, out of which we are to make a felection; *abftraction*, which feparates the felected materials from the qualities and circumftances which are connected with them in nature; and *judgment* or tafte, which felects the materials and directs their combination. To thefe powers we may add, that peculiar habit of affociation to which I formerly gave the name of *fancy;* as it is this which prefents to our choice all the different materials which are fubfervient to the efforts of imagination."—"This," he obferves in another place, "is the proper fenfe of the word, if imagination be the power which gives birth to the productions of the poet and the painter," and we may add of genius in general. We have no objection to fuch an appropriation of the term. In the Hartleyan nomenclature, however, it is ufed indifcriminately with fancy, in the fenfe in which Mr. Stewart feems to employ the latter term.

The recurrence of ideas, fays Hartley, efpecially vifible and audible ones, in a vivid manner, but without any regard to the order obferved in paft facts, is afcribed to the power of imagination or fancy. Every fucceeding thought is the refult either of fome new impreffion, or of an affociation with the preceding. It is impoffible, indeed, to attend fo minutely to the fucceffion of our ideas, as to diftinguifh and to remember for a fufficient time, the very impreffion or affociation which gave rife to each thought or conception; but we can do this as far as it can be expected to be done, and in fo great a variety of inftances, that we have full right to infer it in all. A *reverie* differs from imagination only

only in this, that the perſon being more attentive to his own thoughts, and leſs diſturbed by external objects, more of his trains of ideas are deducible from aſſociation, and fewer from new impreſſions. It is to be obſerved, however, that in all caſes of imagination and reverie, the train and complexion of the thoughts depend, in part, upon the then ſtate of body or mind. A pleaſurable or painful ſtate of the ſtomach, for inſtance, joy or grief, will make all the thoughts tend to the ſame caſt. "Objects and circumſtances may be ſo diſpoſed," ſays Mr. Grant, (in a very valuable paper on reverie, for which ſee Mancheſter Memoirs, vol. i. or Nicholſon's Journal, vol. xv.) "as to give to reverie a pleaſing or penſive, a refined or an elegant direction. I believe it is unneceſſary to aſk, whether the mind will not be more apt to depart from ſerious meditation in a gaudy chapel, than in the ſolemn gloom of a cathedral? It is remarked by an eminent medical writer, that light, introduced by opening the window-ſhutters, gave a gayer caſt to the ideas of a patient who laboured under reverie. The ſtudy of Taſſo was a Gothic apartment, and he fancied his familiar ſpirit to converſe with him through a window of ſtained glaſs."

It would be eaſy and uſeful to enlarge on this faculty, and particularly on the regulation of it as affecting the character and happineſs; but we ſhould probably be able to add little to what our readers have acceſs to in Stewart's Elements, in the laſt chapter of which they will find an elegant, ſcientific, and highly important inveſtigation of the ſubject. We muſt alſo refer them to the leſs palatable, but not leſs wholeſome food for the underſtanding, in Hartley's 91ſt propoſition, in which he examines how far the phenomena of imagination, reveries, and dreams, are agreeable to the principle of aſſociation; and alſo to prop. 92, where he makes the ſame inveſtigation reſpecting "deviations from ſound reaſon and alienations of mind." On the phantaſms produced by diſeaſe, there is an intereſting detail of facts in one particular caſe, in Nicholſon's Journal, vol. xv. See Imagination.

VIII. *Underſtanding.*—This term, in its moſt extenſive application, clearly includes the operations of ſenſation and aſſociation, except thoſe which reſpect the affections; but we uſe it here in a narrower ſenſe, as we have already ſtated, in reference to thoſe mental ſtates or operations by which we contemplate ſenſations and ideas, conſidered as ſuch, and the various operations of the mind, diſcern the relations which exiſt among the objects of perception and thought, purſue truth, and aſſent to or diſſent from propoſitions.

1. *General Obſervations on the Operations of the Underſtanding.* - *Conſciouſneſs* we regard as the capacity of the mind, by which it is capable of being affected by ſenſorial changes, whether ſenſible, ideal, or motory. Conſciouſneſs is in fact the notice of the mind itſelf; and the term is, in the moſt appropriate ſenſe, applied to that ſtate with which every mental change or operation is attended, if it in any degree excites the notice of the mind. It is by conſciouſneſs alone that we have any knowledge of the other powers of the mind; and when directed to their operations, the appellation is peculiarly appropriate. When it is excited by ſenſible changes it is uſually called *perception*; conſciouſneſs referring to the operations of the mind as ſuch; perception to them, as produced by external objects. (See Div. II.) We are *conſcious* of ideas and ſenſations; we *perceive* the external objects which produce impreſſions on the ſenſes.

When the notice of the mind is continued to any particular object, or to a continual ſucceſſion of objects, whether or not that continuance is cauſed by volition, the ſtate of mind is called *attention.* When it is brought ſo far under the direction of the mind, that it can be directed at will, then it is with propriety termed *the power of attention.* See Div. VIII. 2, and Intellectual *Education*, IV.

When the attention is excluſively directed to ſome object of thought ſeparate from others, or to ſome component part of the object ſeparate from its other parts; then it is termed *abſtraction*, by which we underſtand *ſeparate attention.* See § 2, and Intellectual *Education*, V. VI.

When the attention is directed to our perceptions, (or, in other words, to the qualities, circumſtances, and changes of external objects, as they affect the mind through the medium of the ſenſitive and aſſociative power,) it is termed *obſervation.* The term is one of ſuch familiar and generally appropriate uſe, that it can ſcarcely be miſunderſtood; it is never applied to attention to the ideas of abſent objects of ſenſe, but ſolely to attention directed to the preſent objects of perception, leading to thought reſpecting them. See Intellectual *Education*, III.

When the attention of the mind is directed to its own ſtates, affections, and operations, it is termed *reflection.* As obſervation commonly implies ſome exerciſe of the reaſoning faculty, ſo alſo does reflection: but ſimple attention to our own thoughts and feelings, and to our manner of thinking and feeling, is in the ſtricteſt ſenſe *reflection.* The term is however uſed in common language much more extenſively—to denote the *attentive conſideration* of any ſubject of *thought.* It does not ſeem to be ever uſed in reference to the preſent objects of perception to which obſervation is excluſively appropriated: but the act of thinking on any intellectual object is often termed reflection. In philoſophical inveſtigations, however, it ſeems beſt to limit it, to the attentive conſideration of what paſſes within, of the ſtates, affections, and operations of the mind.

When the mind is employed in the conſideration of any object of thought, it is ſaid to be *thinking.* In a wide ſenſe it includes every intellectual operation, in other words, whatever may be termed an act of the underſtanding, that is, every act of the mind, properly ſo called, except ſenſation and feeling. But it appears moſt appropriate to that ſtate in which the mind is actively employed in the conſideration of thought, whether its perceptions, notions, or feelings. The term *thought* has two ſignifications, the *act* of thinking and the *ſubject* of thinking. Conſidered as denoting the ſubject of thinking, it nearly correſponds with *notion*, *opinion*, &c.

When the mind is left in its trains of thought very much to the operation of the aſſociative power, without any direct reſtraint upon it from without or within, its ſtate is termed *meditation*; which bears nearly the ſame relation to the underſtanding, that reverie does to the imagination. The term is, however, uſed where the mind is more actively engaged, particularly on ſerious ſubjects of thought. It does not very greatly differ in its import from *contemplation*, but this term often appears more particularly to refer to the fields of *obſervation*, rather than of *reflection.*

The characteriſtic faculty or capacity of the underſtanding, is the power of *comparing* the different objects of thought, and *diſcerning* the various *relations* which exiſt among them, ſuch are thoſe of identity, ſimilarity, equality, proximity, continuity in time and place, difference, diſſimilarity, cauſe and effect, &c. &c. This property of the mind is ſo intimately connected with every act of ſenſation and thought, that it might be conſidered as in ſome ſenſe included in the powers by which we acquire ſenſations and ideas. But we are not aware of any ſufficient advantage reſulting from connecting it with them. The receiving of a ſenſation, and the recurrence of an idea, even when theſe are made the objects of an attentive conſideration, do not neceſſarily involve in them

them any comparifon with another: and this is therefore properly to be regarded as a diftinct act of the mind. The paper we are writing upon is rectangular; and if we form a conception of it, we have the fame appearance as the original fenfation prefented: but the mind cannot, with any degree of propriety, be faid to *judge*, when it merely forms that conception, or receives the correfponding fenfation. As foon as our attention is directed to the form of the paper, and by comparing it with the idea annexed to the word *rectangular*, we perceive the agreement of the form with the import of the term, we form a judgment, and the operation of the mind is well called *judging*.

It was fome years ago propofed by the prefent highly refpectable profeffor of moral philofophy at Glafgow, to give the appellation *intellectual perception* to the *power of the mind*, by which we *perceive relations fubfifting among the various objects of thought*. Whether that philofopher ftill retain the appellation, or the precife views which he then took of the fubject, we have not had the opportunity of afcertaining; but our prefent inveftigations lead us to regard them as very judicious. He then confidered fenfation, memory, and intellectual perception, as the three primary faculties of the mind: employing the appellation memory in a wider fenfe than is ufually given to it, fo as to make the affociation of ideas in reality a branch of memory. In this we cannot agree with him. As to the appellation, and the difcrimination of the power from the other faculties of the mind, and the importance which he attached to it, we fee more and more reafon to adopt his views. Still we think it more convenient and accordant with the reft of our plan, to employ the more cuftomary appellation *judgment*, as being a term of greater latitude. That it has been defined fo as to baffle every effort to know from the definition what operation of the mind was intended by it, we are aware; and alfo that it is often ufed very loofely; but the laft circumftance is in our favour: and we wifh to include under it three operations of the mind; 1ft, the attention to different objects of thought, confidered as different, with a view to afcertain their mutual relations or connections; which is appropriately termed *comparifon:* 2dly, the difcerning of the relation which is the object of the mind; which is an operation of the *intellectual perception:* and laftly, the confequent affociation of the ideas, as bearing the obferved relation, which is, in the narroweft fenfe, the *judgment*. The firft may be to a certain degree voluntary: the fecond depends upon the culture, extent, acutenefs of the difcernment, or intellectual perception, and cannot be faid to be voluntary any more than our fenfations are; the laft is a procefs which, like every other cafe of affociation, may be made more efficacious and permanent by voluntary effort, by directing the attention to it, &c. but is not in itfelf a voluntary operation.

We would by no means be underftood as intending to affert that becaufe the intellectual perception is to be regarded as an effential principle of the human mind, and not altogether an acquired faculty, and as involuntary in its operations, that it operates in all alike. If, owing to the influence of affociation, the *perceptions* of the fame *external* objects greatly vary in different individuals (fee INTELLECTUAL *Education*, II.), it cannot be furprifing that the *intellectual perception*, or the *difcernment of relations* among the objects of *thought*, fhould alfo vary greatly. We do not therefore compare it with *fenfation*, in which the fimple effect of external impreffions is invariable, except in the degree of intenfity, and cannot differ in different periods of life, or ftates of mind, or progrefs of mental culture. The perceptions of relations, even the moft common, (fuch as thofe of refemblance or difference,) vary greatly in readinefs, correctnefs, and extent, in different individuals, and in the fame individual at different periods of life. It is fufceptible of great improvement by proper cultivation. It depends for its exercife upon the memory: and its vigour and correctnefs depend upon the degree of habitual and difcriminative attention given to the various objects of thought. The more refined relations can only be difcerned among the objects of thought, when the nature of the relations themfelves is underftood: and this often involves fome extenfive proceffes of the affociative power in connection with the general cultivation of the underftanding; and the facility and correctnefs with which the mind difcerns fuch relations, depends greatly upon the purfuits of the individual, and the habitual tendencies of his mind, derived from them and from the mental character generally.

The judgment clothed in words is called a *propofition*. Every propofition expreffes a connection exifting in the mind of the fpeaker between the ideas denoted by the terms of the propofition, as bearing to each other the relation declared by the propofition: but it is, we apprehend, no uncommon error to fuppofe that every propofition expreffes a judgment, arifing from a direct act of judging. Paffing by thofe numerous cafes in which the act of judging has once taken place, but is no longer neceffary, there is a variety of others continually occurring, where the propofition expreffes no more than that the idea denoted by the predicate makes part of the complex idea of the fubject, either univerfally, or at that particular time. *Milk is white* is a propofition; but if we fuppofe a perfon, who has often feen milk, to ftate it for the firft time, we apprehend no mental procefs takes place to which we can juftly give the appellation of judging. There is no comparifon, difcerning, confidering, and deciding as to the coincidence of the ideas denoted by *milk* and *white;* he merely expreffes a fimple fact: if he has the fubftance before him, he tells you what he fees; if he thinks of it, (forms a conception of it,) he tells you what he recollects.

When a perfon is fomewhat practifed in obferving what paffes within him, the greateft difficulty he has to encounter is to feparate the proceffes of language from thofe of fimple thought; and thofe who are acquainted with the writings of fome of the beft mental philofophers, will fee abundant reafon to believe, that in various inftances they have either not attended to the diftinction between them, or have been unfuccefsful in detecting the actual procedures of the mind. The fact is, as we have before obferved, thought is more or lefs continually accompanied with words, even where it is not communicated to others. Where the object of the mind is fomething of which it can form diftinct or indiftinct conceptions, or confifts of mere feelings, words are not neceffary; but where the proceffes of reafoning or inveftigation are concerned, it is probably in the experience of all thinking perfons, that thefe proceffes are conftantly introducing the conceptions of *words*, either as objects of fight or of hearing. This may be peculiarly the cafe with thofe who are much employed in the communication of their thoughts; for fince it is only by clothing them in words that they can communicate them, they can fcarcely fail to be more accuftomed to think in words, much as they would fpeak in words, than he who confines his fpeculations to himfelf. At all times, however, it contributes greatly to the clearnefs of thought, to exprefs it in words; but if, as is indifputably the cafe, efpecially in mental inveftigations, we find words fail us, when we endeavour to communicate the nice difcriminating features of thought, it muft alfo be allowed that there are proceffes of thought befides thofe which are aided by words.

Further, we have little doubt that it will be found accordant with the experience of all who think much of what paſſes within them, that in the rapidity of thought, and even in drawing general concluſions from particular facts, the mind makes uſe of abbreviated forms of expreſſion to itſelf, and that only the outlines occur of thoſe modes of expreſſion, which would be requiſite in conveying our thoughts into the minds of others. Something analogous to this muſt be familiar to all who compoſe with great fluency, when merely writing, for their own future tranſcribers. To keep up in ſome meaſure with the ſpeed of thought, they continually uſe abbreviations, not merely of words, but of ſentences; ſometimes even making a whole word ſtand for a train of thought, which paſſing with great rapidity, ſeems to require little time to ſtate it in words; but when clothed in words, ſo as to be fit for communication, forms a ſeries of ſentences, which, even in a train of conceptions, would require that time tenfold. In rapid thought, even on the moſt abſtract ſubjects, we are confident that a faint conception of ſome leading words, or of abbreviations of them, is often all that paſſes in the mind.

But to return. We were about to obſerve, that from the cloſe connection between the proceſſes of thought and thoſe of language, important miſtakes in mental philoſophy have ariſen; and we regard as one of them that definition of judgment, which Mr. Stewart has ſanctioned in his Outlines, ſect. 9. "Judgment is defined by the writers on logic to be an act of the mind, by which one thing is affirmed or denied of another; a definition which, although not unexceptionable, *is as good as the nature of the ſubject admits of.*" We ſee great reaſon, from Mr. Stewart's Philoſophical Eſſays, to believe that, in the continuation of his Philoſophy of the Human Mind, (a work which we look forward to with as much earneſtneſs as any of his indiſcriminate admirers,) he will be much more attentive to the proceſſes of thought, as diſtinct from language, than his earlier reſearches lead us to conſider him. If ſo, he can ſcarcely avoid perceiving that he has too haſtily adopted ſome of the errors of his predeceſſors; and among other things he will, we doubt not, give a very different explanation of judgment from that which we have quoted. If he had ſaid, it is that act of the mind which attends the affirming or denying one thing of another, though, from the views which we lately ſtated, we ſhould conſider him as making it too general, including proceſſes of the mind which can be regarded in no light as acts of judgment, yet the leading error would have been avoided. Still it would have left us in ignorance. The queſtion ſtill is, what proceſs of thought, or act of the mind, accompanies the *thoughtful* ſtatement of a propoſition?

The repetition of a ſhort familiar propoſition is a mere act of the memory. It is of courſe merely an aſſociation of *terms;* and as the impreſſion is united with that combination of terms, that it is true, it may paſs in the mind without exciting any idea of its appropriate meaning: but in general it will be found, that a notion of its import paſſes rapidly in the mind, along with the ſtatement of the terms themſelves. In ſuch caſes, we can do little more than detect the exiſtence of fleeting thought. But when the propoſition is not familiar to the memory or belief, or the attention is from ſome cauſe or other particularly directed to its import, then is the period to examine what is the proceſs of the mind when uſing it or receiving it. Let a ſimple caſe be taken. We ſay, *Gold is heavy*, and the propoſition is ſo familiar to us, that the mind is ſcarcely conſcious of any thought going along with it; yet we are certain, if we pay the leaſt attention to it, as an expreſſion of a truth, that ſuch is the fact: for as ſoon as we ſay, *Silver is fuſible*, we not only perceive that the *words* are not the ſame, but that the internal notion attending the ſtatement is different. But if we realiſe the meaning of the propoſition, as expreſſive of ſome proceſs in our own mind, we find it to be, that the complex notion of gold includes in it a notion of its heavineſs; and as this laſt is not one which can be repreſented to the mind as a diſtinct part of that complex notion as the colour of it may, we may be obliged to think of what is the *feel* of it, when we hold a piece in our hands. In this laſt caſe, (and as it appears to us, in this only,) there is an operation of the judgment, properly ſo called. If the propoſition merely ſtates a connection ſubſiſting in the mind of the ſpeaker between the ideas denoted by the terms employed, and eſpecially if the import of the predicate forms an eſſential part of the complex idea denoted by the ſubject, we ſee nothing which can with ſtrict propriety be termed an act of judging. It may indeed be convenient in popular language to give the appellation judgment to every caſe, in which, by an act of attention, we aſcertain the connection exiſting in our minds between two ideas; but if the formation of that connection be ſimply the reſult of mere ſenſation or aſſociation, without any conſideration or compariſon, it cannot itſelf be called a judgment, conſidered as an operation, without making obſcurity more obſcure, by confounding things which are utterly diſtinct.

Let us take the caſe reſpecting the form of ſolids. The perception of a globe includes in it the notion of its real ſhape, though the impreſſion upon the retina could of itſelf communicate no ſuch idea. We may, if we pleaſe, call this connection of the notion of the real ſhape with the viſual appearance a judgment; but it is in reality an effect which would be produced by the operation of the aſſociative power, without the intervention of volition or reflection. We can think of no definition of judgment which can include this caſe, which will not include every operation of aſſociation. But if we attentively conſider the viſual appearance of an object, in order to determine its form, and compare it with that ſame other object whoſe form we have aſcertained, then we clearly have an act of judging:—it may be ſaid, and of reaſoning too. We allow it. If reaſoning ſignifies drawing concluſions from premiſes, every act of judging is an act of reaſoning. Reaſoning is expanded judging, and judging is compreſſed reaſoning. If reaſoning denote an operation of the mind, exactly correſponding with the ſyllogiſtic expreſſion of an act of reaſoning, we think there is no ſuch operation; except when we are intentionally employing a ſeries of *propoſitions*, mentally, much the ſame as we would in communicating our reaſonings.

The real ſtate of the caſe appears to us to be, that a direct exerciſe of the underſtanding is always included in the operation of judgment, properly ſo called. And it ſhould be obſerved, that a propoſition, which is merely the ſtatement of a connection in the mind of the *ſpeaker*, in no way the reſult of conſideration, but neceſſarily ariſing from the influence of external impreſſions on the ſenſitive powers, or from the agency of the aſſociative power upon the relics of theſe, without the intervention of the underſtanding, properly ſo called,—ſuch a propoſition may occaſion in the *hearer's* mind a real judgment, and may even require it, before the truth of it can be admitted. The propoſition may be merely the ſtatement of a complex thought; but as the terms of it repreſent that thought in certain parts, and in ſucceſſion, if the complex thought is not itſelf familiar to the mind of the hearer, ſo as to be excited at once by the propoſition, he is ſet by it to compare, to diſcern, and to decide; in other words, to judge.

We

We perceive here a wide field for interefting inveftigation; not involving mere verbal diftinctions, though thefe are often of the utmoft importance to the progrefs of knowledge; but refpecting the real procedures of the underftanding in the acts of judging and reafoning; but circumftances do not permit us to enter upon it.

We feel fatisfaction in perceiving, that the views to which our examination of this fubject has led us, in feveral refpects agree with thofe ftated by Condillac, in his Cours d'Etude Grammaire, part i. chap. 3. We fufpect, that he was led to them by the hypothefis, which he early adopted, that the judgment, the reflection, the paffions, and all the faculties of the foul, are nothing but fenfations under different modifications; but though the foundation is clearly erroneous, his remarks, as far as they go, are very judicious. We fay as far as they go, for he does not appear to have confidered any other cafes, but thofe which refpect our perceptions merely. If in the formation of thefe, or our complex notions of any kind, the underftanding has not been concerned, we do not perceive any operation of the judgment connected with the propofition ftating the fact; the exercife of the judgment, if exercifed at all, precedes the affirmation or negation.

We have before faid, that, in the popular fenfe, the term *judgment* is ufed more extenfively than in the philofophical acceptation (as referring to a particular power or act of the mind) it can be well employed. It is often ufed with as much latitude as *underftanding*. We fpeak of the folidity, the accuracy, the clearnefs, &c. of the judgment, or of the underftanding, with little or no difcrimination; but it will probably be found that the two words are often diftinguifhed juft as the words *underftand* and *judge*. The underftanding conveys lefs the idea of activity than the judgment; and refers more to the perception of truth than to the formation of right notions. We might even fay, that a good underftanding and found judgment are not infeparably connected. In the wide fenfe of the term, judgment is applicable to every act of the mind, by which an opinion is formed, and confequently includes not only judgment, ftrictly fo called, but extends to the whole round of affociations which refpect the objects of the underftanding. Still, even there, the communication of the judgment by language, and the judgment itfelf, are two diftinct operations of the mind; and fhould in all cafes be kept diftinct by the mental philofopher. In this fenfe, as moft accordant with our then object, we employed it in Intellectual *Education*, VIII. In that divifion of the article, we have introduced fome remarks refpecting the leading excellence of the jugdment, *viz. difcrimination*, to which we beg leave to refer the reader.

Thofe operations of the underftanding which are denominated *reafoning*, clearly are of the fame nature with judgment. Where the relation or connection fubfifting between two objects of thought is fhewn by confidering their mutual relation or connection with one or more others, there is an act of reafoning; and the term is ftrictly applicable wherever one truth is inferred from another. In a variety of inftances it is difficult to fay whether a judgment is formed by any procefs of reafoning or fimply by intuition; but it is clear, that a variety of truths, which are intuitively evident to the cultivated mind, require diftinct proceffes of judging in others. And on the other hand, that truths appear intuitively evident, which have in reality been the fubject of previous examination, but by familiarity are become fo affociated with the feeling of belief, that it is difficult to fuppofe they have ever been otherwife.

We fhall here notice one other clafs of the operations of the underftanding, which may with propriety be called *inveftigation*, that by which truth is perceived and difcovered. The exercifes of the underftanding, when in the purfuit of truth, continually involve operations of reafoning; they depend moft clofely upon the difcrimination of the judgment; they imply, what indeed this ftate always implies, the exercife of abftraction; and yet there is fomething beyond all this neceffary. It confifts in tracing out the proofs on which any pofition depends, in determining their refpective weight as evidence in difcovering the general principles agreeable to which particular phenomena have been produced, or the caufes operating to produce any known effect and their refpective influence. Mr. Stewart (Outlines, p. 58.) gives the denomination *invention* to thefe procedures of the underftanding. "The procefs of the mind," he fays, "in difcovering media of proof for eftablifhing the truth of doubtful propofitions, and alfo the procefs by which we bring new truths to light, is properly called *invention*."

We prefer our own appellation, becaufe it is a lefs fufpicious one. The term *invention* feems mifapplied in reference to the difcovery of truth; though we willingly admit, that in various proceffes of inveftigation, the invention is frequently exercifed. We do not recollect, that this philofopher has furnifhed, in his writings, any clue to thefe proceffes of the underftanding; and we are inclined to think, that no one has thrown fo much light upon the actual procedures of the mind in the difcovery or afcertainment of truth, as Hartley has in his 76th, 77th, and 78th propofitions, particularly the 77th. It contains a fund of profound and important obfervations, the value of which cannot be affected by their having among them a few opinions which muft be regarded as mere fpeculations; they are the fpeculations of a mafter mind, intent upon inquiries of an interefting nature; and contemplating with pleafure, what he confidered as important views refpecting the attainment of that, which indifputably was with him the firft object,—truth. One fuch fentence has furnifhed Mr. Stewart, on more than one occafion, with an appeal to common fenfe againft Hartley, which appears to have had great fhare in finally clofing his own mind againft the reception of the leading principles of Hartley's Philofophy, and even againft the admiffion of the real importance and profundity of many of his obfervations, which, we fhould have imagined, muft have fecured that great philofopher the refpect of every candid inveftigator into the laws of the mind, whatever be the fyftem he has adopted.

Our readers muft here allow us to digrefs fomewhat from our main object, to confider Mr. Stewart's modes of demolifhing the Hartleyan philofophy. In his account of the life and writings of Dr. Reid, we perceive indications of the low eftimation in which he holds the inveftigations of Hartley. He there claffes him with Darwin; and throws out various infinuations againft him as a mere theorift, who, and fome others, form an exception to the progrefs of the philofophical world towards the inductive plan of ftudying human nature. And he fpeaks of the "*reveries* of Hartley," which, he fays, have for a while been called from oblivion by the chemical difcoveries which have immortalized the name of Prieftley. We think it was profeffor Robifon who fpoke of Hartley as an *idiot*. Mr. Stewart is nearer the truth. There certainly are in Hartley's works fome fpeculations, which may be termed reveries of a philofophical underftanding, if we choofe fo to reprefent them; and he has blended with his grand principles, a theory refpecting the phyfical caufes of thought, which, however ingenious and plaufible, affords but little infight into the phenomena of

 hought,

thought. In a few inftances he has expreffed himfelf with incorrectnefs refpecting ideas, fo as to appear to refer them to the material organization, when his fyftem clearly referred only the occafions of thought to matter, and the ideas themfelves to the fentient principle in man ; and he has fometimes ufed the term to denote *ftates* of mind or even *operations* of mind. We are of opinion, too, that he has in a fmall number of cafes carried too far the application of the grand law of affociation ; and, in particular, that he has too much neglected the re-action of the fentient principle on the mental organs ; or perhaps more correctly, the effects produced on the operations of the affociative power by the exercife of the underftanding. Though in his leading inveftigations we profefs ourfelves his humble followers, becaufe we deem them alike important and juft, we are not infenfible of the faults of his great work, and are ready to leave him wherever we fee reafon to believe that he leaves human nature. But after every detraction from the merits of his work, which the moft rigid *juftice* can make, we regard it as a treafure of comprehenfive and judicious obfervations and accurate and profound inveftigations refpecting the phenomena of the human mind, of unrivalled excellence and importance.

Dr. Johnfon, we are told, valued this work next to the bible, and the writer of this article does the fame. Its value cannot be fully appreciated except making it the guide in obfervation and reflection on human nature, fimilar to thofe which led the author to his conclufion refpecting moral and mental truth ; and our own admiration of it arifes in proportion to our acquaintance with the proceffes of thought and the phenomena of affection.

" The authors (fays Mr. Stewart, § 81.) who form the moft confpicuous exceptions to this gradual progrefs, confift chiefly of men, whofe errors may be eafily accounted for, by the prejudices connected with their circumfcribed habits of obfervation and inquiry ;—of phyfiologifts, accuftomed to attend to that part alone of the human frame, which the knife of the anatomift can lay open ; or of chemifts who enter on the analyfis of thought, frefh from the decompofitions of the laboratory ; - carrying into the theory of mind itfelf (what Bacon exprefsly calls) ' the fmoke and tarnifh of the furnace'." If this obfervation had not been fo fituated that it muft be inevitably referred to Hartley in connection with Prieftley and Darwin, we fhould have believed that a philofopher who evinces fo much good fenfe and general candour as Mr. Stewart, could not have involved him in this cenfure. Such particulars of his life are before the public as fhould have prevented it altogether. His education obvioufly was of that regular judicious kind, which was calculated to give a due fcope to the exercife of the underftanding ; and his great talents very early difplayed themfelves. He was originally intended for the church, and he proceeded for fome time in his thoughts and ftudies towards that object, but was prevented from entering upon it by fome confcientious fcruples ; and he then devoted himfelf to the medical profeffion, in which he made himfelf eminent by his fkill, integrity, and benevolence. He had been from his youth, and ftill continued, in the purfuit of thofe branches of knowledge which peculiarly tend to expand and ftrengthen the underftanding ; and lived in intimacy with fome of the moft learned and intelligent men of his age, fuch as Law, (afterwards bifhop of Carlifle,) Butler, Warburton, Jortin, Hales, Smith, &c. There was in fact every thing to bring his mind into that ftate in which the perception of truth is moft eafy ; for with his habits of patient perfevering inveftigation and obfervation, correct and penetrating underftanding, an extenfive acquaintance with the moft important branches of human knowledge, he united thofe moral qualities, the want of which has more than any thing tended to cloud the mind, and prevent the intellectual eye from penetrating into moral truth. His thoughts were not immerfed in worldly purfuits or contentions, and therefore his life was not eventful or turbulent, but placid and undifturbed by paffion or violent ambition. He was free from fenfuality, intemperance, pride, oftentation, envy, and every other branch of fordid felf-intereft ; and the principles which were taught in his works were the invariable guides of his life and conduct.

At the early age of twenty-five his great work was regularly undertaken ; but for fome years before that period his mind had been directed to enquiries and obfervations, which formed the germ of his fubfequent inveftigations. His work was not completed till about fourteen years afterwards ; and after it had lain by for two or three years more, it was publifhed in 1749, when he was little more than forty-three years of age. His mind was for many years conftantly and intently engaged upon the object ; but after the completion of it he did nothing more than keep up a general and vigilant attention to it, to enable him to make any alterations or modifications which might occur from his own reflections or the fuggeftions of his friends. It does not appear, however, that any thing material had occurred to him ; for at his death, in 1757, he left behind him no additional papers or remarks whatever. He did not expect that his work would meet with any general or immediate reception in the philofophical world, or even that it would be much read or underftood ; but at the fame time he did entertain an expectation, that at fome diftant period his philofophical principles would be adopted. Prefent appearances favour his opinion. About two or three years ago, a *fifth* edition was publifhed of the original work ; and befides them, two editions have been fold of Dr. Prieftley's abridgment.

We have been led to this account of Hartley, to affift in counteracting the effect of Mr. Stewart's contemptuous expreffions, and (one muft fay) unfounded ftatements and infinuations refpecting that great philofopher. We have been repeatedly reminded by them of thofe excellent obfervations on *candour in controverfy*, which are to be found in Mr. Stewart's Outlines, p. 240, two or three fentences of which we will quote, and leave to the reader's own reflection. " He who is confcious of his own inventive powers, and whofe great object is to add to the ftock of human knowledge, will reject unwillingly any plaufible doctrine, till after the moft fevere examination ; and will feparate with patience and temper the truths it contains, from the errors that are blended with them. No opinion can be more groundlefs, than that a captious and difputatious temper is a mark of acutenefs. On the contrary, a found and manly underftanding is in no inftance more ftrongly difplayed, than in a quick perception of important truths, when imperfectly ftated and blended with error ;—a perception which may not be fufficient to fatisfy the judgment completely at the time, or at leaft to enable it to obviate the difficulties of others, but which is fufficient to prevent it from a hafty rejection of the whole from the obvious defects of fome of the parts."

In a fubfequent part of the account of Reid, Mr. Stewart quotes the paffage from Hartley, which we referred to at the commencement of thefe remarks. We will quote it ourfelves, and then fhew in what manner it has been quoted by Mr. Stewart. After fome highly important obfervations refpecting the nature of evidence, and on the conduct of the underftanding in the inveftigation of truth, Hartley continues, p. 350, " Thefe fpeculations may feem uncouth to thofe who are not converfant in mathematical inquiries ; but to me they appear to caft light and evidence upon the

methods

methods of purſuing knowledge in other matters, to ſharpen the natural ſagacity, and to furniſh loci for invention. *It appears alſo not impoſſible* that future generations ſhould put all kinds of evidences and inquiries into mathematical forms, and *as it were* reduce Ariſtotle's ten categories, and biſhop Wilkins's forty ſumma genera, to the head of quantity alone, ſo as to make mathematics, and logic, natural hiſtory, and civil hiſtory, natural philoſophy, and philoſophy of all other kinds, coincide omni ex parté." The parts which we have put in italics are of conſequence. The firſt ſhews that the author did not indulge any *very* ſanguine expectations on this ſubject, and meant that it ſhould be regarded merely as, in his eſtimation, judging from what he ſaw of the analogy *between different methods of ſearching after truth*, a thing not impoſſible; and the expreſſion *as it were* clearly qualifies it. Both theſe in Mr. Stewart's quotations are omitted. In the account of Dr. Reid, p. 93, after having ſpoken of the undue love of ſimplicity which has been directed to the proceſſes of the underſtanding, and adduced a ſpecimen from Hume, he proceeds, "and Dr. Hartley, with a ſtill more ſanguine imagination, looked forward to an era, 'when future generations ſhall put all kinds of evidences and enquiries into mathematical forms; reducing Ariſtotle's ten categories'," &c. We ſhould have expected that this indulgence of the imagination (if ſuch it muſt be termed) would have been pardoned by every one, who had ever experienced the enthuſiaſm ariſing from the belief that he had aſcertained important principles of inveſtigation, and had traced out the connection exiſting among the branches of human knowledge: or by any one converſant with the writings of philoſophers on ſubjects connected with the mental inveſtigation; for ſuch ſpeculations are not unfrequently to be met with among the moſt judicious of them. One we have juſt noticed in the writings of Condillac, much reſembling Hartley. (Cours d' Etude, de l'Art de Raiſonner, ch. xi.) "Si nous pouvons découvrir toutes les vérités poſſibles, & nous en aſſurer d'une manière évidente, nous ferions une ſuite de propoſitions identiques, égales à la ſuite des vérités; et *par conſéquent nous verrions toutes les vérités ſe reduire à une ſeule.*"

Hartley's conjecture is obviouſly an inſulated one; in no way neceſſary to, or illuſtrative of, his reaſoning, in the propoſition in which it ſtands. If it had been left out, it would never have been miſſed; and we think it highly unjuſt to repreſent it, as Mr. Stewart appears to us to have done, as a kind of criterion of the value of his obſervations. In the laſt work of the northern philoſopher, p. 15, he quotes the following paſſage from De Gerando. "The philoſophy of mind has its alchemiſts alſo; men whoſe ſtudies are directed to the purſuits of one ſingle principle, into which the whole ſcience may be reſolved; and who flatter themſelves with the hope of diſcovering the grand ſecret by which the pure gold of truth may be produced at pleaſure." Mr. Stewart then adds, "Among theſe alchemiſts in the ſcience of mind, the firſt place is undoubtedly due to Dr. Hartley, who not only attempts to account for all the phenomena of human nature, from the ſingle principle of *aſſociation* combined with the *hypothetical* aſſumption of an inviſible fluid or *ether* producing vibrations in the medullary ſubſtance of the brain and nerves; but indulges his imagination in anticipating an era, "when future generations ſhall put all kinds of evidence and inquiries into mathematical forms; reducing Ariſtotle's ten categories, &c." as before. The reader will obſerve the ſame unaccountable inaccuracy in the quotation as before, which clearly gives it a different complexion from what it has in the Obſervations. After citing this paſſage, Mr. Stewart adds, "*If I had never read another ſentence of this author, I ſhould have required no farther evidence* of the unſoundneſs of his underſtanding." On this ſummary argument we ſhall make only one remark. If, after reading Mr. Stewart's Elements, we were to ſay, he teaches us that when a perſon is moſt intently engroſſed in ſome intereſting and profound inveſtigation, ſo that his attention would not be diſtracted even by a ſudden and violent noiſe, he is at the ſame time *conſcious* of all the impreſſions which external objects make upon the organs of ſenſe, he is at the ſame time *willing* all thoſe little motions of his limbs, to which he has accuſtomed himſelf while thus engaged, we require no further evidence of the unſoundneſs of his underſtanding, we ſhould do him great injuſtice, and ourſelves great injury. Mr. Stewart proceeds; "It is however on ſuch raſh and unwarranted aſſertions as this, combined with the ſuppoſed comprehenſiveneſs of his metaphyſical views, that the peculiar merits of Hartley ſeem now to be chiefly reſted by the more enlightened of his admirers. Moſt of theſe, at leaſt whom I have happened to converſe with, have ſpoken of his phyſiological doctrines as but of little value compared with the wonders which he has acccompliſhed by a ſkilful uſe of the aſſociating principle." The grounds of *our* admiration of Hartley we have already ſtated; and we can only ſay, that our acquaintance with Hartleyans, leads us to conclude, that we are not ſingular in that reſpect.

But Mr. Stewart advances, p. 17, one ſtatement which is regarded by ſome of his followers as a total overthrow of the Hartleyan philoſophy. The generalizations which he has attempted are merely *verbal;* deriving whatever ſpecioușneſs they may poſſeſs, from the unprecedented latitude given to the meaning of common terms. After telling us, for example, that "all our internal feelings, excepting our ſenſations, may be called *ideas,*" and giving to the word *aſſociation* a correſponding vagueneſs in its import, he ſeems to have flattered himſelf that he had reſolved into one ſingle law, all the various phenomena, both intellectual and moral, of the human mind." On this moſt extraordinary ſtatement we muſt offer a few remarks.

(1) There is no evidence to prove that Hartley ever flattered himſelf with having reſolved into one ſingle law all the various phenomena both intellectual and moral of the human mind. In his Preface, to which we refer our readers, he ſtates his views as to what he had done. "I have here put together all my ſeparate papers on theſe ſubjects, digeſting them in ſuch order as they ſeemed naturally to ſuggeſt; and adding ſuch things as were neceſſary to make the whole appear there complete and ſyſtematical.

"I think, however, that I cannot be called a ſyſtem-maker, ſince I did not firſt form a ſyſtem and then ſuit the facts to it, but was carried on by a train of thoughts from one thing to another, frequently without any expreſs deſign, or even any previous ſuſpicion of the conſequences that might ariſe. If the reader will be ſo favourable to me as to expect nothing more than hints and conjectures in difficult and obſcure matters, and a ſhort detail of the principal reaſons and evidences of thoſe that are clear, I hope he will not be much diſappointed. However, be this as it will, I have, in one part or other of theſe papers, alleged all that I know material in ſupport of my ſyſtem; and therefore am now deſirous to recommend it to the conſideration of others. I have tried to reconcile ſuch inconſiſtencies real or apparent, and to cut off ſuch repetitions and redundancies, as have ariſen from my writing the ſeparate parts of this work at different times and in different

ent ſituations of mind. But I have ſtill need of great indulgence from the reader on theſe and other accounts." Pref. p. 14.

We have no doubt whatever, that he has furniſhed the grand clue to the analyſis of all the mental pleaſures and pains, and of the notions of the underſtanding, ſo as to prove ſenſations to be the elements of the whole, (though, as we have before obſerved, he does not appear to have attended explicitly enough to the modifications of them cauſed by the intentional operation of the underſtanding); but he never repreſented himſelf as having himſelf accompliſhed this analyſis. He does not even go ſo far as Mr. Stewart repreſents him by an error in another of his quotations, p. 128. In another paſſage he expreſſes his hopes, that "by purſuing and perfecting the doctrine of aſſociation *he* may ſome time or other be enabled to analyſe all that vaſt variety of complex ideas, which paſs under the name of ideas of reflection and intellectual ideas, into their ſimple compounding parts; that is, into the ſimple ideas of ſenſation of which they conſiſt." Hartley uſes the pronoun *we;* and it is clear, (both from the nature of the paſſage, and his almoſt uniform uſe of the ſingular pronoun,) that he did not mean *himſelf*, but inquirers following the ſame track. It is really melancholy to obſerve how much Mr. Stewart has laboured to excite prepoſſeſſions againſt the Hartleyan ſyſtem.

(2) We are not aware that Hartley himſelf ever thought, that the ſingle principle of aſſociation, united with the power of ſenſation, was *every thing* that is neceſſary to account for all the phenomena of the underſtanding. He certainly endeavours to ſhew, that the aſſociative principle has a wide and important influence in the operations of the underſtanding, furniſhing it with all the materials for its exerciſe, except mere ſenſations, and being, in a variety of caſes, concerned in thoſe operations; but he never repreſents the *underſtanding* itſelf as nothing more than *aſſociation*. The very firſt clauſe of his definition of the underſtanding, that it is "the faculty by which we *contemplate* mere ſenſations and ideas," is ſufficient (unleſs there were the moſt deciſive evidence to the contrary) to ſhew that he did not conſider them as the ſame. The fact is, Hartley's Obſervations, as might be expected from his own account of them, conſtitute much leſs a ſyſtem than is generally ſuppoſed; and there is a great variety of important obſervations reſpecting the proceſſes of the mind, which do not appear to have been deſigned in any way to ſupport the doctrine of aſſociations, though they grow out of his inveſtigations on the ſubject. We do readily admit, however, that if Mr. Stewart derived his ideas of Hartley merely from the ſtatements of ſome of his followers, he would not have been without juſtification.

(3) Hartley is charged with employing the word *aſſociation* with a vague import. This is the firſt time, we ſuppoſe, that the charge has been publicly made; and we deem it altogether unfounded. We do not recollect that Hartley has any where actually defined the term; but we take for granted that it is impoſſible for any one to attend to his tenth and twelfth propoſitions, without underſtanding the import in which he uniformly uſes it without, we believe, *any* real variation; and we preſume it will be found to be that in which we have uniformly employed it in this article, in reference to the principle or law of aſſociation in its two operations, connections and combinations. (See Div. I. IV.) That Hartley has carried the application of the term beyond Mr. Locke's uſe of it, is only that extenſion of a term which ariſes from increaſed acquaintance with the phenomena to which it is applicable. If Mr. Stewart can point out any inſtance in which Hartley has employed the term where it is inconſiſtent with his own uſe of it in theſe two fundamental propoſitions, there he has ſome room to cenſure. "I ſhall not enquire at preſent," ſays Mr. Stewart (Elements, 4to. p. 134.) "into the proper Engliſh meaning of the words *conception* and *imagination*. In a ſtudy ſuch as this, ſo far removed from the common purpoſes of ſpeech, ſome latitude may perhaps be allowed in the uſe of words; provided only we define accurately thoſe we employ, and adhere to our own definitions." Hartley employs his terms with a well defined real meaning, in no reſpect vague nor more comprehenſive than his phenomena required. If he have in any inſtance claſſed among the phenomena of aſſociation any mental operation which does not belong to it, it is a fault in his philoſophy, not in his term. Not leſs unfounded is Mr. Stewart's cenſure on Hartley, for giving the appellation *ideas* to all our internal feelings, excepting our ſenſations. Other philoſophers have included in the term *ſenſations* as well, or, which is much worſe, have termed all our internal feelings *ſenſations*. The queſtion ſtill is, has Hartley adhered to his own definitions; and we think that there are exceedingly few inſtances to the contrary, and theſe few do in no way affect the ſoundneſs of his inveſtigations.

(4) But we are told that *his generalizations are merely verbal*, deriving whatever ſpecioufneſs they may poſſeſs from the unprecedented latitude given to the meaning of common terms. We have already intimated that the fundamental principle of Dr. Reid's philoſophy (if it be more than nominal) is ſo completely in oppoſition to the Hartleyan doctrine of aſſociation, that they cannot be received together. And the influence of that principle is to us clear in the ſingular ſtatement which we have juſt quoted: though Hartley clearly uſes the word idea without any reference to the *phantaſtical* theory. We will, for a moment, ſuppoſe that he had not uſed it at all, that he had done as we have ſometimes done in this article, uſed the term *notions* in reference to the underſtanding, and *feelings* in reference to the paſſions and affections, &c.: ſo as to have divided what he includes under *ideas*, into *notions* and *feelings*. Now we appeal to the candid inquirer, whether, if he had ſucceeded in ſhewing how the aſſociative power operates upon the relics of ſenſations, forming them into various groups and combinations, ſo as to produce complex notions and feelings; and how each ſenſe contributes the elements for this operation of the aſſociative powers, and what elements from each ſenſe enter into the more refined notions and feelings; and in tracing the great influence which aſſociation has in various proceſſes of the underſtanding, and in the operations referred to the head of memory and imagination; and laſtly, in pointing out how the feelings, (the mental pleaſures and pains,) are formed from the more or leſs complex combination of the elements furniſhed by the ſenſible pleaſures and pains; whether, if he had ſucceeded in doing all this, the inveſtigation could be juſtly termed *a mere* VERBAL *generalization*, deriving whatever *ſpecioufneſs* it may poſſeſs from the unprecedented latitude given to the meaning of common terms? We maintain that he has eminently ſucceeded in all this; and that he has done more towards *explaining* the moſt important phenomena of thought, of feeling, and of language, than any other philoſopher ancient or modern, or, we may venture to ſay, even than all put together, whoſe inveſtigations have been completely independent of his.

Mr.

Mr. Stewart may think (and his implicit admirers may think alfo) that he has demolifhed the whole fabric of the Hartleyan philofophy at a blow; but in our apprehenfion the only way to effect it, is by fhewing either that Hartley has given an erroneous view of our mental phenomena, or that he erred in applying a univerfally acknowledged principle to the explanation of them. We are fatisfied that his fyftem has been fubjected to much longer and clofer examination than Mr. Stewart feems to have given it, without any refult unfavourable to its *general* truth and importance; and that as long as human nature continues as it is, it muft retain its truth and its fundamental importance.

We are the more confirmed in the conclufion that Mr. Stewart has not yet given the proper Hartleyan theory a due examination by the following paffage, p. 129, "His ultimate aim, in this part of it, is precifely the fame with that of the fchoolmen, when they attempted to explain, by the hypothefis of certain *internal fenfes*, how the *fenfible fpecies*, received from external objects, are fo refined and fpiritualized as to become, firft, objects of memory and imagination; and, at laft, objects of pure intellection. Such reveries are certainly not entitled to a ferious examination in the prefent age." The writer of this article may obferve, on the fimilarity between the Hartleyan doctrine and that of the fchoolmen, that it had previoufly ftruck his own mind, and convinced him that their opinions, though mixed with error, were founded on actual obfervation on what paffed within them. Their error lay in their hypothefis refpecting the *nature* of fenfations. Fanciful, however, as this hypothefis is, it is in our apprehenfion decidedly preferable to that which fuppofes that the mind thinks without any object of thought.

As to the originality of Hartley's principles, it is to us of little confequence, provided they are true; but it cannot be doubted by thofe who were acquainted with Hartley's character, that he has told us all that led him to his principles. Mr. Stewart (p. xx.) refers to a paffage from Hume, which he regards as anticipating Hartley's conclufions, by reprefenting "the principles of union and cohefion among our fimple ideas as a kind of *attraction*, of as univerfal application in the mental world as in the natural." But the works of Hartley manifeft no acquaintance with the Treatife on Human Nature; and if he had feen it, though he might have derived from it fome valuable extenfions of the connective exercife of the affociative power, the particular expreffion which Mr. Stewart quotes could have afforded no aid to him refpecting the compofition of ideas. Mr. Hume, however, appears to have had a glimpfe of the truth refpecting the formation of the moft complex ideas from the fimple elements of fenfations. Mr. Stewart alfo quotes a paffage from Smith's Harmonics, which clearly implies that he had fome notions fimilar to Hartley's hypothefis of vibrations; and obferves that the work was printed in 1749, but that the preface is dated 1748. Hartley's work was finifhed a confiderable time before; and when it is recollected that Smith and Hartley were intimately acquainted with each other, it is at leaft probable that Smith's mind was directed to the fubject by the inveftigations of Hartley, and that he indirectly refers to them. We fhould not have entered upon the fubject of this paffage, but from a "wonderful coincidence," noticed by Mr. Stewart, (p. 130.) "between Hartley's theory and that of Condillac concerning *the transformation of fenfations into ideas*. Condillac's earlieft work, which was publifhed in 1746, three years before Hartley's Obfervations on Man, is entitled Effai fur l'Origine des Connoiffances. *Ouvrage ou l'on reduit à un feul principe toute ce qui concerne l'entendement humain.* This *feul principe*," adds Mr. Stewart, "is precifely the *affociation of ideas*;" and he quotes an expreffion from the preface, which, infulated, gives fome countenance to the opinion. But thofe who know that in that work (i. 2. § 3.) he fpeaks of the affociation of ideas, (*le liaifon des idées,*) as having no other caufe than the attention we have given them when prefented together, and that he traces, as we have elfewhere ftated, every thing to *fenfation*, muft feel convinced that Mr. Stewart is here alfo in an error. We muft mention, however, that he exprefsly difclaims all infinuation of the fufpicion of plagiarifm; but his mode of ftatement will lead others to entertain it: and we therefore farther obferve, that we have no reafon to fuppofe that Condillac's work was foon known in England; that at any rate, Hartley's work was completed two or three years before its publication in 1749; and that the inveftigations of Condillac are altogether of fo different a character from thofe of Hartley, that we doubt whether the Englifh philofopher could have derived any material aid from them in his refearches. In faying this, we by no means wifh to fpeak with difrefpect of Condillac's works, of which, as far as our acquaintance with them extends, we have been led to think highly, from the good fenfe and perfpicuity which runs through the whole. Where he theorifes, we often leave him; where he gives us the refult of actual attention to the operations of the mind, his obfervations generally are juft and important.

Thefe remarks have expanded far beyond our original intention, and we fhould much fooner have brought them to a clofe, if the ftatements which have led to them had proceeded from a writer of lefs real eminence than Mr. Stewart. Though not to be placed upon a par with feveral portions of his Elements, his Philofophical Effays are in many refpects valuable, and generally interefting. We had not the opportunity of confulting this work, till by far the greateft part of this article was prepared for the prefs, or we fhould probably have made fome ufe of it in a way more grateful to our feelings than we have now done. The reader will find in that work fome very juft animadverfions on Horne Tooke's principle, that the import of a word is to be fought in its origin; and on other points connected with language, Mr. Stewart has advanced various judicious obfervations, which, however, muft in general be familiar to thofe who have been accuftomed to apply the principles of Hartley to the phenomena of language. And the Hartleyan can fcarcely fail to feel aftonifhment, when he fees Mr. Stewart ftating (p. 158.), in unqualified terms: "Many authors have fpoken of the wonderful *mechanifm of fpeech;* but none has hitherto attended to the far more wonderful mechanifm which it puts into action behind the fcene." He cannot but wonder that Mr. Stewart fhould have forgotten the concife, yet moft comprehenfive and profound obfervations of Hartley (fee VIII. 3.); and the reader of Condillac will be compelled to fuppofe that the philofopher's memory was as treacherous on this point, as when he reprefented his views of *attention* as original, though the leading obfervations he makes on the fubject are diftinctly ftated at large, in the Effai fur l'Origine, part 1. fect. ii. ch. 2, &c.; and in different parts of the Art de Penfer in the Cours d'Etude.

We fhould feel great fatisfaction, if circumftances permitted us to bring together the valuable obfervations on the nature of demonftrative reafoning, and on the proceffes of the mind in reafoning, which are to be found in different parts of Condillac's work; and in offering fuch remarks on them as might ferve to illuftrate and extend them: but it is not practicable; and we fhall merely recommend his work

to

to the attentive ſtudy of thoſe who wiſh to purſue this branch of mental ſcience. The remainder of our article we ſhall employ in laying before our readers a few thoughts on ſome other proceſſes of the underſtanding, and a view of the principles of Hartley reſpecting the leading phenomena of the underſtanding, under the head of words, and the ideas aſſociated with them, and the nature of aſſent. In this view, though we ſhall generally uſe his own expreſſions, we ſhall occaſionally make ſuch alterations in them as will beſt adapt them to our object; and we therefore hope that no one will impute any ſuppoſed inaccuracy in our language to Hartley himſelf, without examining the original.

2. *Of Attention, Abſtraction, and Generalization.* (See theſe ſeveral articles.)—By inveſtigating the phenomena of mind, when a connection is already formed between volition and certain mental ſtates or operations, we are repeatedly led to conſider thoſe ſtates or operations, however paſſive the mind might originally have been, as totally and in their own nature voluntary. This is remarkably the caſe with that ſtate of mind which is called attention. That this is in young children entirely involuntary, is certain; and thoſe who are endeavouring to form their minds to habits of ſtudy and reflection, know from conſtant experience that they have it little under their command. So far from having an original power of excluding vivid ideas or ſenſations, to devote the attention to thoſe which, though moſt certainly demanding it, do not make the ſame lively impreſſion upon the mind; it is a habit which requires ſtrict and ſevere diſcipline to produce it; it is a poſſeſſion honourable and invaluable; but, like every other of importance, not the acquiſition of the moment, but of a long continued courſe of rigorous, and in many caſes of painful, exertion. And when the habit of voluntary attention is formed, that is, when we can produce the ſtate of mind called attention by a determination of the will, how much may fairly be attributed to the nature of the object, which, though perhaps at firſt unintereſting, becomes pleaſing and impreſſive, and thus produces that ſtate by the original laws of our conſtitution. It even appears probable, that the perſon who has formed ſuch habits of attention to a particular ſcience, as to be able to give it his undivided attention, would be almoſt as incapable of directing it to frivolous objects, or to a ſcience to which habitual attention, or the nature of the ſubject, does not give any charms, as he was when he firſt entered upon his purſuits. In a word, when we take into conſideration that our attention is never undivided, except to thoſe things which are calculated to engage it, either by the original agreeableneſs of their nature, or that which they acquire in proportion as our habits become confirmed, and that the aſſociative faculty may, and in many inſtances does, form a connection between the mental ſtates we call attention and volition, we have probably then ſufficient data to account for the phenomena of attention, without calling in, with Mr. Stewart, the aid of a new faculty. See INTELLECTUAL *Education*, IV.

Abſtraction is defined by Mr. Stewart, the faculty by which the mind ſeparates the combinations which are preſented to it. This definition, ſo far as it goes, appears to be very correct; but if the proceſſes of generalization are intended to be contained in it, it is by no means ſufficient, as will immediately appear from the ſlighteſt conſideration of that mental proceſs. Abſtraction, in this acceptation of the term, is indeed eſſentially ſubſervient to every act of claſſification, but by no means comprehends that act in the number of its functions. Though we cannot agree with Mr. Stewart in all his ſtatements, in his chapter on attention, we muſt in one poſition which he advances, (if by attention he means the full devotement of the obſervation or reflection to an object,) *viz.* that the mind "cannot attend at one and the ſame inſtant to objects which we can attend to ſeparately." And if this be the caſe, what is abſtraction but attention directed to particular objects, owing either to ſomething vivid in the ſenſation they excite, or to the frequency of their recurrence; in fact, ſubject to all the laws of attention, perfectly involuntary in early life, and afterwards becoming to a certain degree voluntary, by means of the acquired power of the will.

In ſpeaking of the proceſs of generalization, ſome obſervations will apply to the proceſs of abſtraction ſeparately conſidered. (See alſo INTELLECTUAL *Education*, V, VI.) We ſhall, therefore, proceed to conſider the formation of general or abſtract notions; a proceſs in which the mind is moſt uſually paſſive; which is capable of ſatisfactory explanation upon the principles of the aſſociative power, and cannot (as we conceive) be explained without it.

Senſible objects, and particularly thoſe of ſight, are undoubtedly the firſt which exerciſe the power of abſtraction, or ſeparate attention; and here the proceſs is plain. The object makes its appropriate impreſſion upon the organs of ſenſe, and when withdrawn leaves in the mind an idea. Another ſenſation is received from an object bearing ſtrong features of ſimilarity to the former; by the laws of aſſociation, it calls up the idea before produced, and becomes aſſociated with it. Other ſimilar objects are preſented, and the features in which they agree being the moſt frequently called up, engage moſt the attention of the mind, and thus becoming, in ſome degree, ſeparate from the objects which originally were connected with them, conſtitute the abſtract idea. The readineſs with which theſe circumſtances of reſemblance recall the idea or *conception* of the individuals from which they were abſtracted, depends upon the habits of the individual, and the number of objects from which the abſtract notion was formed. If we had ſeen but two or three ſheep, it is probable that the circumſtances of reſemblance would be ſo connected in our minds with the individuals, that one or more of them would be conſtantly called up when conſidering the circumſtances of reſemblance; but if the number be much greater, that is, if the circumſtances of reſemblance have been frequently in the mind, and particular individuals much leſs frequently, the notion of theſe circumſtances of reſemblance becomes ſomewhat disjointed from the objects by which it was formed. And though it is probably impoſſible to have a general notion of any claſs of objects merely ſenſible, without the idea of an individual being preſent in the mind; yet from the cauſes we have mentioned, the general features of reſemblance not being particularly connected with any individual, thoſe features only are ſtrong and vivid, and call the attention of the mind, while all the other circumſtances of diſſimilarity have little effect upon it, and do not attract its attention.

The procedure of the mind appears to be exactly the ſame, though leſs obvious, and uſually more difficult of analyſis, when the general idea is more remote from ſenſation, when in fact the notions of the quality, or qualities even in the individual, may be very complex, and this in proportion as it is more intellectual and refined. In the former claſs of general notions, and even in ſome inſtances of the preſent, where the quality is definite and obvious, it is probable that language would not be requiſite. For the abſtraction, ſo far as it is involuntary, is ſolely the effect of the frequent recurrence of ſome particular qualities with which they are occaſionally combined. But thoſe abſtract ideas, in which the circumſtances of reſemblance between the compoſing ideas are not very obvious or very diſtinct, either would not have

have been formed at all by the bulk of mankind, or at leaft would have been very confufed. We can go very far with thofe who contend that general ideas would not exift in the mind without the medium of language; but that they could not from any deficiency of mental capacity to form them, does by no means appear certain. The fame faculties which now produce them, might have produced them without the powers of *communication;* and there appears no reafon why the deaf and dumb child may not form a general idea of men, or horfes, or fire, or any object of a fimilar kind, as well as if capable of annexing terms to the objects of perception.

It can be no objection to this account of the procedure of the mind in generalization, that we are able to form claffifications of objects from circumftances which are not calculated to ftrike the mind of the common obferver. When left to itfelf, before habits of reflection are formed, the mind will be neceffarily attracted by the moft prominent *fenfible* features of refemblance, and the objects would become affociated by that bond of union; and in very many cafes this would differ in different individuals; but it is indubitable that we may acquire fuch a command over our affociations, that we may be able to combine objects in our minds which have no cuftomary tendency to fuch combination, by a more factitious connection; and that by the requifite culture of the mind, certain connecting principles are either difcovered or confirmed, which could not have been of any force in a more early period of mental progrefs. In the firft of thefe cafes the affociation is voluntary, and if there were not fome apparent benefit refulting from it, or fome circumftances calculated to produce it in the mind, it would foon give place to a more natural union. So far, however, as any general idea is formed, its production is accomplifhed agreeably to the principles we have ftated. In the fecond the operation of the mind is moft ufually involuntary; when voluntary, the obfervations on the firft ceafe to apply.

It is obvious that the fewer and more diftinct the circumftances which are comprehended in the general notion of a clafs of objects, the more clear and definite will be the general notion itfelf. And it appears worthy of notice, and tends to confirm the account given of the formation of our general ideas, at leaft thofe of vifible objects, that the greater the variety fubfifting among the individuals or fubordinate fpecies comprehended under the general idea, (or, more properly, which poffefs that quality, or combination of qualities, which compofe the general idea,) the lefs attention, other things being equal, do we pay to the peculiarities of the individual. Thus the general notion of a triangle is merely that of a figure having three fides, formed from the relics of impreffions derived from every triangle we have feen; and the varieties of triangles are innumerable: and agreeably to the opinion already mentioned, though we certainly cannot form a *conception* of a triangle which fhall be reprefentative of all others without poffeffing the peculiarities which conftitute it an individual, yet the circumftances of its having three fides is fo definite, and our attention is fo thoroughly confined to it, that the peculiarities of the triangle are not unfrequently totally out of confideration; and if, owing to fome particular affociations, the triangle on fuch occafions were not ufually the fame, we fhould afterwards be unable to fay what kind of a triangle had been in the view of our minds.

To ftate the fact refpecting *conception* (which fee) more generally; if we attempt to form a conception of any object, it muft, from the very nature of a conception, be individual, —reprefentative, perhaps, of a numerous clafs, but ftill poffeffing thofe peculiar features which conftitute individuality. It may not be improper to fuggeft that the want of attention to the difference between a notion and *conception* may have, in fome meafure, mifled thofe philofophers who have denied the exiftence of general notions. "The bufinefs of conception," fays Mr. Stewart, "is to prefent us with an exact tranfcript of what we have felt or perceived;" and admitting the truth of this, a conception is that tranfcript fo prefented. We fhall not enter into the enquiry, whether conception be a diftinct faculty of the mind; we may, however, ftate that it appears to us to be nothing different from memory, except as being a branch of that general faculty; and that a conception differs from an idea, only as fpecies does from genus; that in fact without the aid of the affociative faculty, and with retention alone, every idea would be merely a conception. For *the recollection of an individual fenfation, or group of fenfations, whether feldom or frequently received,* is a *conception;* but when a number of fenfations poffeffing common features, but in others differing, are received into the mind, the ideas they form there by the laws of affociation, coalefce with one another; thus conftituting thofe complex ideas or notions, which never from their nature can be conceptions, but which yet may be diftinct, and when words are ufed to denote them, the fubjects of reafoning.

Almoft an infinite variety of the fenfations we receive, are prefented to our view fo conftantly connected with others, that however much it may be in the power of the mind to attend to them in a feparate ftate, it is impoffible to form a conception of them feparately: but, on the other hand, there is a confiderable number of qualities remote from mere fenfation, belonging to an extenfive range of individual objects, which may be confidered by the mind feparate from thofe objects, and have internal feelings or complex ideas attached to the terms which denote them. Now we apprehend it is the grand difference between our general notions, when concerned about things merely fenfible, and thofe which we might call more purely intellectual, that in the former cafe, the conceptions being ufually clear, and frequently very vivid, are very eafily brought up by the affociative power; and the circumftances of diftinction being few, and merely fenfible, are, from their very nature, calculated to produce a conception; and fo little do we poffefs any real abftractive power, that it is in moft cafes impoffible to do this without introducing the conception of the whole object: on the other hand, the circumftances of diftinction in the cafe of *intellectual notions* are lefs definite; they are frequently extremely numerous, and are feldom capable of exciting conceptions, and confequently they do not readily call up any particular individual object to which the general term is applicable. We acknowledge that very much, in thefe latter refpects, depends upon the peculiar circumftances of the cafe, or upon the habits of the individual. If a perfon had been remarkably ftruck with an act of juftice, or of difinterefted benevolence, for inftance, it is probable that, while the vividnefs of the impreffion lafted, he would never be able to think of thofe qualities without the particular fact being recalled into the mind; and if he poffeffed a lively imagination, or had been prefent at the performance of it, he would form an immediate conception of the whole fcene: or if a perfon were not much in habits of fpeculation, he would univerfally think of fome example of the action poffeffing thofe qualities. But thefe circumftances, though they tend to illuftrate the operation of the affociative power, do not in any way militate againft the general truth of the above remarks.

The remarks we have made on the fubject of abftraction or or generalization, have been, in a confiderable degree, feparate from any medium of communication ; or at leaft fuppofing it not already formed. If every perfon were left to form his own claffifications, language, in very many inftances, would be of little utility ; becaufe the fame features of refemblance would not operate in the fame way upon different individuals. But the procefs of the mind, when language is formed, is fomewhat different ; becaufe in this cafe it is reftrained, and has not the fame unbounded liberty of forming its affociations. The mind of the child is not left to claffify objects ; but thefe objects are prefented to it already claffed, owing to the fame word being ufed to exprefs them, and it is very interefting to obferve the efforts of the young mind in finding out fome features of refemblance between the objects which had previoufly been prefented to it with the fame name. The two following facts will explain our meaning ; and perhaps contribute to illuftrate the fubject. A boy of about two years and a half old, who was remarkably fond of looking at watches, was fhewn a hunting watch, and told what it was. He repeatedly looked at both fides with great attention, and appeared very greatly perplexed. Some features of refemblance to other watches which he had feen muft have ftruck him ; but he could not find the *face*, which appeared hitherto to have been his chief criterion. At laft he put it to his ear ; and perceiving that the found was the fame as in other watches, he was fatisfied. If he had then left it, the *ticking* would probably have been the only feature of refemblance which would have fatisfied him, at leaft till he had feen a watch when down ; but the face was fhewn him, and he would doubtlefs have that feature of refemblance fixed ftill more ftrongly in his mind than it was before. This fact was noticed feveral years ago : the following we have juft obferved, and we ftate it without comment. A child between fix and feven years of age had been told, while looking over the plates in Chandler's Hiftory of Perfecutions, that *perfecution* means, " putting perfons to death, or doing any other harm to them, becaufe they do not believe the fame as we do." Some days after, while again looking at the plates, (which have in many inftances, we doubt not, furnifhed the rudiments of the abhorrence of perfecution and love of religious liberty, feldom, however, without adding a tinge of Proteftant bigotry,) fhe afked what perfecution meant. Her father, who had been prefent at the former explanation, expreffed fome furprife at her inattention or forgetfulnefs : fhe made no reply, but fome minutes after, fhe faid, " Papa, on the beach at ——— it is faid, Whoever throws any rubbifh on the beach, fhall be *profecuted* as the law directs." It did not require a father's obfervation to fee that the defect of memory and attention was merely imaginary, and that the little girl's mind had been puzzled by a *verbal* fimilarity, where fhe perceived no fimilarity in the mode of application. It was more difficult to explain *profecution ;* but it was attempted, and the circumftance gave an opportunity of impreffing the importance of attending to *words*, and obferving the difference between them when fpoken or written, or, in more familiar language, learning to *fpell* well.

We had propofed to enter at fome length, in this divifion, into the confideration of Mr. Stewart's theory refpecting the operation of the mind in thofe actions, external or internal, which were once wholly or in part voluntary. But we are too much limited as to time and room to allow it ; and it is a theory which muft fall to the ground when the nature of the mind is duly confidered, and which confeffedly derives no evidence from memory, and as far as we can fee, can derive no known juftification from *confcioufnefs*. We beg our readers' attention to what we have faid on the fubject in our firft divifion, and in other parts of this article, and fhall here only fubjoin a few additional facts and obfervations.

The following ftatements we take as we find them in the Morning Chronicle of Dec. 27, 1813. " Shakfpeare fays of lady Macbeth, when walking in her fleep, her eyes are open, but her fenfe is fhut. This, it appears, is not always the cafe. Sometimes the eyes continue, even in fleep, to prefent objects to the mind which engage its attention ; as in the cafe of Johannes Oporinus, a printer, who being employed one night in correcting the copy of a Greek book, fell afleep as he read, and yet ceafed not to read till he had finifhed not lefs than a whole page, of which, when he awoke, he retained no recollection. Theory of Dreams, p. 62." We do not fpeculate upon the fact, becaufe the particular points in queftion are not detailed with fufficient precifion ; but they feem to us in no way at variance with the ftatement of our great mental dramatift, if, as we take for granted, he meant that the lady's mind was *unconfcious* of the impreffions made upon her fenfes, though thefe might ftill direct her bodily motions. The writer of this article has a perfectly diftinct recollection of a fact which happened refpecting himfelf when a boy. He was reading one evening to fome friends, in a work which did not call for much attention, the words, modes of expreffion, &c. being fufficiently familiar. He remembers that his mind gradually wandered from the book, and by degrees he not only loft all thought of what was going on, but fairly fell afleep : his eyes were open, but his fenfe was fhut. He afterwards found, that he had for fome time been reading indiftinctly, but intelligibly, till at laft fleep fo far overcame the mufcular action requifite for the erect pofture, that he nodded and awoke. The fact amufed him, and was fixed in his memory long before he began to reafon about the proceffes of the *mind* in fuch cafes. He wifhes to lead the attention of the reader to another fact. He has more than once obferved, after glancing over a page in fome book, for the purpofe of reference, &c., that trains of thought and feeling have been begun in his mind, for which he could not account, till on more minutely examining the page, he has difcovered fome *fingle* word, which he could have no doubt from the circumftances of the cafe had, by its impreffion on the external organ, excited the train he was confcious of, though it had not itfelf excited the notice of the mind. It muft, however, be added, that he has alfo been able at other times, to trace an indiftinct recollection of having actually perceived the word in queftion.

On referring to Dr. Reid's truly excellent Effay on the Will, which contains a great variety of important obfervations, with the value of which we were not before acquainted ; or we fhould have referred to them in a more appropriate fituation, we find that we agree with him on this queftion more than Mr. Stewart does. " A man (he fays, ch. 3.) *fees not what is before his eyes, when his mind is occupied about another object.* In the tumult of a battle, a man may be fhot through the body, without knowing any thing of the matter, till he difcover it by the lofs of blood or of ftrength." In the following paffage (ch. 1.) we fee the rudiments of what we would term the *doctrine of motives.* " If the mind were always in a ftate of perfect indifference, without any incitement, motive, or reafon, to act, or not to act, to act one way rather than another, our active power, having no end to purfue, no rule to direct its exertions, would be given in vain. We fhould either be altogether inactive, *and never will to do any thing*, or our volitions would be perfectly unmeaning and futile, being neither wife nor foolifh, virtuous nor vicious." The former we think would have been the cafe. We muft add one more extract, from a former part of the chapter, which we think overturns

turns the foundation of his theory refpecting the intellect. "Every act of the will muft have an object. He that wills, muft will fomething; and that which he wills is called the object of his volition. *As a man cannot think without thinking of fomething*, nor remember without remembering fomething, fo neither can he will without willing fomething. Every act of will, therefore, muft have an object; and the perfon who wills, *muft have a conception*, more or lefs diftinct, of what he wills." In writing this effay, Dr. Reid feems to have left himfelf to the guidance of his own found judgment, and accurate obfervation and reflection, qualities which his works often difplay. In his theory about perception, &c. he was mifled by a miftaken idea, that it was the *only* means of oppofing opinions which his good fenfe and moral and religious principles, convinced him were unfounded in truth and human nature, and which he perceived leading to dangerous confequences. "The difcovery (he himfelf fays) was the birth of time, not of genius; and Berkeley and Hume did more to bring it to light, than the man who hit upon it." Life, p. xci. 8vo.

We have only farther to obferve, that Condillac (Effai fur l'Origine des Connoiffances humaines, fect. ii. ch. i. § 6—9.) in defending the opinion, that we have always a confcioufnefs of external impreffions, though often fo flight that it does not affect the memory, brings forward two hypothefes only befides his own, to account for the phenomena on which it is founded. The firft is, that when the mind is engroffed with fome interefting object of perception, the brain is in fuch a ftate of general excitement, that this is not affected by the external impreffions from other objects. The fecond is, that though every impreffion on the external organs of fenfation is communicated to the brain, or common fenforium, and *confequently* produces a *perception* in the mind, yet cafes may occur in which the mind does not notice them. The fuppofition is obvioufly abfurd; and the philofopher adds, "I here declare in favour of Locke, for I can form no idea of fuch a perception; I fhould be as well pleafed for any one to fay, I perceive without perceiving." Of courfe the inftant the mind becomes *confcious* of the change in the fenforium, produced by any external impreffion, the confcioufnefs of it makes it a perception, or, more accurately, a fenfation. But it is clear, that Condillac begs the queftion, by ufing the term *perception*, which neceffarily implies *confcioufnefs*. (See PERCEPTION.) The opinion advanced in this article is altogether a diftinct cafe, *viz.* that fenforial changes are *not* neceffarily attended with confcioufnefs; and this is we think the only other fuppofition, and is fully borne out by evidence. It may be eafily made to appear ridiculous by half-ftating it, or by over-ftating it; and we doubt not Tucker would do it, as he has done with Hartley's doctrine of fecondarily automatic motions, in an amufing paffage, which we cannot find to refer to, reprefenting a long train of affociated motions, originating in fenfible vibrations, and going on without will or underftanding. If Hartley had feen it, he would probably have merely faid, that his theory was unaffected by it. Such at leaft is the fact.

3. *On Words, and the Ideas affociated with them.*—Words may be confidered in four points of view; *firft*, as impreffions upon the ear; *fecondly*, as the actions of the organs of fpeech; *thirdly*, as impreffions made upon the eye by characters; *fourthly*, as the actions of the hand in writing. We learn the ufe of them in this order; for children get an imperfect knowledge of the meaning of the words of others; then learn to fpeak themfelves; then to read; and laftly, to write. Now it is evident, that in the firft of thefe ways, many fenfible impreffions, and external feelings, are affociated with particular words and phrafes, fo as to give thefe the power of raifing the correfponding ideas; and that the three following ways increafe and improve this power, with fome additions to the ideas and variations of them. The fecond is the reverfe of the firft, and the fourth of the third. The firft afcertains the ideas belonging to words and phrafes in a grofs manner, according to their ufage in common life. The fecond fixes this, and makes it ready and accurate. The third has the fame effect as the fecond, and alfo extends the fignifications of words and phrafes, by new affociations, and, in particular, by affociations with other words, as in definitions, defcriptions, &c. The advancement of the arts and fciences is chiefly carried on by new fignifications given to words in this third way. The fourth, by converting the reader into a writer, helps him to be expert in diftinguifhing, quick in recollecting, and faithful in retaining, thefe new fignifications of words. The action of the hand is not, indeed, an effential in this fourth method, compofition by perfons born blind having nearly the fame effect; it is, however, a common attendant on compofition, and has a confiderable ufe deducible from affociation, at the fame time making the analogy between the four methods more confpicuous and complete.

Hence it appears, that words and phrafes muft excite ideas in us by affociation; and it further appears, that they can do it by no other means, fince all the ideas which any word excites, are deducible from fome of the fources abovementioned, moft ufually from the firft or third; and becaufe words of unknown languages, terms of art not yet explained, barbarous words, &c. have either no ideas connected with them, or only fuch as fome fancied refemblance, or prior affociation, fuggefts. It deferves to be remarked here, that articulate founds are, by their variety, number, and ready ufe, peculiarly fitted to fignify and fuggeft, by affociation, both our fimple ideas, and our complexions formed from them.

We now proceed to defcribe the manner in which ideas are affociated with words, beginning with childhood.

Firft, then, the affociation of the *names of vifible objects*, with the impreffions which thefe objects make upon the eye, feems to take place more early than any other, and to be effected in the following manner. The name of the vifible object, the mother for inftance, is pronounced and repeated by the attendants to the child, more frequently when his eye is fixed upon his mother, than when upon any other objects, and much more fo than when upon any particular one. The word *mamma* is alfo founded in an emphatical manner, where the child's eye is directed to his mother with earneftnefs and defire.

The affociation, therefore, of the found *mamma*, with the vifible impreffion of the mother on the retina, will be far ftronger than that with any other vifible impreffion, and thus overpower all the other accidental affociations; and thefe will alfo themfelves contribute to the fame end, by oppofing one another. And when the child has acquired fo much voluntary power over his motions, as to direct his head and eyes towards his mother, upon hearing her name, this procefs will go on with accelerated velocity; and thus, at laft, the word will excite the vifible idea readily and certainly. The fame affociation of the vifible impreffion of the mother with the found *mamma*, will by degrees overpower all the accidental affociations of this vifible impreffion with other words; and, at laft, be fo clofely confirmed, that the vifible impreffion will excite the audible idea of the word. This, however, is not to our prefent purpofe; but it is a procefs which takes place at the fame time with the other, and contributes to illuftrate and confirm it. Both together furnifh a coma complete instance of one of the classes of connections. See Div. IV. 1.

Secondly: this association of words with visible appearances, being made under many particular circumstances, must affect the visible ideas with a like particularity. Thus the mother's dress, and the situation of the fire in the child's nursery, make part of the child's ideas of his mother and fire. But then as his mother often changes her dress, and the child often sees a fire in a different place, and surrounded by different visible objects, these opposite associations must be less strong than the part which is common to all; and consequently we may suppose, that while his idea of that part which is common, and which we may call essential, continues the same, that of the particularities, circumstances, and adjuncts, varies.

Thirdly: when the visible objects impress other vivid sensations besides those of sight, such as pleasant or unpleasant tastes or smells, warmth, or coldness, &c. with sufficient frequency, these must leave relics or ideas, which will be associated with the visible ideas of the objects, and with the names of the objects, so as to depend upon them. Thus an idea, or nascent perception, of the taste of the mother's milk, will rise up in the mind of the child, on hearing her name; and hence the whole idea belonging to the word *mamma* now begins to be complex, consisting of two sets of ideas derived from different senses: and these ideas will be associated together, not only because the same word raises both, but also because the original sensations were often received together. The stronger idea will therefore assist the weaker. In common cases, visible ideas are the strongest; or at least occur the most readily; but in this case it appears to be otherwise. It would be easy to proceed to various other, and more complex cases, in which the component ideas are united, and all made to depend on the respective names of visible objects; but what has been said is sufficient to shew what ideas the names of visible objects, proper and appellative, raise in us.

Fourthly: we must, however, observe, respecting *appellatives*, that sometimes the *idea*, associated with the term, *is the common compound result of all the sensible impressions received from the several objects comprised under the general appellation;* but sometimes it is, in a great measure at least, *the particular idea of some one of these; viz.* when the impressions arising from some one of the class are more frequent and vivid than those of the rest.

Fifthly: the *names denoting sensible qualities*, whether substantive or adjective, such as *whiteness, white*, &c. get their ideas in a manner which will be easily understood from what has been already stated. That visible impression which is common to all objects which have been frequently seen, having the name *white* applied to them, becomes the leading feature of the ideas belonging to them; and the word excites that most vividly and universally, while it excites only faintly, or at least with great variation, the ideas of the peculiarities, circumstances, and adjuncts; and so of the other sensible qualities.

Sixthly: the names of *visible actions*, as walking, striking, &c. raise the proper visible ideas by a like process. Other ideas may likewise adhere in certain cases; as in those of tasting, feeling, speaking, &c. Sensible impressions, in which no visible action is concerned, may also have ideas dependent upon words; some visible ideas, however, generally intermix themselves here. These actions and perceptions are generally denoted by *verbs*, though sometimes by *substantives*.

Seventhly: as children may learn to read words, not only in an elementary way, *viz.* by learning the letters and syllables of which they are composed, but also in a summary one, *viz.* by associating the sound of entire words with their visible representations; and must, in some cases, be taught in this latter method, that is, whenever the sound of the word differs from that of its elements, so *both children and adults often learn the ideas belonging to whole sentences, in a summary way, and not by adding together the ideas of the several words in the sentence.* And wherever words occur, which, separately taken, have no distinct proper ideas, their use can be learned in no other way than this; and this will be the case where the words are extremely general, applying to a vast variety of visible objects, and to circumstances and relations which are not obvious to the uncultivated mind. Now, pronouns, and particles, and many other words, are of this sort. Thus, *I walk*, is associated at different times with the same visible impressions as *mamma walks, brother walks*, &c. and therefore, for a long time, can suggest nothing permanently but the action of walking. However, the pronoun *I*, in this, and innumerable other short sentences, being always associated with the person speaking, as *those* with the persons spoken to, and *he* with the person spoken of, the frequent recurrency of this teaches the child the use of the pronouns; that is, teaches him what difference he is to expect in his sensible impressions, according as this or that pronoun is used; the vast number of instances making up for the very small quantity of information which each, singly taken, conveys. Of the actual procedures of language respecting the pronouns, see LANGUAGE, col. 8, in which we perceive the printer has unfortunately represented a Gothic verb in Greek characters. In like manner different particles, that is, adverbs, conjunctions, and prepositions, being used in sentences where the substantives, adjectives, and verbs are the same; and the same particles, when these are different, in an endless recurrency, teach children the use of the particles in a gross general way. For it may be observed that children are much at a loss for the true use of the pronouns and particles for some years; and that they often repeat the proper name of the person, instead of the pronoun; which confirms the foregoing reasoning.

Eighthly: the attempts which children make to express their own wants, perceptions, pains, &c. in words, and the corrections and suggestions of the attendants, are of the greatest use in all the steps that we have hitherto considered, and especially in the last, respecting the particles and pronouns.

Ninthly: learning to read helps children much in the same respects; especially as it teaches them to separate sentences into the several words which compose them; which those who cannot read are scarcely able to do, even when they arrive at adult age.

Thus we may see how children and others are enabled to understand a continued discourse, relating to *sensible* impressions only, and how the words, in passing over the ear, must raise up trains of visible and other ideas, by the power of association. Our next inquiry must be concerning the words which denote either *intellectual* things, or *collections* of other words.

Tenthly: the words which relate to the several *passions*, love, hatred, fear, anger, &c. being applied to the child when he is under the influence of these passions, get the power of raising up the ideas of those passions, and also the usual associated circumstances. The application of the same words to others, helps also to annex the ideas of the associated circumstances to them, and even of the passions themselves, both from the infectiousness of our natures, and from the power of associated circumstances to raise the passions. It is, however, to be observed, that the words denoting the paffions, do not, for the moft part, raife up in us any degree of the paffions themfelves, but only the ideas of affociated circumftances. We are fuppofed fufficiently to underftand the continued difcourfes into which thefe words enter, when we form true notions of the actions, particularly the vifible ones, attending the feelings denoted.

Eleventhly: the names of *intellectual* and *moral* qualities and operations, ftand for a defcription of thefe qualities and operations; and therefore, if dwelt upon, excite fuch ideas as thefe defcriptions in all their particular circumftances do. But the common fentences into which thefe words enter, pafs over the mind too quick, for the moft part, to allow of fuch delay. They are acknowledged as familiar and correct, and fuggeft certain affociated vifible ideas, and nafcent internal feelings, taken from the defcription of thefe names, or from the words which are ufually joined with them in difcourfes and writings.

Twelfthly: there are many *terms of art* in all the branches of learning, which are defined by other words, and which, therefore, are only compendious fubftitutes for them. The fame holds in common life, in numberlefs inftances. Such words fometimes fuggeft the *words* of their definitions, fometimes the *ideas* of thefe words, fometimes a particular fpecies comprehended under the general term, &c. But whatever they fuggeft, it may be eafily feen that they derive the power of doing it from affociation.

Laftly: there are words ufed in *abftract fciences* which can fcarcely be defined or defcribed by other words, fuch as identity, exiftence, &c. The ufe of thefe muft therefore be learned, as that of the particles is. Indeed children learn their firft imperfect notions of all the words confidered in this and the laft three paragraphs, chiefly in this way; and come to more precife and explicit ones only by means of books, as they advance to adult age, or by endeavouring to ufe them properly in their own deliberate compofitions.

After the foregoing obfervations, which Mr. Stewart would hardly term *reveries*, Hartley adds the following remark, which may leave on the reader's mind a favourable impreffion of his humility and caution; and we quote it verbatim.

"This is by no means a full or fatisfactory account of the ideas which adhere to words by affociation. For the author perceives himfelf to be ftill a mere novice in thefe fpeculations; and it is difficult to explain words to the bottom by words; perhaps impoffible. The reader will receive fome addition of light and evidence in the courfe of this fection; alfo in the next, in which I fhall treat of propofitions and affent. For our affent to propofitions, and the influence which they have over our affections and actions, make part of the ideas that adhere to words by affociation; which part, however, could not properly be confidered in this fection." The term *idea* feems to be ufed here with too much latitude; and it is to fuch cafes that Mr. Stewart, forgetful of his own excellent maxims on candour, feems principally to have attended. We do not wifh to apply the term in any inftance to *ftates* or *operations* of the mind. Feelings, or complex ideas, produced by thofe ftates or operations either in the way of recollection, or of actual affociation at the time of paffing, may, in the Hartleyan nomenclature, be termed ideas; and it is probably to thefe that Hartley really refers. But to proceed.

From the foregoing train of reafoning, the following inferences may be drawn.

(1) Including under the head of *definitions*, defcription, or any way of explaining a word by other words, excepting that by a mere fynonimous term; and for the fake of brevity, excluding for the prefent from the head of ideas, the vifible idea of the character of a word, and the audible one of its found, and alfo all ideas which are either extremely faint, or extremely variable; words may be diftinguifhed into the four following claffes: 1, fuch as have ideas only; 2, fuch as have both ideas and definitions; 3, fuch as have definitions only; 4, fuch as have neither ideas nor definitions.

It is difficult to fix precife limits to thefe four claffes, fo as to determine accurately where each ends, and the next begins; and if we confider thefe things in the moft general way, there is perhaps no word which has not both an idea and a definition; that is, which is not occafionally attended with fome one or more internal feelings, and which may not be explained, in fome imperfect manner at leaft, by other words. However, the following are fome inftances of words which have the faireft right to be placed in their refpective claffes.

The names of fimple fenfible objects are of the *firft* clafs. Thus, *white*, *fweet*, &c. excite ideas, but cannot be defined. Words of this clafs ftand only for the ftable parts of the refpective ideas, not for the feveral variable particularities, circumftances, and adjuncts, which here intermix themfelves.

The names of natural bodies, animal, vegetable, or mineral, are of the *fecond* clafs; for they excite aggregates of fenfible ideas, and at the fame time may be defined by an enumeration of their properties and characteriftics. Thus, likewife, geometrical figures have both ideas and definitions. The definitions, in both cafes, are fo contrived, as to leave out all the variable particularities of the ideas, and alfo to be more full and precife, than the ideas generally are in the parts, which are of a permanent nature.

Algebraic quantities, fuch as roots, powers, furds, &c. belong to the *third* clafs; and have definitions only. The fame may be faid of fcientifical terms of art, and of moft abftract general terms, moral, metaphyfical, and vulgar. However, mental feelings are apt to attend fome of thefe even in paffing flightly over the ear, and thefe feelings may be confidered as ideas belonging to the refpective terms. Thus the very words *gratitude*, *mercy*, *cruelty*, *treachery*, &c. even feparately taken, affect the mind; and yet, fince all reafoning upon them is to be founded on their definitions, it feems beft to refer them to this third clafs. With the opinions given in this paragraph we cannot fully agree, as the reader will perceive from our remarks on generalization, VIII. 2.

Laftly, the particles *the*, *of*, *to*, *for*, *but*, &c. have neither definition nor ideas, as thofe terms have juft been limited.

(2) It will eafily appear, from the obfervations here made upon words, and the affociations which adhere to them, that the languages of different ages and nations muft bear a great general refemblance to each other, and yet have confiderable particular differences; whence any one may be tranflated into any other, fo as to convey the fame ideas in general, and yet not with perfect precifion and exactnefs. They muft refemble one another, becaufe the phenomena of nature, which they are all intended to exprefs, and the ufes and exigencies of human life to which they minifter, have a general refemblance. But then, as the bodily make and genius of each people, the air, foil, and climate, commerce, arts, fciences, religion, &c. make confiderable differences in different ages and nations, it is natural to expect, that the languages fhould have proportionable differences in refpect of each other.

In learning a new language, the words of it are at firft fubftituted for thofe of our native language; that is, they are

are aſſociated, by means of theſe, with the proper objects and ideas. When this aſſociation is ſufficiently ſtrong, the middle bond is dropped, and the words of the new language become ſubſtitutes for, and ſuggeſt directly and immediately objects and ideas; alſo cluſters of other words in the ſame language.

In learning a new language, it is much eaſier to tranſlate from it into the native one, than back again; juſt as young children are much better able to underſtand the expreſſions of others, than to expreſs their own conceptions. And the reaſon is the ſame in both caſes. Young children learn at firſt to go from the words of others, and thoſe, who learn a new language from the words of that language, to the things ſignified. And the reverſe of this, *viz.* to go from the things ſignified to the words, muſt be difficult for a time from the nature of ſucceſſive aſſociations. It is to be added here, that the nature and connections of the things ſignified, often determine the import of ſentences, though their grammatical analyſis is not underſtood; and that we ſuppoſe the perſon, who attempts to tranſlate from a new language, is ſufficiently expert in paſſing from the things ſignified to the correſponding words of his own language. The power of aſſociation is every where conſpicuous in theſe remarks.

(3) It follows alſo from the foregoing reaſoning, that perſons, who ſpeak the ſame language, cannot always mean the ſame things by the ſame words, but muſt ſometimes miſtake each other's meaning. This confuſion and uncertainty ariſe from the different aſſociations transferred upon the ſame words, by the difference in the accidents and events of our lives. It is, however, much more common in diſcourſes concerning abſtract matters, (where the terms ſtand for collections of other terms, ſometimes at the pleaſure of the ſpeaker or writer,) than in the common and neceſſary affairs of life; for here frequent uſe, and the conſtancy of the phenomena of nature, intended to be expreſſed by words, have rendered their ſenſe determinate and certain. *However, it ſeems poſſible, and even not very difficult, for two truly candid and intelligent perſons to underſtand each other upon any ſubject.*

That we may enter more particularly into the cauſes of this confuſion, and conſequently be the better enabled to prevent it, let us conſider words according to the four claſſes above mentioned.

Now miſtakes will happen in words of the *firſt* claſs, *viz.* ſuch as have ideas only, where the perſons have aſſociated theſe words with different impreſſions. And the method to rectify any miſtake of this kind, is for each perſon to ſhew with what actual impreſſion he has aſſociated the word in queſtion. But miſtakes here are not common.

In words of the *ſecond* claſs, *viz.* ſuch as have both ideas and definitions, it often happens, that one perſon's knowledge is much more full than another's, and conſequently his idea and definition much more extenſive. This muſt cauſe a miſapprehenſion on one ſide, which yet may be eaſily rectified by recurring to the definition. It happens alſo ſometimes in words of this claſs, that a man's ideas are not always ſuitable to his definition; that is, are not the ſame with thoſe which the words of the definition would excite. If then this perſon ſhould pretend, or even deſign, to reaſon from his definition, and yet reaſon from his idea, miſapprehenſion will ariſe in the hearer, who ſuppoſes him to reaſon from his definition merely.

In words of the *third* claſs, which have definitions only and no immediate ideas, miſtakes generally ariſe through want of fixed definitions being mutually acknowledged and kept to. However, as imperfect fluctuating ideas, that have little relation to the definitions, are often apt to adhere to the words of this claſs, miſtakes muſt ariſe from this claſs alſo.

As to the words of the *fourth* claſs, or thoſe which have neither ideas nor definitions, it is eaſy to aſcertain their uſe by inſerting them in ſentences where their import is known and acknowledged; this being the method in which children learn to decypher them; ſo that miſtakes could not ariſe in the words of this claſs did we uſe moderate care and candour. And, indeed, ſince children learn the uſes of words moſt evidently without having any data,—any fixed point at all, it is to be hoped, that philoſophers and candid perſons may learn at leaſt to underſtand one another with facility and certainty; and get to the very bottom of the connection between words and ideas.

(4) When words have acquired any conſiderable power of exciting pleaſant or painful feelings, by being often aſſociated with ſuch things as do this, they may transfer a part of their pleaſures and pains upon indifferent things, by being at other times often aſſociated with ſuch. This is one of the principal ſources of the ſeveral factitious pleaſures and pains of human life. Thus, to give an inſtance from childhood, the words *ſweet, good, pretty, fine,* &c. on the one hand, and the words *bad, ugly, frightful,* &c. on the other, being applied by the nurſe and attendants, in the child's hearing, almoſt promiſcuouſly, and without thoſe reſtrictions that are obſerved in correct ſpeaking; the one ſet to all the pleaſures, and the other to all the pains of the ſeveral ſenſes; muſt by aſſociation raiſe up general pleaſant and painful feelings, in which no one part can be diſtinguiſhed above the reſt; and when applied by further aſſociations to objects of a neutral kind, they muſt transfer a general pleaſure or pain upon them.

All the words aſſociated with pleaſure muſt alſo affect each other by this promiſcuous application. And the ſame holds in reſpect of the words aſſociated with pains. However, ſince both the original and the transferred pleaſures and pains heaped upon different words are different, and in ſome caſes widely ſo, every remarkable word will have a peculiar internal feeling or ſentiment belonging to it; and there will be the ſame relations of affinity, diſparity, and oppoſition, between the internal feeling, belonging to words, as between the ſeveral genera and ſpecies of natural bodies, between taſtes, ſmells, colours, &c. Many of theſe ideas, though affording conſiderable pleaſure at firſt, muſt ſink into the limits of indifference; and ſome of thoſe, which afforded pain at firſt, into the limits of pleaſure. What is here ſaid of words, belongs to groups of them, as well as to ſeparate words. And the ideas of all may ſtill retain thoſe peculiarities, by which they are diſtinguiſhed from each other, after they have fallen below the limits of pleaſure into indifference, juſt as obſcure colours, or faint taſtes, do.

It is obſervable, that the mere tranſit of words expreſſing ſtrong ideas over the ears of children affects them; and the ſame thing is true of adults, in a leſs degree. However, the laſt have learnt from experience and habit to regard them chiefly, as they afford a rational expectation of pleaſure and pain.

(5) Since words thus collect ideas from various quarters, unite them together, and transfer them both upon other words, and upon foreign objects, it is evident, that the uſe of words adds much to the number and complexity of our ideas, and is the principal means by which we make mental and moral improvement. This is verified abundantly by the obſervations which are made upon perſons born deaf, and continuing ſo. It is probable, however, that theſe perſons

make

make use of some symbols to assist the memory, and fix the imagination; and they must have a great variety of pleasures and pains transferred upon visible objects from their associations with one another, and with sensible pleasures of all kinds; but they are very deficient in this, upon the whole, through the want of the associations of visible objects and states of mind, &c. with words. Learning to read must add greatly to their mental improvement; yet still their intellectual capacities cannot but remain very narrow.

Persons blind from birth must proceed in a manner different from that before described, in the first ideas which they affix to words. As the visible ones are wanting, the others, particularly the tangible and audible ones, must compose the aggregates, which are annexed to words. However, as they are capable of learning and retaining as great a variety of words as others, and can associate with them pleasures and pains from the four remaining senses, and also use them as algebraists do the letters which represent quantities, they fall little, or nothing short of others in intellectual accomplishments, and may arrive even at a greater degree of spirituality and abstraction in their complex ideas.

6. On the whole it follows, from the foregoing investigation, that when children or others first learn to read, the view of the words excites ideas, only by the mediation of their sounds, with which alone their ideas have hitherto been associated. And thus it is that children and illiterate persons best understand what they read by reading aloud. By degrees the intermediate links being left out, the written or printed characters suggest the ideas directly and instantaneously; so that persons who are much in the habit of reading, understand more readily by passing over the words with the eye only; since this method, by being more expeditious, brings the ideas closer together. However, all are peculiarly affected by words pronounced in a manner suitable to their sense and design; which is still an associated influence.

Such are the fundamental principles of Hartley respecting *words*. In the rest of his investigations on this subject, mixed with opinions which appear to us hypothetical, are many highly important observations, illustrative of his general theory, and of the procedures of language; but for these we must refer to p. 81—85 of his work.

3. *On Propositions and the Nature of Assent.*—Whatever be the precise nature of assent and dissent, they must class with ideas, being only those very complex internal feelings which are connected by association with such groups of words as are called propositions in general, or affirmations and negations in particular.

Assent, and consequently its opposite, dissent, may be distinguished into two kinds, rational and practical. *Rational assent* to any proposition may be defined, a readiness to affirm it to be true, proceeding from a close association of the ideas suggested by the proposition, with the idea or internal feeling belonging to the word truth; or of the terms of the proposition with the word truth. Rational dissent is opposite to this. *Practical assent* is a readiness to act in such a manner as the frequent vivid recurrency of the rational assent disposes us to act; and practical dissent the contrary.

Practical assent is, then, the natural consequence of rational assent, when sufficiently impressed. It must, however, be observed; *first*, that some propositions, mathematical ones for instance, admit only of a rational assent, the practical not being applied to them in common cases: *secondly*, that the practical assent is sometimes generated, and arrives at a higher degree of strength, without any previous rational assent, and by methods which have little or no connection with it; yet still is, in general, much influenced by it, and conversely exerts a great influence upon it: *thirdly*, practical assent may be in opposition to rational assent, and in consequence of its having been long and firmly cultivated, may altogether prevent the latter from influencing the conduct.

Let us next inquire into the causes of rational and practical assent, beginning, 1, with that given to *mathematical conclusions*.—Now, the original cause that a person affirms the truth of the proposition, *twice two are four*, is the entire coincidence of the visible or tangible idea of *twice two* with that of *four*, as impressed upon the mind by various objects. We see every where that both are only different names for the same impression; and it can only be in consequence of association that the word truth, its definition, or internal feeling, becomes appropriated to this coincidence. Where the numbers are so large that we cannot form any distinct visible ideas of them, as when we say that 12 times 12 are equal to 144, rational assent is founded, if not on the authority of a table or a teacher, on a coincidence of words arising from some method of reckoning up 12 times 12, so as to conclude with 144, and resembling the coincidence of words which attends the before-mentioned coincidence of ideas in the simple numerical propositions. The operations of addition, subtraction, multiplication, division, and extraction of roots, with all the most complex operations relating to algebraic quantities, considered as the denotements of numbers, are no more than methods of reducing this coincidence of words, founded upon, and rising above, one another. And it is merely association again, which appropriates the word truth, &c. to the coincidence of the words or symbols which denote the numbers.

This coincidence of terms is considered as a proof that the visible ideas of the numbers under consideration would coincide as much as the visible ideas of twice two and four, were the former equally distinct with the latter; and, indeed, the same thing may be fully proved, and often is so by experiments with counters, lines, &c. And hence, thinking persons who make a distinction often unthought of, between the coincidence of terms and that of ideas, consider the real and absolute truth to be as great in complex numerical propositions as in the simplest. Now, as it is impossible to gain distinct visible ideas of different numbers, where at least they are considerable, terms denoting them are a necessary means of distinguishing them one from another, so as to reason justly respecting them. In geometry there is a like coincidence of lines, angles, spaces, and solid contents, to prove them equal in simple cases. Afterwards, in complex cases, we substitute the terms whereby equal things are denoted for each other, and then the coincidence of the terms to denote the coincidence of the visible ideas, except in the new step advanced in the proposition; and thus we get a new equality, denoted by a new coincidence of terms; and this, in like manner, we employ in order to obtain a new coincidence of terms, and so on. This resembles the addition of unity to any number in order to make the next; as of 1 to 20 in order to make 21. We have no distinct visible idea of 20 or of 21; but we have of the difference between them, by fancying to ourselves a heap of things, supposed or called twenty in number, and then further fancying one thing to be added to it. By a like process in geometry we arrive at the demonstration of the most complex propositions. The properties of numbers are applied to geometry in many cases, as when we demonstrate a line or space to be half or double of any other, or in any other

other ratio to it. And as, in arithmetic, words ſtand for indiſtinct ideas, in order to help us to reaſon about them as accurately as if they were diſtinct; and as cyphers alſo ſtand for words, for the ſame purpoſe; and letters for cyphers, to render the concluſions leſs particular; ſo letters are put for geometrical quantities alſo, and the agreements of the letters for thoſe of the quantities.

Thus we ſee the foundation upon which the whole doctrine of quantity is built; for all quantity is denoted either by number, or by extenſion, or by letters denoting either one or the other. The coincidence of ideas is the foundation of rational aſſent in ſimple caſes; and that of ideas and of terms, or of terms alone in complex caſes. This is upon the ſuppoſition that the quantities are to be proved equal; but if they are to be proved unequal, the want of coincidence anſwers the ſame purpoſe. If they are in any numerical ratio, this is only introducing a new coincidence. Thus it appears that the uſe of words, either as viſible or as audible ſymbols, is neceſſary for geometrical and algebraic reaſonings, as well as for arithmetical. We may ſee alſo that aſſociation prevails in every part of the proceſſes hitherto deſcribed.

But theſe are not the only cauſes of giving rational aſſent to mathematical propoſitions. The recollection of having once examined and aſſented to each ſtep of a demonſtration, the authority of an approved writer, &c. are often ſufficient to gain our aſſent, though we underſtand no more than the import of the propoſition; nay, even though we do not proceed ſo far as this. Now this again is a mere transfer of aſſociation; the recollection, authority, &c. having been in a great number of caſes aſſociated with the beforementioned coincidence of ideas and terms.

But here a new circumſtance ariſes; for memory and authority are ſometimes found to miſlead; and the recollection of ſuch experience puts the mind into a ſtate of doubt, ſo that ſometimes truth, ſometimes falſehood, will recur and unite itſelf with the propoſition under conſideration, according as the recollection, authority, &c., in all their peculiar circumſtances, have been, on the whole, aſſociated with truth or falſehood.

Thus the idea belonging to a mathematical propoſition, with the rational aſſent or diſſent ariſing in the mind, as ſoon as it is preſented to it, is nothing more than a group of ideas, united by aſſociation, and forming a very complex idea. And this idea is not merely the ſum of the ideas belonging to the terms of the propoſition, but alſo includes the motions or feelings, whatever they be, which belong to the words *equality*, *coincidence*, and *truth*, and in ſome caſes thoſe of *utility*, *importance*, &c. For mathematical propoſitions are, in ſome caſes, attended with a practical aſſent, in the proper ſenſe of theſe words; as when a perſon takes this or that method of executing a projected deſign, in conſequence of ſome mathematical propoſition aſſented to from his own examination, or from the authority of others. Now the train of voluntary actions, here denoting the practical aſſent, is produced by the frequent recurrency of ideas of utility and importance. Theſe operate by aſſociation, and though the rational aſſent be a previous requiſite, yet the degree of the practical aſſent is proportional to the vividneſs of thoſe ideas; and in moſt caſes they ſtrengthen the rational aſſent by reaction.

(2) Propoſitions concerning *natural bodies* are of two kinds, vulgar and ſcientifical. Of the firſt kind are *milk is white*, *gold is yellow*, *a dog barks*, &c. Theſe are evidently nothing more than forming the terms denoting the whole or ſome component parts of a complex idea, into a propoſition, or employing thoſe denoting ſome of its common adjuncts in the ſame way. The aſſent given to ſuch propoſitions ariſes from the aſſociations of the terms as well as of the ideas denoted by them.

In ſcientifical propoſitions concerning natural bodies, a definition having been made of the body from its properties, another property or power is joined to them as a conſtant or common aſſociate. Thus gold is ſaid to be ſoluble in the nitromuriatic acid. Now to perſons who have made the proper experiments a ſufficient number of times, theſe words ſuggeſt the ideas which occur in thoſe experiments, and, converſely, are ſuggeſted by them, in the ſame manner as the vulgar propoſitions above-mentioned, ſuggeſt and are ſuggeſted by common appearances. But then, if they be ſcientific perſons, their readineſs to affirm that gold is ſoluble in this acid univerſally, ariſes alſo from the experiments of others, and from their own and other perſons' obſervations on the conſtancy and tenor of nature. They find it to be a general truth, that almoſt any two or three remarkable qualities of a natural body infer the reſt, being never found without them; and hence ariſes a readineſs to affirm reſpecting all bodies poſſeſſing thoſe two or three leading qualities, whatever may be affirmed of any one body.

The propoſitions formed reſpecting natural bodies are often attended with a high degree of practical aſſent, ariſing chiefly from ſome ſuppoſed utility and importance, and which is no way proportional to the foregoing or ſimilar acknowledged cauſes of rational aſſent. And in ſome caſes the practical aſſent takes place before the rational, but there, after ſome time, the rational aſſent is generated and cemented moſt firmly by the prevalence of the practical. This proceſs is particularly obſervable in the regards paid to medicines; that is, in the rational and practical aſſent to the propoſitions concerning their virtues.

The influence of the practical aſſent over the rational ariſes from their being united in ſo many caſes. And the vividneſs of the ideas ariſing from the ſuppoſed utility, importance, &c. produce a more ready and cloſer union of the terms of the propoſitions.

(3) The evidences for *paſt facts* are a man's own memory, and the authority of others. Theſe are, under proper reſtrictions, the uſual aſſociates of true paſt facts, and therefore produce the readineſs to affirm a paſt fact to be true, that is, the rational aſſent. The integrity and competency of the witneſſes being the principal reſtriction or requiſite in the account of paſt facts, become principal aſſociates to the aſſent to them; and the contrary qualities to diſſent.

If it be aſked how a narration of an event ſuppoſed to be certainly true, or to be doubtful, or to be entirely fictitious, differs in its effect upon the mind in theſe circumſtances reſpectively, the words in which it is related being the ſame in each,—it may be replied, *firſt:* in having the terms *true*, *doubtful*, or *fictitious*, with a variety of ideas uſually aſſociated with them, and the correſponding internal feelings of reſpect, anxiety, diſlike, &c. connected with them reſpectively; whence the whole effects, exerted by each upon the mind, will differ conſiderably from one another. *Secondly:* if the events be of a very intereſting nature, the related ideas will recur oftener, and thus agitate the mind the more, in proportion to the ſuppoſed truth of the event. And it confirms this, that the frequent recurrence to the mind of an intereſting event, ſuppoſed to be doubtful, or even fictitious, by degrees makes it appear like a real one. This affection of the mind, which may be called the practical aſſent to paſt facts, often produces the rational aſſent, as in the other caſes before ſpoken of.

(4) The evidence for *future facts* is of the ſame kind with that for the propoſitions concerning natural bodies, being like

like it taken from induction and analogy. This is the foundation of the rational affent. The practical depends upon the recurrency of the ideas, and the degree of agitation produced by them in the mind. Hence reflection makes the practical affent grow for a long time after the rational is arifen to its height; or, if the practical affent arifes in any confiderable degree without the rational, which is often the cafe, it will generate the rational. Thus the fanguine are apt to believe and affert what they hope to be true; and the timorous what they fear.

(5) There are many fpeculative abftract propofitions in logic, metaphyfics, ethics, controverfial divinity, &c. the evidence for which is the coincidence or analogy of the abftract terms, in certain particular applications of them, or as confidered in their grammatical relations. This caufes the rational affent. As to the practical affent or diffent, it arifes from the ideas of importance, reverence, piety, duty, ambition, jealoufy, envy, felf-intereft, &c. which intermix in thefe fubjects, and thus, in fome cafes, add great ftrength to the rational affent, in others deftroy it, and convert it into its oppofite.

On the whole it appears that rational affent has different caufes in propofitions of different kinds, and practical affent in like manner: that the caufes of rational are different from thofe of practical: that there is, however, a great affinity and general refemblance in all the caufes: that rational and practical affent exert a perpetual reciprocal influence on each other: and, confequently, that the ideas belonging to affent and diffent, and their equivalents and relatives, are highly complex, unlefs in the cafes of very fimple propofitions, fuch as mathematical ones. For befides the coincidence of ideas and terms, they include, in other cafes, ideas of utility, importance, refpect, difrefpect, ridicule, religious affections, hope, fear, &c. and bear fome grofs general proportion to the vividnefs of thefe ideas.

From the preceding ftatements the following inferences may be deduced. *Firft:* when a perfon fays, 'I fee and approve of what is right, I follow what is wrong,' it fhews that the rational and practical affent are at variance; that they have oppofite caufes; and that neither of thefe has yet deftroyed the other. *Secondly:* the rational and practical faith in religious matters are excellent means of producing each other. *Thirdly:* vicious men, that is, all perfons who want practical faith, muft be prejudiced againft the hiftorical and other foundations for rational faith in revealed religion. *Fourthly:* it is impoffible any perfon fhould be fo fceptical as not to have the complex ideas denoted by the words affent and diffent affociated with a great variety of propofitions in the fame manner as in other perfons; juft as he muft have the fame ideas in general affixed to the words of his native language, as other men have. An univerfal fceptic, therefore, is no more than a perfon who varies from the common ufage in his application of a certain fet of words, *viz.* truth, certainty, affent, diffent, &c.

We fhall clofe this divifion with the remarks on evidence, given by Hartley, in propofition 87; referring to the original thofe readers who wifh to fee how he illuftrates or proves them, by the employment of fimple mathematical expreffions, and who are difpofed to enter into his highly important and interefting obfervations refpecting the afcertainment of truth, and the advancement of knowledge; and alfo the application of his principles to the feveral branches of fciences.

Firft: if the evidences adduced for any propofition, fact, &c. be dependent on each other, fo that the firft is required to fupport the fecond, the fecond the third, and fo on; that is, if a failure of any one of the evidences renders all the reft of no value, the feparate probability of each evidence muft be very great in order to make the propofition credible, and this holds the more, in proportion as the dependent evidences are more numerous.

Second: if the evidences of any propofition, fact, &c. be independent on each other; that is, if they be not neceffary to fupport each other, but concur, and can, each of them, when eftablifhed upon its own proper evidences, be applied directly to eftablifh the propofition, fact, &c. in queftion; the deficiency in the probability of each muft be very great, in order to render the propofition perceptibly doubtful; and this holds fo much the more, as the evidences are more numerous.

Third: the refulting probability may be fufficiently ftrong in dependent evidences, and of little value in independent ones, according as the feparate probability of each evidence is greater or lefs. Thus the principal facts of ancient hiftory are not lefs probable practically now, than ten or fifteen centuries ago; nor lefs fo then, than in the times immediately fucceeding, becaufe the diminution of evidence in each century is imperceptible. And for the fame reafon a large number of weak arguments proves little.

Fourth: it appears likewife, that the inequality of the feparate evidences does not produce much alteration in thefe remarks. In like manner, if the number of evidences, dependent or independent, be great, we may make great conceffions as to the value of each. Again, a ftrong evidence in dependent ones can add nothing, but muft weaken a little; and after a point is well fettled by a number of independent ones, all that come afterwards are in one fenfe ufelefs, becaufe they do no more than remove the imperceptible remaining deficiency; on the other hand, however, as evidence produces different effects on different minds, it is of great moment, in all points of general importance, to have as many fatisfactory independent evidences as poffible into view; that if one fail in its effects, from peculiar circumftances, another may fupply its place. And it will be of great ufe to purfue thefe and fuch like deductions, both mathematically and by applying them to proper inftances felected from the fciences, and from common life, in order to remove certain prejudices, which the ufe of general terms and ways of fpeaking, with the various affociations with them, is apt to introduce and fix upon the mind. It cannot but affift us in the art of reafoning, thus to analyfe, recompofe, and afcertain our evidences.

The length of this article, (for which the importance of the fubject, and the variety of topics difcuffed in it, will we hope obtain the reader's excufe,) renders it neceffary, for the convenience of reference, to fubjoin a brief outline of its leading fubjects.

Introductory Remarks.

- Definition of mental philofophy.
- Motives to the ftudy of it.
- Object of this article.
- Proper conduct of our inveftigations in this branch of fcience, and the mental requifites for fuccefsfully purfuing it.
- The leading principle of Dr. Reid's philofophy inconfiftent with fact.
- Confideration of fome of Reid's ftrictures on Locke.
- Platonic and Ariftotelian fyftems refpecting ideas.
- Reid's arguments againft the fuppofed fyftem of Locke, do not militate againft the principles of this article.
- Reid's principles, founded on mere verbal diftinctions, are inefficacious againft Berkeley's hypothefis, or altogether groundlefs.

In the preceding sketch and defence of the Hartleyan philosophy, our ingenious coadjutor, though very ardently attached to this system, has very prudently omitted some of its most exceptionable parts, and touched others with so gentle a hand, as to guard, in a considerable degree, against the conclusions in favour of Materialism and the necessity of human actions, which other modern admirers of this system have deduced from it. The editor, professing his entire disapprobation of such conclusions, and his firm conviction of the existence of *mind* in the human frame as a substance essentially distinct from matter, and also of the freedom of the will, or the proper *agency* of man, must of course renounce those premises, respecting the mechanism of the mind, from which such inferences are drawn by a legitimate train of reasoning. His coadjutor's candour will require no apology for his annexing this declaration to the article, with which he has favoured him, and which, under certain limitations and restrictions, the judicious and discriminating reader will approve. Sentiments concerning the nature, faculties, and operations of the human mind, which the editor conceives to be no less true than important, will present themselves to the reader under the appropriate terms in different parts of this Cyclopædia; from which it will appear to be his aim to do ample justice to those writers, who have distinguished themselves in the department of mental philosophy: claiming for himself the privilege of forming his own judgment after due examination, though he may happen to differ from those who are held by their peculiar admirers and

and partizans in the higheſt eſtimation. "Audi alteram partem," and "Nullius addictus jurare in verba magiſtri," are the general maxims to which he has endeavoured to conform in the compilation of the Cyclopædia.

Philosophy, *Moral*, is that ſcience which teaches men the nature and obligation of duty; in other words, it is "that ſcience which teaches men their duty, and the reaſons of it." This laſt definition is from archdeacon Paley; and it is only objectionable as including rather too much. The *precepts* of duty do not, as ſuch, come under the head of moral *philoſophy:* this is concerned with the *principles* from which the precepts are derived. The inveſtigation of theſe principles, and the conſideration of their mutual connections, will often lead the philoſopher to ſtate the rules of duty; but the preceptive part more properly falls under the head of ethics, or morals.

Paley does indeed ſay, that "*moral philoſophy*, *morality*, *ethics*, *caſuiſtry*, *natural law*, mean all the ſame thing, *viz.* that ſcience which teaches men their duty, and the reaſons of it;" but he is undoubtedly wrong. *Moral philoſophy* is the *ſcience* of morals: it inveſtigates the grounds and reaſons of duty; it traces that quality of actions and diſpoſitions which renders them obligatory upon a reaſonable being like man; it ſhews what claſs of actions and diſpoſitions poſſeſſes this quality; it aſcertains by this means the beſt rule of life; and it lays down thoſe principles, by the aid of which the rule of life may be moſt ſucceſsfully applied. The terms, *ethics* and *morals*, though correctly applied to the *ſcience*, are more appropriate to the *art* of *morality*, (underſtanding by the word *art*, as oppoſed to ſcience, a ſyſtem of rules for the proper attainment of any end;) and, in this ſenſe, the terms are not applicable to inveſtigations reſpecting the grounds and reaſons of duty, as ſuch, though the *art* of morals can ſcarcely fail to include ſome reaſoning reſpecting its foundation and principles, juſt as the *ſcience* of morals can ſcarcely fail to include in ſome meaſure the preceptive part. *Morality* commonly refers to the quality of an action or diſpoſition, which makes it the ſubject of reward or puniſhment; but it is alſo uſed, as when we ſpeak of a ſyſtem of morality, in reference to the art of morals. *Caſuiſtry* has for its ſole object the *difficulties* of duty; and claſſes ſometimes with the *ſcience*, and ſometimes with the *art* of morals. It often requires ſubtle inveſtigations, and nice and refined diſtinctions; and when it is not regulated by invariable attention to the grand principles of morality, it often leads to great intricacy and perplexity. Such diſcuſſions have indeed not unfrequently led, through the ſophiſtry of vanity or ſelf-juſtification, to opinions which confound all moral diſtinctions. The moral reaſoner muſt have ſome fixed points of duty; and when he has ſeen that theſe have a ſolid foundation in the nature of the human mind, and the circumſtances of man, he ought on no account to give them up. If any opinions are in clear oppoſition to them, the principles on which thoſe opinions are founded ſhould be regarded as abſurd, if not practically dangerous. The term *natural law* denotes that ſyſtem of duty, which is derived from conſiderations independent, or ſuppoſed to be independent, of divine revelation.

Great as the merits of Paley indiſputably are, which lead us to rank him among the moſt uſeful writers whoſe works are now commonly read, preciſion is not one of his ſtriking excellencies. If with his happy talent of illuſtration, his uncommon ſkill in ſelecting the leading and moſt impreſſive features of his ſubject, his general neatneſs of arrangement, perſpicuity of expreſſion, and animation and occaſionally even playfulneſs of manner, he had united greater correctneſs of thought, and preciſion in the uſe of words, and if he had never ſuffered himſelf to lower the ſtandard of duty, in accommodation to the practice of thoſe around him, his writings could ſcarcely have been improved. But all excellencies are not to be expected together; and what Paley has done entitles him to the reſpect and gratitude of the religious world. His work, entitled "Horæ Paulinæ," diſplays moſt originality and depth of inveſtigation. His View of the Evidences of Chriſtianity marks the ſoundneſs and clearneſs of his judgment. The Natural Theology has leſs preciſion and correctneſs, and often ſhews a want of acquaintance with the actual ſtate of phyſical ſcience, and natural hiſtory; and it has one important defect, it derives none of its evidence from mental philoſophy, though this ſcience affords to the reflecting mind numerous and ſtriking proofs of the wiſdom and goodneſs of God. But, with all its faults, it is a work of great intereſt and value, and deſerves a ſeries of notes for the purpoſe of illuſtration and correction, accompanied with unexpenſive delineations of the leading objects of anatomy and natural hiſtory, which he refers to. As to his Moral Philoſophy, the writer of this article, though not inſenſible of its real value, which is delineated in Paley's moſt happy manner in his preface, feels obliged to place it below the reſt of his works. He has enlivened and familiarized his ſubject perhaps beyond example; he has made really profound inveſtigations often appear ſimple, and even attractive; he has employed Chriſtian ſanctions and Chriſtian principles, before too much neglected by the moral philoſopher; and his morality is, in general, ſound and comprehenſive, and the explication of it alike intereſting and impreſſive. But his ſyſtem, in our opinion, is fundamentally wrong; and this error in the baſis has, in ſome important caſes, led the author himſelf to erroneous concluſions, and has produced this effect ſtill more among his readers. Though we ſhall not have occaſion to enter into any minute diſcuſſion of his ſyſtem, this article will, we think, furniſh the intelligent reader with principles, which will prevent the ill effects of his errors; and we ſhall, in ſeveral inſtances, have to acknowledge our own obligations to him.

In the ſtatement which we made near the beginning of the ſecond paragraph, reſpecting the objects of moral philoſophy, we have, we perceive, given the baſis of the plan which we ſhall follow in this article. After having offered a few more introductory obſervations, and ſome remarks reſpecting the neceſſity of moral inveſtigation, we ſhall,

I. Conſider the nature of moral obligation, and ſhew the ultimate obligation of duty.

II. We ſhall give a view of thoſe concluſions reſpecting the primary purſuits of man, which are derived, under the guidance of divine revelation, from the laws of our frame, and the uſual courſe of Providence.

III. We ſhall ſhew what criterion of virtue and principle of duty we deem, from the views in the ſecond diviſion, to be moſt ſuitable to the condition of human nature, and moſt likely to lead to its higheſt excellence. And,

IV. We ſhall offer ſome concluſions, which may ſerve in part as a baſis for a ſyſtem of practical morality.

We have already ſaid (ſee Moral *Education*, col. 4.), that our ſyſtem of morality is Chriſtian morality; and we truſt that the influence of Chriſtian principles will be traced throughout. If any one thinks he ſees reaſon for the opinion, that the evidence of the divine origin of Chriſtianity is not ſufficiently ſtable; yet if he believes in the exiſtence of a wiſe and benevolent Firſt Cauſe, in his moral adminiſtration, and in a future ſtate of retribution, he may ſtill go along with us in almoſt all our concluſions: for though we deem divine revelation a moſt important means of knowing

 our

our duty, and the fanctions with which it is attended of inestimable value, (even to thofe who might have been able to fatisfy themfelves of a future life by confiderations folely derived from the frame of man, and the common courfe of providence,) yet our own conviction, confirmed by every re-examination of the fubject, is, that the moral principles of the fcriptures are precifely fuch as would have been eftablifhed, independently of revelation, by an accurate and enlightened acquaintance with the laws of the human frame, and a judicious and comprehenfive view of the confequences of human actions. Not that it is at all probable, that fuch a moral fyftem as the Hartleyan rule of life, for inftance, would have been devifed by unaided human inveftigation. There is a wide difference between the *perception* and judicious *application* of a truth, and the *difcovery* of that truth; and though it is comparatively eafy for the enlightened underftanding, fetting out with a fatisfactory conviction of an important moral truth, to fhew its foundation and importance, fo as to fatisfy the lefs rigorous and comprehenfive mind, yet, without that conviction, the effort would feldom be made; and the doubts and difficulties attending the inquiry would often damp the ardour and perfeverance of the philofopher, or the intricacies of it would miflead him, and bring him to conclufions in direct oppofition to the principle from which he fet out. The moft acute philofophers of antiquity were conftantly at a lofs, when they came to inquire into the grounds and obligations of virtue; and they repeatedly derived from their fpeculations, opinions which were hoftile to the foundeft views of human nature; and we have not been without inftances in later times, where men of vigorous minds, unfettered, as they believed, by any prejudices, and daring to embrace what they fuppofed to be truth, even if they found her in the haunts of vice, and decked out in all her harlotry;—men, too, whofe writings indicate an ardent love of virtue, and prove their obligations (little acknowledged, and perhaps fcarcely perceived by themfelves,) to the Chriftian fyftem of duty;—having purfued their fpeculations without the reftraint of any fixed points of morality, have derived, even from principles wearing the marks of true excellence, and only erroneous by their extravagant extenfion, conclufions alike hoftile to the precepts of the gofpel, to the plain fenfe of mankind, and to the actual condition of human nature. On one of thefe conclufions we fhall have occafion hereafter to offer fome remarks; and we fhall only add in this connection, that even if the philofopher were himfelf fuccefsful in afcertaining the grounds, obligations, and extent of any moral principle, yet he would feldom fucceed in cafes of any intricacy, and efpecially in oppofition to the felfifh paffions, to convince the lefs comprehenfive mind, unlefs it were under the general influence of the belief that the principle itfelf, or thofe which are directly affected by it, are certainly true, becaufe they are fanctioned by the authority of God.

If there be fatisfactory reafons for the conviction, that the frame of nature owes its origin to a Being infinitely wife, powerful, and good, *he* muft act moft wifely, who, in his inveftigations into the reafons of what he fees, prefumes that it has a wife and good end, if he could but find it out, and fets himfelf with humility and caution to difcover it: and if that conviction be a good one, then muft fuch a mode of enquiry be moft conducive (as Hartley has well remarked) to the difcovery of truth. And following up the fame principle of inveftigation, we may add, that if the moral philofopher fee reafon for the conviction, that the Chriftian fyftem of duty has the exprefs fanction of divine authority, he will act moft wifely, if he prefume that its precepts have a folid foundation and wife and good ends, and by the aid of his own experience and obfervation, and that of others, and by the light which a judicious acquaintance with our mental frame affords, aims to find out their foundation and tendency, and to trace their application: and if his conviction be a juft one, he will neceffarily be more fuccefsful in the afcertainment of important truth, than he could poffibly be, if he purfued his fpeculations without fuch fixed points or fundamental principles, even if he brought to the inquiry an equal degree of vigour of mind and clearnefs and foundnefs of underftanding, and, what is not lefs important, equally juft and comprehenfive views of human nature, and equal love of truth and duty. We muft ftate it, however, as our full and decided conviction, that fuch juft and comprehenfive views of human nature would never have been afcertained, *à priori*, from the known laws of our frame; and that it was only a *religious* philofopher who would have traced out what Hartley has done, from the experience of other religious perfons and from his own.

Such is our foundation; if any philofophical enquirer who does not poffefs the conviction of the wifdom, goodnefs, and moral adminiftration of the Supreme Being, fhould look into thefe pages, we apprehend he will fee little to fatisfy him. To enter into the proof of thofe principles is out of our prefent province; and to the real philofopher, we can, with complete fatisfaction, recommend the firft, and, if he choofe to go further, the fecond chapter of the fecond volume of the Obfervations on Man. If the ftudy of that work, and of Paley's Natural Theology, do not remove his doubts and difficulties, we can only advife him to act upon the *poffibility*, to fay no more, that there may be a ftate of endlefs exiftence hereafter, and if fo, a ftate of retribution; and to bear in mind, that fince the nature of that exiftence muft be of infinitely greater importance than any prefent good or evil, it is the part of true wifdom fo to regulate his conduct and difpofitions, that fhould he enter into that new ftate of being, though through the weaknefs of the human underftanding (for which gracious allowance will affuredly be made by Him who "knoweth our frame,") he has widely erred on fubjects of the higheft moment, he may obtain the approbation of having faithfully ufed his lower degree of intellectual and moral light.

It may be expected by fome, that becaufe we have reprefented our moral views as Chriftian morality, we fhould enter into the confideration of the duties peculiarly Chriftian, arifing from the poffeffion of the Chriftian fyftem of faith and practice, and derivable from no other fource; this, however, we fhall not do: not that we think it *altogether* out of our province, but becaufe the preceptive part of morals is not our immediate object; becaufe the duties which are peculiarly Chriftian, (though they may be fhewn to be accordant with the frame of the mind and the circumftances of man,) can be afcertained only from the fcriptures; and becaufe the confideration of thofe duties would involve difcuffions of a directly controverfial nature, which are unfuitable to the defign of this work. We are not among thofe who think the diftinctions of Chriftian belief unimportant. Religious error in its direct, or its indirect effects, on ourfelves or on others, muft be prejudicial: religious truth, taken in all its bearings, (the whole truth, and nothing but the truth,) muft be beneficial; and we are fully fatisfied, that indifference as to the peculiarities of religious belief, moft commonly leads to indifference to religious truth altogether. But, in our apprehenfion, there is fomething beyond and above them; fomething in which every Chriftian who underftands his religion

ligion muſt agree with every other: and it is this which is the baſis of our moral inveſtigations. If in the eſtimation of any we do not go far enough, we ſhall be ſatisfied if the ſerious and liberal inquirer ſhall ſee reaſon to admit, that we are right as far as we do go. As to the bigot, whoſe narrow mind can allow the worth of no motives which are not immediately founded upon his own peculiar creed, and do not directly imply its truth, we are unfeignedly ſorry for him, but cannot in the leaſt go out of our way on his account.

For the ſatisfaction of the more candid, however, we will add, that we do not leave out of our practical ſyſtem of morals, the regards due to the great "Mediator between God and man:" and we are fully ſatisfied, that the baſis of the duty which we owe to him is laid down in the following pages. If he were, as to nature, truly God, whatever concluſions are derived from the ſcriptures, and from the laws of the human frame, reſpecting the affections and ſervice due to God, will apply, with little variation, to him: if he were one of the creatures of God, and (whatever his rank in the ſcale of being) deriving all his powers from him, and in every way dependent upon him, but appointed by him to fill a moſt important ſtation in his moral adminiſtration towards mankind, then the regards due to him are derived from our ſocial and pious affections united; aſſuming, from that union, a directly religious character. *Faith* in him will then depend upon the proofs of his divine authority: ſubmiſſive *obedience*, upon the principle of religious obedience to his God and Father; *reverence*, upon the impreſſive teſtimonies which he received of the peculiar favour of God, upon the importance of his work while on earth, and the high dignity and power to which he has been exalted: *eſteem* and *veneration* will be founded on the moral likeneſs he bore to the Supreme object of veneration: affectionate and moving *gratitude* upon the contemplation of the bleſſings in the communication of which he was the agent, and of his labours and ſufferings to aſſure and extend them. Except, on the one hand, in the external ſervice due to him, and, on the other, in the affections founded upon the nature of his ſufferings, there is leſs difference in the complex feelings termed love to Chriſt (if at all regulated by ſcriptural repreſentations,) than is generally imagined; and in all their practical reſults, (provided again, theſe are guided by the plain declarations of the ſcriptures,) they completely agree. We hope we ſhall not be ſuppoſed to have forgotten our object. To what we have ſaid in this paragraph, we have been led by the deſire of removing unneceſſary prepoſſeſſions from the mind of any ſerious Chriſtian enquirer.

To conclude theſe preliminary obſervations; ſince much of the happineſs of this life, and of our ability to benefit others, and ſince the happineſs of a boundleſs exiſtence, on the whole, depends upon the proper regulation of our conduct and affections, ſurely it muſt be an object of the firſt importance that we ſhould learn the regulation to which they ſhould be ſubmitted. To know our duty, and to practiſe it, are indeed two diſtinct things, but to practiſe our duty well, certainly requires that we ſhould know it well.

How ſhall we know it? Shall we conſult the law of the land, or make the general conduct of mankind our guide? Shall we bend our actions implicitly and conſtantly to the rules of holy writ, or follow invariably the dictate of our conſciences? All theſe are of uſe in their degree, ſome are of ineſtimable value; but they do not ſuperſede the neceſſity of moral inveſtigation.

The *law of the land*, to adopt the ideas of Paley, labours under two defects, conſidered as a rule of life. *Firſt:* human laws omit many duties, becauſe they are not objects of *compulſion;* ſuch as, piety to God, bounty to the poor, forgiveneſs of injuries, education of children, gratitude to benefactors. The law never ſpeaks but to command, nor commands but where it can compel: conſequently thoſe duties which, by their nature, muſt be voluntary, are left out of the ſtatute book, as lying beyond the reach of its operation and authority. *Secondly:* human laws permit, or, which is much the ſame thing, leave unpuniſhed many crimes, becauſe they cannot be ſettled by any previous deſcription; ſuch as luxury, prodigality, partiality contrary to the good of others, &c. For it muſt either ſettle the crime to be puniſhed, or leave it to the magiſtrate to ſettle it: which is in effect leaving the magiſtrate to puniſh or not to puniſh at his pleaſure. (See Paley, book i. chap. 3.) Beſides, as Mr. Belſham adds, (Elements, p. 418.) if the law of the land require any thing which the law of God forbids, diſobedience is not only innocent, but our duty.

The *general conduct of mankind* cannot, to any great extent, be a ſafe guide. Scarcely is there a vice for which we may not find a juſtification in the general conduct of large ſocieties; ſcarcely a diſpoſition, however pernicious to individual happineſs, which may not receive confirmation from its allowed indulgence among whole nations. The bulk of mankind do not poſſeſs thoſe advantages which enable perſons of cultivated minds to ſee, almoſt at a glance, the path of duty. What culture they have is often unſkilfully applied, and therefore bad habits gain ſtrength, and falſe notions of honour, pleaſure, and intereſt, occupy their minds: they think leſs of what is right than of what will not expoſe them to puniſhment; and their conſcience is ſeldom conſulted, even where its deciſions would be right. Nevertheleſs, a rule of life founded upon the general practice of mankind in the aggregate, would on the whole be favourable to virtue. It would indeed exclude all eminent degrees of virtue as well as of vice; but it would alſo lay ſome reſtraint upon that violence and exorbitancy of paſſion and appetite, which is one chief ſource and occaſion of vice. The *opinions* of mankind are, on the whole, more favourable to virtue than their practice, being, in general, formed from experience, and often upon mature deliberation, when free from the violent impulſes of their appetites and paſſions. Like their practice, the opinions of mankind in the aggregate would exclude all eminent virtues, but in a weaker manner; and it would exclude the great vices in a ſtronger manner. (See Hartley, vol. ii. prop. 46—49.) In the laſt he argues, that the Rule of Life, drawn from the practice and opinions of mankind, corrects and improves itſelf perpetually, till at laſt it determines entirely for virtue, and excludes all kinds and degrees of vice. The whole of the propoſitions referred to, eſpecially the 48th, we recommend to the conſideration of thoſe who give themſelves up to vicious courſes, under the plea of "cool rational ſcepticiſm, and uncertainty in religious matters."

To the *rules of the ſcriptures* we may indeed implicitly ſubmit. He who ſteadily cultivates the diſpoſitions which Chriſtianity enjoins, and conforms his conduct to its ſacred precepts, cannot fail to mount high in the ſcale of moral worth. But this does not prevent the value of moral inveſtigation. For in the *firſt* place, it gives greater promptitude to our obedience, to perceive that the Chriſtian principles and precepts are in perfect conſiſtency with the laws of human nature; and that an acquaintance with thoſe laws leads us to the concluſions forced upon us by the ſcriptures, that it is our duty to make the love of God, the love of our neighbours, and the law of our hearts, the guide of our actions,

tions, and of our affections. But, *secondly*, the precepts of Christianity are very general. This is absolutely necessary to render them of use as the guide of life. Were they as voluminous as the laws of England, and the decisions of the supreme courts of justice, (which are said to fill at least fifty folio volumes,) they could not contain all the cases that would occur; for "it is not once in ten attempts, that you find the case you look for in any law book whatever; to say nothing of those numerous points of conduct, concerning which the law professes not to prescribe or determine any thing." (*Paley*.) Were the rules of scripture equally particular, they would be useless from their extent; and they would be injurious too, because they would prevent the reference of our actions to the general principle, and we should be satisfied if our case were not stated in the Christian system of morals. Again, *thirdly*, it follows from the Christian precepts being so general, and principally regarding dispositions, that it not unfrequently requires some consideration to ascertain where they are directly applicable, and still more whether they altogether coincide with one another in their direction. The virtuous dispositions may dwell together without opposition; a man may be generous, grateful and just: but the actions to which each prompts, may not have that consistency with one another, which would permit their being brought into exercise together; thus an external action which generosity and gratitude may solicit, justice may forbid. Hence it is of great importance to be able to form such a set of decisions, or still better such principles for decision, as might present themselves when called for, and prevent us from giving each class of virtuous actions a disproportionate attention;—such as should enable us to decide, when circumstances required it, to which class of virtuous actions our preference should be given, where we ought to restrain the impulse of feeling, and where to allow it to be our unhesitating guide. Besides, *fourthly*, again to use the words of Paley, "the scriptures commonly pre-suppose in the persons to whom they speak, a knowledge of the principles of natural justice; and they are employed, not so much in teaching *new rules* of morality, as in enforcing the practice of it by *new sanctions*, and by a *greater certainty*: which last seems to be the proper business of a revelation from God, and what was most wanted." See Paley, b. i. chap. 4.

But it may be thought that there is a principle in the human mind, which altogether supersedes the necessity of moral investigation; which infallibly directs us to our duty even in the most minute circumstances. We know of no such principle. We know that there is a principle which springs up, more or less, in the mind of every human being, and which approves of, and prompts to, certain actions and dispositions, and disapproves of, and urges to shun, the contrary actions and dispositions; but we see no ground to imagine that the conscience is to be regarded in the light of a blind instinct, or a mere sense: this would degrade the moral actions of man to a level with the instinctive actions of the brute, or with mere appetite; and it is unnecessary to resort to the supposition; the existence of the conscience, its variations, and its effects, can be accounted for without it. See PHILOSOPHY, *Mental*, IV, 7 (6), and MORAL *Education*, III.

But in whatever light we regard the *conscience*, one thing is indisputable, that its dictates are not uniformly the same in any one, and that they are exceedingly variable in different individuals, even with respect to the grand principles of duty, and still more with respect to the application of those principles. It is indisputable that the moral principle grows to maturity from a small seed. It is indisputable that it is susceptible of culture; that, if neglected, its judgments become wavering and impotent; that if its dictates be made to undergo revision, if corrected by the means of the knowledge we possess, if its defects are supplied by the more extended views of duty, its decisions proportionally become more firm, and in general more efficacious. See Paley, b. i. ch. 5.

Even an ardent desire to keep with exactness the best rules of duty, will not render attention unnecessary to the cultivation of the conscience; ("*I verily thought with myself*," said the apostle Paul, "that *I ought* to do many things contrary to the name of Jesus of Nazareth;") and an enlightened love of duty must, therefore, urge to such cultivation. Dr. Cogan, in his Philosophical Treatise on the Passions (p. 348.), adduces as an example "of the influence of perverted principles," "the conduct of a pious mother, towards a most excellent and dutiful son, who, from a principle of conscience, in opposition to his interests, renounced the religious system in which he had been educated, for another which he deemed more consonant to truth. She told him, that 'she found it her duty, however severe the struggle, to alienate her affections from him, now he had rendered himself an enemy to God, by embracing such erroneous sentiments.' My friend added, that she was completely successful in these pious endeavours; and that the duty which she enjoined upon herself, was scrupulously performed during the remainder of her days." The same philosophic writer mentions another instance of the irregularity of the moral principle in a child, in whose character mildness and compassion were pre-eminent features. "I was once passing through Moorfields," he says, "with a young lady, aged about nine or ten years, born and educated in Portugal, but in the Protestant faith; and observing a large concourse of people assembled around a pile of faggots on fire, I expressed a curiosity to know the cause. She very composedly answered, I suppose it is nothing more than that they are going to burn a Jew."

It is surely unnecessary to say more on these points. It is a truth, as indisputable as that we are living for a purpose beyond mere present gratification, "that moral excellence is the true worth and glory of man, and that therefore the knowledge of our duty is to every man, in every situation of life, the most important of all knowledge." Reid.

The leading questions in morals may be reduced to the three following: 1. What is that quality of conduct and affections, or character, (the sum total of the moral habits of feeling and action,) which render them obligatory upon a reasonable being constituted like man? 2. What are those affections, and classes of conduct, which possess this quality? 3. What are the best means for the culture of those affections, and the proper direction of our conduct? The first of these we shall now proceed briefly to consider.

1. *Moral obligation*.—The term *obligation* respects *voluntary* actions only. We use the word *actions* as Mr. Stewart does (Outline, p. 76.), to include every mental or corporal exertion consequent on volition. We say we are *obliged* to walk, if we wish to have health; we are *obliged* to use regular exertion, if we wish to acquire valuable mental habits; and, generally, we are *obliged* to perform certain actions, in order to attain certain ends. The use of the term in this and similar situations, shews its true import. *Obligation* expresses the *necessity of certain voluntary actions as means*, in order to obtain certain ends. Thus, if the end be the possession of health, a *necessary* means is that we take exercise. If the end be the formation of valuable mental habits, a regular series of exertions is the *necessary* means; and, in short, in whatever case we wish to express that certain ends can *only* be obtained by certain voluntary actions as the means,

we

we fay we are *obliged* to ufe thefe means in order to obtain thefe ends. This fimple and truly excellent view of obligation is taken, with a little alteration, from Mr. Belfham's Elements, fect. 4. It feems to have been derived from Gay's Preliminary Differtations, fect. 2; but with great improvement. In its prefent form it beft accords with our object.

Obligation differs from *compulfion.* The former refpects *voluntary* actions, the latter *involuntary.* Compulfion always implies fome external force. Thus a man is obliged in honour to pay his debts, and if he do not he will be compelled by the law; that is, if to fatisfy the laws of honour be the end, the payment of his debts is the neceffary means; if this obligation do not operate with fufficient ftrength as a *motive,* he will be compelled to do it, againft his will, by the law.

Obligation by no means implies an *obliger.* I may be obliged by reafon, by intereft, by convenience, by honour, by confcience, &c. as well as by the authority of another. Authority is one, but not the only, fource of obligation. Paley's opinion, that "a man is faid to be obliged, when he is urged by a violent motive refulting from the command of another," (feparate from the very objectionable expreffion *a violent motive,*) is by far too limited an account of obligation.

Moral obligation refpects thofe actions which are denominated virtuous or vicious; we are *obliged* to perform the one, and to abftain from the other, becaufe this is the *neceffary means,* in order to effect a certain end. That is to fay, unlefs we do practife virtue and abftain from vice, we cannot obtain the end which wifdom points out as deferving purfuit.

As has been remarked of obligation in general, there may be *various fources* of moral obligation; thus, a perfon may be obliged to the performance of his duty, by the laws of God, the dictates of his confcience, his greateft happinefs on the whole, and fo on. Whatever can be fhewn to be the *ultimate* obligation, that is, that to which all others may be reduced, will then furnifh the moft general *criterion* of duty; we do not fay the *beft,* for that we think a different one. (See Div. III.) Thus, if it appear that the *ultimate* obligation to virtue is the agent's *greateft happinefs on the whole,* then we fhould fay, that *virtue* is that quality of an action, or affection, or of the characters by which it tends to the greateft happinefs of the agent on the whole. In other words, a certain character of action or difpofition, is a neceffary means to a certain end; that end may be various, according as we go back more or lefs remotely; fuppofe the remoteft end to be the greateft happinefs of the agent on the whole, then it follows, that the *tendency* to produce that end, is, philofophically fpeaking, the moft general criterion by which we are to afcertain whether or not it is *obligatory;* and to this tendency may be given the denomination of virtue.

Many fources of obligation have been pointed out by different philofophers. That is, to the queftion, Why ought I to act in a certain way, which we call virtuoufly, many anfwers have been given. Some of the moft important are the following.

It is agreeable, fay fome, to the *eternal and neceffary fitnefs of things.* This, in a great meafure, leaves the diftinction between virtue and vice, indefinite and arbitrary; for it depends upon the *perception* of a fitnefs or unfitnefs, which can only be afcertained by inveftigations, whofe conclufions will neceffarily, and often widely, differ in different individuals. Befides, as it has with fome juftice been afked, what are thofe moral fitneffes fit for? If the fitnefs or unfitnefs of actions mean any thing different from their tendency to produce happinefs or mifery, the expreffion is unintelligible. We may fafely ufe the expreffion, for there are certainly a beauty and propriety in virtue, a fuitablenefs to the nature and condition of man, which increafe in our eftimation as virtue itfelf gains an influence in our breafts; but ftill, when we fpeak of it as a fource of moral obligation, 'we find the queftion returning, Why ought I to act agreeably to the fitnefs of things?' The principal fupporters of this view of moral obligation are, Grotius, Balguy, and efpecially Clarke. To a certain extent, it is alfo defended by the advocates of the next opinion.

Some whofe own confirmed habits of virtue probably were in fome meafure the caufe of the opinion, have maintained, that virtue carries in itfelf its own obligation,—that *the underftanding at once perceives* a certain action, *to be right,* and that *therefore* it *ought* to be performed. It is objected with great juftice to this fyftem, that it leaves the matter where it found it; for the queftion recurs, why am I obliged to perform an action which my underftanding reprefents to me as right? Again you tell me, my underftanding reprefents fuch an action as right, that is, obligatory; and therefore I am obliged to perform it. I may afk, *why* does your underftanding reprefent this as right? If you fay, becaufe the mind is fo conftituted by its Maker, you refer me to a kind of infallible judge within, whofe dictates, neverthelefs, are very different in different perfons.—Befides, if the *perception* of right conftitutes obligation, we muft admit that perfons fometimes do right in performing wrong actions. Felton believed that he did what was right, that in fhort he performed an action which was highly meritorious, when he murdered the duke of Buckingham; according to this theory, he was really under an obligation to do it. There cannot be a doubt, that it is the part of true wifdom to endeavour to cultivate the moral powers, and then leave the actions entirely, (except in extreme cafes,) to their fuggeftions. But to ftate that an action is obligatory, *becaufe* the underftanding, or the moral fenfe, (for it comes to the fame thing,) reprefents it as right, is to fanction, as virtuous, fome of the moft injurious actions; for fome of the moft injurious actions have been performed by thofe who thought it right to perform them. The fact appears to be, that the advocates for this fyftem, having fpent much of their lives in cultivating their moral perceptions, and finding them, in their prefent ftate, always correct, have acquired the habit of acting implicitly upon them, and hence (not remembering their lefs perfect ftate) have judged, that becaufe certain actions were reprefented by the moral perception as right, *therefore* they were obligatory. This is a fufficient obligation, where perfons have done their beft to enlighten their confciences, generally, and in the particular point of difficulty, but not otherwife; and the queftion ftill recurs, *why* is this action obligatory? This fource of moral obligation was maintained by Cudworth, Butler, Adams, and Price; men whofe writings difplay talents of the firft order for profound inveftigation; and whofe errors are the errors of confirmed moral worth, viewing their own minds rather than the actual condition of human nature, and unacquainted with fome of the grand principles of the mind, which would have led them to different conclufions. Perhaps the works of Butler and Price do not fuit the tafte of the prefent age; but the intelligent reader can fcarcely rife from the ftudy of them, without moral and intellectual benefit.

An action is obligatory, fay others, becaufe it is agreeable to the *moral fenfe.* The obfervations under the laft head have anticipated what might be made here. When we analyfe the grounds of our moral feelings and fentiments, (fee PHILOSOPHY, *Mental,*) we cannot but perceive, that they

they cannot be fafely made the infallible rule of our conduct; ftill lefs can they furnifh the ground of obligation. It cannot, however, be too ftrongly impreffed upon the mind, that correct dictates, and the exaction of implicit obedience to thofe dictates, conftitute the perfection of the confcience. Enlighten and obey it, is a maxim of true wifdom. Lord Shaftefbury and Dr. Hutchefon are the principal fupporters of this theory. Adam Smith's hypothefis nearly coincides with it. See Belfham's Elements, p. 428.

It is clear, then, that we do not reach the ultimate obligation by faying that it is agreeable to the eternal fitnefs of things, to the perceptions of the underftanding, to the dictates of the moral fenfe; but when we add, it is agreeable to the will of God, we feem incapable of advancing further. We furely are obliged to perform the will of God, by every confideration. Moft true, and yet we are not come to the remoteft obligation. Even, in the fentence we have juft ufed, we have, without intending it, referred to one beyond it. Under the moral adminiftration of an all-wife and gracious being, there cannot be a doubt, that obedience to his commands is the higheft wifdom: but why? It is a queftion that admits of an anfwer, and may therefore be put, though reverently: why am I *obliged* to do the will of God? And the anfwer is obvious. Obedience to the commands of a benevolent God muft be productive of the agent's greateft happinefs on the whole. Not that it is neceffary frequently to take this into confideration; for when we have afcertained that we are walking furely, we may walk fafely without that degree of attention which, before fuch afcertainment, might have been neceffary. To obey the will of God in all things is the higheft point of wifdom; and the confequences of obedience we may leave to him with perfect fecurity. It muft be well with thofe who fear him. For references to the writers who have deduced all moral obligation from the Deity alone, fee Thomas Cooper's Tracts, Effay on Moral Obligation, where will be found an acute examination of the foregoing and other views of moral obligation. See alfo Belfham's Elements at the end. Mr. Belfham has extended the examination to the moral fyftems of Paley, Gifborne, and Godwin.

Every queftion, Why is any one obliged to perform a certain action? gives us an ultimate anfwer; becaufe it tends to the agent's greateft happinefs on the whole. When we arrive at this point, it is obvious that we can go no further. And though, as will hereafter appear, true wifdom undoubtedly directs, that in order to attain the higheft degree of moral excellence, we fhould leave our own happinefs out of confideration,—and though the human mind is fo conftituted, that difinterefted benevolence, founded upon and fupported by piety, would lead an individual who has attained it, to obey the will of God and feek to promote the welfare of mankind, even if his underftanding were convinced that he fhould thereby entail upon himfelf confequences highly prejudicial to, or deftructive of happinefs on the whole,—yet it does not appear that there could be any proper *obligation* to any conduct in oppofition to the agent's happinefs on the whole. If felf *muft* be annihilated, it is becaufe felf-annihilation, or felf-oblivion, is neceffary for the attainment of the higheft poffible happinefs. It has been remarked in favour of this as the *ultimate* obligation to virtue, that no nearer obligation could ever be admitted, which cannot at laft be refolved into this moft remote one: that no one, if he had his choice, would accept of exiftence but upon condition of a preponderance of happinefs; that happinefs is the end of the whole creation, though the means by which it is to be obtained are not always in themfelves confidered productive of happinefs; and that revelation affumes this as the ultimate fanction of all its requifitions. This view of moral obligation is ably defended by T. Cooper in the firft of his tracts: his ftatements, however, are fometimes deficient in that reverence which fhould ever be maintained to the Supreme Being; there is an occafional vaguenefs, or rather inaccuracy, in his expreffions; and in fome inftances we fee more indications of acutenefs than of folidity. It is lefs exceptionably and more compendioufly confidered and maintained in Mr. Belfham's Elements. It is ftated by Cooper (p. 86.) to have been entertained by Cumberland, Puffendorf, Gay, Law, Turnbull, Rutherforth, Clayton, Johnfon, and others; Belfham adds Browne and Gifborne; and Paley (fee b. ii ch. 2.) may evidently be arranged among them. On this and every other point of morals, however, our decifion muft be founded on fomething more fecure and fatisfactory than human *authority*.

Here, then, we come to the ultimate, or (as we fhould prefer faying) the *remoteft* obligation of virtue; and from this point we fhall proceed, till it appears that the ends of human exiftence will be beft anfwered by refting at a fomewhat nearer and equally ftable ground of obligation. And we cannot forbear anticipating the conclufions from the next divifion, by obferving, that it will clearly appear, from carefully confidering the laws of our mental frame and the circumftances of mankind, that the love of God, of man, and of duty, (in other words, the affections of piety and benevolence, and a regard to confcience,) fhould be our primary aim, fince he will be moft happy, in whom thofe principles exift with the greateft ftrength and vigour. The *ultimate obligation*, the *beft rule*, and the *immediate motive*, of duty, are three diftinct confiderations. If it appear that to make the will of God our *rule* of duty, is the *beft* way to promote our own worth and happinefs, as well as the worth and happinefs of others, this muft be our *beft rule*: we may, neverthelefs, be acting in perfect confiftence with this rule, when we are exerting ourfelves for the good of others, or impofing reftraints upon our felfifh inclinations, with an explicit intention to promote the welfare of others, or to follow the dictates of confcience, without, for the time, any direct reference to the will of God as fuch; benevolence, or a fenfe of duty, is in this cafe our *immediate motive*. The remoteft obligation in this cafe, is the fame as before; but we can feldom find it neceffary, even in theory, to revert to it as the ultimate obligation; for if God is juft and good, obedience to his will muft be productive of our greateft good on the whole. He is perfectly juft and good, and therefore, in the actual ftate of the cafe, and we need think of no other, the will of God may, with the utmoft propriety, be affumed, not only as the nobleft *motive*, and the beft *rule*, but alfo as the *foundation*, and even (with very little departure from logical correctnefs, and with greater accordance with the feelings of the man who is accuftomed to employ this rule) as the *ultimate obligation* of duty. He perhaps perceives, when he comes to difcriminate nicely, that he *may* go one very fhort ftep farther; but religious obedience and his greateft good, appear to him fo infeparably connected as caufe and effect, that they make a part of one complex idea; fo that when he is acting under a fenfe of religious obligation, he feels a fecurity, if he think at all about it, that he is effectually promoting his own greateft happinefs on the whole. But he wifhes to feel and act as little as may be with an explicit regard even to this higheft fpecies of felf-intereft, as a primary confideration; and therefore when he has come to the will of God, he cheerfully refts with that, as *his* fartheft obligation.

II. *Confideration of the Primary Purfuits of Man.*—According

cording to the plan propofed near the beginning of this article, we fhall now proceed to confider what fhould be made our primary purfuits in life, in order to obtain the greateft degree of happinefs on the whole; in other words, according to the fecond inquiry at the end of our introductory obfervations, what are thofe affections and claffes of conduct which poffefs the quality which renders them obligatory upon a reafonable being like man. In anfwering this inquiry, the third will, alfo, in a confiderable degree, receive an anfwer, *viz.* what are the beft means for the culture of thofe affections, and the proper direction of our conduct.

In this divifion we fhall make a free and almoft continual ufe of Hartley's Rule of Life. We do not think it neceffary to make any point of ftating where we extract or abridge from him, or where we leave him; thofe who are acquainted, or who may be led by what we here ftate to an acquaintance with that part of his Obfervations, will eafily perceive what we owe to him; and to others it would be ufelefs. We do ourfelves pay no regard to his authority, farther than where it appears to us he has reached moral truth; and we afk for no one's adoption of any ftatement he may find here, *becaufe* it is Hartley's; but we fhall deem ourfelves happy, if our prefent labours fhould lead any to cultivate an intimate acquaintance with that invaluable treafury of moral principles.

Hartley's Rule of Life follows the arrangement of the pleafures and pains in the firft part of his Obfervations; and we fhall purfue the fame order. It was greatly with a view to this, that we entered fo much into his analyfis of the mental pleafures and pains in our preceding article (PHILOSOPHY, *Mental*, IV. 7.), and we muft beg the reader to refer, under each clafs, to the correfponding fection there. The primary divifion of the pleafures and pains is into the fenfible and the mental or intellectual; and thefe laft are divided by Hartley into thofe of 1. IMAGINATION; 2. AMBITION; 3. SELF-INTEREST; 4. SYMPATHY; 5. THEOPATHY; and 6. Thofe of the MORAL SENSE.

1. *Eftimate of the Pleafures of Senfation.*—The firft pleafures and pains of the human being are obvioufly thofe of fenfation, and they form one fource of enjoyment, and ftill more of fuffering, during the whole of life. It is from thefe that the whole round of mental or intellectual pleafures and pains is compofed. (See PHILOSOPHY, *Mental*, II. IV.) To eftimate the value of thefe pleafures in their uncompounded ftate, take the extreme cafe, that any one purfued them as a primary object, laying afide all reftraint from the virtues of temperance and chaftity; he would foon deftroy his bodily faculties, thus rendering the objects of the fenfible pleafures ufelefs; and he would precipitate himfelf into pain, difeafes, and death, evils of the firft magnitude in the eyes of the voluptuous. This is a plain matter of obfervation, verified every day by the fad example of loathfome, tortured wretches, that occur which way foever we turn our eyes in the ftreets, in private families, in hofpitals, in palaces. Pofitive mifery, and the lofs even of fenfible pleafure, are too infeparably connected with intemperance and lewdnefs, to leave room for doubt even to the moft fceptical. The fenfual appetite muft therefore be regulated by, and made fubfervient to, fome other part of our natures, elfe we fhall mifs even the fenfible pleafure which we might have enjoyed, and fhall fall into the oppofite pains, which are, in general, far greater, and more exquifite than the fenfible pleafures.

The fame conclufion alfo follows from the fact, that inordinate indulgence in fenfual gratifications, deftroys the mental faculties, expofes to external inconveniences and pains, is totally inconfiftent with the duties and pleafures of benevolence and piety, and is all along attended with the fecret reproaches of the moral fenfe, and the horrors of a guilty mind. Such is the conftitution of our frame, that the formation of mental feelings and affections cannot be altogether prevented; but an inordinate purfuit of fenfible pleafures converts the mental affections into a fource of pain, and impairs, and cuts off, the intellectual pleafures.

The fame thing may be inferred from the fact, that the fenfible pleafures are formed firft, and the mental pleafures from them, by the affociative power. Now it is a general principle in the order of nature, that the prior ftate, or means, is lefs perfect and important than the pofterior ftate, or the end. Hence the fenfible pleafures cannot be of equal value and dignity with the mental, to the generation of which they are made fubfervient. This inference may be drawn from the analogy of nature, without reference to the infinite benevolence of the Supreme Being, which, however, makes it more fatisfactory.

Further, the mental pleafures are more confiftent with the gentle gradual decay of the body, than the fenfible pleafures, becaufe, as they are formed from the combination and coalefcence of many fenfible pleafures, they more affect the fenfible fyftem at large; while the fenfible pleafures principally affect the particular parts of the fyftem to which they belong, and therefore, when indulged to excefs, they injure or deftroy their refpective organs, before the whole body comes to a period.

Laftly, the duration of mere fenfible pleafure is neceffarily very fhort, and cannot, even when free from guilt, afford any pleafing recollections; whereas one of the principal pleafures of our nature, is, and muft be, the pleafures of reflection and confcioufnefs. In like manner the evident ufe and reftriction thereto of one of the chief fenfible pleafures to preferve life and health, with all the confequent mental faculties, and executive bodily powers; of the other to continue the fpecies, and to generate and enlarge benevolence, make the fubordinate nature of both manifeft in an obvious way.

2. *Regulation of the Purfuit of the Pleafures of Senfation.*—The foregoing remarks prove that the pleafures of fenfation ought not to be made the primary purfuit of life, but require to be regulated and reftrained by fome foreign regulating power. That they fhould be fubmitted to the precepts of benevolence, piety, and the moral fenfe, may be proved by fhewing, that by this means they will contribute both to their own improvement, and to that of other parts of our nature.

Now benevolence requires that the pleafures of fenfe fhould be made entirely fubfervient to health of body and of mind, fo that each perfon may beft fill his place in life; beft perform the feveral relative duties of it; and as far as in him lies, prolong his days to their utmoft period free from great difeafes and infirmities. All gratifications, therefore, which tend to produce difeafes of body or irregularities of mind, are forbidden by benevolence; and the moft wholefome diet, as to quantity and quality, enjoined by it. It alfo moft ftrictly forbids all gratifications by which the health or virtue of other individuals is injured, or by which encouragement is given to others to depart from the rules of chaftity and temperance. The precepts of piety are to the fame purpofe, whether they are deduced from our relation to God, as our common Father and Benefactor, who wills that all his children fhould ufe his bleffings fo as to promote the common good; or from the natural manifeftations of his will in the immediate pleafures and advantages arifing from moderate refrefhment, and the manifeft inconveniences and injuries caufed by excefs in quantity or quality; or from his revealed will, by which temperance in all fenfible pleafures is commanded, and intemperance feverely threatened. In like manner the moral fenfe abfolutely directs to the fame moderation, whether it be derived explicitly from the foregoing rules of benevolence and piety, or from ideas of decency, rational felf-intereft, the practice of wife and good men, the difgufting nature of the difeafes confequent on intemperance, the odioufnefs and mifchief of violent paffions, &c. It is evident, therefore, that all thefe guides of life lead to the fame end, *viz.* great moderation in fenfible enjoyments, though they differ fomewhat in their motives, and in the commodioufnefs of their application, as a rule in the particular occurrences of life.

By this fteady adherence to moderation, we are no lofers, even with refpect to fenfible pleafures themfelves; for by thefe means our fenfes and bodily powers are preferved in their beft ftate, and as long as is confiftent with the neceffary decay of the body; and this moderation, and its beneficial confequences, directly tend to infpire the mind with perpetual fecurity, cheerfulnefs, and good will, and with gratitude to the Giver of all good. In the common intercourfe of life, affociated circumftances add greatly to the pleafures of fenfation: thus the pleafure of receiving a thing from a friend, or fharing it with a friend, fociality and mirth at the time of enjoyment, &c. greatly enhance the gratifications of tafte. Much more then will the pure and exalted pleafures of piety and benevolence increafe thefe pleafures.

We are then great gainers on the whole, by religious moderation as to fenfible pleafures; ftill more fo as to the fenfible pains and fufferings which the intemperate bring on themfelves. Thefe are of the moft exquifite kind, and often of long duration, efpecially when they give intervals of refpite; they impair the bodily and mental powers fo as to render moft other enjoyments infipid and imperfect; they difpofe to peevifhnefs, paffion, and murmuring againft Providence; and are attended with the pangs of a guilty mind.

On the whole, the proper method of avoiding the fenfible pains, whether the refult of excefs, or fuch as occur in the daily difcharge of the duties of life, and of obtaining the fenfible pleafures in their beft and moft lafting ftate, is not to aim at either directly, but in every thing to be guided by the dictates of benevolence, piety, and the moral fenfe. It is evident that luxury, felf-indulgence, and an indolent averfion to perform the duties of a man's ftation, not only bring on grofs bodily difeafes, but previoufly to this, often produce fuch a degree of anxiety and fearfulnefs in minute affairs, as to make perfons inflict upon themfelves greater torments than the moft cruel tyrants could inflict. There are cafes, however, in which perfons are obliged, from a fenfe of duty, from benevolence, from adherence to true religion, &c. to forego pleafure, and to endure pain; and this where there is no probability of a recompence in this life. Here the hopes of futurity lend their aid, and the prefent pleafure which thefe afford, is in fome cafes fo great, as to overpower, and almoft to annihilate, the oppofite pains.

3. *Rules refpecting the Pleafures of Senfation.*—"The only rule with refpect to our diet," fays Dr. Prieftley in his Inftitutes, "is to prefer thofe kinds, and that quantity, of food, which moft conduce to the health and vigour of our bodies. Whatever in eating or drinking is inconfiftent with, and obftructs this end, is wrong, and fhould carefully be avoided; and every man's own experience, affifted with a little information from others, will be fufficient to inform him what is nearly the beft for himfelf in both thefe refpects, fo that no perfon is likely to injure himfelf through mere miftake."

It is fufficiently obvious, that it is the benevolent affections which give the chief value and higheft intereft to the fenfible pleafures, arifing from the intercourfe of the fexes; and it alfo appears that thefe pleafures were defigned by the great Author of our frame to be one chief means of transferring our affection and concern from ourfelves to others. If, therefore, this great fource of benevolence be corrupted or perverted, the focial affections depending on it will alfo be perverted, and degenerate into felfifhnefs or malevolence. Thefe confiderations, of themfelves, point to marriage as the only juftifiable mode of indulging the focial paffions.

Unreftrained promifcuous intercourfe would produce the greateft evil public and private. By being unreftrained, it would deftroy the health and prevent the propagation of the fpecies; by being promifcuous, it would be ineffectual to promote the tender and benevolent charities, either between the individuals themfelves, or towards their offspring, and would produce endlefs contentions among mankind. Now though fcarcely any known nation has allowed of fuch entire licentioufnefs, yet the evils arifing from any great degree of it are fo abundantly obvious and important, that they have almoft univerfally led to fome fuch regulation of fexual intercourfe as that of marriage, and prove its neceffity for the well-being of fociety.

Further, to ufe the words of Paley, already cited under the article MARRIAGE, whofe excellent remarks on this fubject we fhall freely employ as fuits our purpofe, the public ufe of marriage inftitutions alfo confifts in their promoting the production of the greateft number of healthy children, their better education, and the making of due provifion for their fettlement in life; and their promoting the private comfort of individuals, and particularly of the female fex. It may be true, all are not interefted in this laft reafon; neverthelefs it is a reafon to all for abftaining from any conduct, which tends in its general confequence to obftruct marriage: for whatever promotes the happinefs of the majority is binding upon the whole.

Thefe confiderations prove that the reftraint of marriage inftitutions is an effentially important obligation. It may be violated by vagrant concubinage, or by cohabitation limited to a fingle individual. The former will be the object of the next paragraph; the latter cannot be placed upon the fame footing with it in feveral refpects: but as it can anfwer the primary public ends of marriage in only a few cafes, as it tends to annihilate the individual advantages which are naturally derived from it, both as to moral welfare and to comfort; and as it decidedly difcountenances marriage, and confequently in the prefent ftate of fociety countenances fornication, it follows that it is immoral. "Laying afide the injunctions of the fcriptures," fays Paley, "the plain account of the queftion feems to be this: it is immoral, becaufe it is pernicious that men and women fhould cohabit, without undertaking certain irrevocable obligations, and mutually conferring certain civil rights; if, therefore, the law has annexed thefe rights and obligations to certain forms, fo that they cannot be fecured or undertaken by any other means, which is the cafe here, (for whatever the parties may promife to each other, nothing but the marriage ceremony can make their promife irrevocable,) it becomes in the fame degree immoral, that men and women fhould cohabit without the interpofition of thefe forms."

With refpect to the crime of fornication, it is to be obferved that promifcuous concubinage tends greatly to difcourage marriage, and therefore to defeat the feveral beneficial purpofes fpoken of in the preceding paragraph. The reader

reader will learn to comprehend the magnitude of this mischief, by attending to the importance and variety of the uses to which marriage is subservient, and by recollecting that the malignity and moral quality of each crime are not to be estimated by the particular effect of one offence, or of one person's offending, but by the general tendency and consequence of crimes of the same nature. If one instance of licentious indulgence be innocent or allowable, why should not more? and if allowable in one, why should not licentiousness become general? and if it were so, what dreadful consequences would follow? Every instance of licentious conduct has the direct and decided effect of leading to those dreadful consequences, which none but a purely malevolent being could contemplate without horror; and every instance is therefore criminal, altogether independent of its individual effects and tendencies.

Again: fornication supposes prostitution, and prostitution brings and leaves the victims of it to almost certain misery. It is no small quantity of misery in the aggregate, which between want, disease, and insult, is suffered by those outcasts of human society who infest populous cities; the whole of which is a general consequence of fornication, and to the increase and continuance of which every act and instance of fornication contributes.

Further: fornication produces habits of ungovernable lewdness, which introduce the more aggravated crimes of seduction, adultery, violation, &c. Of this passion it has been truly said, that irregularity has no limits; that one excess draws on to another; that the most easy, therefore, as well as the most excellent way of being virtuous, is to be so entirely. However it be accounted for, the criminal intercourse of the sexes corrupts and depraves the mind and moral character, more than any single species of vice whatsoever. That ready perception of guilt, that prompt and decisive resolution against it, which forms one grand feature in a virtuous character, is seldom found in persons addicted to these indulgences. They prepare an easy admission for every sin that seeks it; they are, in low life, usually the first stage in men's progress to the most desperate wickedness; and, in high life, to that lamented dissoluteness of principle, which manifests itself in a profligacy of public conduct, and a contempt of the obligations of religion and moral probity. Add to this, that habits of libertinism incapacitate and indispose the mind for all intellectual, moral, and religious pleasures, which is a great loss to any man's happiness.

Lastly: fornication perpetuates a disease, which may be accounted one of the sorest maladies of human nature, and the effects of which are said to visit the constitution of even distant generations. The passion being natural, proves that it was intended to be gratified; but under what restrictions, or whether without any, must be collected from such considerations as the foregoing. And we must hint here, that the gratification of it in *any* way but by sexual intercourse, is not only directly and expressly forbidden by the laws of God, (and even, in some instances, of man,) and by general consent branded with shame and infamy, but leads to consequences in the bodily and mental system alike mischievous and irremediable. See § 2.

If fornication be criminal, all those incentives which lead to it are accessaries to the crime, and, as such, are criminal, independently of their injurious effects upon the mind, which, however, are very great: for instance, lascivious conversation, whether expressed in obscene, or disguised under modest, phrases; also wanton pictures, songs, and books, the writing, publishing, and circulating of which, whether out of frolic, or for some pitiful profit, is productive of so extensive a mischief, from so mean a temptation, that few crimes, within the reach of private wickedness, have more to answer for, or less to plead in their excuse.

Though the sexual desires are very strong, yet there is abundant reason to believe that they are not originally much disproportionate to their end; and that if due care were taken, they would not arise in youth much before the proper time for this end. But the violence and unseasonableness of these passions are so manifest in the generality of young persons, that one cannot but conclude the general education of youth to be grossly erroneous and perverted; and, upon examination, this will appear very evident in fact. The diet of children and young persons is not sufficiently plain and sparing; a proper regulation of which would lay a better foundation for health and freedom from diseases, and put some check upon these passions. They are brought up in effeminacy, and neglect of bodily exertion, which would materially assist to prepare both body and mind for the discipline of life, and would restrain the sexual passion. The due culture of the mind, especially in respect of religion, is very generally neglected; so that the young are usually left without employment for their thoughts, and destitute of the chief armour, that of religious motives, whereby to oppose temptation. Lastly: the conversation which they hear, and the books which they are allowed to read, (and even to employ as a part of their learning,) are so corrupt in this respect, that it is a matter of astonishment how a parent, who has any serious concern for his child, can avoid seeing the immediate destructive consequences, or think that any consideration relating to this world can be a balance to them.

4. *Estimate of the Pleasures of Imagination.*—It does not appear from actual experience, that those who devote themselves to the study of the polite arts, or of science, or to any other pleasure of mere imagination, as their chief end and aim, do attain any greater degree of happiness than the rest of the world. The frequent repetition of these pleasures cloys, as in other cases; and though the whole circle is extensive, yet no one can grasp the whole, and as a matter of fact few apply themselves to more than one or two considerable branches. From the manner in which the feelings of imagination are usually generated, and transferred upon their several objects, it might be expected that deformity would be often mixed with beauty, so as to produce an unpleasing discordancy of opinion, even in the same individual; and, as a matter of fact, it is not uncommon for men, after a long and immoderate pursuit of one class of beauty, natural or artificial, to deviate into such by-paths and singularities, that the objects excite rather pain than pleasure; their limits for excellence being narrow, and their rules absurd, and all that falls short of these being condemned by them as deformed and monstrous. Eminent votaries of this kind are generally remarkable for ignorance and imprudence in the common affairs of life; thus subjecting themselves to ridicule and contempt, and to real, great, and lasting inconveniencies. Vanity, moroseness, and envy, are too generally the painful and injurious concomitants of an overweening attention to the pursuit of these pleasures. And scepticism in religious matters is a frequent attendant here, which, if it could be supposed free from danger as to futurity, is at least very uncomfortable as to the present. This almost necessary consequence of such confined attention is, that too high a degree of importance is given to the object, and the superiority which is supposed to be possessed in it, is supposed also to extend to other cases in which the individual is perhaps uncommonly ignorant; and thus he either becomes dogmatical or sceptical; qualities which, though

though apparently different from each other, are, in reality, to be confidered as antecedent and confequent, dogmatifm being frequently followed by fcepticifm. And as religious knowledge, to be properly cultivated, requires that the foil fhould be prepared by the benevolent and pious affections, and no kind of learning being of itfelf fufficient to give this preparation, if attention to the purfuit of literature or of fcience be fo inordinate as to fupprefs the growth of thefe affections, religion itfelf will be treated as incomprehenfible, abfurd, uncertain, or incredible.

It is, however, difficult to reprefent juftly, what is the genuine confequence of the purfuit of the mere pleafures of the imagination; their votaries being alfo generally actuated by motives of ambition; but, as will be feen hereafter, this does not invalidate any of the foregoing remarks.

It is juftly obferved by Dr. Percival, that the endlefs progreffion of knowledge, is apt to give the love of it an inordinate afcendancy over every other principle; and as this paffion does not, like the love of virtue, temper its particular exertions, by preferving a due fubordination of the powers which it calls into action, the wildeft extravagancies of emotion and of conduct, have been difplayed by thofe who have fubmitted to its uncontrouled dominion.

Further, we have reafon to fuppofe that the pleafures of imagination ought not to be made our chief end and aim, becaufe in general they are the firft of the intellectual pleafures, come to their height early in life, and decline in old age. There are fome few, indeed, who continue devoted to them through life; fo there are fome to the pleafures of fenfation; but both are irregularities which cannot be confidered as indications of the defigns of Providence refpecting thefe pleafures. Hence the analogous argument refpecting fenfation, § 1, is applicable to thefe pleafures alfo. Like every other part of the great machine, they have their ufe, but it is a fubordinate one; they tend to the improvement and perfection of our nature, but eminence in them is not that perfection. They teach a love of regularity, exactnefs, truth, fimplicity: they lead to a knowledge of many important truths refpecting themfelves, the world in general, and its Author: they habituate to invent and to reafon; and when the focial, moral, and religious affections begin to be generated in us, we may make a much quicker progrefs towards the perfection of our natures by having a due ftock, and no more than a due ftock, of knowledge in natural and artificial things, of a relifh for natural and artificial beauty.

5. *Regulation of the Pleafures of Imagination.*—As the pleafures of imagination are manifeftly intended to affift in generating and augmenting the higher orders of benevolence, piety, and the moral fenfe, fo thefe laft may be made to perfect and improve the former.

(1) Thofe parts of the *arts and fciences* which infpire us with devout affections, and enable us to be moft ufeful to others, abound with the moft and greateft beauties. Thus the ftudy of the fcriptures, of natural hiftory, and natural philofophy, of the frame of the human mind, &c. when undertaken with pious and benevolent intentions, lead to more interefting and furprifing truths, than any ftudy intended for mere private amufement.

Further, fince the world is a fyftem of benevolence, and confequently the Author of it is the object of unbounded love and adoration, benevolence and piety are the only true guides in our inquiries into it, the only clues which will lead through the labyrinths of nature. In the purfuit of every branch of valuable knowledge, let the inquirer take for granted that every thing is right on the whole, that is, let him with a pious confidence feek for benevolent purpofes, and he will find the right road, and by a due continuance in it, attain to fome new and valuable truth; whereas, every other principle and motive for examination, being foreign to the great plan upon which the univerfe is conftructed, muft lead to endlefs mazes, errors, and perplexities. Again, it is to their tendency to the increafe of happinefs, that almoft all truths owe their luftre. Hence thofe whofe minds are under the influence of benevolence, will have the higheft gratification which the perception of thofe truths can produce.

Laftly, the pleafures of the imagination point to devotion in a particular manner, from their unlimited nature. All the pleafures derived from beauty, both natural and artificial, begin to fade and languifh after a fhort acquaintance with it: novelty is a never-failing requifite; we look down with indifference upon what we comprehend eafily, and feel the wifh to aim at fuch things as are but juft within the compafs of our prefent faculties. To what inference does this tendency to prefs forwards, this endlefs grafping after infinity, neceffarily lead us? Is it not that the infinite Author of all things has fo formed our faculties, that nothing lefs than himfelf can be an adequate object for them: that nothing finite, however great and glorious, can afford full and lafting fatisfaction: that as nothing can give us more than a tranfitory delight, if its relation with God is excluded, fo every thing, when confidered as the production of his infinite wifdom and goodnefs, will gratify our utmoft expectations, fince, in this view, we may reft fatisfied that every thing has numerous ufes and excellencies, and that in the courfe of nature the leaft and vileft, according to common apprehenfion, bear a proper part, as well as thofe whofe prefent fuperiority over them appears indefinitely great.

In fine, then, and then only, is fcience a worthy object of purfuit as a leading object, when it is purfued with juft views; when it is valued for its tendency to form valuable mental habits, and to cultivate moral ones; when we appreciate its value by its enlarging our capacity of ufefulnefs to our fellow men, and by its enabling us to raife our minds from fenfe to intellect, when we make it the path to religious and moral worth. As a means, it is highly conducive to the purification and perfection of our nature: purfued as an end, it will engrofs the affections, and more honourable and more fafcinating than the fordid or fenfible pleafures, it will by degrees become a more dangerous and obftinate evil than thofe.

The foregoing remarks more particularly refpect the pleafures arifing from the purfuit of the objects of the underftanding; and we think it will be defirable to offer fome obfervations on thofe arifing from the elegancies and amufements of life, from wit, mirth, and humour, and from the polite arts. A great part of thefe we fhall collect from Hartley's 57th and following propofitions on thofe fubjects.

(2) By the *elegancies of life* are to be underftood, the artificial beauties of houfes, gardens, furniture, drefs, &c. There is in them, as in moft other things, a certain middle point, which coincides with our duty and our happinefs; while all great deviations from it incur the cenfure of criminality, or at leaft of unfuitablenefs and abfurdity. It is impoffible for any one exactly to judge for another on thefe points; but a few general principles may be of ufe refpecting them.

Againft the immoderate purfuits of the elegancies of life it may be urged; 1. That vanity and oftentation, and the *unlawful* pleafures of property, are almoft infeparable from the purfuit of thofe elegancies, and often engrofs all to themfelves. 2. The profufion of expence attending them is inconfiftent with charity to thofe who are in want of our fuperfluities. 3. The beauties of nature are far fuperior to all

all artificial ones: they are open to every one, and therefore rather reſtrain than feed the deſire of property; and they lead to humility, devotion, and the ſtudy of the ways of Providence. We ought, therefore, much rather to apply ourſelves to the contemplation of natural than of artificial beauty; and even the ſources of the former ſhould not be made our ultimate object.

On the other hand, that ſome attention may lawfully, and even ought to be paid to artificial beauty, will appear from the following conſiderations. 1. Convenience and utility are certainly lawful ends; nay, we are even ſent hither to promote theſe publicly and privately. But theſe coincide for the moſt part with, and are promoted by, ſimplicity, neatneſs, regularity, and juſtneſs of proportion; that is, with ſome of the ſources of artificial beauty; though not with all; ſuch as grandeur, ſumptuouſneſs, and the profuſe variety and accumulation of natural beauty and ſplendour. 2. The ſtudy of artificial beauty draws us off from the groſs ſenſual pleaſures; refines and ſpiritualizes our deſires; and, when duly limited, teaches us to transfer and apply our ideas of ſimplicity, uniformity, and juſtneſs of proportion, to the heart and affections. 3. In this ſtate of trial it is neceſſary to be occupied in innocent purſuits, leſt we fall into ſuch as are miſchievous and ſinful. It is therefore, in its proper place and degree, as great a charity to mankind to employ the poor in improving and ornamenting external objects, rewarding them generouſly and prudently for their labour, as to give alms; and as uſeful for the rich, at proper times, to be employed in contriving and conducting ſuch deſigns, as to read, meditate, or pray at others. Our natures are too feeble to be always ſtrained to the pitch of an active devotion or charity: ſo that we muſt be content, at ſome intervals, to take up with employments that are merely innocent, ſitting looſe to them, and purſuing them without eagerneſs or exceſſive devotement of mind.

Theſe and ſimilar reaſons, for and againſt the purſuit of the elegancies of life, hold, in various degrees, according to the ſeveral circumſtances of particular perſons. And it will not be difficult for thoſe who are really in earneſt, endeavouring to do their duty, to balance them againſt one another in every caſe, ſo as to approach nearly to that medium wherein our duty and happineſs coincide.

(3) "The practice *of playing at games of chance or ſkill*, is one of the principal amuſements of life; and it may be thought hard to condemn it as abſolutely unlawful, ſince there are particular caſes of perſons infirm in body or mind, where it ſeems requiſite to draw them out of themſelves, by a variety of ideas and ends in view, which gently engage the attention. But this reaſon takes place in very few inſtances. The general motives to play are, avarice, joined with a fraudulent intention, explicit or implicit, oſtentation of ſkill, and ſpleen, through the want of ſome ſerious uſeful occupation. And as this practice ariſes from ſuch corrupt ſources, ſo it has a tendency to increaſe them; and, indeed, may be conſidered as an expreſs method of begetting and inculcating ſelf-intereſt, ill-will, envy, &c. For, by gaming a man learns to purſue his own intereſt ſolely and explicitly, and to rejoice at the loſs of others as his gain; grieve at their gain as his own loſs; thus entirely reverſing the order eſtabliſhed by Providence for ſocial creatures, in which the advantage of one meets in the ſame point as the advantage of another; and their diſadvantages likewiſe. Let the loſs of time, fortune, reputation, ſerenity of temper, &c. be conſidered alſo."

We have quoted the above paſſage in Hartley's own words; becauſe we do not quite accord with him in every reſpect, and yet think his ſtatement deſerving of ſerious attention. Our principal objection to it is, that it does not take in a ſufficient number of caſes. His remarks are truly forcible againſt playing for money; and it can ſeldom be allowable, and never more. But we may conſider them independently of this connection. The only caſe in which games of mere *chance* can be juſtifiable, Hartley has well laid down. The habit of gaming is ſo infatuating, and ſo deſtructive in its conſequences to moral worth and happineſs, that the mind ſhould be kept from all tendencies to it, and impreſſed with a great horror of it, by all proper means. And the ſame reaſon excludes all games in which chance is the chief ſource of intereſt. Games of mere *ſkill* (ſuch as cheſs) may be of conſiderable ſervice, eſpecially in the early part of life, in exerciſing attention, ſagacity, activity, and forethought; and we ſhould be diſpoſed to encourage ſuch among the young, particularly the volatile and thoughtleſs. As the plans of one muſt often depend upon the unforeſeen determinations of another, involving many points of conſideration, they call into play the qualities which are neceſſary in the buſineſs of life. To employ ſkilfully the unforeſeen conjunctures of events, is often one of the greateſt exerciſes of human wiſdom. For this reaſon we do not think that games of ſkill, in which what we call chance has ſome ſhare, are without their uſe; for thoſe unforeſeen conjunctures are, as far as reſpects ourſelves, of the ſame character as thoſe which occur in the mixed games we are ſpeaking of; but we would not encourage them among the young, eſpecially from their tendency to lead on to direct gaming, and to habits of wild ſpeculation, by producing the practical belief that the valuable objects of human attention are to be obtained by ſome eaſier means than the ſtraight-forwards path of uprightneſs and patient perſevering exertion. For reaſons which correſpond with thoſe already ſtated, all betting and lottery ſpeculations ſhould be carefully avoided and diſcouraged; and theſe laſt in particular, becauſe the injury done to the morals of ſociety by the lotteries is great, almoſt beyond calculation, and it cannot therefore be right to encourage them.

With reſpect to theſe and recreations in general, if they clearly contribute to the bodily, intellectual, or moral health, then, ſo far, they are wiſe and uſeful; if the uſe of them tend to cultivate ſelfiſh purpoſes, (ſuch as thoſe of avarice, ill-will, vanity, envy, eagerneſs for ſuperiority, &c.), or excite deſires which cannot be gratified conſiſtently with virtue, then they are wrong, either in themſelves, in their degree, or in the mode of their employment: and it is the part of wiſdom and duty to obſerve their effects, and the degree in which theſe are neceſſary, and to regulate, reſtrain, or altogether exclude them, accordingly.

We wiſh it to be conſidered, however, by thoſe ſerious perſons, who, penetrating deeply into the poſſible, but remote conſequences of actions, leave the immediate effects and the actual ſtate of human nature too much out of view, whether the intereſts of religion and virtue would not be more promoted among the young and inexperienced, by their giving their ſanction to pleaſures in themſelves conſidered innocent, while innocently purſued, (that is with moderation, and without abuſe to wrong purpoſes,) than by their marking the gaiety of youth and healthful activity with too ſevere an eye: and whether, by keeping altogether aloof from the common amuſements of life, they do not remove an important reſtraint on the abuſe of them. In the preſent circumſtances of mankind, ſuch amuſements are neceſſary to keep men from actual vice: and the great object is to reſtrain them within due bounds, and to leſſen their unavoidable evils as much as poſſible. If the good left them entirely, the bad would ſoon make them twofold more injurious than they

they are at present. Extreme rigour, we would farther suggest to them, with respect to amusements which are wrong only when carried to excess, tends to confound moral distinctions in the minds of the young, to weaken their own influence in their minds, and to render the strict discharge of duty unamiable and unpleasant.

(4) With respect to *mirth*, *wit*, and *humour*. 1. It is necessary to avoid all such as lessen our reverence to God and religious subjects, injure our dispositions, or excite in ourselves improper and corrupt inclinations. From Hartley's analysis of this species of the pleasures of the imagination, (Obs. vol. i. p. 439.) it can scarcely fail to appear to the reflecting mind, that the greatest part of what passes under these names, and that, too, which is in general estimation most striking, have a wrong tendency; and it is therefore nenessary to be moderate and cautious in our mirth, and in our attention to wit and humour, and our endeavours after them. 2. However innocent mirth may be, and even if kept within narrow limits, it has a great tendency to produce a degree of levity and dissipation of mind, little consistent with the views of Christian duty respecting this life and its connection with another. 3. Wit and humour, by arising for the most part from fictitious contrasts and coincidences, have a direct tendency to disqualify the mind from the pursuit after truth, and attention to the useful practical relations of things. 4. Wit and humour too commonly generate an excessive love of admiration and applause; and the display of them, as it arises from it, so it contributes powerfully to increase it. See hereafter, § 6, 7.

A due attention being paid to these and similar cautions, it appears not only allowable, but even requisite to aim at a state of perpetual cheerfulness, and to permit ourselves to be amused and diverted by the innocent pleasantries of our friends and acquaintance, contributing also ourselves thereto, as far as is easy and natural to us. This temper of mind flows from benevolence and sociality, and in its turn produces them: it relieves the mind, qualifies us for the discharge of serious and afflicting duties, when the order of Providence lays them upon us: and it helps to correct, in ourselves and in others, many little follies and absurdities, which though they scarcely deserve a severe chastisement, yet ought not to be overlooked entirely.

(5) Respecting the *polite arts*, particularly those of *music*, *painting*, and *poetry*, the reader of the Observations can scarcely fail to infer, either that Hartley carried his views too far, or that there is considerable improvement among us with respect to public taste since his time; that it is, on the whole, decidedly more accordant with virtue. We think the latter. Except among the gay and licentious, who lay themselves under no restraints of duty, we see no reason to believe that there is a greater regard than in the former part of the last century, to decency of manner: and if something is lost in the way of creative genius, in consequence of the restraint which this improvement lays upon the imagination, there is no doubt that a great deal of much more consequence is gained. To a certain extent, however, Hartley's rules appear still to be too well founded, and we shall accommodate the spirit of them to what appears to us the present state of things among those who have some principle of duty, and add some other remarks. In the way of caution respecting them, we observe, 1. It is evident that, to leave out of view the avowedly licentious kinds of music, painting, and poetry, there are many which have a close connection with vice; particularly with the vices of intemperance and lewdness, representing them in gay and pleasing colours, or at least taking off from the abhorrence due to them. 2. Great skill in these arts requires an extensive consumption of time upon them; they are very apt to excite vanity and self-conceit in their votaries; and in many cases, the expences with which they are attended are too great to be reconciled with charity to the poor, and other duties of a man's station and relations in life. 3. The pleasures arising from these sources are of that fascinating nature, and tend to excite the feelings so much in various ways, that, when the pursuit of them is carried to excess, it unfits the mind for the active and serious employments and duties of life; making them appear insipid, and at the same time, by the constant effects of over-excitement, weakening the mind itself for attention to them. This is a great and serious evil, and it particularly respects the arts of poetry and music, including under the former all the classes of works in the production of which the imagination has the chief share. We say less respecting the pleasures derivable from the art of painting, because they are either of comparatively rare occurrence, or, if otherwise, as in the case of the artist, are attended with an exercise of the habits of patience, attention, and ingenuity, yet without, in a general way, any excessive excitement of mind. In this connection we solicit the reader's attention to the remarks which we have offered in MORAL *Education*, III. 11, 12. col. 51, 52.

Nevertheless it is to be observed, on the other hand, 1. That the polite arts in general, when pursued with innocence and moderation, have, in a great measure, the effects pointed out at the end of § 4, and do strongly contribute to raise the mind one step at least above the pleasures of mere sensation. 2. They also contribute in no inconsiderable degree, but, as is obvious, in different proportions, to the pleasures of sociality; and similar remarks to those which were made respecting wit and humour, may be applied with respect to the arts, where the application of them is consistent with virtue. 3. The art of painting, and others related to it, are of eminent use in the promotion of science, and in the application of it to various practical purposes of life: and they cultivate the habits of observation, and the taste for natural beauty. 4. Works of imagination, when under the guidance of good sense and observation, and of sound principles of morality, have often a beneficial effect, in refining the mind, raising it above the more sordid pursuits of selfishness, inspiring it with generous and noble sentiments, and communicating to it a knowledge of human nature, which may not unfrequently assist in supplying the want of experience, or at least in extending what we possess. (On this point, see INTELLECTUAL *Education*, XII.) 5. Of the art of music there is probably room to be the most suspicious, through its peculiarly powerful effects on the physical and mental sensibilities. It can be directly licentious, only through its associated circumstances; but from these and its physical effects, it has great influence in preparing for the admission of loose desires and conceptions. Musical skill among young men too commonly leads to social intercourse of a pernicious kind; and among females to vanity and ostentation. Nevertheless it must be allowed by all, that its pleasures do essentially contribute to the innocent pleasures of sociality; and where it is employed to enliven the domestic circle, or to afford recreation to the fatigued and harassed mind, and these always restrained within the bounds of moderation, it is not only agreeable but useful. But, 6. All these arts are capable of being directly devoted to the interests of religion and virtue: and when so devoted, they not only improve and exalt the mind, but are themselves improved and exalted to a much higher degree than when employed upon subjects unconnected with, or in opposition to them. The dignity and importance of the ideas derived from religion, add a peculiar force and lustre to them.

Here this cultivation may be made an excellent means of awaking and alarming our affections, and transferring them upon their true objects.

With respect to all the pleasures appropriate to the imagination, (considered as distinct from those of the understanding, which Hartley might, perhaps, with great advantage, have made a separate class,) the true principles are, that they should always be pursued in complete subserviency to the great ends of life, without interfering with the duties of piety and benevolence, or with the proper employments of our station; that where they are derived from the mere recreations of life, they should be carefully kept within the limits of innocence and moderation; employed lawfully, and for lawful ends; so as not only to be free from injury at the time, but from injurious effects afterwards; and that all the pleasures of the imagination should, as much as possible, be associated with the pursuits of benevolence and religious duty, so that they may contribute to increase the tendencies of the mind to those pursuits.

Upon most of the subjects of this section, and upon others connected with them, if the writer's recollection is accurate, the reader will find many important observations in the first volume of Clarkson's Portraiture of Quakerism.

6. *Estimate of the Pleasures of Ambition.*—That the pleasures of honour ought not to be made a primary object of pursuit, appears from the following considerations. An eager desire of the pleasures of honour, and an earnest endeavour to obtain them, has a manifest tendency to disappoint itself. The merit of actions, that is, that property for which they are approved and admired, and the agent loved or esteemed, is, that they proceed from benevolence, or some other moral or religious consideration; whereas, if the desire of praise form any considerable part of the motive, we censure rather than commend. But if praise be supposed the greatest good, the desire of it will prevail over other desires; and vanity, self-conceit, and pride, qualities which all regard as censurable, will be necessary consequents. Again, if praise be considered as the supreme good of the species, what is there which shall be selected as the greatest subject of encomium. What is there which shall be the universal object of praise, as well as within the reach of every one. External advantages, riches, beauty, strength, &c.? These are neither in the power of all, nor universally commended. Great talents, wit, sagacity, invention? These, though more the subjects of encomium, fall to the lot of very few only. In short, virtue alone is both universally esteemed, and in the power of all who are sufficiently desirous to attain it. But virtue cannot consist with the direct pursuit of praise; much less with its being made a primary object. Hence it ought not to be made such. Even those who possess the advantages which are made the subject of praise, can seldom pursue praise with success. Praise cannot be the lot of many, because it supposes something extraordinary in the thing praised; so that he who pursues it must either have a very good opinion of himself, which is a dangerous quality in the seeker of praise, or allow that there are many chances against him. The same conclusion is drawn, if we consider the *progress* of the pleasures of honour. Children are pleased with encomiums upon *any* advantageous circumstances which relate to them; but this wears off by degrees; and as we advance in life we learn more and more to confine our pleasures of this kind, to things within our own power, and to virtue. In like manner, the judicious part of mankind, that is, those whose praise is most valued, give it only to virtue, and to those feelings and habits of which virtue is the basis. Here, again, is a manifest subserviency of these pleasures to virtue; they not only tell us that they cannot be our ultimate end, but shew us what is.

If we suppose a person to be perpetually feasting his mind with the praises that already are, or which he hopes will be hereafter, given to him, we at once perceive something extremely absurd and ridiculous in his conduct. And yet, unless a man do this, which besides would incapacitate him for deserving or obtaining praise, how can he fill up a thousandth part of his time with the pleasures of ambition. Further, men who are much commended, are apt to think themselves above the level of the rest of the world; and it is evident, that praise from inferiors wants much of the high relish those expect who make praise an object; it is even uneasy and painful to a man to hear himself commended, though he may think it his due, by a person whom he does not think qualified to judge. And in this view of things, a mind which has acquired truly philosophical and religious notions sees immediately, that all the praises of mankind are comparatively of no value, because no man can be a thoroughly competent judge of the actions and motives of others. Lastly, the desire of praise carries us from less to greater circles of applauders, at greater distances of time and place; hence it necessarily inspires us with an eager hope of a future life. Now all reflections upon a future life, the new scenes which will be unfolded there, the discoveries which will then be made of the secrets of all hearts, must cast a damp upon every ambition, except a virtuous one, and produce diffidence even in those who have the best testimony of their conscience.

7. *Regulation of the Pleasures of Honour.*—We have already seen sufficient ground for the position, that it is a law of our natures, that the inferior sources of happiness are most productive of happiness, when not made the primary objects of pursuit, but submitted to the direction of the higher means. This is eminently the case with respect to the pleasures of honour. They may undoubtedly be obtained in their highest degree, and in their greatest perfection, by paying a strict regard to the precepts of benevolence, piety, and the moral sense. These precepts lead to the attainment of those qualities, and the performance of those actions, whose value is universally felt, and universally admitted; and, at the same time, they preserve from that ostentatious display of them, or of other supposed grounds of honour which would make their possessor ridiculous or contemptible. Honour is certainly affixed, by the bulk of mankind, to actions of *benevolence*, such as acts of generosity, compassion, public spirit, &c.; and the encomiums bestowed upon such actions are one principal source of the feelings of the moral sense. The maximum of honour, therefore, must coincide with benevolence, and the moral sense, and, consequently, with piety also, which is closely connected with them. It must, however, be admitted, that direct acts of *piety* are by no means calculated to gain the honour of the world in general; but, on the contrary, they expose to the reproach of enthusiasm, superstition, &c.; on the other hand, however, it must also be admitted, that humility, which is the principal of all the qualifications which recommend men to the world, cannot be obtained in any high degree without piety. Hence piety indirectly leads to the honour of men; and at the same time in proportion as piety increases in its efficacy on the mind, the fear of their censure gradually diminishes.

The grand source of honour, directly or indirectly, is the tendency of an action or disposition to happiness of some kind or other, occurring to a man's self, or to the world by his means. He, therefore, who is most happy in himself, and

and contributes moſt to the happineſs of others, muſt, in the end, from the very law of our natures, have the greateſt quantity of honourable aſſociations conferred upon him. But it has already appeared, in part, that benevolence, piety, and the moral ſenſe, are the only true and laſting ſources of *private* happineſs; and that the greateſt *public* happineſs ariſes from them cannot be doubted by any one: hence he in whom theſe qualities are prevalent, will, as far as his character is known and underſtood, obtain the applauſe of all, both good and bad. The eſteem of the good he will firſt obtain; becauſe they can moſt eaſily eſtimate his worth; and it is this alone which is valuable and uſeful, in exciting to honourable attainments.

In proportion as the views extend, and the comprehenſion of the mind increaſes, the deſire of honour and eſteem will require higher ſources of gratification than that of men, even of the wiſe and good; it riſes even to the throne of the Moſt High, and from him to whom all hearts are open, humbly hopes for approbation. This greateſt of all honours can, undeniably, be obtained only by a regard to piety, benevolence, and the moral ſenſe. If the deſire of it be not the deſire of our mind, it muſt ariſe from ſuch inattention to the moſt important relations in which we ſtand, as is totally inconſiſtent with our true happineſs; and if it become a ruling principle of our minds, all encomiums will derive their value from their conſiſtency with this the higheſt ſtandard of honour.

8. *On Pride and Vanity.*—Before we offer a few conſiderations on this point, it may be requiſite that we explain in what manner we uſe our terms, ſince they are employed (particularly *pride*) with a latitude which ſerves to throw great diſcredit on the repreſentations of the moraliſt on the ſubject; and by the transference of the aſſociations connected with what is called *honeſt* or *laudable*, or even *virtuous* pride, to a quality of the mind which in every ſhape of it is vicious, that abhorrence of real pride is diminiſhed, which its obvious ill conſequences ſhould always produce.

By *pride* we underſtand, an *unjuſt feeling of ſuperiority over others*, or (without direct compariſon with others) *of elevation in the ſcale* by which the individual eſtimates *honour*: by *vanity* we mean, an *exceſſive deſire of the praiſe or good opinion of others*. The former indicates an *unfounded opinion* as to the *title to honour*; the latter is generally accompanied with ſome opinion of that kind, but it does not neceſſarily imply more than an *eager deſire* of honour. This paragraph the reader will find, with a little variation, in Moral *Education*, II. remark 5, where there are ſome obſervations reſpecting the *comparative* effects of pride and vanity, and the employment of the ſtimulus of praiſe, which would have been introduced in this ſection, if they had not been inſerted then; and we beg leave to refer the reader to them.

Pride may exiſt almoſt ſingly in the mind; altogether, or at leaſt, almoſt independent of vanity. There may be thoſe to whom their own good opinion (independently of the approbation of God) is every thing; and who find the ſympathy of others totally unneceſſary for the nurture of their own pride. In the preſent ſtate of ſociety this is not common; the good opinion of others is productive of too many important conſequences, ever to permit pride to be thus foſtered; except where it is the effort of a ſtrong, but ill-directed mind, to counterbalance the diſappointments of vanity. He who has made the good opinion of others the primary object of purſuit, having met with its ſure conſequence,—diſappointment in his wiſhes,—if he have not loſt all his ſtrength of mind by the weakening effects of vanity, will endeavour to riſe above it; and if he have no religious principles, or but little religious culture, will dwell with gratification upon all the fancied excellencies of his own character, till they have acquired in his eſtimation an importance to which they are little, if at all, entitled. Then moroſeneſs muſt be the predominant feature in his temper; for he cannot bear that others ſhould treat him with leſs reſpect than he thinks he has a right to claim: till at laſt an almoſt total unconcern for the opinion of others is forced upon his mind, and having no higher principle of action he becomes a miſanthrope. It is probably doing no injuſtice to the character of Swift, when we mention him as having in a great meaſure gone this round. But this is an extreme caſe: pride leads a man to ſet too high a value upon himſelf, but it is only that ſtrength of mind which, when well directed, would have led to the higheſt attainments in moral worth, that will permit him to reſt ſatisfied without the ſympathy which he ſuppoſes is his due. Hence his pride muſt meet with a conſtant mortification; for where will be found thoſe who will be willing to reſtrain their conduct continually by the rules to which he would bind them? where even are thoſe who can enter into his views and feelings? Pride then, even in a leſs extreme caſe, cannot be productive of happineſs. But its ill effects are not thus limited. Blind to his own deficiencies, keen-ſighted to obſerve the marks of merit in his own mind, the proud man throws continual impediments in his own progreſs towards worth of character. He ſees not his deficiencies; how can he ſupply them? He imagines his excellencies have mounted high in the ſcale of worth; how ſhall he purify them, when that which preſents their eminence is foſtered by every compariſon which he draws?

It has been ſaid by one who appears to have poſſeſſed ſome knowledge of the world, that pride has at leaſt this valuable effect,—it tends to exclude all other failings; for the proud man places his ſtandard ſo high, that he never feels his regard to his own dignity ſatisfied, till all inferior feelings are extirpated: this is undoubtedly erroneous. It is ſuppoſing a mixture of pride and humility, which will never appear in that mind in which pride is the ruling feature. The man who is proud of his own excellencies ſeldom ſees that they are defective: and beſides, a deſire of ſelf-approbation is not pride, though too ſtrong and unchaſtened a deſire may tend to produce pride, becauſe ſelf-approbation is eaſily gained when made independent of higher ſources. There may be anomalies here, as in every other caſe of the operation of moral cauſes; but they are not ſufficient to lead to the concluſion, that pride has a tendency to raiſe the mind above all other failings. Pride will operate differently on different minds; and the deſire of ſelf-approbation is, and ought to be, a primary motive in all the earlier ſtages of the moral progreſs: but if the mind reſt ſatisfied with this approbation, that progreſs will ſoon be impeded; the ſtandard will be lowered rather than the conduct exalted; compariſon with others will ſuggeſt numerous ſources of ſelf-gratulation; and the mind, unable to riſe to the heights which once appeared in view, now rather looks down upon the advances ſhe has made, than upon the cliffs which tower very far above her. Here, then, is a ſtop to improvement; the deſire which ſtimulated to improvement is gratified; and he, who, had he looked beyond himſelf, might have riſen almoſt to the ſummit of excellence, now reſts contented on the little pinnacle which his imagination has raiſed, looks with contempt on the crowds below, but, wrapt in the veil of imaginary ſuperiority, ſees not that numbers whom he once ſaw below him

him have risen, and are rising, while he is himself lost to all improvement.

In minds possessed of some strength, pride may exist with little or no tendency to vanity. Firmly convinced of their own worth, they need not the sympathy of others; and if that respect which they deem their due is not given, it is the last suggestion that would occur to their minds that they had mistaken their due. But in those whose pride is less confirmed, or whose minds are more dependent, that pride leads them on to vanity; their high ideas of their own powers and attainments, require the sympathy of others to render them steady. Precisely as pride or vanity has the predominance, the want of such gratification will lead to greater independence, or greater submission; in the one case leaving the mind to the wayward wanderings of its own feelings, in the other fixing more firmly the shackles which bind it to the world. Happy they who have learnt from various discipline and instruction, that higher approbation is to be sought for, than the approbation of the world, or even than their own; and that neither possess permanent value, except where sanctioned by that which, when once the ruling object of the mind, will make all others comparatively insignificant!

We stated that pride may exist in the mind almost independently of vanity: from what we have advanced it appears, that this can be the case only in a vigorous mind: vanity, we would add, will be found independently of pride only in a weak mind. He who cannot rest satisfied without the praise or approbation of others, must be ever varying in his ideas, and fickle in his conduct. Without it, he will possess no firmness; and with it, no decision. The approbation which pride claims as its due, vanity seeks as a favour: if it receive it not, the vain mind desponds, for it has not learned to trust in itself.

[Here we would request the reader to turn to the observations referred to near the beginning of this section. See MORAL *Education*, col. 38.]

The virtue of humility is the most difficult to acquire of all the train, yet it is this which gives the true grace to the character. It is the characteristic of Christianity, and it is in this respect that the Christian so far excels the stoical system of morality in its best state. The whole structure of the latter was laid upon the foundation of human pride; and though frequently captivating to the imagination, which loves to view the elevated mind, yet it often affords a poor shelter to the children of humanity. Humility does not direct us to estimate ourselves lower than impartiality requires; but it is seldom that we need fear wandering into this extreme, except where it arises from that self-diffidence, which distrusts merely because vanity has not yet lent its support. This excess of diffidence is not unfrequently the cause of vanity: for the mind, in consequence of it, often feels the more eager desire to be well in the estimation of others; and, when their good opinion is obtained, fosters the thoughts and pleasures of it with too great interest. Still however the frequent mortifications it meets with tend to lower it in its own estimation, unless, by degrees, it learns to set a value upon its own approbation, independently of the capricious applause of others; and then it deviates into the opposite extreme of self-sufficiency and pride. Here a strong mind, not under religious culture, will rest; a weak one will probably be again driven to that support on which it originally rested its self-approbation. If it do not return to its former state, the attentions which vanity received as a favour, pride claims as its right: and in both cases endless inquietude, envy, and resentment, are the almost necessary attendants. On the subject of this section, see Cogan's Philosophical Treatise on the Passions, p. 70, &c.

9. *Cultivation of Humility.*—In order to cultivate the tender plant of genuine humility, we must clear away the high ideas we have of our own excellencies. All thoughts which please are apt to recur frequently; and their contraries to be kept out of sight: hence, by dwelling upon these excellencies, they will be magnified; by keeping our imperfections out of view, they are diminished. And the same causes too frequently lead to keep in view the defects of others, and neglect the consideration of their excellencies; and thus pride, that is, too high an opinion of ourselves, and, as a general consequence, too low an opinion of others, must be generated. Now the only way to obtain a just opinion of ourselves is to reverse this operation, and, by express acts of volition, dwell upon the excellencies of others and our own defects, and to pass by, with little notice, the defects of others and our own excellencies.

To cultivate humility we must farther learn not to seek the applause of the world, but to acquiesce in the respect it pays us, however disproportioned this may be to the merit of the action under consideration. We should remember, that however beautiful the productions of nature and art which pass under our notice, it would be absurd to say, till long experience and accurate examination justified it, that they are unequalled in their kind: much less should we suppose this of those sources of honour which happen to be our lot, which are certainly magnified beyond the truth in our own eyes from the interest we take in ourselves. On the other hand, humility will be cultivated by receiving with readiness the censures and shame which we have deserved; and by acquiescing under them where we have not deserved them; in this last case always suspecting our own judgment.

Lastly: the frequent recollection that all our valuable qualities proceed from God, that we have nothing which we did not receive from him, and that there could be no reason in ourselves why he should select us to perform the particular part he hath assigned us; and the application of this important truth to the real occurrences of our lives, must greatly accelerate our progress to humility and self-annihilation.

10. *Estimate of the Pleasures of Self-interest.*—We ought not primarily to pursue the means of obtaining the pleasures of sensation, imagination, or ambition; because these pleasures themselves, from what we have already seen, ought not to be made a primary object of pursuit. The means borrow all their value from their end by association; and if the original value of the end be not sufficient to justify our making them our primary object, the borrowed value of the means cannot.

Gross self-interest, or the treasuring up of the means of happiness from these sources of sensation, imagination, and ambition, bears a very near relation to ambition. Those who desire great degrees of riches, power, learning, &c. desire also that their acquisition should be known to the world: *to be thought* happy often constitutes a stronger motive for action, than *to be* happy. The reason, therefore, which excludes ambition as a primary pursuit, excludes self-interest also.—Gross self-interest has a manifest tendency to deprive us of the pleasures of sympathy, and to expose to its pains. Rapaciousness extinguishes all sparks of good will and generosity, and produces endless resentments and jealousies: and indeed great part of the contentions and mutual injuries, which we see in the world, arise because either one or both of the contending parties desire more than

than an equitable ſhare of the means of happineſs. Beſides, groſs ſelf-intereſt has a moſt painful and peculiar tendency to increaſe itſelf, by the conſtant recurrence, and conſequent augmentation, of the ideas and deſires that relate to ſelf, and the excluſion of thoſe which relate to others. This inconſiſtency of groſs ſelf-intereſt with ſympathy would be an argument againſt it, barely upon the ſuppoſition that ſympathy was one neceſſary part of our nature, which ought to have an equal ſhare with ſenſation, imagination, and ambition; but as it now begins to appear, from the excluſion of thoſe as primary objects, that more than an equal ſhare is due to ſympathy, the oppoſition between them is a ſtrong argument againſt ſelf-intereſt. There is, in like manner, an evident oppoſition between groſs ſelf-intereſt and the pleaſures of theopathy, and the moral ſenſe. Hence, if theſe be admitted as eſſential parts of our nature, and eſpecially if it appear that they ought to be made primary objects of purſuit, an inſuperable objection ariſes againſt our making the pleaſures of ſelf-intereſt our primary objects. Groſs ſelf-intereſt, when indulged, deſtroys many of the pleaſures of ſenſation, and moſt of thoſe of imagination and ambition; that is, many of thoſe pleaſures from which it takes its riſe. This is peculiarly true and evident in the love of money, and it holds in a conſiderable degree with reſpect to other ſelfiſh purſuits. It muſt, therefore, deſtroy itſelf in part, as well as the pleaſures of ſympathy, theopathy, and the moral ſenſe, with the refined ſelf-intereſt founded upon them: and thus it happens, that in very avaricious perſons, nothing remains but a ſenſual ſelfiſhneſs, and an uneaſy hankering after money, which is a more imperfect ſtate than that in which they were at their firſt ſetting out in infancy.

Men, in treaſuring up the means of happineſs without limit, ſeem to go upon the ſuppoſition that their capacity for enjoying particular ſpecies of happineſs is infinite, and conſequently that the power of enjoyment depends upon the ſtock of means which they amaſs. But our capacity for enjoying happineſs is confined and fluctuating; and there are many periods during which no object, however grateful to others, can afford any pleaſure, owing to the diſeaſed ſtate of our minds or of our bodies.

Further: it is evident in part, that ſelf-intereſted men are not more happy than others, whatever means of happineſs they may poſſeſs. Experience appears to confirm the reaſoning already adduced, but it certainly confirms this concluſion. Thoſe who are continually aiming to treaſure up the means of happineſs, are in general remarkably miſerable. The covetous man ſubjects himſelf to hardſhip, cares, fear, ridicule, and contempt; and thus undergoes greater evils than what falls to the ſhare of mankind upon an average.

Some degree of *refined ſelf-intereſt* is the neceſſary conſequence of the power of receiving the pleaſures of ſympathy and theopathy. He who has had a ſufficient experience of the pleaſures of friendſhip, generoſity, devotion, and ſelf-approbation, cannot avoid the deſire to have a return of them, when he is not under the particular influence of any one of them, merely on account of the pleaſure which they have afforded; and if he have not advanced into very conſiderable purity of motives, will ſeek to excite thoſe pleaſures, by treaſuring up the means of them; and to keep himſelf in a diſpoſition to uſe them, not from any particularly vivid love of his neighbour, or of God, or from a ſenſe of duty, but entirely from the view of private happineſs. Refined ſelf-intereſt is neither ſo common, nor ſo conſpicuous in real life as the groſs ſelf-intereſt. It riſes late, and is never in any great magnitude in the bulk of mankind, through the want of the previous pleaſures of ſympathy, religion, and the moral ſenſe; and in ſome it ſcarcely prevails at all: whereas groſs ſelf-intereſt riſes early in infancy, and arrives at conſiderable magnitude before adult age.

The objections which lie againſt making the purſuit of refined ſelf-intereſt our ultimate object, though leſs obvious, do not appear leſs weighty than thoſe which lie againſt groſs ſelf-intereſt. In the firſt place, the mind which has ſo far advanced towards perfection, as to make the means of obtaining the refined pleaſures of religion and virtue the primary object, will be more likely finally to ſtop at this point, than he who was guided by groſs ſelf-intereſt. There is leſs the appearance of deficiency, and leſs oppoſition between it and the claims of benevolence and piety; and as it leads to the performance of laudable actions, the conſcience is too apt to give approbation, where, if all that influenced the mind were brought into full view, nothing but ſelf would be ſeen. Hence there is little inducement to refine the motives, and purify them from their baſe alloy; and making ſelf continually the motive, checks the natural progreſs of the affections to complete diſintereſtedneſs.

To act with a direct view to the pleaſures of benevolence and piety, ſeems to carry with it a degree of ſelfiſhneſs little ſuperior to that of the refined ſenſualiſt, who chooſes from among the objects of his degraded taſte ſuch only as will give the leaſt alloyed pleaſures, and thoſe of the moſt continued duration. It differs from his ſelfiſhneſs, in producing to ſociety more valuable effects; but from what has been ſtated reſpecting the progreſs of the affections in the preceding article, and in Moral *Education*, it appears that it is very conſiderably below that ſtate in which the affection is perfect: and we have already ſeen that it ſtops its progreſs towards that perfection. It may fairly be admitted in the commencement of a virtuous courſe, as a ſtep towards improvement; but if the mind be ſuffered to reſt here, we cannot eſteem its progreſs great. In addition to theſe objections, ſome very forcible ones will appear among thoſe which lie againſt acting with an explicit view to our greateſt happineſs on the whole; making even the higheſt and leaſt debaſing, becauſe leaſt ſpecific kind of ſelf-intereſt, our ground of action.

Rational ſelf-intereſt is certainly to be put upon a very different footing from the groſs and refined: agreeably to which, the ſcriptures promiſe general hopes and fears, and eſpecially thoſe of a future ſtate, and inculcate them as good and proper motives; and they may, therefore, certainly be conſidered as auxiliary in our moral progreſs. But Chriſtianity holds out ſtill more refined motives, diſtinct from hope and fear,—the love of God and our neighbour, the law of our minds, &c.; that is, the motives of ſympathy, theopathy, and the moral ſenſe. Rational ſelf-intereſt will lead to the formation of theſe, and to the deſtruction of the impure motives to action; and preciſely as far as it does this, it may be reckoned a virtue. When it tends to cheriſh the impure motives, or ſimply to obſtruct the growth of the pure motives, then it muſt be conſidered as vice.

That we ought not to reſt ſatisfied with that ſtate in the moral progreſs, in which an explicit and direct view to the greateſt general happineſs or miſery is made the primary motive to action, may be argued from the conſideration, that a conſtant attention even to theſe moſt general hopes and fears would extinguiſh, by degrees, our love of God and our neighbour; and this eſpecially by augmenting the ideas and deſires which centre immediately in ſelf to an undue height. While our own happineſs, even the moſt refined and general, is the explicit motive, benevolence and piety will never acquire that diſintereſtedneſs, which will prompt to their reſpective courſe of conduct, without any exterior

exterior ftimulus, fimply by the impulfe of the affection. Rational felf-intereft will at times be prefent to the mind, even of thofe who have advanced higheft in the fcale of prefent excellence; and in the early ftages of the moral progrefs, may be called in as a moft ufeful auxiliary, and important fupport: but even this muft be made fubordinate to the cultivation of thofe affections, which are only perfect as they approach difintereftednefs.

On the fubject of this head, we wifh to refer our readers to Dr. Prieftley's fermon on the duty of not living to ourfelves.

We fhall conclude this head in the words of Dr. Reid, with a few alterations. Though a fteady purfuit of our own real good may, in an enlightened mind, produce a degree of virtue which is entitled to fome approbation; yet it can never, while the mind refts with this explicit regard to felf, produce the nobleft kind of virtue which claims our higheft love and efteem. We account him a wife man who is wife for himfelf; and if he profecute his end through difficulties and temptations, his character is far fuperior to that of the man who, having the fame end in view, is continually ftarting out of the road from an attachment to his appetites and paffions, and doing every day what he knows he fhall heartily repent of having done. Yet after all, this wife man, whofe thoughts and cares are all centered ultimately in himfelf, who indulges even his focial and divine affections, only with a view to his own good, is not the man whom we cordially efteem, nor who poffeffes the noble elevation of mind which commands our admiration. Our cordial efteem and admiration are due, and are given only to him whofe foul is not contracted within itfelf, but embraces a more extenfive object; who loves religion, not for her dowry only, but for her own fake; whofe benevolence is not felfifh, but generous and difinterefted; who, forgetful of himfelf, has the common good at heart, not as a means only, but as an end; who abhors what God and confcience condemn, however attractive its appearance; who choofes without hefitation what God and confcience approve, though furrounded with tenfold dangers. Such a man we efteem the perfect man, compared with whom, he who has no other aim than good to himfelf, is a mean and defpicable character. To ferve God, and be ufeful to mankind, without any concern about our own good and happinefs, is probably beyond the pitch of human nature. But to ferve God, and be ufeful to men, merely to obtain good to ourfelves, or to avoid ill, is imperfect fervice, and not of that liberal nature which true devotion and real virtue require.

Though we might be apt to think that he has the beft chance for happinefs, who has no other end of his deliberate actions but his own good, yet a little confideration will fatisfy us of the contrary. A concern for our own good is not a principle that, of itfelf, gives any enjoyment; on the contrary, it is apt to fill the mind with fear, and care, and anxiety. And thefe concomitants of this principle often give pain and uneafinefs, which counterbalance the good they have in view. We may compare in point of prefent happinefs, two imaginary characters; the firft, that of the man who has no other ultimate end of his deliberate actions than his own good, and who has no regard to religion and duty, but as a means to that end; the fecond, of the man who is not indifferent with regard to his own good, but has another ultimate end, perfectly confiftent with it, a difinterefted love of goodnefs for its own fake, or a regard to duty as an end. Comparing thefe two characters in point of happinefs, that we may give all poffible advantage to the felfifh principle, we fhall fuppofe the man who is actuated folely by it, to be fo far enlightened as to fee it his intereft to live foberly, righteoufly, and pioufly in the world, and that he follows the fame courfe of conduct, from the motive of his own good only, which the other does, in a great meafure, or in fome meafure, from a fenfe of duty. The one labours for hire, without any love to the work, the other loves the work, and thinks it the moft noble and the moft honourable he can be employed in. In the firft it is mortification and felf-denial to which he fubmits only through neceffity; to the other it is victory and triumph in the moft honourable warfare. It ought further to be confidered, that though wife men have concluded that virtue is the only road to happinefs, and the commands of a benevolent Creator neceffarily lead us to confider it as fuch, yet he who follows it only as a means to an end, and who obeys God only for the fake of the rewards he has attached to obedience, would, in all probability, be continually wandering from the direct path, and feeking for happinefs where it was not to be found. The road to duty is fo plain, that the man who feeks it with an upright heart cannot greatly wander from it; but the road to happinefs, except where that confidence in the Supreme Being is formed, which fuppofes the pious affections to have become, in fome meafure, difinterefted, would be found dark and intricate, full of thorns and dangers, and therefore not to be trodden without fear and care, and perplexity. The happy man, therefore, is not he whofe happinefs is his primary care; but he who, with perfect refignation, leaves the care of his happinefs to his Maker, while he purfues with ardour the road of his duty. This gives an elevation to his mind which is real happinefs; inftead of care, and fear, and anxiety, and difappointment, it brings peace and joy. It gives a relifh to every good we enjoy; it fmooths the brow of diftrefs, calms the perturbed mind, and makes the pillow of fuffering and of death the reft of happinefs. See Active Powers, eff. iii. p. iii. ch. 4.

11. *Eftimate of the Pleafures of Sympathy.*—We have now proceeded through, and examined all the inferior fources of happinefs. We have feen that if any of them be made the primary object of purfuit, happinefs cannot be obtained; and that the greateft degrees of thefe pleafures are to be obtained, not by making them our primary object, but fubmitting ourfelves to the guidance of piety, benevolence, and the moral fenfe. We might hence alone regard the inference a juft one, that the affections of benevolence and piety, and thofe actions to which they prompt, fhould be made by us our primary object. We fhall feel our ground more fure, when we enter into the pofitive arguments for the conclufion; and we now proceed to afcertain what rank the benevolent affections fhould have, in our rule of life. And it will appear that the cultivation of thefe affections, and the conduct to which they prompt, fhould be made a primary object of purfuit, from the following confiderations.

Benevolence *improves the inferior pleafures*, by limiting and regulating them, as we have already feen in the preceding fections.

Again, the pleafures of benevolence unite and *coincide with thofe of piety and the moral fenfe.* That benevolence unites with piety is obvious, for by the love of the good we are led to love the fource of goodnefs; and back again from the love of God to the love of all that he has made. The pleafures of benevolence are one principal fource of the moral fenfe, and the moral fenfe in its turn improves and enforces them entirely.

The pleafures of benevolence are *unlimited* in their extent. In order to fhew that the pleafures of fenfation do not deferve our primary attention, an extreme cafe was taken of a perfon who actually made them his primary object: in the fame way fuppofe a perfon to take all opportunities of ex-

 ercifing

ercifing his benevolent difpofitions, making it his ftudy, pleafure, and conftant employment either to promote happinefs or to leffen mifery. Now it is very obvious that he would have a very large field for exercife, no lefs than the whole round of domeftic and focial relations. And if his benevolence were pure, and regulated by the dictates of piety and the moral fenfe, he might in general expect fuccefs. And from the experience of thofe who have made the trial, it does not appear that the relifh for its pleafures languifhes, as in other cafes, but gains ftrength by gratification; and they continue to pleafe in reflection. The reafon of this is obvious from the law of affociation; for fince they are, in general, attended with fuccefs, and are confiftent with, and productive of, the feveral inferior pleafures, when thefe are purfued in their due degree, and are alfo further increafed by the moral and religious pleafures, they receive frefh addition upon every gratification, and therefore increafe perpetually, not perhaps in vividnefs, but in extent as well as fteadinefs, when the affections are cultivated as they ought to be.

The pleafures of benevolence are *felf-confiftent*. All may fhare them without diminifhing their mutual happinefs. Harmony and mutual co-operation prevail among the benevolent; and benevolent actions have a tendency to excite correfpondent actions indefinitely. By degrees, when benevolence has arrived at its due height, all the fenfibilities of the individual for himfelf, will be more or lefs transferred upon others, by his benevolence and compaffion for them. And in like manner, when our moral fenfe is fufficiently eftablifhed and improved, and we are capable of being influenced to perform what is fit and right, by the confideration that it is fo, our imperfect fenfibility for others tends to diminifh (by being compared with it) our exorbitant attachment to ourfelves; at the fame time that compaffion takes off our thoughts from ourfelves. And benevolence to a fingle perfon may become equal to felf-intereft by this tendency of felf-intereft to increafe benevolence, and reciprocally of benevolence to leffen felf-intereft, though originally felf-intereft was indefinitely greater than benevolence; and thus we may learn to be as much concerned for others as for ourfelves, and as little concerned for ourfelves as for others. It is not often that benevolence is thus heightened: perhaps, in the ftricteft fenfe, it can never reach this height in the prefent ftate; but let us take the cafe where there is a decided preponderance of benevolence over every feeling which bears the character of malevolence. It is not, perhaps, capable of proof, but certainly has decided probability, that in the circle in which each moves, and in the circle of the race at large, happinefs greatly preponderates. If the benevolent individual, though he do not fee this balance of happinefs clearly, yet has fome comfortable general knowledge of it, he muft be a great gainer in the whole by his benevolence, becaufe thus he has a fource of conftant gratification in the perception of fuch a preponderance of happinefs among thofe in whofe happinefs he has learned to rejoice in fome meafure as in his own.

It will confirm our belief that the cultivation of benevolence fhould be made a primary purfuit of life, if we recollect that *its pleafures lie open to all* kinds and degrees of men; fince every man has it in his power to benefit others, and fince we all ftand in need of each other's good offices. Unlike the brute creation, we are dependent upon each other from the cradle to the grave, for life, for health, for convenience, for pleafures, for intellectual accomplifhments, and, in no fmall degree, for moral culture; and we are unable to fubfift with comfort fingly, or even in very fmall focieties, and this may be confidered as a mark of the fuperior excellence of man's focial pleafures. All the tendencies of the events of life, ordinary and extraordinary, of the relations of life, of the various pleafures which have been enumerated, to connect us together, to connect accidental affociations, and thofe forced upon us by the common fituation of man, and his fituation in fociety, into permanent affections, prove the fame thing. So great, indeed, is this tendency, that two men without claims to the title of benevolent, can fcarcely become familiarly known to each other, without receiving fome good-will, complacency, compaffion, and tendernefs for each other. Further, we love, efteem, and affift the benevolent more than others: fo that a benevolent action not only excites the receiver to a grateful return, but alfo the by-ftander to approve and reward: and benevolence receives a hundred fold even in this world. "But," fays the excellent Hartley, "it would be endlefs to purfue this. Benevolence is, indeed, the grand defign and purport of human life, of this probationary ftate; and every circumftance of human life, duly confidered, muft and does point to it directly or indirectly."

And as it is now eftablifhed that benevolence is a primary purfuit, it follows *that all the pleafures of malevolence are excluded*, as direct obftacles to our happinefs. The lower pleafures may all be made confiftent with, and even fubfervient to, benevolence, by its limitations and power; but thofe of malevolence are quite incompatible with it. As far as malevolence is allowed, benevolence muft be deftroyed. There is, however, this exception; where wifhing evil to fome, difpofes us to be more benevolent on the whole, (as in the cafe of what is called a juft indignation againft the vicious,) it may fomewhat aid the moral progrefs in the lower ftages of benevolence. But it is exceedingly dangerous to encourage fuch a difpofition of mind, by fatire, invective, or difpute, however unworthy the opponent may be; for foftered, it will foon wear the features of ill-will, will foon become rank malevolence.

We muft not only forego the pleafures of malevolence, but patiently and refolutely endure the *pains of benevolence*, particularly thofe of compaffion. But we fhall not be lofers on either of thefe accounts. The pleafures of the moral fenfe which refult from thefe virtues, will, in the firft cafe, compenfate for what we forego; in the laft over-balance what we endure. Befides, mercy and forgivenefs are in themfelves pleafures; and, in the event, productive of many others: and compaffion generally leads us to fuch conduct as makes the afflicted to rejoice, and increafes our difpofition to rejoice with them.

As benevolence is thus fupported by many direct arguments, there are many fimilar and oppofite arguments to prove that *malevolence is the bane of human happinefs;* that it occafions mifery to the agent as well as to the fufferer; that it is indefinitely inconfiftent with itfelf, and with the courfe of nature; and that, confequently, it is impoffible that it fhould fubfift for ever. Now all thefe become fo many indirect arguments for benevolence, and urge us to make the cultivation and exercife of it, one of the fupreme pleafures and ends of our lives.

In order to make this appear more fully, we have only to take a furvey of human life, the reverfe of what we have already attended to. Injuries are increafed by mutual injuries, till at laft mutual fufferings oblige both parties to defift: the courfe and conftitution of human nature give numberlefs admonitions to forbear; and the hand of every man, and the power of every thing, is againft the malevolent. So that if we fuppofe a number of beings purely malevolent, and confequently to have an indefinite number of enemies, they would firft ceafe from their enmity on account of their mutual fufferings, and become purely felfifh, each being his own fole ſole friend and protector, and afterwards, by mutual good offices, endear themſelves to each other; ſo that at laſt each of them would have an indefinite number of friends, and thus would be indefinitely happy. This is, in part, mere ſuppoſition; but its obvious correſpondence with what we ſee and feel in real life, is a ſtrong argument both of the infinite goodneſs of God, and conſequently of the tendency of all beings to unlimited happineſs through benevolence. For the beings whom we have ſuppoſed to ſet out with pure malevolence, could no more reſt at pure ſelfiſhneſs, or any other intermediate point, than they could at pure malevolence. And thus the arguments which exclude pure malevolence, united with the direct arguments for benevolence, neceſſarily lead us to infer that *pure unlimited benevolence ſhould be the ultimate object of man.*

12. *Culture of Benevolence.*—In order to augment the benevolent, and ſuppreſs the malevolent affections, we ſhould diligently practiſe all ſuch acts of kindneſs, of friendſhip, generoſity, and compaſſion, as our abilities of any kind extend to; and rigorouſly refrain from all ſallies of anger, reſentment, envy, jealouſy, &c. For though our affections are not directly and immediately ſubject to the voluntary power, yet our actions are, and, conſequently, through them, our affections. He that at firſt practiſes acts of benevolence by conſtraint, and continues to practiſe them, will at laſt have aſſociated with them ſuch a variety of pleaſures, as to transfer a great inſtantaneous pleaſure upon them, and produce in himſelf the affections from which they naturally flow. In like manner, if we refrain from malevolent actions and expreſſions, we ſhall dry up the ill paſſions which are the ſources of them.

With the ſame objects in view, it will be of great uſe frequently to dwell upon the great pleaſures and rewards attendant on benevolence; and alſo upon the many evils preſent and future, to which the contrary diſpoſition expoſes us. For thus we ſhall likewiſe transfer pleaſure and pain by aſſociation upon theſe diſpoſitions reſpectively; and rational ſelf-intereſt will be made to produce pure benevolence, and to extinguiſh all kinds and degrees of malevolence.

Frequent and fervent prayer for others, friends, benefactors, ſtrangers, and enemies, has a very great and decided tendency to augment benevolence, and to extinguiſh malevolence. All exertions of our affections cheriſh them; and thoſe made under the more immediate ſenſe of the divine attributes, have an extraordinary efficacy, in this reſpect, by mixing the love, awe, and other exalted emotions of the mind attending our addreſſes to God, with our affections towards man, ſo as to improve and purify them. Petitions for the increaſe of our benevolence, and the ſuppreſſion of our malevolence, have the ſame tendency. Again, all meditations upon the attributes of God, and particularly upon his infinite benevolence towards all his creatures, have a ſtrong tendency to refine and augment our benevolent affections. And, laſtly, the frequent conſideration of our own unworthineſs, our entire dependence upon God, &c. raiſes in us compaſſion for others, as well as concern and earneſt deſires and prayers for ourſelves. And compaſſion is, in this imperfect probationary ſtate, an eſſential and principal part of our benevolent affections.

13. *Rules for the Conduct of Men in Society.*—Having now eſtabliſhed the poſition, that benevolence ſhould be a *primary* purſuit of man, it follows that we ſhould aim to direct every action, ſo as to produce the greateſt happineſs and the leaſt miſery in our power. This is the rule of ſocial conduct, which univerſal unlimited benevolence inculcates.

But the application of this rule in real life is attended with conſiderable difficulties and perplexities. It is impoſſible for the moſt ſagacious and experienced perſons to make any accurate eſtimate of the future conſequences of particular actions, ſo as, in all the variety of circumſtances which occur, to determine juſtly which action would contribute moſt to augment happineſs and leſſen miſery. Inſtead, therefore, of this moſt general rule, we muſt ſubſtitute others leſs general, and ſubordinate to it, admitting of a more commodious practical application. Whatever rules are laid down for this purpoſe, it is obvious that their coincidence muſt add ſtrength to each; and that when they differ, or are apparently oppoſite to each other, this difference or oppoſition muſt moderate or reſtrain their application. On the whole, however, the general reſult will prove the beſt direction for promoting the happineſs and leſſening the miſery of others.

Hartley lays down the ten following ſubordinate rules: 1. That we obey the ſcripture precepts, in the natural, obvious meaning of them. 2. That we ſhould pay great regard both to our own moral ſenſe, and to that of others. 3. That in all deliberate actions we ſhould take into account the probable conſequences on each ſide. 4. That we are not to be guided implicitly by the mere impulſe of compaſſion and good-will; yet that great regard ſhould be paid to them in our conduct. 5. That we ſhould place ourſelves in the ſituation of all the perſons concerned. 6. That perſons in the near relations of life, benefactors, dependents, and enemies, ſeem to have, in moſt caſes, a prior claim to ſtrangers. 7. That benevolent religious perſons have, all other circumſtances being equal, a prior claim to the reſt of mankind. 8. That we ſhould contribute, as far as lies in our power, to the moral and religious improvement of others. 9. That we ought to pay the ſtricteſt regard to truth, both in our affirmations and in our promiſes. 10. That we ought to obey the civil magiſtrate and the laws of the community. Theſe rules we think truly unexceptionable; and we ſhall follow the order of Hartley, enlarging on ſome of them as we proceed. Some conſiderations reſpecting the neceſſity of *general* rules of duty will be found in Div. IV. § 3.

(1) The firſt rule is, that we obey the ſcripture precepts in the natural, obvious meaning of them. The ſcripture precepts are indeed themſelves the rule of life. There is, however, the ſame kind of difficulty in applying them accurately to particular caſes, as in applying the abovementioned moſt general rule, by means of an eſtimate of the conſequences of actions. It is, from the nature of language, impoſſible, in many particular caſes, to determine preciſely the connection of the action with the precept. However, unleſs it would obviouſly lead a perſon to act in oppoſition to ſome or other of the following rules, it is the ſafeſt way, in the particular circumſtances of real life, to recollect the ſcripture precepts, and follow them in their firſt and moſt obvious ſenſe.

(2) Great regard muſt be paid, both to our own moral ſenſe, and to that of others. Among thoſe who have received a Chriſtian education, this rule muſt coincide in a great meaſure with the foregoing. They are together the chief ſupports of all that is good, even in the moſt refined and philoſophical, as well as in the vulgar; and therefore muſt not be weakened or explained away. It is well remarked, by a judicious moraliſt, that, in a mind whoſe moral powers have been cultivated, ſecond thoughts are ſeldom the beſt. The firſt are the impulſe of well-regulated feeling, and are produced inſtantaneouſly, without attention to all

4 petty

petty ſuggeſtions of ſelf, which crowd themſelves in various ways into our mind, and by leading to doubt, and then, aided by inclination, to diſobey, prevent the efficacy of the conſcience, and throw a miſt over the before clear directions of duty. (See Dr. Aikin's Letters to his Son.) With reſpect to the moral ſenſe of others, two motives ſhould induce us to pay great regard to its dictates. The one is purely benevolent; we ought not to throw any moral impediment in the way of others; the other is, that prudence and humility direct, that we uſe the experience and the feelings produced by great moral culture as guides of our own conduct.

(3) It is very proper, in all deliberate actions, to weigh, as well as we can, the probable conſequences on each ſide, and to ſuffer the balance to have ſome influence in all caſes, and the chief influence where the other rules do not interfere much, or explicitly. But to be determined by our own judgments as to conſequences, in oppoſition to the two foregoing rules, or to thoſe which follow, is too probably the dictate of pride or ſelf-intereſt. Though in ſome inſtances God ſpeaks as plainly by the conſequences of actions as he does by his revealed will, and though, without a doubt, if we were capable of ſeeing all, even the remoteſt conſequences, we ſhould, in all caſes, perceive that the precepts of revelation are in perfect conſiſtency with the courſe of Providence, yet it is a fact, that the wiſeſt of men cannot trace all the conſequences of any one moral or immoral action, and that in numerous inſtances we cannot ſee enough to enable us to form a decided idea as to the courſe of duty. Wherever the ſcripture precepts clearly apply to our own caſes, we ſhould be extremely cautious as to any inferences we may derive from the ſuppoſed conſequences of actions in oppoſition to them; and at any rate we may reſt ſatisfied that we cannot do wrong by obeying them. We are not anſwerable for the ill conſequences, if ſuch there be, of our obedience; but we are for thoſe of diſobedience; and in proportion to the ſtrength and correctneſs of our conſciences, will, moſt probably, be the conviction of our folly, and our regret for our pride and preſumption.

(4) The impulſe of the mere inſtantaneous emotions of good-will and compaſſion, will not always furniſh a ſufficient guide; at the ſame time they ought to have great regard paid to them, leſt we contract a philoſophic hardneſs of heart, by pretending to act upon higher and more extenſively benevolent views than thoſe of vulgar minds, or the more feeling ſex, &c. Some, however, carry this much too far on the other ſide, and encourage many public miſchiefs through a falſe, miſguided tenderneſs to criminals, perſons in diſtreſs through preſent vice, &c. Where feeling is thus made the guide of conduct, he who can beſt play upon the ſympathy, and beſt decorate his tale of woe, will meet with a reward for his ingenuity, due only to the modeſt merit, which ſhrinks from the public view, or at leaſt does not obtrude itſelf upon our notice. The injury done to ſociety at large by this ill-directed compaſſion, ſo generally prevalent becauſe it gratifies without trouble, is very great indeed; and while we have it in our power to cultivate compaſſion and ſympathy, by the view and the relief of real miſery and ſuffering worth, the deſire of ſuch cultivation will be ſcarcely ſufficient to exculpate us, (when our minds have acquired ſome degree of comprehenſion,) from the charge of preferring a ſelfiſh indolent gratification to the good of others. To uſe the words of the elegant Stewart, "the dictates of reaſon and conſcience inform us, in language which it is impoſſible to miſtake, that it is ſometimes a duty to check the moſt amiable emotions of the heart; to withdraw, for example, from the ſight of thoſe diſtreſſes which ſtronger claims forbid us to relieve, and to deny ourſelves that exquiſite luxury which ariſes from the exerciſe of humanity."

(5) The rule of placing ourſelves in the ſeveral ſituations of the perſons concerned, and inquiring what we ſhould then expect, is of excellent uſe for directing, enforcing, and reſtraining our actions, and for producing in us a ſteady conſtant ſenſe of what is fit and equitable. This rule is ſo comprehenſive, that it may be called the ſum and ſubſtance of Chriſtian morality, as it reſpects the ſocial duties. It has been objected by ſome that it teaches nothing, ſince it does not ſhew what juſtice is; and that it is even an improper rule, for we ought not to do to others what we ſhould wiſh them to do to us, but what we may juſtly expect them to do to us. But theſe objections have little or no force. The real object of the rule clearly is to ſerve as a criterion of duty which ſhould counteract the impreſſions of ſelf. We ſeldom need fear, leſt we ſhould carry our imaginary ſubſtitution to too great a length. Our only danger is, leſt we ſhould not go far enough; that we ſhould admit of exceptions to this principle, which, if circumſtances had been real, ought to have had no place. This rule of duty, ſays Dr. Reid, "comprehends every rule of juſtice without exception. It comprehends all the relative duties, ariſing either from the more permanent relations of parent and child, of maſter and ſervant, of magiſtrate and ſubject, of huſband and wife, or from the more tranſient relations of rich and poor, of buyer and ſeller, of debtor and creditor, of benefactor and beneficiary, of friend and enemy. It comprehends every duty of charity and humanity, and even of courteſy and good manners."—"He who acts invariably by this rule, will never deviate from the principle of his duty, but from an error of judgment. And, as he feels the obligation that he and all men are under, to uſe the beſt means in his power to have his judgment well informed in matters of duty, his errors will only be ſuch as are invincible." (Active Powers, Eſſ. v. ch. 1.) In order to apply this rule according to the obvious intention of the Chriſtian lawgiver, we are firſt to conſider what we ſhould wiſh done to us, if we were in the place of the other perſon, and at the ſame time poſſeſſed of all the knowledge which we ourſelves poſſeſs reſpecting the object under conſideration. For inſtance, ſuppoſe a child requeſts from a parent, a gratification which the parent knows would, in ſome way or other, be injurious to him; is the parent to grant his requeſt, becauſe, if in the child's place, he would himſelf wiſh to be ſo gratified? The anſwer is clear; and ſo in ſimilar inſtances. The fact is, in all ſuch caſes we are to conſider, not merely what we might wiſh if in the ſituation of another, ſo as to have all his fooliſh deſires, and his ignorance or miſguided opinions; but what we ſhould deſire with all the means of knowledge which we actually poſſeſs, and with all the views we have of the reaſonableneſs of the objects of deſire, when not ourſelves under the influence of paſſion or intereſt. The rule is not ſo much deſigned to *teach* us what is juſt and right, as to enable us to ſee and attend to what we do know; to make us think of the claims of others, and to overcome the promptings of ſelfiſhneſs. 2. We muſt farther conſider, not only what we ſhould wiſh for, and, as far as reſpects ourſelves only, might reaſonably wiſh for, if in the place of another, but alſo take into account what we ſhould wiſh for, if in the place of thoſe others whoſe conduct or happineſs will be affected. Suppoſe, for inſtance, that a favour is requeſted which in itſelf conſidered is right and reaſonable; we might

conſider

confider the application of our Saviour's rule as neceffarily directing us to grant it, becaufe, if in the fituation of the individual foliciting it, we might reafonably wifh for fuccefs. But it may fo happen, that by attending to his requeft, we may deprive ourfelves of the power of difcharging more imperious duties to others: we may be prevented from paying our debts, or from contributing as we ought to the welfare of thofe who have ftronger claims upon us. Their claims muft alfo be taken into account; but we muft take care, that fuch calculations be not made under the bias of felfifhnefs; and that, under the pretence of juftice, we do not ftifle the feelings of compaffion and good-will. The doublings of felf-love are fo numerous and intricate, that he who has the fincere and earneft defire to do his duty, will be cautious where the promptings of intereft or indolence, or other perfonal feelings are concerned. "Charity begins at home" is an excellent maxim; and he who neglects his home in order to do good to others, may reafonably expect that he will do more harm by fuch neglect, than he can do good in other ways; but we fhould alfo remember, that this maxim is often the prompting of felf-love, to excufe our covetoufnefs or our indolence; and where the good to others is prefent and certain, and the good to our narrow circle of domeftic relations is diftant and uncertain, the latter is not to be placed in competition with the former. On *candour*, an important and perhaps too much neglected branch of juftice, the reader will find an interefting paffage from Mr. Stewart's Outlines, in IV. § 1.

(6) Perfons in the near relations of life, benefactors, dependents, and enemies, feem to have, in moft cafes, a prior claim to ftrangers. General benevolence arifes from the cultivation of the particular fources of it. The root muft therefore be cherifhed, that the branches may flourifh, and the fruit arrive at perfection. Some remarks on a theory directly oppofing this rule, will be found in IV. § 2.

(7) Benevolent and religious perfons have, all other circumftances being equal, a prior claim to the reft of mankind. Natural benevolence itfelf teaches this, as well as the moral fenfe. Two reafons ftrongly enforce this rule; in the firft place, we thus contribute towards the promotion of goodnefs; we add fomething to the ftrength of the motives which there are, even in the prefent life, for fteady adherence to the practice of duty. If it be our aim to remove mifery without difcrimination, we fhall in fome inftances break down the barriers of virtue; we cannot remove all; let our efforts, therefore, be fo directed, that they may be as beneficial as poffible; and it is obvious, that they will be moft effectual, where they contribute to difcourage vice in all its fhapes. If indolence be fecure of relief from that preffure which it places upon itfelf, indolence will be increafed; if the appearance of mifery be the only paffport to our affiftance, vice will be continually receiving encouragement. But it is not merely with a view to the relief of actual mifery that difcrimination is important; it is equally important with refpect to the extenfion of the means of doing good. We may confidently expect, that all the opportunities and powers we can commit to others, will be moft ferviceable in the hands of thofe whofe habits are formed upon the model of benevolent piety. In all cafes, however, efpecially while our benevolence is in its infancy, we are in fome meafure to be guided by its mere impulfe. It is one important confequence of doing good to others, that we do good to ourfelves, we cultivate our benevolence, and with it cultivate our happinefs. But that benevolence will be found to reft upon the fureft footing, which is made to prompt to exertions which in no way interfere with the moft extenfive interefts of mankind.

(8) Since the concerns of religion, and a future ftate are of infinitely more importance than thofe which relate to this world, it fhould be our moft earneft object to contribute, as far as in us lies, to the moral and religious improvement of our fellow creatures. In various ways we have this power; and this is a field in which all can, more or lefs, employ their talents. Here no effort can be altogether thrown away; at leaft no effort will be prejudicial; and even if to others they fhould be ufelefs, their effects will return to our own bofoms.

(9) We ought to pay the ftricteft regard to truth, both in our affirmations and promifes. There are very few inftances where veracity of both kinds is not evidently conducive to the public good, and falfehood in every degree pernicious. It follows, therefore, that in cafes where appearances are otherwife, the general regard to truth, which is of fo much confequence to the world, ought to make us adhere inviolably to it; and that it is a moft dangerous practice to falfify, pretended or real, as is often done, from falfe delicacy, falfe fhame, and other fuch difingenuous motives, or even from thofe which border upon virtue. The harm which thefe things do, by creating a mutual diffidence, and difpofition to deceive, is exceedingly great; and in fcarcely any inftances to be counterbalanced by the prefent good effects affigned as the reafon for this practice. On the fuppofed reftrictions of this duty, fee hereafter, IV. § 3.

(10) Obedience to the civil magiftrate, and to the laws of the community, is a fubordinate general rule of the greateft importance. It is evidently for the public good, that every member of a ftate fhould fubmit to the governing power, whatever that be. Peace, order, and harmony, refult from this, taken on the whole: confufion and mifchief of all kinds from the contrary. So that, though it may, and muft be fuppofed, that difobedience in certain particular cafes will, as far as the fingle act and its immediate confequences are confidered, contribute more to the public good than obedience, yet as it is a dangerous example to others, and will probably lead the perfon himfelf into other inftances of difobedience afterwards; difobedience becomes, in every cafe, upon the whole, of a tendency deftructive of the public welfare. We ought, therefore, in confequence of this rule, to refpect all perfons in authority; not to pafs hafty cenfures upon their actions; to make candid allowances on account of the difficulties of government, the bad education of princes, and of perfons of high birth; and of the flattery and extraordinary temptations with which they are furrounded; to obferve the laws ourfelves, and to promote the obfervance of them where the penalties may be evaded, or are found infufficient; to look upon property as a thing abfolutely determined by the laws, fo that, though a man may, and ought to recede from what the law would give him out of compaffion, generofity, love of peace, view of greater good upon the whole, &c.; yet he muft never in any way evade, ftrain, or do violence to the laws, in order to obtain what he may think his own according to equity; and whenever he has offended, or is judged by lawful authority to have offended, he muft fubmit to the punifhment whatever it be.

This rule obvioufly does not extend to thofe extreme cafes, where the people at large, (for whofe benefit all power fhould be exercifed, and on whofe will it muft eventually depend,) fee reafon to refift the exercife of ufurped or arbitrary power, to change one line of fovereigns for another, or to place the exifting monarch under thofe reftrictions, which may prevent the abufe of his authority. In making fuch refiftance, however, it fhould be clear, that the propofed change will meet with at leaft the concurrence of of the great bulk of the people, that the probabilities of fuccefs are adequate to juftify the rifks which muft be run, and that the advantages to be gained will be fuch as to counterbalance the immediate evils; evils which muft often check the ardour of enlightened and difinterefted patriotifm, and fhould be ferioufly weighed, not only in the more extenfive cafes, but even in thofe which merely refpect the reformation of real or fuppofed abufes. The mafs of fuffering, and of moral evil produced when force muft be employed to throw off an oppreffive yoke, is utterly incalculable; and, on the whole, more is generally to be effected by the gradual diffufion of knowledge and of found views of the nature and ends of political eftablifhments, which muft eventually, (and often much more rapidly than could be expected before hand,) fet a complete bar to all injurious encroachments on civil liberty.

Nor does this rule extend to thofe important cafes where the rights of confcience are concerned. If the laws of the civil magiftrate require any thing which the law of God forbids, they muft be neglected, or difobeyed, without hefitation.

Intimately connected with this fubject is one point, to which we muft briefly advert, *viz.* honefty with refpect to the public revenue. Many who have a real principle of genuine uprightnefs in other refpects, are loofe in their practice in this; and it is, we fear, a mournful truth, that by the frauds and falfehoods which they have employed in connection with the revenue, great numbers have had their moral principles weakened, if not altogether perverted. How much fuch practices have a tendency to diminifh mutual confidence, it is unneceffary to fay. If we know that a man defrauds the revenue, contrary, it may be, to his own folemn declaration, we may hope, and perhaps fee reafon to believe, that he will not defraud or deceive in the common tranfactions of life; but our ftrong confidence that he will not muft be greatly fhaken. The preffure of national burdens cannot indeed but be deeply felt by individuals; but we ought ever to bear in mind, when we are difpofed to aim to leffen its effects on ourfelves, by unlawful concealment, or falfe declarations, &c. that we are thereby throwing an undue weight upon the more confcientious, and that we cannot do it without (as far as it is known or fufpected) leffening the confidence of others in us, and loofening the bonds of fociety, nor without weakening our own moral principles; and even if we fhould fatisfy ourfelves, that, in the particular inftance, we have equity, if not law on our fides, yet that we cannot employ our fuppofed right without fraud, if not deliberate falfehood, and perhaps even perjury. As long as we have the power of curtailing thofe expences which refpect fhow and luxury, or, at moft, mere convenience, we have no plea of real neceffity: and, after all, our pleafures and our pride are commonly our heavieft taxes.

Refpecting thofe frauds on the public revenue, which come under the general head of fmuggling, they cannot be too much deprecated. They almoft folely refpect articles of luxury, on which the fame remark may be made as above; and, at any rate, fmuggled goods cannot be purchafed, without directly encouraging frauds and falfehood in others, and affifting to train up a fet of defperate perfons, who are thus prepared to make fociety in any manner the fubject of their lawlefs prey: they cannot be purchafed without increafing the burdens of the confcientious, nor without injury to the fair dealer. The direct tendency of fome of our revenue laws is, in various ways, to weaken the reftraints of duty; and the evil, for which individuals cannot be altogether anfwerable, fhould not be increafed by their own violations. If thefe remarks fhould meet the eye of any one of thofe refpectable fenators, who are concerned for the morality as well as prefent interefts of the people, we earneftly folicit him to take into confideration the ftate of thofe laws in this particular point of view. We doubt not he will find that, in fome cafes, even the truly upright man, who is anxious to make no declaration but what is ftrictly true, can fcarcely avoid departures from the exact truth, which are extremely painful to his own mind; and that thofe who are but little under fuch reftraint, are continually led, by the forms and oaths of the cuftom-houfe, to breaches of truth, fanctioned by an appeal to God, which cannot fail to loofen the influence of an oath in all cafes, and prepare the way for perjury in its worft forms. The effect of the whole, in its various ramifications, is a degree of moral injury which can fcarcely be calculated: and while we experience heart-felt delight (not, however, unmixed with pain from prefent difappointment) at contemplating thofe exertions, which are defigned to bring our penal law to a correfpondence with the only juftifiable ends of punifhment, we fhould be difpofed to place upon a level with them, efforts of the fame enlightened, comprehenfive, dignified, perfevering nature, directed to the reformation of our revenue laws, where they unneceffarily affect the morals of the people.

Other rules, fays Hartley, befides the ten foregoing, might be affigned, or thefe expreffed in a different way. I have put down thofe which appear to be, in fact, the chief principles of focial conduct to wife and good men. They muft all be fuppofed to influence and interpret each other. Let a man only diveft himfelf as much as poffible of all felfifh regards, and love his neighbour as himfelf, and God above all, and he will generally find fome point, and that without much difficulty or perplexity, in which all thefe rules unite to produce the greateft good, upon the whole, to all perfons concerned.

Though our plan and limits will not allow of our entering at length into the duties arifing from the particular relations of focial life, yet we deem the obfervations of Hartley, on the fubject of the parental relation, fo important, that we fhall make an abftract of his leading ftatement. The principal duty of the parental relation is the giving of a right education, or the imprinting fuch affociations on the minds of children, as may conduct them fafe through this world to a happy futurity. In the latter refpect there can be no doubt, becaufe religion muft on all hands be allowed to be the one neceffary thing; and, in the courfe of thefe inveftigations refpecting the primary purfuit of life, it appears that it contributes as certainly to give us the maximum of happinefs in this world, at leaft the faireft profpect of it, as to fecure it in the next: fo that a parent ought to inculcate it in every point of view. The chief errors of education are owing to the want of a practical perfuafion of this point, or to a falfe tendernefs or opinion on the part of a parent, by which he is led to believe that the object does not require, in the cafe of his child, frequent corrections and reftraints, with perpetual encouragements and incentives to virtue, by reward, example, advice, books, converfation, &c. If due care were taken from the firft, little feverity would ordinarily be neceffary; but in proportion as this is neglected in the firft years, a much greater degree of care, with high degrees of feverity, both bodily and mental, become abfolutely neceffary to preferve from mifery both here and hereafter. Affectionate parents fhould, therefore, labour from the earlieft dawnings of underftanding and defire, to check the growing obftinacy of the will; to curb all fallies of paffion; to impress the deepeft, moft amiable, reverential,

and

and awful impreffions of God, a future ftate, and all facred things; to reftrain anger, jealoufy, and felfifhnefs; to encourage love, compaffion, generofity, forgivenefs, gratitude; to excite and even oblige to fuch induftry, as the tender age will properly admit. For one principal end and difficulty of life is, to generate fuch moderate, varying, and perpetually actuating motives, by means of the natural fenfible defires being affociated with, and apportioned to, foreign objects, as may keep up a ftate of moderate cheerfulnefs, and ufeful employment, during the whole courfe of our lives; whereas fenfual, blind, and uninformed defire preffes violently for immediate gratification, is injurious to others, and deftroys its own aims, or, at the beft, gives way only to fpleen and diffatisfaction.

14. *Eftimate of the Pleafures of Theopathy.* — We now proceed to the important inquiry refpecting the theopathetic affections, what regard they claim from us in the formation of the rule of life. And here it appears that the love of God fhould be our primary purfuit, and ultimate end, becaufe it regulates, improves, and perfects all the other parts of our nature, and affords a pleafure fuperior in kind and in degree to all the reft.

We have already feen the influence of the precepts of piety on the four inferior claffes of human pleafures, thofe of fenfation, imagination, ambition, and felf-intereft; but the precepts of piety are thofe which teach us what homage of our affections and external actions ought to be addreffed to the Deity, in a direct and immediate manner. Now all the affections, enjoined by thefe precepts, terminate ultimately in the love of God, which, therefore, may be ufed in the fame fituations in which the term precepts of piety has been employed.

But in addition to this, it is obvious in a fhorter way. The perpetual exertion of a pleafing affection towards a Being who is infinite in power, knowledge, and goodnefs, and who is alfo our friend and father, cannot but enhance all our joys, and alleviate all our forrows. A fenfe of his prefence and protection will reftrain all actions which are exceffive, irregular, or hurtful; will fupport and encourage us in all fuch as are of a contrary nature; and will infufe fuch peace and tranquillity of mind, as will enable us to fee clearly and act uniformly. The perfection, therefore, of every part of our natures muft depend upon the degree in which the love of God, and a conftant fenfe of his prefence, have obtained poffeffion of the mind.

With refpect to the fupport and regulation afforded by piety to benevolence, it may be obferved that the love of our fellow men can never be free from partiality and felfifhnefs, until we are able to view all things in the relation which they bear to God. If the relation to ourfelves be made the point of view, our profpects muft be narrow, and the appearance of what we do fee, diftorted. When we confider the fcenes of vanity, folly, and mifery, which prefent themfelves to our view from this point; when we are difappointed in the happinefs of our friends, or feel the refentment of our enemies, our benevolence will begin to languifh, and our hearts fail us: we fhall complain of the corruption and wickednefs of that world which we have hitherto loved, with a benevolence merely human; and fhew, by our complaints, that we are ftrongly tinctured with the fame corruption and wickednefs. This is generally the cafe with young and unexperienced perfons in the beginning of a virtuous courfe, and before they have made advances in piety. The difappointments which human benevolence meets with, are fometimes apt to incline us to call the divine goodnefs in queftion. But he who is poffeffed of a full affurance of this, who loves God with his whole powers, as an inexhauftible fountain of love and benevolence to his creatures, at all times and under all circumftances, as much when he chaftifes as when he rewards, will learn thereby to love enemies as well as friends, the finful and miferable as well as the holy and happy; to rejoice and give thanks for every thing he fees and feels, however irreconcileable to his prefent fuggeftions; and to labour as an inftrument under God, with real courage and conftancy, for the promotion of virtue and happinefs.

In like manner the confcience or moral fenfe requires a perpetual direction and fupport from the love of God to keep it fteady and pure. When men ceafe to have a due regard for God, having fome other end beyond which they do not look, they are very apt to relapfe into negligence and callofity, and to act without any virtuous principle. And, on the other hand, if they regard him with flavifh fear, they fill their minds with endlefs fcruples and anxieties about the lawfulnefs of trivial actions.

Thus the love of God regulates, improves, and perfects all the other parts of our nature: but further it affords a pleafure fuperior in kind, and in degree, to all the reft of which our natures are capable.

(1) The love and contemplation of God in fome meafure render us partakers of the divine nature, and, confequently, of the perfection and happinefs of it. Our wills may thus be united to his will, and therefore rendered free from difappointment: we fhall, by degrees, fee every thing as God fees it, that is, fee every thing which he has made to be good. Though this can only be the cafe in part in the prefent world, yet it is well known that there have been thofe who have fo far reached this perfection of our nature, as to acquiefce, and even to rejoice in the events of life, however apparently afflicting; to be freed from fear and folicitude; and to receive their daily bread with conftant thankfulnefs. And though the number of thefe happy perfons may have been comparatively fmall, and the path be not frequented and beaten, yet if the defire be fufficiently earneft, it is in the power of all to arrive at the fame ftate, by fufficient earneftnefs and conftancy in the ufe of the appointed means.

(2) The love of God may be confidered as the central affection to which all the others point. When men have entered fufficiently into the ways of piety, the ideas of the Supreme Being recur more and more in the whole courfe and tenor of their lives, and, by uniting with all their thoughts and feelings, overpower all the pains, and augment and connect with themfelves all the pleafures of the mind. Every thing beautiful and glorious brings in the ideas of God, mixes with them, and coalefces with them; for all things are from God, he is the only caufe and reality, and the exiftence of every thing elfe is only the effect and proof of his exiftence and excellence. Let the mind be once duly imbued with this truth, and its practical applications, and every thing will afford exercife for the devout affections. Add to this their unlimited extent, their purity, and perfection, and it cannot but be acknowledged that they muft be far fuperior to all the reft both in kind and in degree.

(3) The objects of other pleafures are frequently removed. No time, no place, no circumftance of life can deprive us of this. Our hearts may be directed towards God in the greateft external confufion, as well as in the deepeft filence and retirement. All the duties of life, when directed to God, become pleafures; and by the fame means every the fmalleft action becomes the difcharge of the proper duty of the time and place. Thus time is turned to

to its beft advantage: thus every fituation and event of life may be converted into a fource of prefent comfort and future felicity.

(4) When the love of God is thus made to arife from every object, and to exert itfelf in every action, it becomes of a permanent nature, fuited to our prefent frame, and will not pafs into deadnefs or difguft, as our other pleafures do from repeated gratification.

We fhould be glad if our limits would allow of our laying before our readers a view of thofe means which are pointed out by Hartley, for the culture of the theopathetic affections, of *faith*, *fear*, *gratitude*, *hope*, *truft*, *refignation*, and *love:* we muft, however, content ourfelves with referring to his 72d propofition on this fubject; and to his important rules in the 73d propofition, concerning the manner of expreffing them in prayer, and other religious exercifes; and fhall only add the following obfervations, derived from the 73d.

There cannot be a more fatal delufion, than to fuppofe, that religion is nothing but a divine philofophy in the foul; and that the foregoing theopathetic affections may exift and flourifh there, though they be not cultivated by devout exercifes and expreffions. Experience, and many plain obvious reafons, fhew the falfehood and mifchievous tendency of this notion; and it follows from the theory of affociation, that no internal difpofitions can remain long in the mind, unlefs they be properly nourifhed by proper affociations, that is, by fome external acts. This, therefore, among others, may be confidered as a ftrong argument for frequent prayer.

In fection 10, (entitled Eftimate of the Pleafures of Self-intereft,) we referred to Dr. Prieftley's fermon on the duty of not living to ourfelves; we fhall here copy a few paragraphs from it, which the reader will perceive to bear clofely upon this, and upon the 10th fection, and for which, if not before familiar to him, we perfuade ourfelves we fhall have his thanks.

"Every day paffed in the fteady and earneft difcharge of a man's known duty, will pafs with uniform cheerfulnefs and alacrity. And in the glorious animating profpect of a future happy ftate of mankind, on which, in a humble truft and confidence in the affiftance and grace of God, he has fpent all his cares, and exerted all his powers, that joy will fpring up in his heart here, which will hereafter be unfpeakable and full of glory.

"If troubles and perfecutions arife on account of our adhering to duty; if we be oppofed in the profecution of laudable undertakings, or fuffer in confequence of undertaking them; the true piety of a perfon who habitually lives to God, and not to himfelf, is capable of converting them all into pure unmixed joy and tranfport. Then the human mind roufed to the moft intent exertion of all its faculties, burdened with no confcioufnefs of guilt, referring itfelf abfolutely to the difpofal of its God and father, diftrufting its own powers, and confiding in the infinite power, wifdom, and goodnefs of God, acquires a fervour of fpirit, a courage, fortitude, and magnanimity, tempered with the moft perfect ferenity, and the greateft prefence of mind, that is fufficient, and more than fufficient, to bear a man through every difficulty, and even to convert all pain into pleafure. His highly agitated ftate of mind, in thofe trying circumftances, is almoft pure rapture and extacy.

"What the extraordinary exercifes of devotion are able to do upon extraordinary occafions, the habitual moderate exercife of piety will be able to do in the ordinary courfe, and the common troubles of our lives; fo that it may not only be compared to a ftrong cordial, to be applied when the mind is ready to faint under adverfity, but to that food which is the daily fupport of our lives.

"To have God always in our thoughts, is not poffible in this world. Prefent objects, to the influence of which we are continually expofed, muft neceffarily engage a great part of our attention; and worldly objects, by continually engroffing our thoughts, are apt to become of too great importance to us. We grow anxious about them, and our minds are haraffed and fatigued with a conftant and clofe attention to them. Now, it is when the mind is in this ftate, or rather tending towards it, that the benign influences of devotion are, in the ordinary courfe of our lives, the moft fenfibly felt; when the mind, looking off, and above, all worldly objects, and deeply impreffed with a fenfe of the infinite power, wifdom, and goodnefs of God, unburdens itfelf of every anxiety, and cafts all its cares upon its heavenly father; and when the preceding tumult and diforder of the paffions only ferve to augment that unfpeakable joy, fatisfaction, and confidence, with which a deep fenfe of the prefence and providence of God infpires the foul.

"The relief a benevolent mind feels from communicating its troubles and cares to an intimate friend, in whofe wifdom and integrity he can confide, though of the fame nature, is but a faint image of what the truly pious foul feels in the delightful feafons of the devout intercourfe which he maintains with his God.

"This is a perpetual fource of joy and fatisfaction to a truly devout mind, which the wicked, thofe perfons who live to themfelves, and not to mankind, or to God, intermeddle not with. Not even an idea of that fweet tranquillity, exalted joy, and calm fortitude, which true devotion infpires, can be communicated to another who hath had no experience of it himfelf. This is true of thofe things of which St. Paul fays that the natural man cannot comprehend them, and that they are foolifhnefs to him, becaufe they are fpiritually difcerned.

"I would be no advocate for enthufiafm. The fervour of devotion cannot always be kept up. That is inconfiftent with the condition of our nature, and far from being neceffary in our prefent ftate; but that cheerful ferenity and compofure in which moderate acts of devotion leave the mind, is an excellent temper for entering upon, and perfevering with fpirit and alacrity in any ufeful and honourable undertaking."

This religious philofopher then proceeds, in reference to the general object of his difcourfe, in the following words.

"The fum of this practical doctrine, fuggefted by revelation, and confirmed by reafon and obfervation, is, that *no man can be happy who lives to himfelf;* but that true happinefs confifts in having our faculties wholly engroffed by fome worthy object, in the purfuit of which the ftrongeft and beft of our affections have their full play, and in which we enjoy all the confiftent pleafures of our whole nature; that though a regard to our greateft happinefs be of excellent ufe, particularly about the beginning of our progrefs towards perfection and happinefs, in bringing our inferior appetites and paffions into due fubjection to the fuperior powers of our nature, yet that felf-love, and a regard to ourfelves, is very apt to grow too intenfe, and is, in fact, the caufe of a great deal of the ufelefs anxiety, perplexity, and mifery which is in the world; and that therefore it ought to be our care, that our minds be engroffed as much as poffible by other objects; and that even motives to virtue which turn our attention frequently upon ourfelves fhould be ufed with caution, for fear of feeding that vanity and felf-conceit which we ought to ftudy every method of repreffing, as the greateft bane of true religion, being moft oppofite to the

the genuine temper of Chriſtianity, and moſt deſtructive of human happineſs."

15. *Eſtimate of the Moral Senſe.*—It has been already ſtated, that the moral ſenſe ought to have great influence even in the moſt explicit and deliberate actions; hence the culture of its feelings, and the correcting of its dictates, ſhould be made a primary object.

Further, the moral ſenſe ought, on urgent occaſions, to have the ſole influence; and this for ſeveral reaſons. 1. Becauſe it offers itſelf on the various occaſions of life, with the tone of authority. It warns us before hand, and calls us to account afterwards; it condemns or approves; it rewards by the pleaſures of ſelf-approbation, or puniſhes by the pains of ſelf-condemnation. 2. The moral ſenſe is principally generated by piety, benevolence, and rational ſelf-intereſt. All theſe are explicit guides in deliberate actions; and ſince they are excluded, on ſudden occaſions, through the want of time to weigh and determine, it is highly reaſonable to admit the moral ſenſe formed from them, and whoſe dictates are immediate, as their ſubſtitute. 3. The greatneſs, the permanency, and the calm nature, of the pleaſures of the moral ſenſe, with the horrors and the conſtant recurrence of the ſenſe of guilt, are additional arguments to ſhew that theſe pleaſures and pains were intended as the guides of life.

The perfection of the moral ſenſe conſiſts in the four following particulars: 1. That it extend to all the actions of moment which occur in the intercourſes of real life; and be a ready monitor on all ſuch occaſions: 2. That its pleaſures and pains ſhould be ſo vivid as to furniſh a very ſtrong excitement to ſhun vice, and to walk ſteadily in the path of religious duty: 3. That it ſhould not deſcend to trifling or minute particulars; for, though ſcrupuloſity is probably a neceſſary ſtep in the progreſs of the mind to moral excellency, yet, if it continue, and become the prevailing habit of the mind, it will check benevolence, and turn the love of God into a ſuperſtitious fear: 4. It is neceſſary that the dictates of the moral ſenſe ſhould be perfectly conformable to piety and benevolence, of which it may be conſidered as a ſubſtitute.

In order to obtain the moſt perfect ſtate of the conſcience, it is neceſſary for us to be much employed in the practical ſtudy of the ſacred ſcriptures, and of the writings of good men of all denominations; in obſerving the living examples of moral worth, and in the peruſal of moral and religious biography; in ſelf-examination; in prayer, and other exerciſes of devotion; in endeavouring to convert all the ſocial and religious affections into the love of God; in aiming to acquire a truly charitable and benevolent ſpirit; and in walking faithfully, according to the dictates of benevolence, piety, and the moral ſenſe, ſuch as they are at preſent. Some of theſe directions are more particularly ſuited to correct one defect in the moral ſenſe; ſome, another; but they will all conſpire in purifying and perfecting it. On the origin, growth, and culture of the moral ſenſe, we beg leave to refer the reader to Moral *Education*, IV.; and we ſtrongly recommend the peruſal of Hartley's General Corollaries, at the end of his inveſtigations reſpecting the Rule of Life.

16. *A ſtrict regard to the precepts of Benevolence, Piety, and the Moral Senſe, favours even groſs Self-intereſt, and is the only method by which the refined, and the rational, can be ſecured.*—Here we may obſerve, 1. That ſince the regard to benevolence, piety, and the moral ſenſe, procures the pleaſures of ſenſation, imagination, and ambition, in their greateſt perfection on the whole, it muſt favour groſs ſelf-intereſt, or the purſuit of the means of obtaining them. 2. This regard has, in many caſes, an immediate tendency to procure theſe means, that is, to procure riches, power, learning, &c. and though it ſometimes happens that a man muſt forego both the means of obtaining pleaſure, and pleaſure itſelf, from a regard to duty, and often happens that the beſt men have not the greateſt ſhare of the means; yet it ſeems that the beſt men have, in general, the faireſt proſpect for that competency, which is moſt ſuitable to real enjoyment. Thus, in trades and profeſſions, though it is ſeldom obſerved that men eminent for piety and charity amaſs great wealth, yet they are generally in affluent or eaſy circumſtances, from the faithful diſcharge of duty, their prudence, moderation in expences, &c. and ſcarce ever in indigent ones. A ſenſe of duty produces a deſire to diſcharge it: this recommends to the world, to the bad as well as to the good; and where there are inſtances apparently to the contrary, farther information will generally diſcover ſome ſecret pride, negligence, or imprudence, that is, ſomething contrary to duty, to which the perſon's ill ſucceſs in reſpect of this world, may be juſtly aſcribed. 3. A regard to duty plainly gives the greateſt capacity for enjoyment; as it ſecures us againſt thoſe diſorders of body and mind, which render the natural objects of pleaſure inſipid or ungrateful. 4. As to refined ſelf-intereſt, or the purſuit of the means for obtaining the pleaſures of ſympathy, theopathy, and the moral ſenſe, it appears at firſt ſight, that a due regard to theſe muſt procure for us both the end and the means. 5. However groſs or refined ſelf-intereſt may, upon certain occaſions, be diſappointed, the rational one never can whilſt we act upon a principle of duty. Our future happineſs muſt be ſecured thereby. This the profane and profligate, as far as they have any belief of God, providence, or a future ſtate, (and it is ſcarcely poſſible for a rational being to arrive at more than ſcepticiſm and uncertainty in theſe things,) muſt allow, as well as the pious Chriſtian. And, when the rational ſelf-intereſt is thus ſecured, the diſappointments of the other two become far leſs grievous, and make far leſs impreſſion on the mind. He that has a certain reverſion of an infinite and eternal inheritance, may be very indifferent about preſent poſſeſſions.

17. *Practical Obſervations on Self-intereſt and Self-annihilation.*—Self-intereſt being reckoned by ſome writers the only ſtable point upon which a ſyſtem of morality can be erected, and ſelf-annihilation by others the only one in which man can reſt, I will here (ſays Hartley, prop. 67.) endeavour to reconcile theſe two opinions, giving at the ſame time both a general deſcription of what paſſes in our progreſs from ſelf-intereſt to ſelf-annihilation, and ſome ſhort hints of what is to be approved or condemned in this practice.

(1) The vicious pleaſures of ſenſation, imagination, and ambition, being often very expenſive, are checked by the groſſeſt of all the kinds of ſelf-intereſt, the mere love of money; and the principle upon which men act in this caſe is eſteemed one ſpecies of prudence. This may be tolerated in others, where it is not in our power to infuſe a better motive; but, in a man's own mind, it is very abſurd to have recourſe to one, which muſt leave ſo great a degree of impurity, when others which are purer and ſtronger, rational ſelf-intereſt particularly, are at hand.

(2) The deſire of bodily and mental accompliſhments, and in particular of ſcience and learning, conſidered as means of happineſs, often checks both the forementioned vicious pleaſures, and the love of money. Now this kind of ſelf-intereſt is preferable to the laſt indeed; but it cannot be approved by any that are truly ſolicitous about their own reformation and the purification of their motives.

 (3) Groſs

(3) Grofs felf-intereft fometimes excites perfons to external acts of benevolence, and even of piety; and though there is much hypocrify always in thefe cafes, yet an imperfect benevolence or piety is fometimes generated in this way. However, one cannot but condemn this procedure in the higheft degree.

(4) As refined felf-intereft arifes from benevolence, piety, and the moral fenfe; fo converfely it promotes them in various ways. But then, as it always checks their growth in various other ways, it cannot, in many cafes, be allowed; and is, upon the whole, rather to be condemned than approved. More favour may be fhewn it, where it reftrains the vicious pleafures of fenfation, imagination, and ambition.

(5) Rational felf-intereft excites us to all the proper methods of checking the laft-named vicious pleafures, as well as grofs and refined felf-intereft, and producing in ourfelves the virtuous difpofitions of benevolence, piety, and the moral fenfe. This part of our progrefs is extremely to be approved, and efpecially the laft branch of it.

(6) The virtuous difpofitions of benevolence, piety, and the moral fenfe, and particularly that of the love of God, check all the foregoing ones, and feem fufficient utterly to extinguifh them at laft. This would be perfect felf-annihilation, and refting in God as our centre. And upon the whole we may conclude, that though it be impoffible to begin without the pleafures of fenfation and the felfifhnefs founded upon them, or to proceed without the other intermediate principles, and particularly that of rational felf-intereft; yet we ought never to be fatisfied with ourfelves, till we arrive at perfect felf-annihilation, and the pure love of God.

III. We now proceed to the third object propofed, *viz.* to ftate what *criterion of virtue and fundamental principle of duty*, we deem, from the foregoing views, moft fuitable to the moral condition of human nature, and moft likely to lead to its higheft excellence.

We have already ftated, (near the clofe of our *firft* divifion,) that the *ultimate obligation*, the *beft rule*, and the *immediate motive* of virtue, are three diftinct confiderations; and we apprehend, that owing to this diftinction not being kept fufficiently in fight, much confufion has arifen in moral inveftigation.

On the worth and purity of our motives, depends entirely the value of any action as far as the individual himfelf is concerned: and that rule of duty muft be the beft, which is itfelf the beft *guide* of duty, and at the fame time is the moft likely to lead to thofe motives, which, in proportion as they have the chief actuating influence in the mind, exalt it towards the higheft point of human excellence. The beft rule of duty will of courfe fupply the beft *criterion* of virtue, in other words, the beft teft by which to determine whether an action or difpofition is entitled to the denomination of virtuous.

Though we fet out with the pofition, that the agent's greateft happinefs on the whole is the remoteft obligation of virtue, yet it is clear, from the foregoing confiderations, that this is not a motive on which the mind can reft without checking its moral progrefs. It cannot be made a primary motive, without defeating its own end (fee II. 10.) It is equally clear, that an habitual regard to one's own greateft happinefs on the whole, as the fole end of actions and difpofitions, would be continually mifleading us from that path, by which alone we can reafonably expect to reach the object. It cannot, therefore, be made the criterion of virtue.—When it is once afcertained, that a ftrict regard to the dictates of piety, benevolence, and the moral fenfe, are the beft means of promoting our greateft welfare, we have nothing to do but to obey them, with the fecurity, (if we think at all about it) that thus all will be well for us. To fhew that a certain courfe of conduct is our duty, is a good way of proving that it will promote our greateft happinefs on the whole: and, in fact, taking a future life into account, we have no other means of proving it; for nothing can be more certain, than that it is only by a faithful endeavour to difcharge our duty, that we can obtain happinefs in a ftate of retribution. That, therefore, cannot be made a criterion of duty, for which duty does itfelf afford the beft criterion.

From the confiderations in the foregoing paragraph it neceffarily follows, that the tendency to promote the agent's greateft happinefs on the whole, though it has been fhewn to be the remoteft fource of obligation, cannot be the beft criterion of virtue, any more than the beft motive to the practice of it. Indeed it would be abfurd to employ that as the mode of judging refpecting our duty, which duty, as well as a regard to our own greateft happinefs, requires to be made only a fubordinate motive to the difcharge of it, and which in the higheft ftages of moral excellence will be entirely left out of fight as a motive.

On this ground, we cannot accord with Mr. Belfham's ftatement in p. 432 of his Elements. "Hence it follows, that *there can be but one rule of right*, namely, the tendency of an action or affection to the ultimate happinefs of the agent, or what completely coincides with this, under the government of perfect wifdom and benevolence, to the greateft general good; and all diftinctions between what is commercially, legally, politically, &c. right, and what is morally or theologically right, are groundlefs, abfurd, and in practice highly pernicious." The laft part of the paragraph is unexceptionable and important; the pofition, which we have put in italics, in the unlimited and unqualified way in which it is expreffed, is erroneous, and liable to great and injurious perverfion. The effect of an action or affection on the ultimate happinefs of the agent, muft itfelf be dependent on the will of God: that will muft undoubtedly fpring from infinite benevolence and perfect rectitude; but a rule, which is itfelf dependent upon another, cannot be the *only* rule of right, and from what we have already ftated, it cannot be the beft.

It may often be convenient to employ fome one of the extenfive criteria of virtue as, in fact, a means of applying the moft general and beft criterion: juft the fame as in order to apply the moft general rule of benevolence, we find it convenient to employ fome rules of lefs extent as means of judging what benevolence really requires (fee II. 13.); but no quality or effect of virtue can be admitted as the ultimate or even the beft criterion, which is in any way arbitrary or dependent upon peculiarities in the mental or moral character of the individual applying it, which will not include all fpecies of virtue, or which cannot itfelf be made a primary motive to the performance of it. If any criterion of virtue can be laid down which is felf-confiftent, univerfal, invariable, authoritative, eafily applicable, itfelf excellent as a motive, and perfectly and obvioufly confiftent with the remoteft obligation, that muft be the *beft* criterion or rule of duty.

Thefe principles completely exclude all confiderations founded folely on a regard to our own prefent welfare; all views of individual intereft, utility, expediency, &c. If the tendency of virtue to our own greateft happinefs on the whole, is not the beft criterion of virtue, its tendency to more limited degrees of happinefs cannot. The tendency of virtue to promote our prefent welfare is often a good guide; and as a fubordinate rule may be admitted with advantage. In one point of view it is even fuperior to the tendency of virtue to promote our greateft happinefs on the whole;

whole; becaufe of this we can decide but imperfectly, and only by taking the will of God into account: the prefent effects of virtue are often obvious to all poffeffed of any tolerable degree of experience and good fenfe. But as the prefent effects of virtue are often in oppofition to immediate intereft and pleafures, and its moft valuable influence on human happinefs cannot be thoroughly difcerned except by the virtuous themfelves, they cannot furnifh more than a fubordinate teft of duty, and are at the fame time in oppofition to the higheft, fo far as they tend to fix the mind upon themfelves as motives.

The tendency of virtue to promote the good of others, though, perhaps, in a greater or lefs degree, directly or indirectly, an invariable quality of virtue, yet is far from being eafily applicable, except to thofe branches of virtue which do not immediately refpect our fellow creatures: it is often remote, indirect, and fubordinate. Befides, if this tendency were affumed as the teft of virtue, it would have little authority; it would carry with it little obligation, in thofe branches of felf-regulation and piety which do not obvioufly affect the interefts of others. The conformity of actions and difpofitions to *benevolence*, is an excellent and extenfive criterion of duty; but we are feeking for that which may be truly called THE *criterion* or rule of duty. Benevolence has a great advantage over the preceding rule, becaufe it cannot too much operate as a motive; it often has a powerful influence in the exercife of the perfonal virtues, and when fupported by the views of religion, muft always appear to be confiftent with the individual's own higheft welfare: but it will not appear to include every fpecies of duty without a greater degree of moral comprehenfion, than can be expected before a high degree of moral worth has been acquired.

Nor can a conformity to *juftice* be juftly deemed the criterion of virtue; not even in the fenfe in which it is taken by the author of Political Juftice, (b. ii. ch. 2.) who, as Mr. Belfham obferves, (Elements, p. 442.) makes it exprefs "benevolence under the direction of wifdom." A difpofition to render unto *all* their due, will, in a variety of cafes, perfectly coincide with benevolence, and contribute to prevent the erroneous directions of this affection; and the conformity to juftice may with great advantage be made a criterion of focial virtue, but no farther. Juftice as a criterion of duty in general is more defective than benevolence; becaufe benevolence has more influence over the difpofitions, and will operate more extenfively as a motive, in thofe cafes of duty which are not directly focial, and where juftice does not appear to afford any direction, except through the medium of benevolence. Godwin does, indeed, "affume the term *juftice* as a general appellation for all moral duty," (clearly by this and his fubfequent ftatements excluding from the clafs of moral duty, the divine and perfonal virtues); and he defines juftice (p. 127.) to be "that impartial treatment of every man in matters that relate to his happinefs, which is meafured folely by a confideration of the properties of the receiver, and the capacity of him that beftows:" but he afterwards (p. 150.) gives a much more comprehenfive account of *virtue*, which he defines "to be any action or actions of an intelligent being, proceeding from kind and benevolent intention, and having a tendency to contribute to general happinefs." According to this, together with his previous theory, virtue is juftice in action, fpringing from benevolence in principle: but it is clear that even this cannot reach the virtues which refpect God and ourfelves; becaufe though benevolence may prompt to them, it cannot be faid, with any propriety, (nor, we imagine, would Godwin have intended to fay,) that they are a branch of juftice, efpecially as he has himfelf defined it.

If the conformity of actions, &c. to the dictates of the *moral fenfe*, to the perceptions of the *underftanding*, and fo on, be made the criterion of duty, it muft, from the very nature of thofe mental principles or powers, as we find them actually exifting in the human mind, be an unfteady, ever varying guide. The directions of the well cultivated underftanding, or of the well regulated confcience, efpecially of the latter, are often a good means of judgment; but it is only when they accord with the directions of a ftill higher and more authoritative principle; and they do not, therefore, poffefs thofe qualifications which would entitle them to be made the ultimate criterion of duty.

Still lefs can the congruity, fitnefs, propriety, beauty, &c. of actions or difpofitions, be made more than one criterion of moral worth. The perception of thefe qualities depends upon the correctnefs and extent of the underftanding and the moral powers; and they are, therefore, more exceptionable than the foregoing as criteria of duty.

The fact is, the idea affociated with the term *virtue*, or *rectitude*, or *moral worth*, is fo exceedingly complex, formed of fo many notions and feelings, that no definition can directly include them all. All that can be expected from a definition is, that it fhall include every object to which the term can juftly be applied, and exclude every other: but in fuch a cafe as this, at leaft, it is in vain to look for one which fhall bring into view all the affociated circumftances. Thefe will depend upon the mental and moral character of the individual, upon his experience and obfervation, &c. And it is owing to inattention to this circumftance, that fo many definitions have been given, in reality, effentially defective, though, through the unobferved influence of other views, not excluding in the minds of thofe who have laid them down, claffes of human conduct and difpofitions which are certainly a part of moral excellence, but to which thofe definitions do by no means extend.

Paley's definition (vol. i. p. 41.), which is copied from Gay's Preliminary Differtations, is peculiarly defective, yet at the fame time redundant. "Virtue," he fays, "is the doing good to mankind, in obedience to the will of God, and for the fake of everlafting happinefs. According to which definition," he continues, "the good of mankind is the fubject; the will of God, the rule; and everlafting happinefs, the motive of human virtue." Paley had good reafon to be pleafed with Mr. Gay's Differtations; for they contain many judicious and valuable obfervations on the foundation of morals; but thofe who read them fubfequently to their ftudy of the Hartleyan philofophy, can fcarcely fail to be ftruck with the progrefs which has been made in moral and mental inveftigation fince the author wrote; and if Paley's acquaintance with the principles of mental fcience had been more precife and extenfive, it may reafonably be fuppofed that his clear judgment would have framed a definition much more fatisfactory than the one he has adopted. In the firft place, what he terms the *fubject* of virtue is radically defective; it excludes, becaufe it does not include, the perfonal and divine virtues; and yet, in the very next page, he fpeaks of the divifion of *virtue* into the duties towards *God*, towards other men, and towards *ourfelves*. It is clear, neverthelefs, that Paley's definition does not include reverence, gratitude, chaftity, temperance, &c. Next, his mode of ftating his *rule* is inaccurate. If it is faid that we do a thing *in obedience* to the will of another, it is obvioufly implied that we not only do it conformably to his will as a rule, but having the intention to obey it as our *motive*. As the expreffion ftands, it excludes from the character of virtuous, every action which is not influenced, directly

rectly or indirectly, by the disposition to obey God; and is liable to the objection which we shall hereafter make to a definition much more satisfactory than Paley's. If it were designed to represent the influence of religious obedience as an essential part of virtue, it excludes a vast deal of what is usually regarded as justly included under the appellation. If *in obedience* were intended, as we suppose, to imply no more than *conformably* to the will of God, it must be regarded as an important verbal inaccuracy; and the expression for which it stands, would have rendered unnecessary the statement of the *subject* of virtue. If the *will of God* be the *rule* of virtue, *conformity* to that rule, in its various objects, must be virtue itself; and if this had been taken as the criterion of virtue, it would have been equally needless and embarrassing to introduce any specification of those objects. As to the *motive*, this is still more objectionable than the *subject*; for it excludes, not only the virtuous actions of those who do not believe in a future state, but even those which spring from a *disinterested* regard to the welfare of others, to the will of God, or to the dictates of conscience; that is, when an action becomes the most virtuous, according to the definition which Paley has adopted, it ceases to be virtuous.

We know of no criterion of moral excellence, which possesses the qualification above-stated as requisite to make it *the* standard of duty, except the will of God; and we now proceed to those considerations by which we are led to regard the conformity of actions or dispositions to the will of God, as the best criterion of virtue or rule of duty.

The will of God may be regarded as the *rule* of duty or as the *motive* to the performance of duty; but there never, perhaps, was an instance, in which the two views were not united in the actual employment of it. He who honestly makes the will of God his rule of duty, can scarcely avoid perceiving that it is his duty to act under the influence of an habitual regard to his will, and (while he endeavours to guide his conduct and his dispositions by the commands of God) to make the desire of his approbation and the fear of his displeasure, his direct and constantly actuating motives in the regulation of heart and life. On the other hand, he who is really and habitually influenced by the desire to obey the divine will, cannot but be led by that desire to use every means in his power to know what is his will; if he sincerely and heartily desire to obey God, he will make what he knows of his will the rule of his life. In short, if the desire to obey the will of God operates powerfully in the heart, the will of God will be made the guide of duty; if the will of God is sincerely and heartily made the guide of duty, the desire to obey the will of God must necessarily operate powerfully as a motive.

We shall not attempt to preserve any marked distinction between the will of God considered as the rule of duty, and considered as the motive to the performance of it; we shall not, however, lose sight of our immediate object, and shall have principally in view to shew, that the will of God is the best criterion of duty, in other words, the best guide of moral conduct. At first sight it really appears unnecessary in any way to attempt to prove this. It seems a self-evident maxim, that the will of an infinitely wise, powerful, and good being, upon whom we are constantly and absolutely dependent, must afford the best guidance to his weak and erring creatures; and it is probable that no consistent and serious believer in the existence of such a being, can entertain a doubt, that wherever the divine will is known, it is our duty to obey it, and that it cannot but be for our interest and happiness to obey it. But the fact is, that in a variety of instances we are left, even with all the aid of revelation, to ascertain the will of God from the subordinate criteria of virtue; and as these often afford satisfactory grounds of decision, and some of them bring into view motives which form an essential part of moral excellence, the mind is too apt to rest upon them as themselves the foundation of duty, where it would be well to seek one more extensive and invariable.

When we consider the speculations of philosophers on the subject of moral obligation, and the rule of duty, and observe the great diversity which exists among them as to the theory of virtue, we might naturally expect to find great difference in the application of their system to the practical principles of morality; but where they have been in any considerable degree guided by the morality of the gospel, it will seldom be found that they differ widely on any essential point. Yet it is not a matter of slight importance what we lay down for ourselves as our fundamental principle of duty; some principles are more confined, others more accommodating; and our views of duty will usually be found to be clear, extensive, correct, and impressive, in proportion as the principle is so which we employ as our foundation.

We do not wish to go so far as one excellent writer has done, and say that virtue is *voluntary obedience* to the will of God. Undoubtedly every act of obedience to the divine will is an act of virtue; but an action may surely be virtuous, which does not include an explicit reference to the will of God, which is not produced by the immediate operation of a regard to his will. We admit that where the mind is habitually under the influence of a regard to the divine will, it will operate directly or indirectly in almost every action, and in almost every instance of the exercise or restraint of the affections: but should we therefore deny the character of virtuous to actions in themselves right where the motive also was right; for instance, a strong sense of duty, a disinterested desire to promote the happiness of a fellow creature,—or should we deny the character of virtuous to such motives or dispositions,—though, for the time at least, there was no direct intention of obedience to the divine will, or even any idea at the time in the mind that we were, in reality, acting agreeably to the will of God? We admit, again, that the character of the action is greatly heightened, if it not only spring from a sense of duty, and a desire to do good, but also from the belief that it was agreeable to the divine will, and the desire to obey it; indeed it has then reached the highest point of excellence; but we contend that an action is truly virtuous if it be in itself right, *i. e.* conformable to the will of God, and spring from a sense of duty, or a desire to do good; and this in proportion as these motives are pure, *i. e.* free from a regard to our own real or supposed good. The excellent writer to whom we have referred (Pearson in his remarks on Paley), has taken as a definition of virtue, one which only includes the perfection of virtue. We can think of no higher degree of it, than what he lays down as essential to it, voluntary obedience to the divine will. It was the distinguishing excellence of our Saviour's character, that it was his habitual object and aim to do the will of God; and in so far as his disciples imbibe the spirit of their venerated Lord, they will approach that height of excellence in which the will of God will be their will, and his glory their chief aim. But if we refuse the character of virtue to all actions but those which directly spring from this ennobling motive, we must not only say that the speculative atheist cannot be in any degree virtuous, however much he may act from a sense of justice, of benevolence,

&c.

&c. but muſt deny the appellation of virtuous to the moſt worthy, juſt, generous, or humane actions of thoſe who, while they believe in the exiſtence and government of God, yet have little, if any, explicit regard to his will. Their virtue is defective, both in its extent and in its worth. Their characters want that grand quality which is eſſentially requiſite to complete excellence, and which would not fail to give them ſtability and purity, but in ſo far as they obſerve the laws of benevolence, truth, uprightneſs, temperance, &c. from a ſenſe of duty, a deſire to do good, or any other motive *conſiſtent* with the will of God, their conduct is virtuous, and their motives are virtuous alſo. The real excellence of Pearſon's principles of morality, which have their foundation in religion, in a regard to the will of God, will be preſerved, if we define *virtue* to be *the conformity of diſpoſition and of actions which reſult from them to the will of God.*

And here we muſt obſerve, before we proceed, that the views of duty which revelation unfolds to us, will not allow us to ſeparate actions from their motives, when we ſpeak of them as virtuous. Actions may, in themſelves conſidered, be right, and yet, as far as reſpects the agent, have no moral character, becauſe they ſpring from no worthy principles within: they may, as far as reſpects the agent, be even ſinful, becauſe, though right in themſelves, they ſpring from ſinful motives; for inſtance, the libertine may afford pecuniary aid to a diſtreſſed family, in order to gain the confidence and ruin the happineſs of one of its deareſt members. On the other hand, right motives cannot make a wrong action right. The agent may not be culpable, ſince his conduct might be wrong ſolely through unavoidable ignorance; but though his motives may excuſe him in the ſight of God, they cannot alter the nature of his conduct. The perſecutor may really be influenced by the idea of doing God ſervice, and may ſuppoſe that what he does is right; but his acts of perſecution are not thereby deprived of their real character; they are wrong, and can be made right by no motives whatever. For an action to be entitled to the appellation of virtuous, it muſt not only be right, that is, conformable to the will of God, but it muſt ſpring from right motives, that is, ſuch as are conformable to the will of God. On this point it might not be uſeleſs to enlarge, but we muſt proceed with our leading object, referring to Mr. Belſham's 7th ſection, entitled "The Moral Value of an Action eſtimated;" and alſo to Dr. Price's "Review of the principal Queſtions and Difficulties on Morals," ch. 8 and 9. How far we agree with theſe writers, the intelligent reader will eaſily perceive: but we cannot avoid adding, that Dr. Price's views of duty, though we think he would occaſionally have altered them, if he had attended more to the real nature of the human mind, are ſo refined and exalting, that the careful conſideration of them can ſcarcely fail to make a perſon wiſer and better. Though out of place here, we will add, that we find ſome of our ſtatements reſpecting the underſtanding in *Mental* PHILOSOPHY, correſpond beyond our previous expectations with the ideas of Dr. Price in his firſt chapter. The correſpondence is the more ſatisfactory to us, as our views on other points materially differ from his.

(1) By making the will of God the criterion of virtue, in other words, our rule of duty, we do, in fact, include every other criterion of virtue, or rule of duty, that is in itſelf reaſonable and juſt. If it is urged that the dictates of conſcience ſhould be our rule of duty, we ſay, that from attentive conſideration of the nature of man, as well as from the declarations of revelation, it is clear that the conſcience was intended by the great Author of our frame to be our guide in all caſes of emergency, and to have great influence in every department of duty, but that without due care and culture it may and often is erroneous and defective: that therefore it is not ſafe as an excluſive guide of duty, but ſhould itſelf be put under the direction of the ſtill higher principle, the will of God: that we ſhould enlighten the conſcience by the law of God, and other intimations of his will, and then ſubmit implicitly to its direction; but that it is only where its directions are in conformity to the will of God, that it is our duty to obey it. The will of God is at laſt the point to which we muſt come, if we would judge how far the dictates of conſcience ought to govern us: and though theſe do of themſelves often afford us much light as to the will of God, though they may ſometimes be our only direct guide as to the conduct which will be acceptable to him, and in all caſes ſhould receive great attention, yet it is only ſo far as we have reaſon to believe the conſcience to be conformable to the will of God, that obedience to it is our duty: and the will of God ſhould therefore be our chief guide of duty, and ſhould be employed to regulate, correct, refine, and extend the dictates of this ſubordinate principle. Suppoſe, again, that the beneficial tendency or utility of actions and diſpoſitions be made the rule of duty, we reply, that in ſo far as they really have this beneficial tendency, they muſt be conformable to the will of God, and that therefore this rule is alſo included under the rule which ſhould be employed as our grand and invariable guide. The beneficial tendency of actions, &c. may ſometimes be our only guide as to the will of God, and may often aid us in the application of the ſcripture precepts of duty, and ſtill more frequently may ſerve to ſhew us the grounds and reaſons of theſe precepts, their importance, and ſubſerviency to the welfare of mankind: but the ſuppoſed tendency of actions can never be put againſt the law of God as delivered to us by revelation, and ſhould not therefore be made our chief rule. The ſame may be ſhewn of every other criterion of virtue or rule of duty: as far as it is ſelf-conſiſtent, conſiſtent with other principles of duty, and really juſt and uſeful, it cannot fail to be included under that one which it is alike our wiſdom and our duty to make the invariable guide, the will of God. That by which all other principles of duty muſt be tried, ſhould itſelf be employed as our conſtant ſtandard of right and wrong.

(2) The will of God affords a criterion of duty which is abſolutely *univerſal:* it extends to every part of the external conduct, and to every internal diſpoſition. Some rules of duty leave out of ſight important branches of moral excellence: for inſtance, if virtue be made to conſiſt, as ſome moraliſts define it, in doing good to others, in benevolent endeavours to promote the welfare of mankind, thoſe important claſſes of duty which reſpect piety towards God, and the regulations of our own deſires and affections, are completely left out of view; and we have no doubt that this deficiency has in a vaſt variety of inſtances tended to weaken the ſenſe of their obligation, to make them but little thought of, or if thought of, viewed as not eſſential to human virtue. When the will of God is made the rule of duty, there can be no ſuch deficiency. His will cannot but reſpect all our actions, deſires, affections, and diſpoſitions. The laws of God, (by which we particularly underſtand the revealed declarations of his will,) clearly extend to all theſe; and attentive obſervance of the courſe of providence, of the dictates of conſcience, and of the frame of man, while they aid us in the application of the divine commands, do alſo ſerve to ſhew his will in a degree, and with a force, proportioned to the extent and accuracy of our obſervations; and even if there be any

caſes

cafes in which the laws of God fail of application, yet from thefe fources the mind fincerely defirous of knowing and doing the will of God can feldom be at a lofs to difcover what it really is.

(3) The will of God confidered as a rule of duty is an *invariable* principle. As far as we are left to afcertain the will of God from inferior and fubordinate rules, this rule muft, in fome meafure, partake of their uncertainty: but with the laws of God to aid and guide us, to prevent confined experience and an erroneous confcience from mifleading us, it is extremely feldom that there can be any difference of opinion as to duty, where the will of God is honeftly employed as the ftandard. If utility be made the criterion of virtue, or rule of duty, greater or lefs degrees of experience, greater or lefs freedom from the perverting influence of felfifh feelings, will lead to widely different conclufions, if not with refpect to the juftnefs of the grand principles of duty, at leaft with refpect to the extent and application of them. If the dictates of confcience (unlefs it be trained by the very rule of which we are fpeaking) be fixed upon as the guide of duty, we fhall find them varying in extent, in correctnefs, and in power, through the influence of fafhion, of prejudice, of ignorance, of prevalent opinions, and examples. But he who fets out with the will of God as his rule of duty, has a fixed principle which will not bend to the reafonings of the philofopher, to the opinions of the multitude, or to the promptings of paffion. If, indeed, we do not feek for that as a *primary* principle of duty, we may fometimes be led to fuppofe that conduct to be directed by the will of God which is really inconfiftent with it: but the more we feek for the guidance of that principle, humbly, fincerely, and earneftly, the more we fhall find it; and the more we find it, the more firm, fteady, and invariable, muft our views of duty become, for the will of God itfelf muft be invariable. And here we would obferve

(4) That by taking the will of God as our rule of duty, our ideas of duty gradually become clear and comprehenfive, and this to a degree which cannot be generally, at leaft, expected, where we reft in any fubordinate rules. Voluntary obedience to the will of God has an exalting and expanding influence on the mind. If our individual welfare be regarded as the foundation of duty, in fo far as we make it our rule, our views would be confined to our own little fphere, we fhould judge of actions and difpofitions only, or principally, in the relation they bear to perfonal happinefs; and, leaving out of view the intricacies and perplexities in which we fhould be continually involved, our notions of duty (unlefs ftill guided by the rules of revelation) would be as narrow and contracted as the principle on which they are founded. The fame thing may be obferved, though to a lefs extent, as to rules of duty founded upon utility and confcience, unlefs ftill further guided by the rules of revelation: fo far from expanding as we proceed, our views would ufually become limited by difficulties and objections, which, in the commencement of our moral inveftigations, we had overlooked. But fix upon the will of God as the rule of duty, with an impreffive conviction upon the mind that his will muft be right and good, we fee more and more clearly the tendency of obedience to promote the welfare of his rational creatures: one moral truth ferves as the bafis for another: as we advance difficulties leffen: we fee things more as they would be viewed by us if we could take the whole into account and forget their relation to ourfelves: and we learn to view duty in its whole extent, where other rules would leave deficiencies; we learn to view actions and difpofitions without that undue reference to their *immediate* confequences, to which the fubordinate rules of duty muft too generally confine us. From this we are led to obferve

(5) That the will of God, confidered as a rule of duty, is in an eminent degree *a fafe* guide. Several eminent moralifts have made general expediency the criterion of virtue; and the author of Political Juftice, (whofe moral fpeculations, though in fome cafes interefting and valuable, often fhew the folly of leaving the will of God as our chief guide,) maintains, that morality "is nothing but a calculation of confequences, and an adoption of that mode of conduct, which, upon the moft comprehenfive view, appears to be attended with a balance of general pleafure and happinefs." But it is plain that beings who cannot fee the confequences of any action in their whole extent and connections cannot be adequate judges of general expediency: and that if they take this as more than a fubordinate rule of duty they muft be continually mifled by their ignorance and felfifh prejudices. The true plan undoubtedly is, to afcertain, as far as we can, what is our duty, taking the will of God as our rule and guide; and then to purfue it without thinking too much on the particular confequences of our obfervance of it. "The happinefs of the world," as bifhop Butler admirably remarks, "is the concern of Him who is the lord and proprietor of it; nor do we know what we are about when we endeavour to promote the good of mankind in any way but thofe which he has directed." Even benevolence will fometimes do harm, unlefs it is under the guidance of religious principle.

(6) The will of God is a rule which carries with it its own obligation. We may indeed be told, that we have ourfelves admitted that there is one ground of obligation beyond it, which is brought into view by that definition of virtue, which makes it confift in its tendency to promote the ultimate happinefs of the agent; and it is to be allowed, that we may afk with reverence, Why fhould we obey the will of God? But the anfwer is plain and obvious:—Becaufe, under the government of an infinitely wife, good, and powerful being, obedience to his will muft fecure our greateft welfare. When once afked, it is a queftion which never need be afked again. Its anfwer is a felf-evident and neceffary truth. We may fay, therefore, that this rule carries its own authority along with it. We cannot think of any *higher* obligation than the command of that gracious Being, under whofe government we live, and upon whom we depend now and for ever. We have nothing to do but to know what his will is, and then obey, with full fecurity that we are doing what is wife and right; what, in fact, is beft for others and for ourfelves. And we muft again obferve, that if we make the tendency of our actions, &c. to our own ultimate happinefs the criterion of virtue, we have no more fure and general guide as to that tendency than the will of him, upon whom our ultimate happinefs depends; fo that take whatever view of it we will, we come to the fame conclufion.

(7) It is impoffible for any one, who regards the fcriptures as the authentic records of divine revelation, to hefitate in admitting that the principle of religious obedience is the foundation of duty; and that we cannot fulfil our duty, without making the will of God our rule of life. The exprefs declarations of the fcriptures, the examples they prefent to our imitation, and the views they unfold as to the relations in which we ftand to God, all point to this truth. This to the Chriftian muft be decifive; and to him, and to every one who agrees in the foregoing views of human nature, it muft appear an important confideration in favour of the fame pofition.

(8) That

(8) That the employment of the will of God as our *rule* of duty, muſt almoſt neceſſarily lead us to make the will of God our *motive*, as well as our guide. It is indeed a ſuppoſable caſe, that a perſon ſhould habitually employ this exalted rule, only from its being the beſt for him, as the beſt guide to his higheſt intereſts; but ſuch is the conſtitution of the human mind, that it is ſcarcely a poſſible caſe. We are ſo formed, that what we purſue as a means will gradually become our end. In whatever way we learn the will of God, whether by the courſe of his providence, by our conſciences, by the frame of man, or, above all, by revelation, if we ſteadily employ it as our rule and guide, (although in the firſt inſtance, becauſe it is our wiſdom to do ſo, becauſe thus we ſhall beſt promote our own welfare,) it muſt, as we proceed, be continually obeyed, without any explicit reference to its conſequences to ourſelves; and in proportion to the frequency and conſiſtency of voluntary obedience to the will of God, it will of itſelf become our ultimate object. Beſides, if we take the will of God as the guide of duty, it cannot fail to teach us, (what other rules too often leave out of ſight,) that it is our duty to cultivate the diſpoſition to obey him, to ſeek for his approbation, to ſhun his diſpleaſure, to fear him, to love him, to truſt in him, and to ſerve him; and we cannot therefore doubt, both from the natural tendencies of the mind, and from thoſe views of duty which the will of God communicates, that if we do make it our guide, we ſhall neceſſarily be led to make it our motive. Habitual, univerſal, voluntary, intentional obedience to the will of God, muſt be the higheſt point of excellence among all his rational creatures. This motive muſt carry along with it worth and happineſs, ſecurity and peace, in proportion to the ſteadineſs and extent of its influence. This the frame of man, and the courſe of providence, and the light of revelation, moſt expreſsly and forcibly teach us. In proportion as the will of God becomes our motive, ſhall we ſee clearly, and diſcharge ſteadily, the whole of our duty: in that proportion ſhall we become like him, whoſe grand end and aim was to promote the glory of the great Being who ſent him, and to finiſh his work: in that proportion ſhall we become partakers of the divine nature, and the will of God become our will.

We ſhould here be diſpoſed to enter expreſsly into the conſideration of the means we have of knowing the will of God; but ſome remarks, cloſely bearing on this point, will find a place in the next diviſion of this article; and others, reſpecting ſocial duty, have already been ſtated in the 13th ſection of the preceding diviſion.

IV. We now proceed to our laſt diviſion, in which we propoſed to offer ſome concluſions from the preceding diviſions, which may give ſome aſſiſtance in forming a baſis of practical morality.

If our limits of time and ſpace permitted, we had propoſed to make this diviſion more extenſive than we now find practicable, and to introduce ſome conſiderations reſpecting the ſeveral branches of virtue, which come under the denomination of juſtice. We muſt now confine ourſelves to the following objects: 1. The duty of candour. 2. Remarks on a theory reſpecting the confined charities, in Godwin's Political Juſtice. 3. On the extent of the obligation of truth, including ſome principles applicable to other caſes, in which the dictates of duty are not clear.

1. *On the Duty of Candour.*—" The word *juſtice*," ſays Mr. Stewart in his Outlines, p. 234, " in its moſt extenſive ſignification, denotes that diſpoſition which leads us, in caſes where our own temper, or paſſions, or intereſt, are concerned, to determine and to act, without being biaſſed by partial conſiderations. In order to free our minds from the influence of theſe, experience teaches us either to recollect the judgments we have formerly paſſed, in ſimilar circumſtances, on the conduct of others; or to ſtate caſes to ourſelves in which we, and all our perſonal concerns, are entirely left out of the queſtion."—" Juſtice operates, firſt, in reſtraining the partialities of the temper and of the paſſions; and, ſecondly, in reſtraining the partialities of ſelfiſhneſs, where a competition takes place between our intereſts and thoſe of other men. Theſe two modifications of juſtice may be diſtinguiſhed from each other, by calling the firſt *candour*, the ſecond *integrity* or *honeſty*." Mr. Stewart's remarks on the ſubject of candour are peculiarly judicious and important; and we deem no apology neceſſary for laying them before our readers. " This diſpoſition," he obſerves, " may be conſidered in three points of view: as it is diſplayed, 1, in judging of the talents of others; 2, in judging of their intentions; 3, in controverſy.

" The difficulty of eſtimating candidly the talents of other men, ariſes, in a great meaſure, from the tendency of emulation to degenerate into envy. Notwithſtanding the reality of the theoretical diſtinction between theſe diſpoſitions of mind, it is certain that in practice nothing is more arduous than to realize it completely; and to check that ſelf-partiality, which, while it leads us to dwell on our own perſonal advantages, and to magnify them in our own eſtimation, prevents us either from attending ſufficiently to the merits of others, or from viewing them in the moſt favourable light. Of all this a good man will ſoon be ſatisfied from his own experience; and he will endeavour to guard againſt it as far as he is able, by judging of the pretenſions of a rival, or even of an enemy, as he would have done if there had been no interference between his claims and theirs. In other words, he will endeavour to do juſtice to their merits, and to bring himſelf, if poſſible, to love and to honour that genius and ability which have eclipſed his own. Nor will he retire in diſguſt from the race, becauſe he has been outſtripped by others, but will redouble all his exertions in the ſervice of mankind; recollecting that if nature has been more partial to others than to him in her intellectual gifts, ſhe has left open to all the theatre of virtue; where the merits of individuals are determined, not by their actual attainments, but by the uſe and improvement they make of thoſe advantages which their ſituation has afforded them.

(2) " Candour in judging of the intentions of others is a diſpoſition of ſtill greater importance." It is " highly probable that there is much leſs vice or criminal intention in the world, than is commonly imagined; and that the greater part of the diſputes among mankind ariſe from mutual miſtake, or miſapprehenſion. Every man muſt recollect many inſtances in which his motives have been groſsly miſapprehended by the world; and it is reaſonable for him to allow, that the caſe may have been the ſame with other men. It is but an inſtance, then, of that juſtice we owe to others, to make the moſt candid allowances for their apparent deviations; and to give every action the moſt favourable conſtruction it can poſſibly admit of. Such a temper, while it renders a man reſpectable and amiable in ſociety, contributes, perhaps more than any other circumſtance, to his private happineſs.

(3) " Candour in controverſy, implies a ſtrong ſenſe of juſtice united to a ſincere and diſintereſted love of truth. It is a diſpoſition of mind ſo difficult to preſerve, and ſo rarely to be met with, that the moſt uſeful rule, perhaps, to be given with reſpect to it, is to avoid the occaſion of diſpute and oppoſition. A love of controverſy indicates not only an overweening vanity, and a diſregard for truth, but, in general, perhaps always, it indicates mediocrity of genius; for

for it arifes from thofe feelings of envy and jealoufy which provoke little minds to depreciate the merit of ufeful difcoveries. He who is confcious of his own inventive powers, and whofe great object is to add to the ftock of human knowledge, will reject unwillingly any plaufible doctrines, till after the moft fevere examination; and will feparate, with patience and temper, the truth they contain from the errors that are blended with them. No opinion can be more groundlefs, than that a captious and difputatious temper is a mark of acutenefs. On the contrary, a found and manly underftanding is in no inftance more ftrongly difplayed, than in a quick perception of important truth, when imperfectly ftated and blended with error;—a perception which may not be fufficient to fatisfy the judgment completely at the time, or at leaft to enable it to obviate the difficulties of others; but which is fufficient to prevent it from a hafty rejection of the whole from the obvious defects of fome of the parts." "The effects of controverfy on the temper, although abundantly fenfible even in the folitude of the clofet, are more peculiarly adverfe to the difcovery of truth in thofe difputes which occur in converfation; and which feldom anfwer any purpofe, but to rivet the difputants more firmly in their errors. In confequence, indeed, of fuch difputes, the intellectual powers may be fharpened, and original hints may be fuggefted; but few inftances are to be found, in which they do not miflead the difputants to a ftill greater diftance from truth than before, and render their minds ftill more inacceffible to conviction."

2. *Remarks on a Moral Principle in Godwin's Political Juftice.*—Following Hartley, we formerly ftated, as a good general rule of benevolence, that perfons in the near relations of life, benefactors, &c. appear to have, in moft cafes, a prior claim to ftrangers. This rule will lead us to avoid all thofe opinions which attempt to found univerfal benevolence upon the ruin of the more confined charities. However fpecious they may appear, they muft be falfe, becaufe they counteract the moral improvement of man, by checking it at its origin. We particularly refer to thofe which Godwin has advanced in his work on Political Juftice. His moft general principle is, that every individual exertion fhould be fo directed, as to produce the greateft poffible fum of good to the fpecies; and hence he infers that if we have the power to fave the life, or increafe the happinefs of one or two human beings, we owe our exertions to him who is ufeful, and perhaps extenfively ufeful to fociety, in preference to him who is an ufelefs and perhaps injurious member of fociety. The claims of felf are excluded by the general principle. "What magic," fays Godwin, "can there be in the word *my* which fhould change its operation?" Hence the claims of the confined charities ought not to oppofe the deductions from the general principle. Hence it is not our bufinefs, in the direction of our benevolent exertions, to confider the relation in which the individual ftands to us; but that in which he ftands to fociety. Not is he my parent, relative, friend, or benefactor; but is he a worthy or a worthlefs member of fociety?

Godwin's errors are the more injurious, becaufe they are apparently on the fide of benevolence; they refult from the inaccurate extenfion and application of principles which in themfelves are indifputable. Whenever private intereft interferes with the public good, private intereft is to be facrificed; and this, whether our own immediate good is the object, or the good of thofe who are intimately connected with us, by fome of the natural bonds; that is, thofe which arife in the mind by the laws of our conftitution. That the conduct dictated by the confined charities is to yield to what is really for the general good, cannot be difputed; but that we are in all cafes to act totally independently of a regard to thofe confined charities, is a pofition which will not bear the teft of experience, nor of the mental conftitution of man.

In the firft place, general benevolence never could arife in the human foul but through the medium of the more limited affections. Love to others is founded on feelings originally perfonal, then it embraces the narrow circle of our immediate friends and acquaintance, and then, perhaps, there is little difficulty in extending it to thofe who bear with us the relation of children to the great parent of mankind. But before we can form the defire to do good to *all* men, we muft have formed the defire to do good to *fome* men; and though the defire of doing good to fome, may be of that confined nature which would fometimes lead to the promotion of their aggrandizement and happinefs, at the expence of thofe of others, yet the confined charities form too important a part in the great fyftem, to be on this account rejected, as not being on the whole fafe guides. We may lop off the excrefcences, but it would be folly to deftroy the root.

But, fecondly, admit the formation of the affection of general benevolence independently of the private charities, it is obvious that without long culture and enlarged views, the general affection could acquire the vividnefs, which, by their frequent recurrence and particularity, the more confined affections can. Hence the removal of mifery would be left to thofe who had thus cultivated the extenfive affections, and confequently the means of removing it muft be moft materially diminifhed.

Thirdly: this principle would leave no rule for conduct upon which any one could act. If we are to be determined in our acts of benevolence, particularly in cafes of immediate urgency, merely by the confideration of the utility of the individual to fociety, our lives would be a continual feries of calculation, and, in general, of erroneous calculation. Who is there capable of accurately appreciating the worth of the individual? Our ideas are, in general, formed merely upon appearances which ftrike our attention, and force us to obferve them. The filent efficacy of example, and private exertions to remove mifery, and ftill more to remove or prevent vice, the parent of mifery, are in general known only to him who feeth in fecret. Even in cafes where much is obvious, what diverfity fhall we find in opinion; and where the co-operation of individuals for the benefits of others is neceffary, how improbable that they fhould have formed the fame ftandard.

But admit that the cafes are clear, that the perfon whom we are about to leave to death, (which is a fuppofition of Godwin's,) is obvioufly and decifively a lefs important member of fociety than he whom we attempt to fave;—if we violate none of thofe feelings which rife up in the human frame altogether independently of the will of the individual, there can be no hefitation: but fuppofe that our intended conduct will violate them. Let it firft be confidered, that thofe feelings are not only neceffary to the culture, nay, even to the formation of individual benevolence, but to the good order, perhaps to the very exiftence, of fociety. Take the ftrongeft cafe; fuppofe the filial and parental affections to be annihilated, and it is abfurd to juftify and lay down as juft, that conduct which, if not counteracted by the eternal laws of our frame, would lead to fuch annihilation, if that annihilation itfelf be not an object of defire; fuppofe thefe affections annihilated, and the heart fhrinks from the picture. The claims of the helplefs infant upon the parent would be rejected; and if enlarged views of duty to fociety did not induce the parent to think that he had better remove from exiftence a being who would be a burden to others and himfelf,

felf, and who probably would not be educated fo as to be wife and happy, there would arife conftant difcouragements which would effectually prevent thofe fteady, uniform, endeavours to cultivate the mental and moral powers, which are neceffary to attain the object; and if the evil did not foon eradicate itfelf, man, if he exifted, would gradually fink to the level of the brute. But if the parental affections did not exift, neither would thofe of the filial relation. Yet by thefe it is that the rudiments of general good-will are formed in the infant breaft: with thefe it is that the being who is to love all mankind begins his career of love: thefe are the fource of that ardent difinterefted benevolence which carries the individual out of himfelf, which leads him to forget himfelf and all his immediate interefts, and view only the good of others. Can it be fuppofed that this highly cultivated benevolence is in oppofition to that more confined affection from which it fprung? We fee it modifying its direction, but never annihilating it. On the contrary it may juftly be affirmed, that the confined affections become more inwrought in the frame, as univerfal benevolence becomes more and more a feature of the mind: and it muft, for univerfal benevolence is but only the fum total of all the confined affections, extended by the hand of piety. It is perhaps an invariable truth that we love *fome* more in proportion as we love *all* more.

Wherever the claims of the confined affections are in direct oppofition to the dictates of the enlightened confcience, there can be no room for doubt, though we ought to be careful that our departure from their claims not only is, but if poffible, fhall appear to be, demanded by thefe dictates; but even in cafes which, independently confidered, are obvious, we are to take into confideration the evil that will refult from a breach of thefe affections. For this purpofe we fhould confider what would be the confequence if our conduct became general: and next the tendency of human conduct to fuch extenfion. There are fome affections which not all the efforts of philofophy could fucceed in eradicating: vice may do it, and heedlefs levity; but the calm exertion arifing from a view to utility never could. We refer to the parental affections. Hence though we might condemn the parent who left his fon to perifh in the flames, while he endeavoured to fave the life of Fenelon, and fhould require ftrong proof that the parental affections exifted in him, in their due force; yet we fhould doubly condemn the fon who in fuch a cafe left his father to perifh.

Godwin's principles, if carried to their full extent, would deftroy fociety. We prefume that the ardour of general benevolence mifled him, and that in his wifh to make its dictates paramount in the human breaft, he forgot, or rather did not obferve, that he was endeavouring to counteract the moft effential laws of the human frame. It is one of thofe numerous inftances in which an acquaintance with the human mind is neceffary: had Godwin attended to its laws, it is reafonable to hope that he never would have given a theory to the world, which even a flight acquaintance with its practicability and effects fhould have configned to oblivion.

On the Obligation of Truth.—We fhall in this fection offer fome confiderations on a fubject of no fmall importance, and which has been the fource of fome very erroneous and injurious principles; we mean the reftrictions which eminent moralifts have admitted to the duty of truth.

A *lie* is *a falfehood told with a defign to deceive.* Whatever be the motive leading to the employment of it, it is equally a lie. The moral culpability of the individual may be leffened or increafed by the motive; but nothing more. We may call it by the mild appellations, *untruth, falfehood, departure from truth,* &c.; but the nature of the thing is not altered. A falfehood told with the defign to deceive is a lie. The expreffion a *departure from truth* does not appear invariably to imply any *intention* to deceive; a *breach of truth,* according to common ufage, always does. *Veracity* expreffes the difpofition to adhere ftrictly to truth: it is uprightnefs in our words. A *departure from veracity* always implies an intention to deceive; and ftill more forcibly does a *breach* of veracity.

It is an important maxim in morals as well as in education, to call things by their right names. The odium of vice is often leffened by mild expreffions refpecting it. And, on the other hand, moral diftinctions are often confounded, by giving to things, in themfelves harmlefs, appellations which properly belong only to what is morally culpable. Fictitious narratives, *e. g.* are not lies: if the author pretend that they are founded on fact, or that they are true, when fuch is not the real ftate of the cafe, that affertion is a lie; but the narratives themfelves are not lies. In like manner the exaggerations too common in converfation, and thofe falfehoods which folely arife from unfortunate mental habits, without any intention to deceive, and thofe expreffions of complaifance which, though not true in their ftrictly literal fenfe, are fo in the way in which they are almoft univerfally interpreted, thefe ought not to be called lies. We do not fay that they are altogether free from moral culpability; but it is not that of intentional deception. The exaggeration, or the expreffion of complaifance, may be intended to deceive; and then it becomes a lie; and in proportion as it verges to this point is its culpability. The culpability of the other departures from truth, (fee Intellectual *Education,* col. 31.) depends upon the degree in which the individual has been negligent in his endeavours to check, or to correct, fo injurious a habit: in itfelf confidered it has no moral quality.

We have given the only definition of a lie which appears precife and intelligible; and it is accordant with the ferious ufe of the term in common language. We fear that Paley has contributed to caufe great incorrectnefs of expreffion, and even great laxity of principle, on this fubject; and we are led to enter fomewhat more fully into it from this circumftance. When we fee that eminent writer expreffing himfelf fo loofely as to fpeak of thofe falfehoods which are not criminal as not being lies, and laying down as a maxim that falfehoods are not criminal, "where the perfon to whom we fpeak has no right to know the truth," we feel apprehenfive of the confequences, and fhould rejoice to be able to correct his views by thofe principles of morality which our rule of duty appears to us decidedly to prefcribe on the fubject.

Paley does, indeed, qualify a little the random pofition we have quoted from him, by adding, "or, more properly, where little, or where no inconvenience refults from the want of confidence in fuch cafes," and his illuftrations are cafes of an extreme nature; but he ftill founds the obligation of truth upon a balance of known or fuppofed advantages, or even of conveniencies; and his authoritative decifions on this point have, we doubt not, often led to departures from truth, where an unbiaffed judgment muft have fhewn at once what was the way of duty.

This is a period of inquiry and fpeculation; and there are few who have opportunities of mental culture, who do not meet with difcuffions and difficulties, which the religious man of plain underftanding might decide at once by an appeal to the fcriptural rule of life, but which puzzle the reafoner who prefers fome other bafis of duty than the will of God, and ftill more miflead the confciences of thofe

 who

who want juftification or excufe for their own half-acknowledged violations of duty. And there are cafes in common life, where thofe who are accuftomed to think of the confequences of their actions, and rightly judge that they may thus often obtain important affiftance in knowing the will of God, are apt to lay too much ftrefs upon the *immediate* confequences, where their way would otherwife be clear. And the worft of all is, that thefe fpeculative difficulties, and thefe fuppofed excufable departures from a clear and acknowledged rule of duty, are continually leading to other departures which are obvioufly wrong; and this particularly among the young, and thofe whofe views of duty are not yet fettled, and their habits confirmed. The influence, too, of authority is great, efpecially where it accords with the previous difpofitions, and with the prefent interefts. And it is peculiarly injurious, where we look up with juft refpect to the moralift who fanctions fuch departures,—refpect founded upon his eminent ufefulnefs, and upon the general correctnefs of his principles, united with an interefting and convincing method of proof and illuftration. And with refpect to example, a lie is a definite thing: and the young and uninformed can ufually judge as correctly as to the fact, as perfons of the moft cultivated underftanding; while at the fame time they cannot enter into the force of thofe nice difcriminations and plaufible reafonings, by which fuch perfons bewilder themfelves, and perfuade themfelves that they are excufable in violating an exprefs rule of duty. It has often in fuch cafes been, we doubt not, the inference,—"If another is excufable in lying, in order to prevent fome mifchief, or to produce fome good, why may not I? and if this exprefs law of God may be broken, when fome good is to be obtained, or fome evil to be fhunned, why may not another?" The ftate of the matter is, that the *extreme* cafes in which the obligation of truth has been fuppofed to ceafe, are of very rare occurrence; and if the exception were confined to them, it would be attended with no advantage to bring them forwards for public difcuffion: but when an exception is admitted to a rule of duty, unlefs it can fo be well defined, as to form itfelf a rule, there is no knowing where to ftop. The fhades of diftinction in cafes of moral conduct are often fo much blended, that it requires a very difcerning eye to perceive their limits; and all know that when felfifh feelings of eafe, of pleafure, or of profit, are concerned, they never fail to throw a film over the eye of the underftanding, and greatly obfcure its power of difcrimination. Thofe fuppofed exceptions to truth which are of an extreme nature, feldom fail to lead the fpeculative philofopher to others in which the way of duty feems to the Chriftian moralift perfectly clear: and thefe again at leaft furnifh excufes, and fometimes imaginary juftification, for departures from truth in which thofe who judge by the ftandard of revelation can fee nothing but guilt.

It may perhaps make our way clearer, if we come to the more direct confideration of the cafes of real or fuppofed difficulty, and attend a little to fome fundamental pofitions which fhould have great influence in all our inquiries refpecting duty.

(1) General rules of duty are abfolutely neceffary for the moral welfare of man; and, therefore, whatever tends to weaken the influence of any fuch rule, is in itfelf confidered an evil. To perceive the neceffity of general rules of duty in the prefent condition of human nature, it is fimply requifite to confider what would be the ftate of things without them. We fhould then be under the neceffity of calculating in every cafe that comes before us, on which fide the good or evil attending the propofed action preponderates. In fact, our lives muft then be a feries of mere calculation, and the active employments of life muft be interrupted or altogether neglected. We fhould be obliged to decide, in numerous cafes of continual occurrence, without poffeffing the means of judging as to the confequences of our actions. The great mafs of mankind would be left without any guide. All would be left under the influence of emotion, prejudice, and felf-love; and no confiftency or regularity could be expected in the moral conduct of men. We are not unfrequently unable to trace completely even thofe confequences of actions which are immediate and apparent: ftill lefs thofe which gradually arife in the filent lapfe of time. The confequences of actions may laft, when the agents have long finifhed the journey of life. Our actions may influence others: our deviations may directly or indirectly produce more extenfive deviations, of which we fhall have, and can have, no knowledge. Perhaps there is fcarcely an important action of our lives, the confequences of which are confined to ourfelves, or even to our own fphere of obfervation. Befides, if we were unable to lay down general rules for moral conduct, and were obliged to decide upon each action as it occurred, it is fcarcely poffible that we fhould avoid the influence of heated feeling; and we fhould feldom poffefs that abftraction of mind, which would enable us to leave the prefent out of confideration, and view with calmnefs and impartiality the real tendencies of our actions. The cafes are innumerable in which intereft or paffion paints in vivid colours the courfe to which they prompt; and throw into the back ground, and render almoft imperceptible the dangers which fhould induce us with fteady firmnefs and perfeverance to avoid it. From thefe confiderations taken together, it may be regarded as indifpenfably neceffary, that there fhould be general rules for directing the moral conduct; and from this it immediately follows, that every deviation from a general rule of duty muft, in itfelf confidered, be an evil.

(2) In confidering the confequences of departing from a rule of duty, we muft not confine ourfelves to the *immediate* confequences; but muft alfo take into account the ill effects arifing from the limitation of the rule itfelf, the tendency of one limitation to furnifh ground for another, the tendency of one departure from the rule to lead on to another, to weaken its authority in our own minds, to weaken its authority in the minds of others, and fo on.

(3) *Expediency* muft always give way to *right*. *Expediency* particularly refers to the temporal confequences of actions, efpecially to thofe which actually come within the fphere of our own obfervation; and, of courfe, our views of it muft depend upon the comprehenfion of our minds, and upon the extent of our experience and obfervation. *Right* takes the whole into confideration, and refts moft on eftablifhed principles of duty, particularly thofe derived from the divine law. As foon as a perfon has by any means fatisfied his mind refpecting the will of God, in any particular cafe, he then knows what is right for him. Expediency is peculiarly the fubject of prudence; right, of duty. Though it is often the part of duty as well as of prudence to do that which is moft expedient; yet where expediency appears to oppofe a clear rule of duty, we ought not to hefitate in our choice. The right, purfued aright, muft always prove, under the government of wifdom and benevolence, the moft expedient.

(4) Where the rules of duty are not only agreeable to the dictates of confcience, and to thofe conclufions which are drawn from an extenfive confideration of the external and internal confequences of actions, of the frame of man and the courfe of Providence; but are alfo fanctioned by the

the exprefs authority of revelation, they ought not to be violated, except in cafes of abfolute neceffity; that is, where, after a ferious deliberate examination, they appear to us to interfere in their direction. In fuch cafes, (which, however, are very rare, even in our prefent ftate of knowledge as to duty, and which in all probability will hereafter altogether difappear,) we muft, to the beft of our abilities, balance the importance of their directions, and decide by the refult. According to the old maxim, we muft, of two evils, choofe the leaft.

(5) If ever the rules of duty appear to interfere in their directions, we muft be confiderably guided by the comparative importance of the rules themfelves. In forming the comparifon, we muft take into account, not merely the confequences of the particular cafe, but alfo the ftrength and univerfality of their obligation; the confequences which would follow from their being generally neglected, and the common tendency to fuch neglect; and alfo the nature of the confequences, whether they affect the religious and moral welfare of ourfelves and others, or refpect temporal interefts merely; and again, we muft confider whether the rules are clear and definite, or whether they are by their nature indeterminate; becaufe, where they are clear and definite, the violation of them is obvious and certain; where they are indeterminate, the violation of them may be in appearance only; and the confequent ill effects on the minds of others, will ufually be lefs in the latter cafe than in the former. Some may perhaps think, that if all thefe calculations are to be made in cafes of duty, the way of duty muft be indeed difficult and perplexed. The fact is, we are fpeaking of cafes which, if the mind be under the guidance of religion, are of rare occurrence. An humble devout heart is the beft preparation for knowing our duty. The wifeft among the fages of antiquity has well faid, "truft in the Lord with all thy heart, and lean not to thine own underftanding; in all thy ways acknowledge him, and he fhall direct thy paths."

(6) It appears to us a clear and important moral principle, (founded, in a great meafure, on the foregoing confiderations,) that the violation of any rule of duty is wrong unlefs it is right; that is, unlefs it be required by fome other rule, which, in the particular cafe at leaft, requires the preference as more urgent and important. For inftance, obedience to parents is a clear and pofitive duty; and where no higher duty interferes, difobedience cannot but be wrong; but it may happen that a parent commands what is forbidden by the laws of God; and it then is not only right to difobey, but it would be wrong to obey. With refpect to the rules of duty, there is, we apprehend, no middle courfe. If no higher rule interferes with the operation of that which refpects our own cafe, it is our duty to obey it; if a higher rule does interfere with it, it is our duty to neglect it. In every cafe of moral conduct, there is but one right courfe; every other muft be wrong. Not that all the rules of duty are of equal importance; ftill lefs that there are no degrees of right and wrong, as far as refpects the motives; but that our actions, to have any moral character at all, muft either be right or wrong. There is no neutrality in duty.

We have not referred to the motives leading to any departure from a rule of duty, becaufe our concern is not here with the criminality of the agent, but merely with the character of the action; and, indeed, it belongs not to any human being to apportion to each his place in the fcale of moral worth. He only who knows the fecrets of the heart, can know, with certainty, in any cafe of departure from duty, whether it arofe from blamelefs ignorance, from a miftaken defire to do right, from benevolent feelings, or from weaknefs and timidity, from the promptings of intereft, from directly criminal difpofitions. Where actions are right, we fhould not readily admit fuppofitions tending to lower the worth of them; where they are in themfelves indifferent, we fhould be cautious in affigning wrong motives to them; and even when wrong, we ought readily to admit and fuggeft what will palliate the culpability of the offender; but we fhould never allow ourfelves, through the feelings of candour, to confound the diftinctions between right and wrong; and, without pretending to afcertain the merit or demerit of the agent, it is often neceffary to decide refpecting the rectitude or immorality of his conduct, both with a view to our own guidance, and as a direction and warning to thofe around us. Ignorance is an excufe for departures from duty, only where it is unavoidable. If it arife from the want of a fincere defire to feek and find the true path, or from an indifpofition to fee the truth, becaufe the truth will probably condemn; ignorance partakes of the criminality of thofe fources of it, and is refponfible for its confequences. And the true way to acquire ftability and confiftency of conduct, is to enlighten the confcience beforehand, to form judicious fteady principles of action, and to fubmit to their guidance without allowing the immediate confequences to enter much into our calculations. Such a principle, we are fatisfied, is what we have already ftated; that the violation of any rule of duty is wrong, unlefs in the circumftances of the cafe it is required, by fome more immediately urgent and higher rule; that is, unlefs in thofe circumftances it is right.

The application of the foregoing moral principles to the difficulties of veracity, is fufficiently obvious; but a general view of it may abridge the particular confideration of them. There may be cafes in which benevolence feems to lead to a violation of truth. It is our duty to do good as we have opportunity, and therefore, the cafuift may fay, fince in this particular cafe, the good to which benevolence points is great and important, the neceffity urgent, and the ill confequences of a breach of truth are flight, here benevolence ought to fufpend the obligation of truth, and here *falfehood* is a *duty*. The genuine feelings of uprightnefs and fincerity can fcarcely bear fuch a combination of terms; and yet falfehood cannot be otherwife than wrong, unlefs it be abfolutely right. But let us not decide by mere feeling, left when the defire of felf-juftification turns the fcale, principle fhould be forgotten. The falfehood muft be an evil, as a violation of a pofitive rule of duty, exprefsly enjoined, and ftrongly fanctioned by the revealed will of God. It muft be an evil, becaufe that rule is of the utmoft confequence to the temporal and fpiritual welfare of mankind; for words are the grand medium of all the influence we have over the happinefs of others, and mutual confidence is neceffary to this influence, not only in cafes of prefent intereft, but in thofe which are moft clofely connected with our eternal well being. It muft be an evil, becaufe that rule is clear and intelligible; admitting of but one meaning, and that perfectly precife and definite; becaufe the rule is univerfal in its application, in no cafe made to depend upon confequences, but abfolute in its injunctions, and in no cafe inconfiftent with itfelf; becaufe the rule is upheld by the authority of the confcience, where this is enlightened by Chriftianity, and cannot be flighted without neglecting its dictates; becaufe the rule is fo ftrict, precife, and extenfive, that fcarcely any exception can be imagined, which, if allowed to be right, will not juftify others; and thefe juftify or palliate others, and fo on, thereby weakening its authority and its value, and making way for thofe baneful effects which

which neceffarily arife from the common neglect of it, in proportion to that neglect; becaufe the obligation of this rule is fuperior to that of the other rules of focial duty, inafmuch as they require truth, and therefore it has their obligation to fupport it; and at the fame time it has an obligation of its own. In moft cafes benevolence clearly enjoins a ftrict adherence to truth, and in like manner does juftice; and juftice never fets any limit to its obligation; this of itfelf would make truth a duty; but befides this, its authority refts on the ftrong declarations of the confcience, and upon the more fteady unvarying declarations of the law of God, and therefore, upon its powerful and all-important fanctions.

Againft all this, he who is determined to adhere to duty cannot, with any confiftency, place any felfifh interefts;—no one at leaft can fuppofe that the greateft worldly interefts can *outweigh* the obligation. But the limits which appear fometimes to be fet to it by benevolence, have coft many a perplexity and many a ftruggle; and too probably many a departure from truth, and we doubt not many a bitter pang of remorfe when the mind ceafed to be guided by the impulfe of feeling, and when the confcience has become enlightened by a fteady principle of religious duty: for though we cannot but fuppofe that he who knoweth our frame will make every allowance for our wanderings from the narrow path of duty which not felfifh anxiety, but real, though not enlightened, benevolence has produced, yet piety, whenever it gains its full fway in the heart, will make it feel its weaknefs, if not prefumption, in fuppofing that the good of the creature might lawfully be fought by means which the all-wife Creator hath forbidden. The commands of God muft be a better guide for promoting the welfare of mankind, than thofe affections which, though implanted by him to excite to promote it, are capable of a wrong direction, and clearly require the fupport and guidance of a higher principle. Benevolence, confidered as a *rule* of duty, never can be inconfiftent in its directions, becaufe it requires us to do the *greateft* good in our power; and pious benevolence muft always feel a confidence, that this will be beft accomplifhed by a fteady adherence to that courfe of duty which infinite wifdom and benevolence has prefcribed: but benevolence, as it refers to our own *feelings*, is often inconfiftent in its directions, and may miflead us;—it may dwell upon fome fuppofed good or means of good, when fome other ought in the eye of reafon to be the end propofed;—it may be directed to one object, when, if our comprehenfion were enlarged, we fhould give the preference to another; and, (what is moft to be apprehended,) where not completely placed under the direction of piety, it muft often be fubject to the capricious inconfiftencies and partialities arifing from felf-love. Where, however, the heart is devoted to do good, and common prudence is employed in effecting it, we need not be afraid of following the dictates of the benevolent affections, unlefs they interfere for the time with fome higher principles; nor fhould we be too fcrupulous in our calculations, left we lofe means and opportunities which cannot be recovered; but wherever our feelings prompt us to facrifice fo important a principle of duty as truth, in order to do fome fuppofed good, let benevolence reprefent that it is not immediate good, or temporal interefts alone, which are to be taken into account, but future evils alfo, and the fpiritual well-being of others and ourfelves; and if even their confcience is undecided, let piety fay, whether in the departure from an acknowledged, ftrict, exprefs, unlimited rule of duty, we can hope for the approbation of him who feeth the heart. One whofe noble facrifices to a fenfe of duty will ever endear his memory to all who know and can appreciate their value, (we refer to the excellent Lindfey,) has well faid, " God does not want our finful acts;" and one whofe authority muft rank high with the Chriftian, has taught us not to do evil that good may come. Obedience to the will of God muft in all cafes be beft for frail erring man.

We once more return to the fame point, if any cafe can be pointed out in which, all things taken into account it is right, our duty, to depart from truth, then and then only can fuch a departure ceafe to be wrong, and contrary to duty. We can admit of no exception to a rule of duty, which we cannot make itfelf a rule of duty; and to fo clear and definite a rule as that of truth, no exceptive rule can be admitted, which is not itfelf perfectly clear and definite.

The chief exceptions to the obligation of truth which have been admitted by different moralifts, are, where falfehood is fuppofed to be important to the fpiritual welfare of others,—in the conduct of wars,—in cafe of immediate danger to our life or the lives of others,—in intercourfe with thofe who do not poffefs the ufe of reafon, or who have not yet acquired it,—and in the fick chamber.

1] It is rather fingular, that in what is, in fome points of view, the ftrongeft cafe, where the benefit to be gained, or the evil to be avoided, refpects the fpiritual welfare of others, it is almoft univerfally allowed that no violation of truth is admiffible. What were once termed *pious* frauds, are now pretty generally confidered as *impious* frauds. It is a great and good end, to promote the moral well-being of a fellow creature,—to communicate to him thofe views and principles, which will preferve him from vice, and raife him in the fcale of moral worth; and there can be no doubt that this is our duty as far as our influence extends; but we here fee clearly that we are not to employ unlawful means to promote a lawful end, even though that end be important in the higheft degree. It is true, increafed experience and enlightenment give us now the means of perceiving, that, in reality, the evil furpaffes the good; and that the good, if not in the individual cafe, yet, generally fpeaking, is beft accomplifhed by employing only the weapons of truth,—is even greatly impeded by employing thofe of fraud and falfehood; but this could not be perceived when fuch departures from truth were practifed by fome of the Chriftian fathers, and even applauded by them. They had, however, the exprefs rules of revelation to guide them, as we have; and the immorality of their conduct confifted, not in the intentions, and in the end propofed, but in fetting up their weak judgments in oppofition to the commands of God, and doing evil that good might come. We have referred to this cafe, not becaufe any enlightened Chriftian can now hefitate in believing, that he is forbidden by duty to endeavour to promote the caufe of Chriftian truth and practice by means which are inconfiftent with that fimplicity and fincerity which the Gofpel requires; but becaufe fuch means were once, by great and good men who were heartily devoted to that caufe, confidered as allowable and even juftifiable,—that we now fee that they were wrong,—and that this fhould teach us great caution in admitting of any fpecious exception, fince the beft ends will not fanction bad means. It fhould be an invariable principle, that unlefs duty *requires* the violation of truth, duty forbids it.

2] With refpect to the falfehoods employed in the conduct of war, we have but little to fay. War is in all cafes an evil. It may fometimes be a neceffary evil; but in all it is a great one; and in no view greater than as foftering the evil paffions, and cultivating the vices of men. In many circumftances, deceit in actions is a part of the fyftem of warfare;

warfare; and if war itfelf be ever juftifiable, we fuppofe that ftratagems in the conduct of it, not involving any breach of faith, muft alfo be fo. But there is a clear and well-defined diftinction between fuch ftratagems and lying; and the horrors of war would be greatly increafed and prolonged if falfehoods alfo were employed to deceive. Befides, it would alfo deferve confideration, if the queftion were not already decided by a general fenfe of expediency, that the employment of falfehoods, while in a ftate of warfare, would not be confined to it. The foldier would not make thofe nice diftinctions which the general might have endeavoured to make, to fatisfy himfelf that he was not doing wrong; and thus his regard to truth would be weakened. And it may farther be remarked, that the violations of duty practifed by thofe whofe general conduct from any circumftances excites our admiration, whether obferved by ourfelves, or read of in the pages of hiftory, have a great and direct tendency to confound moral diftinctions in our own minds, to weaken our abhorrence of what is wrong, and to lead to the practice of it. It is not poffible for any man to know, when he departs from duty, when the ill confequences ftop.

3] Cafes have occurred where a perfon has preferved his life by a breach of truth. In fuch cafes we muft leave the culpability of the individual to the decifions of him who alone can fully appreciate the moral worth of actions; our examination merely concerns his conduct. If it be right to preferve life by falfehood, it muft be wrong to forfeit it by adherence to truth; and yet, we conceive, there are few who would not cordially approve and admire the conduct of him who, in fuch circumftances, followed truth at the certain rifk of his life. As far as his conduct is known, it neceffarily tends to produce a fteady love of duty, a decided attachment to principle; as far as the conduct of the other is known and regarded as juftifiable, it tends to weaken the fenfe of the obligation of a virtue, which is of the firft importance to the well-being of fociety.

We confine ourfelves to the cafe of fimple falfehood to preferve life. If, farther, there be a defertion of fome important principle, there are few who can hefitate. The difciple of him who came to bear witnefs to the truth, and who bore it in the midft of fuffering and of death, cannot but regard it as the indifpenfible duty of every one, who believes he poffeffes Chriftian truth, to ftand by it at any rifk. It was by this noble determination in the breafts of the early confeffors and martyrs, that Chriftianity made its way in the world: it was by the fame noble determination in the minds of the firft reformers and their followers, that Chriftianity has been freed from its groffeft corruptions. But if, in fuch cafes, we perceive at once that truth is not to be violated, it is only becaufe we fee the good confequences of adherence to it in a more obvious and ftriking light. The prefent evil is the fame as in the cafe where there is no further defertion of principle, than what is implied in the fimple defertion of truth; and the folly and bafenefs of it in the one cafe, fhould make us feel great hefitation in fuppofing it to be right in the other; and if it be not right, we muft pronounce it wrong.

But let us try to trace the confequences a little. Suppofe a perfon in fuch a dreadful fituation, that a lie appears to be the only means to fave his life. If he have been habitually accuftomed to regard a lie with abhorrence, it is extremely improbable that he will be able to tell one in fuch circumftances, with that firmnefs and freedom from embarraffment, which will make it effectual. But allow that he has the requifite prefence of mind, (which by the way would ufually enable him to obtain the end without falfehood,) what are the effects of fuch violation of truth on the murderer, on himfelf, and on others. The highway-robber, for inftance, would take for granted, that if one man may juftly lie to fave his life, another will feel at liberty to do the fame to fave his money; and though, in the particular inftance, confidence has been obtained, yet in proportion as this exception to truth is admitted as right, fo will that confidence be deftroyed in other cafes, which is often fo neceffary to the prefervation of life. There can be no doubt, that if there were not that general degree of confidence, life would often be taken away by the depredators on fociety, where now they are contented with fimple robbery. Thus the probable effect of lying to fave life would, perhaps, univerfally be, to make even truth unavailing to fave it. But farther, very few inftances occur in which the fuccefsful lie does not weaken the individual's general refpect for truth: but fuppofing that this ill confequence does not follow, and that the individual, being under the influence of a ftrict regard for truth, has merely departed from it in this extreme cafe, becaufe in this extreme cafe, and this alone, he thought it juftifiable,—can the limit, which is thus broken down from the laws of duty, be removed to any place a man may choofe? If one may juftly lie to fave his life, why may not another to fave that which he values more than life, his reputation? why may not a third lie to fave that on which the comfort of life depends? Indeed, when once we allow exceptions to the rules of duty, which are not rendered neceffary, (in other words right,) by the obligation of fome higher duty, there is no knowing where to ftop. The property, which to one may appear as valuable as his life, and for which he thinks that he may juftly violate truth, may be a mere trifle to another: but if one may lie to prevent the lofs of a thoufand pounds, why may not another? and if for a thoufand, why not, in correfponding cafes, for a hundred? and fo on: if one may juftly lie to preferve his reputation, or any other poffeffion which he values, or thinks he values, as much as his life, why fhould another be culpable who does the fame to acquire it?—Inftances continually occur, in which men rifk their lives to defend their property, or even a comparatively fmall portion of their property; and yet fome fuppofe that it is juftifiable to avoid fuch rifk, where truth muft for this purpofe be violated. If it be, then truth is not to be regarded as of the fame value as money. But, indeed, there is no end to the difficulties and inconfiftencies in which we muft be involved in this and every other cafe of moral conduct, by departing from the plain ftraight forward path of duty. If any one fhould be expofed to a trial fo fevere as what we have been confidering, let him call to mind, that there is fomething more valuable than life and every external means of comfort,—the approbation of our own hearts, and the prefent and final approbation of Him, who is greater than the heart: let him call to mind, that there is fomething more terrible than death, the anguifh of a wounded fpirit, and that which alone need render death terrible, the confequences which are to follow it.

It may indeed be faid, that no one but he who has a confcience in fome good meafure void of offence, could be without that dread which would prevent him from adhering to the ftrict line of duty at a rifk involving not only life, but interefts of infinitely more importance. We allow it: but our confideration here is, what is the ftrict line of duty in fuch a cafe; and what courfe a man of uprightnefs, veracity, and fortitude, ought to purfue, and would purfue, under the ftrong influence of religious principle and regard to the dictates of confcience; and we fuppofe, that he would in fuch a cafe think he had nothing to do but to do his

his duty, and humbly leave his own interefts, and the interefts of thofe whom he held moft dear, in the hands of a gracious and all-wife Providence.

4] With refpect to education, we feel confident that the ftricteft truth and fincerity ought to be employed on every ground, not merely of duty but even of expediency. Children are, at a very early age, aware of deception; and at this point of the mental progrefs, the feeds of truth or falfehood are to be fown. Implicit confidence in the word of a parent, is of the utmoft confequence to give that influence, and to produce that obedience, which can never follow from parental authority alone; and he who departs from truth in his intercourfe with his child, will fome time or other have caufe to lament his weaknefs and his folly. The habit of truth cannot be begun too early; nor is there any effectual method of producing it as a permanent, confiftent, actuating principle, but by ftrongly impreffing the mind with an abhorence of falfehood, by making its ill confequences perceived and felt, and by calling in (on fuitable occafions, and in proper degrees) the authority of the divine commandments and the aid of religious principle in general: and all this cannot poffibly be done with fuccefs, if truth do not ftrictly regulate the words of thofe by whofe inftruction, and difcipline, and example, the principles of moral conduct are to be formed or cultivated. The truth need not always be told to a child; and by proper care and early repreffing a more prying curiofity, and efpecially by acquiring their confidence, we may make our children not only fubmiffive, but *fatisfied* without knowing every thing that we know: but falfehood they fhould *never* be told. See MORAL *Education*, III. 13.

It really ought to make us extremely fufpicious of every fuppofed reftriction to the duty of truth, to recollect, that once it was thought *right* to lie in order to promote the fpiritual welfare of others; and that, even till very lately, it has been reprefented by Chriftian moralifts as at leaft allowable in our intercourfe with children. In the former cafe the folly of fuch conduct is now univerfally admitted; and, in the latter, we truft that religious parents, at leaft, fee more and more what wifdom and duty alike require from them. The heathen poet has given them a noble maxim, "The greateft reverence is due to a child;" teaching us, that in no cafe fhould we do or fay in the prefence of children, what will tend to weaken their fenfe of duty and difpofition to practife it: and fhall it be fuppofed, that thofe who are enjoined to bring up their children in religious obedience, can be juftified in loofer principles of morality?

5] After what has been advanced, efpecially in reference to the general principle, we think it cannot be neceffary to fay much on a cafe of common occurrence, but in moft inftances of very eafy decifion; we mean, in our intercourfe with the fick. If, in fuch circumftances, the immediate advantage to be gained appear to require a breach of truth, we fhould call to recollection that it cannot be obtained but by the violation of a ftrict, and moft important rule of duty; and if, after this, we cannot reft fatisfied without confidering confequences, let it be taken into account that, in the particular inftance, every fuch departure from truth muft, as far as it is difcovered, which it commonly is, directly tend to weaken that confidence which is peculiarly neceffary to preferve the mind calm and tranquil, and in its place introduce a haraffing and injurious fufpicion; and alfo to weaken confidence in the other exercifes of the domeftic relations; that it contributes greatly, and almoft inevitably, and far beyond ufual eftimation, to leffen the regard to truth in thofe around us; that there can be no reftriction to fuch departures, and that in proportion as they become frequent, they muft defeat their own purpofe, and at any rate muft often make truth unavailing where it is of the utmoft confequence for peace of mind, and even for the continuance of life.

We cannot poffibly fee the whole refult of our actions; and without perplexing ourfelves too much with the difficulties of particular cafes, it is beft to go on, without the wavering of uncertainty, fatisfied that all we have to do, is to exercife ourfelves to that prudence and felf-control which will make the confequences of truth as little injurious as poffible. If there are any extreme cafes of the above defcription, where a departure from it becomes our *duty*, it muft be included in the clafs which we are about to confider.

We have proceeded thus far, not without difficulty, but with fatisfaction. We have not been without the apprehenfion that we fhould appear to ftrain the principles of duty too far; and are well aware that if we really did fo, we fhould do injury, rather than fervice to its caufe. We can only fay that we have allowed this apprehenfion its full influence. We have examined the fubject at different intervals, and with various degrees of experience; and our ideas remain radically unchanged, and our conviction in the juftnefs of them in feveral inftances more fatisfactory. With refpect to the cafes of moft conftant occurrence, we have no difficulty remaining; with refpect to the extreme cafe (ftated in No. 5,) there it appears to us that every felfifh intereft is to be given up; but it is only becaufe we deem this an inevitable confequence from principles which appear to us indifputably true. If any bias has exifted refpecting it, it has been what we have above ftated. If we faw reafon to think it right, we fhould willingly give it up, as being, in appearance, little calculated for actual practice. But we fee no line which can be drawn to exclude it from the general obligation; which will not, at the fame time, exclude thoufands of inftances in the daily occurrences of life, where, neverthelefs, no doubt can exift in the mind of any one whofe confcience is at all guided by our rule of duty. We are farther fatisfied that the admiffion of the exception would, in almoft all inftances, defeat its own purpofes; and we know that it is a principle of Chriftianity that our prefent interefts are never to be placed in competition with our duty; and we fee that benevolence requires this as well as religion.

6] After deliberate re-examination, however, of our own difficulties, in thofe cafes where a departure from truth may be neceffary for the prefent welfare of others, we think we perceive a rule which may guide us, fo as to fuit the actual condition of human nature, without leading us too far. When confidering it for their own fatisfaction, we entreat our readers to apply our principles. If thefe exclude it, let the cafes it includes remain among the difficulties of duty which we have at prefent no means of fatisfactorily removing. Feeling ourfelves the force of the obfervations ftated in different parts of this fection, it is with much hefitation that we propofe, as a reftrictive rule, that wherever the evil attending a ftrict adherence to veracity affects *others*, and is otherwife *unavoidable*, and *abfolutely irremediable* there, and, as it appears to us, there only, we fhould do *right* to depart from it. This limit *feems* to be required by benevolence in fuch cafes as thefe; where, by departing from veracity, we could fave the life of a perfon who, we had reafon to believe, was in a ftate utterly unfit for death; or, of an excellent parent on whom a young and numerous offspring abfolutely depended for fupport and for training up in the way of duty; or where, by fuch means, we could prevent an irretrievable injury to the moral purity of one whofe chaftity was yet unftained. And if it be really required by benevolence in ſuch caſes as theſe, we know no reſtriction which will not include every caſe affecting others, where the evil is otherwiſe *unavoidable* and abſolutely *irremediable*. We have reaſon to rejoice that ſuch caſes are extremely rare, and can ſcarcely occur more than once in the courſe of any one's experience; and they might therefore have been paſſed unnoticed, but that we are deſirous fairly to meet the difficulties of the ſubject. And while propoſing this reſtrictive rule, we do not forget that what, in his ignorance of futurity, a perſon might aim thus to promote, might eventually be injured by it. Any thing ſhort of unavoidable and (eſpecially) *irremediable* injury, our rule does not extend to. By a ſtrict adherence to truth, I may ſubject a man to great loſs or inconvenience; and it may be required by benevolence to do what I can to remedy it, by my exertions and ſacrifices; and if I have increaſed the injury by a want of prudence or preſence of mind, more may reaſonably be expected from me; but it never can be required from me that I ſhould do any thing really wrong for the benefit of another.

If after due conſideration of the exceptive rule which we have here propoſed, it ſhould appear to be excluded by the general principles already laid down, we ſhall willingly relinquiſh it; and we cannot help ſuppoſing that the time will come, when, as in the caſe of the other ſuppoſed exceptions to truth, this will be ſeen to be by no means required by duty. At preſent the conſequences appear to us, in this claſs of circumſtances, to be of that nature, that the more urgent claims of benevolence, without *any* reference to perſonal conſiderations, require the ſuſpenſion of the claims of truth, and that a departure from it is right. We wiſh it, however, to be well conſidered, that this exceptive rule tends, in the caſes to which it is applicable, to defeat its own purpoſes, and to prevent the beneficial conſequences of truth and confidence. And if, after all, it do appear to be a right one, we muſt repeat, that it can only be defined and limited, by extending it to thoſe caſes alone where the evil affecting others is otherwiſe unavoidable and abſolutely irremediable.

7] As to the caſe of intercourſe with thoſe who labour under mental derangement, we have not ſufficient knowledge of circumſtances to ſpeak with confidence. We are fully aware that ſuch circumſtances are of too extraordinary a nature to come within the common rules of duty; but we are inclined to believe that the injury done by violations of veracity in ſuch caſes, muſt, on the whole, be ſuch as, in general, to exclude them, except in caſes which come under the laſt head. And it is probable, that by ſkill and prudence, the neceſſity of all direct breaches of truth may, in all others, be prevented. It may ſometimes be neceſſary to fall in with the train of ideas paſſing in the mind of the patient; but, with caution and good ſenſe, it can ſeldom be even apparently neceſſary to go any farther.

If caſes occur of the extreme kind, included under the ſixth claſs, the individual who is influenced in them by a real regard to duty, will do his beſt to ſhew upon what principle he has proceeded,—to make it manifeſt that the ſuppoſed neceſſity was extremely painful to him,—and to prove by his conduct that he does in no way conſider it as furniſhing any reaſon for departures from the ſtrict principles of veracity in caſes of a leſs urgent nature, and where the evil was not abſolutely irremediable.

In thoſe caſes of the 5th or 7th claſs where departures from ſtrict truth appear unavoidable, it ſhould be regarded as an indiſpenſible duty, not to expoſe thoſe to ſuch ſituations whoſe moral principles are weak;—that, in particular, the young ſhould be kept aloof from them;—that they ſhould not be made the ſubject of converſation in their preſence;—and that, if mentioned, they ſhould be repreſented as diſtreſſing to the moral feelings, and only practiſed becauſe apparently unavoidahle;—and the young ſhould be convinced, by ſtrict and invariable regard to truth in other caſes, that this is the only motive. By ſuch means, much of the evil ariſing from them may be prevented: but when they are not employed, (in caſes, eſpecially, of a domeſtic nature,) the evil is often greater than could poſſibly be produced by a ſtrict obſervance of truth, under the guidance of firmneſs and diſcretion.

To conclude: we are fully aware, that to adhere ſteadily to this branch of duty, often requires conſiderable fortitude; and ſometimes, to make truth really beneficial in the particular inſtance, much preſence of mind: but it is not the only caſe in which theſe important qualities are requiſite. Real fortitude is eſſentially neceſſary in almoſt every department of duty: and nothing contributes more to produce it, and at the ſame time to produce a proper degree of prudence and preſence of mind, than having fixed principles of moral conduct, and propoſing to ourſelves nothing more than a ſingle ſteady aim to diſcharge our duty,—nothing, we ſhould ſay, except that which is itſelf of the firſt conſequence to the means as well as to the end, an humble dependence upon Him who condeſcends to call himſelf our father, a conſtant regard to his will, and the deſire of his approbation as our chief good.

Philosophy, *Natural*. See Natural.

Philosophy is alſo frequently uſed for the particular doctrine or ſyſtem of opinions, broached by ſome conſiderable philoſopher, and eſpouſed and adhered to by his followers. In this ſenſe we ſay,

Philosophy, *Arabian*, *Ariſtotelian*, *Carteſian*, *Epicurean*, *Hermetical*, *Leibnitzian*, *Newtonian*, *Oriental*, *Platonic*, and *Socratic*. See Peripatetic, &c.

Philosophy is alſo uſed for a certain manner of philoſophizing; or certain principles, upon which all the enquiries thereby made do turn. In this ſenſe we ſay,

Philosophy, *Corpuſcular* or *Atomical*, *Mechanical*, and *Experimental*. See the adjectives.

Philosophy, again, is conſidered with regard to the age, or the place, in which it was taught. In this ſenſe we ſay,

Philosophy, *New*, &c. See Mechanical *Philoſophy*.

PHILOSTORGIUS, in *Biography*, an eccleſiaſtical hiſtorian of the fourth century, was born at a village in Cappadocia, about the year 368. When he was in his twentieth year he went to Conſtantinople, in order to acquire literary improvement under the moſt celebrated profeſſor in that city. He wrote an "Eccleſiaſtical Hiſtory," in twelve books, containing the hiſtory of affairs from the commencement of the Arian controverſy, or about the year 300, to the year 425, when it was publiſhed. This work, which was written to vindicate the Arian hypotheſis, was condemned and proſcribed by the Catholic party, who were ſo active in ſuppreſſing it, that no entire copy of it has reached modern times. Large extracts from it are preſerved in Photius' "Codex," which were publiſhed at Geneva by James Godfrey, accompanied with a Latin verſion, notes and long diſſertations, in 1643. About thirty years after, the learned Henry de Valois having collated the original with different manuſcripts corrected the text, and having given a new tranſlation of the whole, publiſhed theſe extracts at Paris, together with the eccleſiaſtical hiſtories of Euſebius, Socrates, Sozomen, Theodoret, &c. in 3 vols. folio, followed by a ſupplement of additional fragments from Suidas and others. This edition was reprinted at Cambridge in 1720.

PHILOSTRATUS, Flavius, a celebrated ſophiſt, was

was born either at Lemnos or Athens. He refided at Rome in the reign of Severus, and was employed by the emprefs Julia to compile a life of the famous philofopher Apollonius of Tyana. He wrote likewife a work entitled "Icones," being a collection of defcriptions in a florid but pure and elegant ftyle. His nephew, who flourifhed in the time of Heliogabalus, wrote the lives of the fophifts. The beft edition of the works of Philoftratus is that of Leipfic, in 1709.

PHILOTERA, in *Ancient Geography*, a town in the vicinity of the Troglodytes, placed by Ortelius on the Cimmerian Bofphorus, in the environs of Caucafus.—Alfo, the name of a town placed by Polybius on the lake of Tiberias.

PHILOTHEUS, in *Biography*, a celebrated patriarch of Conftantinople in the 14th century, was a native of Greece, who embraced the religious life in the monaftery at mount Sinai: he afterwards became abbot of the monks at mount Athos, and before the year 1354, was made archbifhop of Heraclea. In the following year, upon the depofition of Calliftus from the patriarchate of Conftantinople, he was raifed to that dignity, which, however, he was obliged to quit to make room for Calliftus, when he was reftored to favour. Upon the death of that prelate, in 1356, the emperor John reftored Philotheus to his former dignity, and ever afterwards treated him with diftinguifhed favour. He retained the patriarchal chair till his death, which happened about the year 1371. He was author of a great number of works, enumerated by Fabricius, and he is fpoken of by Cantacuzenus, as a perfon who was highly refpected for the fanctity of his life, and for the eloquence with which he was gifted.

PHILOXENUS, a dithyrambic poet of Cythera, lived at the court of Dionyfius of Syracufe, who banifhed him to the ftone quarries for cenfuring his verfes. He died at Ephefus about the year 380 B.C. He was the rival of the elder Timotheus and of Polyides, dithyrambic poets of great reputation. His innovations in mufic are ftigmatized by Plutarch.

PHILOXERUS, in *Botany*, from φιλος, *a lover*, or *friend*, and ξηρος, *dry*, or *burnt up*; alluding to its native climate, and favourite places of growth. Brown Prodr. Nov. Holl. v. 1. 416. Clafs and order, *Pentandria Monogynia*. Nat. Ord. *Holeraceæ*, Linn. *Amaranthaceæ*, Brown.

Eff. Ch. Calyx in five deep fegments. Corolla none. Stamens five, combined at the bafe into a fmall entire cup, fhorter than the germen. Anthers of one cell. Stigmas two. Capfule membranous, fingle-feeded, without valves.

Obf. This genus is next akin to GOMPHRENA, and, according to Mr. Brown, differs from LITHOPHILA only in the number of *ftamens*, and the equal *perianth*; fee thofe articles.

The name is well contrived to keep in view its analogy with the latter genus, whofe reputed natural order, as well as its generic defcription, given by Swartz, require correction. The fpecies of *Philoxerus* have oppofite *leaves*; fhort denfe terminal *fpikes*; and three *bracteas* to each flower. We prefume the latter have been taken in *Lithophila* for a *calyx*, and the true *perianth* for a *corolla*.

1. Ph. *conicus*. Br. n. 1.—Spikes conical; ternate or folitary. Calyx woolly. Leaves linear, revolute. Stem erect.—Found by Mr. Brown, in the tropical part of New Holland.

2. Ph. *diffufus*. Br. n. 2.—Spikes ftalked, folitary. Calyx very fmooth. Leaves lanceolate, downy on both fides. Stem proftrate, woolly.

3. Ph. *vermicularus*. (Illecebrum vermiculatum; Linn. Sp. Pl. 300. Gomphrena vermicularis; Swartz. Obf. 101. Willd. Sp. Pl. v. 1. 1322. Amaranthoides humile curaffavicum, cepeæ foliis lucidis, capitulis albis; Herm. Parad. 15. t. 15. f. 2.)—Spikes feffile, folitary, ovate. Calyx fmooth. Leaves linear, fpatulate, fmooth. Stem creeping. —Native of the fandy fea-fhores of the Weft Indies, and South America.

4. Ph. *brafiliana*. (Gomphrena brafiliana; Linn. Sp. Pl. 326. Willd. Sp. Pl. v. 1. 1322. Jacq. Ic. Rar. t. 346.) —Leaves elliptic-oblong. Spikes aggregate, feffile or ftalked. Bracteas pinnatifid. Stem erect.—Native of the Brafils. Much larger than any of the foregoing. *Stem* bent, afcending, three feet high, fomewhat fhrubby. *Leaves* drooping, four or five inches long, acute, fmooth, with downy ribs. *Spikes* numerous, crowded, partly ftalked, ovate, white, briftly. *Bracteas* and *calyx* pinnatifid and fringed.

Thefe two laft fpecies are referred hither at the fuggeftion of Mr. Brown. See GOMPHRENA.

PHILPOT, JOHN, in *Biography*, an Englifh divine, was born in Hampfhire, and educated in New college, Oxford. He became a zealous reformer in the reign of Edward VI., and was made archdeacon of Winchefter. At this period he was fo inflamed with zeal for orthodoxy, that having been engaged in a difpute with an Arian, he fpit in his face, to fhew the great deteftation which he entertained againft that herefy. He afterwards wrote a treatife to juftify this unmannerly expreffion of his zeal, faying that he was led to it, to relieve the forrow he had conceived from fuch horrid blafphemy, and to fignify how unworthy fuch a mifcreant was of being admitted into the fociety of any Chriftian. In the reign of Mary, Philpot fell into the hands of people as zealous as himfelf, but more powerful, and, being a Proteftant, was condemned to the flames. He fuffered in Smithfield in 1555. Hume's Hift.

PHILTER, PHILTRE, *Philtrum*, in *Pharmacy*, &c. a ftrainer, or *filter*; which fee.

PHILTER, Φιλτρον, formed of φιλεω, *I love*, is alfo ufed for a drug, or preparation, or charm, which it is pretended will excite love.

Philters are diftinguifhed into true and fpurious: the fpurious are fpells or charms, fuppofed to have an effect beyond the ordinary laws of nature, by fome magic virtue; fuch are thofe faid to be given by old women, witches, &c.

The true philters are fuppofed to produce their effect by fome natural and magnetical power. There are many enthufiaftic authors, who believe in the reality of thefe philters; and allege matter of fact in confirmation of their opinion: among the reft is Van Helmont, who fays, that, upon holding a certain herb in his hand for fome time, and taking afterwards a little dog by the foot with the fame hand, the dog followed him wherever he went, and quite deferted his former mafter.

He accounts for the phenomena of love tranfplanted by the touch of an herb; by afferting, that the heat communicated to the herb, not coming alone, but animated by the emanations of the natural fpirits, determines the herb towards the man, and identifies it to him: having then received this ferment, it attracts the fpirit of the other object magnetically, and gives it an amorous motion. But all this is mere cant; and all philters, whatever facts may be alleged in their favour, are mere chimeras.

Naturalifts afcribe an effect, fomewhat of kin to that of a philter, to cantharides taken inwardly: thefe, it is true, tend to excite love, or rather luft; but it is luft in the general, not determined to any particular object; and they do it no otherwife than by irritating the fibres of the nerves and mufcles,

mufcles, by whofe action the emiffio feminis is effected. See Filter.

PHILTRATION, or Filtration. See Filtration.

PHILYCA, in *Botany*. See Phylica.

PHILYDRUM, received that appellation from fir Jofeph Banks and Dr. Solander, in allufion to the watery fituations in which it delights; the word being compofed of φιλεω, *to love*, and ὑδωρ, *water*. Willdenow unaccountably prints it *Phylidrum*.—Gærtn. v. 1. 62. t. 16. Schreb. 782. Willd. Sp. Pl. v. 1. 17. Mart. Mill. Dict. v. 3. Brown. Prodr. Nov. Holl. v. 1. 264. Ait. Hort. Kew. v. 1. 9. Rofcoe Tr. of Linn. Soc. v. 8. 342. t. 20. f. 5. Lamarck Illuftr. t. 4. (Garciana; Loureir. Cochinch. 14.) —Clafs and order, *Monandria Monogynia*. Nat. Ord. *Scitamineæ*, Rofcoe. *Junceæ?* Brown.

Gen. Ch. *Cal.* none: unlefs the bractea be taken for a fheath. *Cor.* Petals two, inferior, vertical, oppofite, divaricated, ovate, withering. *Stam.* Filaments three, combined at their lower part, inferted into the bafe of the upper, or outer, petal, fhorter than the corolla; the two lateral ones leafy, jagged, abortive, (fometimes diftinct, very rarely furnifhed with anthers, *Brown*); the perfect one linear, abrupt, pointlefs; anthers of two feparate oblong lobes, parallel, united to the upper part of the filament in front. *Pift.* Germen fuperior, ovate, compreffed; ftyle thread-fhaped, erect, rather longer than the filament, embraced by the lobes of the anther; ftigma dilated, capitate. *Peric.* Capfule oblong, with three furrows, of three cells and three valves, the partitions from the centre of the valves. *Seeds* cylindrical, numerous, inferted horizontally, in feveral rows, into the inner margins of the partitions.

Eff. Ch. Calyx none. Petals two, oppofite. Barren filaments two, leafy. Anther two-lobed, embracing the ftyle. Capfule fuperior, of three cells and three valves. Seeds numerous.

Obf. Mr. Brown has, with great judgment, pointed out the collateral affinity, at leaft between this very fingular genus and the no lefs puzzling, hitherto mifunderftood, *Burmannia*, as well as their common relationfhip, in fome degree, to *Xyris*. They are all extremely curious, and *Philydrum* in particular betrays fome odd affinities, which render its natural order highly problematical. We ftill incline moft to our excellent friend Rofcoe's opinion on this fubject; the ftructure of the ftamens and anther, the prefence of barren filaments, with the pofition of the ftyle, being fo very like the *Scitamineæ*, and fo unlike every thing elfe.

1. Ph. *lanuginofum*. Woolly Philydrum. Gærtn. v. 1. 62. Willd. n. 1. Ait. n. 1. Brown. n. 1. Curt. Mag. t. 783. (Garciana cochinchinenfis; Loureir. Cochinch. 15.) —Bracteas, flowers, and capfules woolly. Lobes of the anthers fpiral.—Gathered by Loureiro in watery places in Cochinchina, as well as near Canton; by fir J. Banks about Endeavour river; by Dr. White and Mr. Brown, at Port Jackfon, New South Wales, as well as by the laft mentioned botanift in the tropical part of New Holland. It is faid to have been introduced by fir J. Banks into the ftoves at Kew in 1801; but was firft figured from Mr. Woodford's collection, near Vauxhall, in 1804, where it flowered in June. *Root* fibrous, biennial. *Stem* three or four feet high, erect, leafy, round, alternately branched in the upper part, where it becomes purplifh and woolly. *Leaves* fword-fhaped, long and narrow, entire; the radical ones largeft; the reft fheathing, alternate. *Spikes* long, terminal, folitary, erect, fimple, many-flowered, woolly. *Bracteas* ovate, long-pointed, reflexed while the flower is expanded, then again erect, as at firft. *Flowers* yellow, without fcent, expanding about an inch. Mr. Brown obferved the lobes of the *anthers* in this fpecies to be fpiral. The *feeds* are rough with tubercles, and crowned each with a cup-like border.

2. Ph. *pygmæum*. Dwarf Philydrum. Brown n. 2.—Bracteas, flowers, and capfules fmooth. Lobes of the anthers kidney-fhaped.—Difcovered on the fouth coaft of New Holland, by Mr. Brown, who, befides the differences indicated in the fpecific character, found the *feeds* fmooth or even, and deftitute of a terminal crown.

PHILYRA, in *Natural Hiftory*, a name given to the fubftance on which fome of the moft ancient books are written. It is the inner bark of the tilia, or common lime-tree. The emperor's library at Vienna has a book, written by Tully, never yet publifhed, which is written on this fubftance.

PHIMOPOLIS, in *Ancient Geography*, a town of Thrace, at the mouth of the Euxine fea. Pliny. Ptolemy.

PHIMOSIS, or Phymosis, from φιμοω, *to tie up*, in *Surgery*. When the opening of the prepuce is fo much contracted that this part cannot be drawn backward fufficiently to uncover the glans penis, the complaint is termed by furgeons *phymofis*. The difeafe often arifes from a thickening of the cellular fubftance of the prepuce, brought on by fome kind of irritation. It moft frequently owes its origin to a chancre; in many inftances, it is an effect of gonorrhœa, or of fimple inflammation and excoriations beneath the prepuce. The latter part is often feverely inflamed, and prefents an anafarcous appearance, occafioned by the extravafation of ferum.

Numerous fubjects are born with a contraction of the aperture of the prepuce, and the cafe is then called a *natural* or *congenital* phymofis.

Sometimes, in adults, and particularly in old perfons, the prepuce contracts fo much, without any evident caufe, that its cavity becomes filled with urine during the act of making water, and great pain is the confequence.

In cafes where the opening is exceedingly fmall, and the diforder is either congenital, or has occurred without obvious inflammation, it is by no means an uncommon circumftance for calculi to be formed under the prepuce. Thefe fometimes refemble in fhape the glans, on which, as it were, they are moulded.

When the phymofis is congenital, and has exifted a long while, it frequently happens, that in confequence of inflammation, adhefions have taken place between the glans and the prepuce, and, in this event, it may not always be in the power of the furgeon to effect a cure. The poffibility of doing fo muft depend, in a great meafure, upon the extent and firmnefs of the adhefions. According to Richerand, it is feldom practicable to deftroy them, after the patient has attained the age of puberty.

In fome cafes, a phymofis is productive of very bad confequences, efpecially when it is accompanied with chancres behind the glans; for as the latter part is fituated between the fores and the orifice of the prepuce, it frequently hinders the pus from finding its way outward; confequently, there is an accumulation of matter behind the corona glandis; and this kind of abfcefs produces ulceration on the infide of the prepuce. When the matter has made its way out, the glans often protrudes through the opening, throwing the whole prepuce to the oppofite fide.

No operation ought to be practifed on children for the natural phymofis, unlefs preffing inconvenience fhould immediately arife from the malformation. The conftriction generally goes off, as fuch fubjects approach the adult ftate.

When a phymofis originates from the irritation of a chancre, a gonorrhœa, or excoriation beneath the prepuce, the beft best treatment consists in making the patient remain quietly in bed, in injecting very frequently the saturnine lotion underneath the prepuce, and in applying round the penis linen wet with the same remedy. These measures are not to interrupt the exhibition of mercury, when a chancre is known to be present. When the patient is not taking the latter mineral, his bowels must be kept well open with a solution of the magnesiæ sulphas in the infusum sennæ. When a phymosis is occasioned by the lodgment of acrid sebaceous matter beneath the prepuce, nothing gives relief more expeditiously than uncovering the corona glandis, if possible, and washing the parts well with soap and water. Then the employment of the saturnine lotion, both as an injection and an application for keeping the inflamed parts cool, and the exhibition of a saline purgative, or two, will soon accomplish a cure.

As in cases of phymosis, extensive sloughing is not an uncommon consequence of operations performed on the prepuce, during its inflamed and œdematous state, the writer of this article has ever entertained an aversion to the practice. In his opinion, no inflamed phymosis can ever require the employment of the knife, if we exclude the particular instance in which the matter accumulates under the prepuce, and cannot make its escape, except by ulceration. The application of dressings to sores is never a sufficient reason; for these may be washed and kept clean, by frequently injecting suitable lotions under the prepuce; and if they are chancres, they will almost always heal when thus treated, and a due quantity of mercury has been exhibited.

When matter is completely confined beneath the prepuce, behind the glans, a puncture may be made into the collection of pus with a lancet, and through this opening proper lotions should be injected.

The cases which truly demand an operation, are such as are natural, and do not amend as the patient advances to the adult state; such as occur without acute inflammation, and to all appearances spontaneously; and others, which arise from the puckering of the prepuce, in consequence of former ulcerations.

At one time it was the ordinary practice to perform the operation, by slitting open the prepuce with a curved bistoury, a little on one side of the centre of its upper part.

The deformity of the prepuce, occasioned by this mode of operating, and the annoying friction to which the angles of the part are continually exposed, have been such as to induce some surgeons to recommend an attempt to unite the divided part again. Fabricius ab Aquapendente advised a patient, who was thus incommoded, to submit to an operation, resembling that for a hare-lip; but the author does not state whether it was actually performed. Bertrandi, however, was acquainted with a surgeon at Paris, who endeavoured to reunite the part by means of the twisted suture; but could not succeed.

The most judicious surgeons now prefer circumcision. The prepuce is taken hold of with a pair of forceps, and as much of the part being left out as seems necessary to be removed, the surgeon cuts a complete circle of it off by one stroke of the knife, and if the inner membrane of the prepuce should still appear to be too tight, it must be divided. The external skin of the part is then generally kept from becoming separated from the inner membrane by means of a fine suture. The bleeding vessels do not often require ligatures: Bertrandi cut off the whole prepuce in three instances, but without any hemorrhage of importance. Consult Hunter on the Venereal; Fabricius de Chirurg. Operationibus, cap. 61; Bertrandi Traité des Operations de Chirurgie; Samuel Cooper's First Lines of Practice of Surgery, chap. 55, edit. 3, &c. &c.

PHINTONIS Insula, in *Ancient Geography*, an island of the Mediterranean, between Sardinia and Corsica. Ptolemy and Pliny.

PHIPPS's Island, in *Geography*, an island in the Mergui archipelago, about eight miles in circumference. N. lat. 10° 8′.

PHIRSOVA, a town of Russia, in the government of Irkutsk, on the Amur; 20 miles N. of Stretensk.—Also, a town of Russia, in the government of Tobolsk; 20 miles E.N.E. of Ischim.

PHISON, in *Ancient Geography*, a town of Asia, in Armenia; 8 miles N.W. of Martyropolis.

PHITIUSA, or Pitiusa, an island of the Ægean sea, in the vicinity of the Peloponnesus.

PHLA, an island of Africa, in the Triton lake, in Libya, according to Herodotus.

PHLAGUSA, a town in the neighbourhood of that of Troy, situated in the Chersonesus.

PHLASMA, from φλαω, *to bruise*, in *Surgery*, a contusion.

PHLEBOCARYA, in *Botany*, from φλεψ, φλεβος, *a vein*, and καρυον, *a nut*. Brown Prodr. Nov. Holl. v. 1. 301.—Class and order, *Hexandria Monogynia*. Nat. Ord. *Hæmodoraceæ*, Brown.

Ess. Ch. Petals six, superior, beardless, permanent. Stamens inserted into the base of each petal. Anthers square, nearly sessile. Germen of one cell, with three seeds. Style thread-shaped. Stigma simple. Nut coated, crowned, single-seeded.

1. Ph. *ciliata*. Gathered by Mr. Brown on the south coast of New Holland. A perennial herb, with scarcely any *stem*. *Leaves* in two rows, equitant, narrow-sword-shaped, fringed. *Panicle* nearly sessile, shorter than the leaves. *Flowers* small, with a solitary *bractea* to each. Nothing is said of the colour of the *flowers*. We have called *petals* what Mr. Brown terms a *perianth*, to preserve the necessary analogy with Hæmodorum; see that article, and Hæmodoraceæ.

PHLEBOLITHIS, from φλεψ, φλεβος, *a vein*, and λιθις, *a little stone*, was so called by Gærtner, on account of the numerous white veins, lining the hard shell of the nut. He took his description and figure from a specimen in the collection of seeds at the Amsterdam garden, without knowing any thing of the plant, or even the entire fruit to which it belonged. Jussieu observes, Gen. 453, that this seed seems akin to *Mimusops*, Gærtn. t. 42; and indeed the author himself had already advanced the same opinion. See Gærtn. v. 1. 201, 202. t. 43. f. 2. *Ph. indica*.

PHLEBORRHAGIA, from φλεψ, *a vein*, and ρεω, *to flow*, in *Surgery*, bleeding from a vein.

PHLEBOTOMUS, a lancet, or fleam for bleeding.

PHLEBOTOMY, from φλεψ, *a vein*, and τεμνω, *to cut*, the operation of opening a vein; venesection. See Bleeding.

PHLEGM, Φλεγμα, in *Chemistry*, an aqueous and insipid fluid, supposed to be found in all natural bodies, and obtained from them by distillation or otherwise; coinciding with what the other philosophers call *water*.

Phlegm makes the fourth of the chemical elements, or elementary principles. But the term is now litttle used.

Phlegm, φλεγμα, in *Medicine*, called by the Latins *pituita*, seems to be derived from φλεγω, *I burn*, yet its signification is very opposite to that of inflammation. The ancient physicians spoke of phlegm, as one of the four humours existing in the body, and giving the qualities of cold and moisture to the constitution; whence the *phlegmatic* temperament stood in opposition to the *sanguine*, and phlegm was supposed

ſuppoſed to predominate in dropſical diſeaſes. The later writers ſpoke of phlegm as a crude, aqueous, mucous fluid, of an excrementitious nature, which prevailed before the proper concoction took place. By the older chemiſts, the term phlegm was applied to the pureſt ſtate of water, when deprived by diſtillation of all heterogeneous matter.

PHLEGMAGOGUES, from φλεγμα and αγω, *I expel*, an epithet given to ſuch purgative medicines as were ſuppoſed to occaſion a particular evacuation of pituitous or watery humours. Theſe were purgatives of a violent and draſtic nature. See CATHARTICS.

PHLEGMASIA, φλεγμασια, ſignifies *inflammation*, or fever accompanied with inflammation, the derivation from φλεγω being here adopted. Sauvages conſtituted his third claſs, comprehending inflammatory diſeaſes, with the title of *Phlegmaſiæ;* and Dr. Cullen adopted the ſame appellation for his ſecond order of Febrile Diſeaſes, which includes all the *inflammatory* fevers. See their reſpective ſyſtems of noſology. See alſo NOSOLOGY.

PHLEGMATIA, from φλεγμα, *pituita*, as alſo *leucophlegmatia*, is ſynonimous with *œdema* and *anaſarca*, or dropſy of the ſkin. Whence

PHLEGMATIA *Dolens* has been appropriately applied to denote a peculiar and painful ſwelling, occurring in one of the lower extremities in women, during their confinement in child-bed.

This diſeaſe is not of very frequent occurrence; and hence it appears to have been altogether overlooked, or but very ſlightly noticed, by the older writers on the diſeaſes of puerperal women. Mr. White of Mancheſter was the firſt to point out fully the nature and appearances of the diſorder to the notice of medical men in this country, in his work publiſhed in 1784, entitled "An Inquiry into the Nature and Cauſe of that Swelling in one or both of the Lower Extremities, which ſometimes happens to Lying-in Women." In the year 1792, the ſubject was again taken up by Mr. Trye, of Glouceſter, who publiſhed a ſmall eſſay, under a ſimilar title. Since that period Dr. Ferriar, in the third volume of his Medical Hiſtories and Reflections, and Dr. Hull, in a ſeparate work, have diſcuſſed the nature of the diſeaſe. Several of the continental writers, however, had been acquainted with this diſorder; and even our own countrymen, Wiſeman, ſir Richard Manningham, and others, had curſorily noticed it. But the firſt ample account of the diſeaſe appears to have been drawn up by Puzos, a celebrated Pariſian accoucheur, who died in 1753, in his "Mémoires ſur les Dèpôts laiteux," printed at the end of his "Traité des Accouchemens." About the ſame time, another eminent accoucheur in France, Levret, deſcribed the diſeaſe at conſiderable length, under the appellation of "Engorgemens laiteux dans le Baſſin et aux Extrémités inferieures." (See his "Art des Accouchemens," part iii. chap. 3. § 7.) The diſeaſe was alſo noticed by Aſtruc, Lieutaud, Sauvages, Selle, and others, under correſponding appellations, in conſequence of their adoption of the ſame hypothesis reſpecting its nature and origin; namely, that it was occaſioned by metaſtaſis of the milk, which was ſuppoſed to be *depoſited* in the cellular membrane of the pelvis and lower extremities, inſtead of being carried to the breaſt, or to be taken up from the breaſts by the abſorbent veſſels, and carried thither. Sauvages has included the various forms of this *infiltration laiteuſe*, or milky depoſit, under two or three different genera in his noſology, calling it Phlegmatia lactea, Iſchias ab Sparganoſi, Hyſteralgia lactea, and Hyſteralgia ab Sparganoſi, reſpectively. (See his Noſol. Method. See alſo Calliſeu, Syſt. Chir. Hodiern. p. ii. § 34—39. Van Swieten, Comment. ad Aph. 1329. Plenck, Inſt. Chirurg. p. 378, ed. 3.) It is not now neceſſary to enter into any refutation of this hypotheſis, which the more accurate anatomical inveſtigations of modern times have entirely diſproved, and which all Engliſh writers, from Mr. White downwards, have juſtly diſcarded. We ſhall, therefore, proceed to relate the ſymptoms of the diſeaſe.

In about twelve or fifteen days after delivery, the patient is ſeized with great pain in the groin of one ſide, accompanied with a conſiderable degree of fever, which, however, is ſeldom preceded by rigor or ſhivering. This part ſoon becomes affected with ſwelling and tenſion, which extend to the labium pudendi of the ſame ſide only, and down the inſide of the thigh, to the ham, the leg, the foot, and the whole limb: the progreſs of the ſwelling is ſo quick, that in a day or two the limb becomes twice the ſize of the other, is moved with great difficulty, and is hot and exquiſitely tender, but without any external appearances of inflammation. The pain in the groin is generally preceded by a pain in the ſmall of the back, and ſometimes by a pain at the bottom of the belly on the ſame ſide: the parts which ſuffer the moſt pain, are the groin, the ham, aad the back part of the leg about its middle. The pain indeed extends over the whole limb, in conſequence of the ſudden diſtention; but in a day or two it becomes leſs ſevere. The ſwelling is general and equal over the whole limb; it is much harder and firmer than in anaſarca, in every ſtage of the diſorder; it is not ſo cold, in any ſtate of the diſeaſe, as the dropſical ſwelling, nor ſo much diminiſhed by a horizontal poſition, neither does it *pit* when preſſed upon by the finger, nor does any water iſſue from it when it is punctured by means of a lancet. The ſurface is very ſmooth, ſhining, and pale, and is even and equal to the touch in every part, except where the conglobated glands are ſituated, which in ſome caſes are knotty and hard, as in the groin, the ham, and about the middle of the leg, at its back part.

This diſorder generally comes on in the ſecond or early in the third week after parturition. But Mr. White mentions one inſtance in which it commenced as early as twenty-four hours after delivery, and another as late as five weeks: but theſe are rare and extreme occurrences. The diſeaſe ſubſides in the following order: firſt the pain and ſwelling of the groin and labium pudendi begin to remit, next thoſe of the thigh, and laſtly thoſe of the leg.

The fever in ſome patients ſubſides in two or three weeks, in others it continues ſix or eight weeks, attended with quick pulſe and hectic ſymptoms. The diſeaſe ſometimes attacks both extremities; but this rarely happens, perhaps not in one caſe in ten. After the diſorder has exiſted a week or two, it is not uncommon for the ſound leg to ſwell towards evening, and become œdematous; but then the groin and thigh are not affected on that ſide, and the leg is much ſofter to the touch than the other, and pits when preſſed upon by the finger. Mr. White affirms, that he has never known it to ſuppurate or prove fatal, or to be followed by any material inconvenience, after a few months were elapſed, except a little ſwelling of the leg after fatigue, particularly after walking.

Neither the prediſpoſing nor the exciting cauſes of this diſeaſe are very obvious. It attacks women who are in full ſtrength, and thoſe who are reduced by flooding; thoſe who have a moderate diſcharge of the lochia, and thoſe who have a ſmall or a large quantity; thoſe who give ſuck, and thoſe who do not, whether their breaſts be drawn or not, and whether they have a great deal or little milk. It attacks women in whatever poſition they have been delivered; but of thofe who were delivered on the fide, it appears that the greater number were affected on that fide in which they lay at the time of delivery. It attacks women of all ranks and of different habits, both the rich and the poor; the moft healthful, as well as thofe who have laboured under chronic difeafes; the ftrong and the weak, the lean and the corpulent; the fedentary and the active; the young and the middle-aged; after the firft or any other labour, and whether the labour be natural or preternatural. It happens at all feafons of the year indifcriminately; and in the country as well as in large towns. It never attacks either of the arms, or other parts of the body; and though it fometimes occurs in both the lower extremities, in the fame or in different lyings-in, it never attacks the fame limb more than once.

In a fubfequent publication on the difeafe, Mr. White ftates more ftrongly, that the limited fwelling of the labium pudendi on one fide only, is to be confidered as conftituting the principal diagnofis of the phlegmatia dolens. The fwelling is fo exactly confined, he fays, to the labium pudendi of that fide, that if a line were drawn from the navel to the anus, it would be found never to go beyond that line, in the fmalleft degree; and this pathognomonic fymptom, he adds, is never wanting in any cafe whatever. "About nine times out of ten it attacks one fide only, and the limits are fo exactly drawn, that in no cafe whatfoever does the fwelling rife higher than the loins and the hypogaftric region, nor fpread wider than the fpine and linea alba; and this is fo conftantly and invariably the cafe, that it may be confidently faid, *fo far fhalt thou go, and no farther.*" See an Inquiry into the Nature, &c. of that Swelling in one or both the Lower Extremities, &c. part ii. p. 7. (1801), and part i. p. 7. 1792.

This limited ftate of the fwelling has led modern authors in general to confider the difeafe as principally feated in the lymphatic veffels and glands. The exact ftate of thefe parts, however, has not been clearly made out, and the different writers above quoted have attempted to explain it in different ways; all of them, however, fpeaking conjecturally, and none of them appearing to make out an hypothefis fatisfactory in all its parts. Mr. White confiders the fwelling of the limb to be occafioned by an obftruction in the trunks of the lymphatic veffels, and the confequent detention and accumulation of the lymph in the limb. This obftruction, he conjectures, may be occafioned by inflammation in the trunk or trunks of thefe veffels, brought by preffure during parturition, or by actual rupture of them. Mr. Trye is of opinion that the origin of the obftruction is feated folely in the lymphatic glands in the groin, which are inflamed, and therefore incapable of admitting the tranfit of the lymph through them. To this fuppofition, however, it is juftly objected, that inflammation in the inguinal glands is extremely apt to terminate in fuppuration; whereas fuppuration does not occur in phlegmatia dolens: not to mention, that a tendernefs and enlargement of thefe glands, though occafionally obferved in this difeafe, is not always prefent, is often very flight, or does not exift at all until the complaint is confiderably advanced.

Dr. Hull, in an able and learned treatife on this difeafe, after a confideration of the unfatisfactory nature of thefe theories, propofes another explanation of the feat and phenomena of the complaint. He confiders it as confifting of a peculiar inflammation, feated in the mufcles, cellular membrane, and interior furface of the fkin, and producing a rapid effufion of ferum and coagulable lymph from the exhalants into the cellular membrane of the limb. The exquifite pain, tendernefs, and heat of the limb, as well as the feverifhnefs which accompanies it, he thinks, are thus fatisfactorily explained, independently of any primary affection of the lymphatic fyftem, which may be involved in the progrefs of the difeafe.

On the whole, this appears to afford the moft rational explication, both of the fymptoms of the difeafe and of the mode of its occurrence. Dr. Hull remarks, that, under the increafed irritability and inflammatory diathefis connected with pregnancy and the puerperal ftate, various caufes may excite this fort of inflammation, efpecially in the lower extremities, in which a great determination of blood has taken place during the latter months of utero-geftation; fuch as contufions, or even violent exertions of the lower portions of the abdominal mufcles, or thofe of the pelvis and thighs, cold and moifture, fuppreffion or diminution of the lochia or milk, inducing a plethoric ftate, too much or too ftimulating food, too early walking or much ftanding, &c. As the difeafe feldom takes place before the twelfth or fourteenth day after delivery, and fometimes confiderably later, it is certainly more probable that it fhould be occafioned by fome caufe fubfequently applied, than by any injury fuftained at the time of parturition.

Of the Cure of Phlegmatia dolens.—The different views which have been taken of the nature of the difeafe by different practitioners, have neceffarily led them to propofe different methods of treatment. Mr. White juftly obferves, that the mode of cure muft be varied with the different ftages of the diforder. The *firft ftage*, which may be called the inflammatory, he recommends to be treated in the antiphlogiftic method; but as he confiders the inflammation not as the original difeafe, but as fecondary or a fymptom only, occafioned by the diftention of the lymphatic veffels and glands; fo he deems it neither neceffary nor prudent to wafte the patient's ftrength by large evacuations. He advifes the ufe of laxative medicines and glyfters, for the purpofe of keeping the bowels open; the application of blifters to the upper part of the thigh, with the view of evacuating fome of the effufed fluids and relieving irritation in the part originally affected; and the adminiftration of opiates internally, together with the external ufe of anodyne fomentations, and of the warm and vapour bath, for the purpofe of alleviating the pain. At the fame time, he prefcribes cooling diaphoretic medicines, with acidulated drinks, fruit and cool air, in order to moderate the general feverifh difpofition. In the *fecond ftage*, when the violence of the pain abates, and the fwelling and tenfion of the groin, labium, and upper part of the thigh begin to leffen although fome degree of feverifhnefs remains, he recommends a fuller diet, and a more tonic medicine, with an occafional fmall dofe of calomel. He advifes alfo, that gentle friction fhould be employed upon the limb, with warm oil, and that the patient fhould ufe the Buxton bath, or water heated to 82 degrees Fahrenheit's thermometer, which may be gradually lowered to 76, the temperature of that of Matlock. The *third*, and laft ftage, may be faid to take place, when the pain and fever have entirely left the patient, and no complaint remains except the fwelling of the limb, and fome degree of debility. He then prefcribes the cinchona, with or without chalybeates, together with fea-bathing, or the cold-bath at home, where a refort to the fea is inconvenient. He recommends alfo embrocations with camphorated fpirit, or diftilled vinegar, dipping the limb in cold water, gentle friction upwards, the ufe of a calico bandage, carefully and properly applied, and exercife on horfeback; and confiders much walking as injurious in every ftage of the difeafe.

Mr. Trye's method of treatment differs from that of Mr. White,

White, principally in the more active employment of local evacuations from the groin, as he considers the inflammation of the lymphatic glands to be the primary cause of the disease. He therefore applies both leeches and blisters to the part, while he administers laxatives and emetics internally; and, in more obstinate cases, introduces mercury so as to make it pass through or near the glands and lymphatic trunks affected.

Dr. Hull divides the disease into three stages, after the manner of Mr. White, and treats the *first*, or inflammatory stage, upon the same antiphlogistic principles, applying leeches and blisters to moderate the local action, and emollient fomentations, liniments, and ointments, to relieve the tension of the skin. The *second* stage does not require or bear evacuations; but the other parts of the antiphlogistic treatment, such as rest, the removal of irritations, gentle diaphoretics and sedatives, the warm bath, &c. must be continued; and the topical affection is to be remedied by gently stimulating liniments. The *third*, or *asthenic* period, requires the administration of tonics, and stimulants, and exercise, especially in a carriage; while at the same time the topical affection must be treated, by the application of a tight bandage, by the cold bath, or cold water dashed on the limb, and by remedies which may increase the action of the absorbents, such as blisters, friction, heat, electricity, &c. and by the internal medicines, which excite absorption, such as mercury, digitalis, alkalies, &c. These remedies, particularly the evacuants, will of course be regulated according to the vigour and habit of the patient.

There is, in fact, little essential difference in the practice recommended by the different writers on this singular disease, which is often very obstinate and of long continuance, notwithstanding the vigorous application of the remedies above-mentioned. Of a disease of comparatively rare occurrence, (for of 1897 women delivered at the Westminster General Dispensary, only five were affected with this malady, and of 8000 delivered in Manchester, only four,) any individual practitioner cannot have witnessed a sufficient number, to enable him to appreciate satisfactorily the most effectual mode of practice. In three or four cases, which we have seen, the importance of free purging appeared to be decidedly established; and while, in the first, the use of warm fomentations, so far from alleviating the pain in the early stage, seemed to aggravate the sufferings of the patient; in the case last treated, both the violence of the pain and the duration of the disease, appeared to be greatly diminished, by cooling the limb by frequent *tepid* and *cold washing*. See Report of the Dispensary in Carey-street, in the Edin. Med. and Surg. Journal for Jan. 1807, vol. iii. Also, An Essay on the Swelling of the Lower Extremities incident to Lying-in-women, by Charles Brandon Trye, 1792, and an Essay on Phlegmatia Dolens, by John Hull, M.D., Manchester, 1800.

PHLEGMATIC, an epithet given to one of the four temperaments by the ancients, in which the prevalent humour was considered to be *pituita*, or *phlegm*; whence the diseases to which the phlegmatic temperament was subject, were said to be defluxions, rheums, and other cold discharges. See TEMPERAMENT.

PHLEGMON, or PHLEGMONE, from φλεγω, *to burn*, a term signifying common, or healthy, acute inflammations. See INFLAMMATION.

PHLEGON, in *Biography*, one of the freedmen of the emperor Adrian, who was brought up to letters, and survived to the 18th year of Antoninus Pius. He was author of various works, of which the most important was entitled, "Olympiads," or "Chronicles," in sixteen books, brought down to the year 137 of the Christian era. This contained an account of the remarkable events occurring in every year of the Olympiads. Phlegon also wrote a work "De Mirabilibus," and another, "De Longævis." Of his "Opuscula," the best editions are that of Meursius, and that of Franzius, the former printed in 1620, and the latter in 1775.

PHLEGRÆI CAMPI, *Phlegrean* or *Burnt Fields*, in *Ancient Geography*, a district of Campania, or Campagna, in Italy, of which the ancient mythologists have given very pompous descriptions. This, they say, was the scene of the combats between the giants and the gods, and of the victory over them gained by Jupiter. The territory thus denominated appears to have experienced in a great degree the destructive effects of subterranean fires. Accordingly we here find Vesuvius, the Solfatara still smoking, as the poets have pretended, from the effects of Jupiter's thunder; the Monte Nuovo, which was suddenly thrown up from the bowels of the earth on the day of St. Michael's feast, in the year 1538, as if the sons of Titan had intended to renew the war; the Monte Barbara, formerly Mons Gaurus, the favourite of Bacchus, the grotto of the Cumæan Sibyl, the noxious and gloomy lakes of Avernus and Acheron, the green bowers of Elysium, &c. &c. It is not improbable that these objects terrified the Greeks, in their first voyages to this coast; and that they were afterwards embellished and exaggerated by the fancy and fiction of the poets. It remained for the geographer and natural historian to develope the facts which had been thus disguised by the poets. See TARTARUS and TITANS, and also CUMÆ and *Cumæan* SIBYL.

PHLEOS, in *Botany*. See PHEOS.

PHLEUM, φλεον, or φλεως, in Greek, a name adopted by Linnæus for the *Gramen typhinum* of preceding botanists, our Cat's-tail-grass. This indeed has little connection with the ancient plant, except the latter might be, as some suppose, our *Typha*, which the *Phleum* resembles in shape.—Linn. Gen. 33. Schreb. 47. Willd. Sp. Pl. v. 1. 354. Mart. Mill. Dict. v. 3. Sm. Fl. Brit. 68. Prodr. Fl. Græc. Sibth. v. 1. 41. Ait. Hort. Kew. v. 1. 145. Schrad. Germ. v. 1. 182. Juss. 29. Lamarck Illustr. t. 42. Gærtn. t. 1.—Class and order, *Triandria Digynia*. Nat. Ord. *Gramina*.

Gen. Ch. *Cal.* Glume single-flowered, oblong, linear-lanceolate, compressed, of two, nearly equal, straight, compressed, clasping, concave valves, each tipped with a point; their inner membranous margin abrupt or oblique. *Cor.* of two awnless valves, shorter than the calyx, and concealed within it; the outermost embracing the smaller inner one. Nectary of two ovate, concave, acute scales. *Stam.* Filaments three, capillary, longer than the calyx; anthers oblong, forked at each end. *Pist.* Germen roundish, superior; styles two, capillary, reflexed; stigmas feathery. *Peric.* none, the calyx and unchanged corolla enfolding the seed. *Seed* solitary, roundish, clothed with the corolla, but not united to it.

Eff. Ch. Calyx single-flowered, of two, nearly equal, awn-pointed valves, enclosing the two-valved awnless corolla. Seed invested with the unchanged corolla.

Obs. Much difference of opinion has existed among botanists, respecting the limits between this genus and *Phalaris*, chiefly on account of the abrupt inner margin of the calyx-valves, attributed to *Phleum* by Linnæus. Schreber and Schrader, two excellent judges, though they differ somewhat in the denomination of the parts in *Phalaris*, have determined these genera on the same principles as we have here adopted. Hence numerous species, hitherto deemed ambiguous, are referred to *Phleum*, with which they agree in habit,

habit, though they have not the abrupt calyx. Their ſingle corolla, which does not, as in the real ſpecies of *Phalaris*, become hardened and united with the ſeed, is certainly a much more important and well-defined character. See Phalaris.

1. Ph. *pratenſe*. Common Cat's-tail-graſs. Timothy-graſs. Linn. Sp. Pl. 87. Schrad. n. 1. Schreb. Gram. 102. t. 14. Mart. Ruſt. t. 5. Knapp. t. 6. Engl. Bot. t. 1076. (Gramen typhinum majus et minus; Ger. Em. 11, 12.)—β Ph. nodoſum; Linn. Sp. Pl. 88. Leers 17. t. 3. f. 2. Fl. Dan. t. 380.—Cluſter ſpike-ſhaped, cylindrical, obtuſe. Valves of the calyx abrupt, fringed at the keel. Awns ſhorter than the calyx. Common in meadows and paſtures throughout Europe; moſt luxuriant in ſuch as are moiſt and rich. In a dry or fluctuating ſoil, the loweſt joints of the ſtem become bulbous, and the whole plant diminiſhed. It is perennial, flowering from June to October; and by means of ſome reports from America, was at one period celebrated by agriculturiſts, under the name of Timothy-graſs, after its introducer, Mr. Timothy Hanſon. Its reputation proved fallacious, as has happened in other ſimilar caſes. The climates of America and Europe, though in ſome reſpects alike, are, in many others, far too different, for the ſucceſs of an agricultural graſs, in one of thoſe countries, affording any probable reaſon for its utility in the other. The plant before us is known from every other common graſs by its denſe cylindrical *ſpike*, (or rather *cluſter*, as the *flowers* are not ſeſſile, but ſtalked and faſciculated,) and the very abrupt inner edges of its *calyx*. The *root* creeps moderately. *Stem* erect, three or four feet high, except when ſtarved, roughiſh, as are alſo the *leaves*, and their long *ſheaths*. *Spike* erect, purpliſh, from two to four or five inches in length, of innumerable fringed *flowers*, whoſe *awns* are half the length of the *calyx*, and ſlightly ſpreading. The tawny *anthers* are large and conſpicuous, hanging looſely out of the *flowers*. The Rev. H. Davies has obſerved the *flowers* to be occaſionally viviparous in Angleſea.

2. Ph. *alpinum*. Alpine Cat's-tail-graſs. Linn. Sp. Pl. 88. Schrad. n. 2. Engl. Bot. t. 519. Fl. Dan. t. 213. Knapp. t. 7. Sm. Tour on the Continent, v. 3. 134. (Gramen typhoides alpinum, ſpicâ brevi, denſâ, et veluti villoſâ; Scheuchz. Agr. 64. Prodr. 17. t. 3.)—Cluſter ſpike-ſhaped, ovate-oblong. Valves of the calyx abrupt, fringed at the keel. Awns about as long as the calyx. Root tuberous.—Native of lofty Alpine paſtures, in Lapland, Germany, Switzerland and Scotland, flowering about the end of July. Its rather tuberous, ſomewhat creeping, but never bulbous, *root*; ſhort ovate *cluſter*; longer hairs and awns of the *calyx*; and long inflated ſheath of the uppermoſt *leaf*; are the ſufficient marks of diſtinction between this and every variety of the preceding. The *flowers* moreover are uſually of a darker purpliſh hue. The height of the *ſtem* is from twelve to eighteen inches.

3. Ph. *felinum*. Briſtly Cat's-tail-graſs. Sm. Prodr. Fl. Græc. v. 1. 42.—Spike ovate. Valves of the calyx abrupt, fringed at the lower part of the keel. Awns longer than the calyx, divaricated, angular, rough. Root fibrous.—Native of Zante, where it is known by the name of *μουςάκια του κατζούλιων*, or Cat's whiſkers. We have alſo a Sicilian ſpecimen, from Mr. Bivona Bernardi. The *root* is fibrous and annual. *Stem* from one to two feet high, erect, ſmooth, leafy, branched in the lower part. *Leaves* light green, nearly ſmooth; the ſheath of the upper one inflated, ſtrongly ribbed. *Stipula* elongated. *Spike* ovate, about an inch long, pale, denſe. *Calyx-glumes* very abrupt, white, and membranous at their inner edge; their keel denſely fringed about half way up, and continued into a tapering, angular, rough, but not hairy ſpreading awn, uſually longer than the glume itſelf.

4. Ph. *aſperum*. File Cat's-tail-graſs. Schrad. n. 3. Jacq. Ic. Rar. t. 14. Villars Dauph. v. 2. 61. t. 2. f. 4. (Ph. paniculatum; Hudſ. 26. Sm. Fl. Brit. 70. Engl. Bot. t. 1077. Ait. Hort. Kew. v. 1. 145. Phalaris aſpera; Retz. Obſ. faſc. 4. 14. Willd. Sp. Pl. v. 1. 328. Hoſt. Gram. Auſtr. v. 2. 28. t. 37.)—Panicle cylindrical, ſpike-ſhaped. Valves of the calyx wedge-ſhaped, abrupt, naked, rough, pointed; tumid upwards.—In dry open fields, very rare in England, more common in the ſouth of Europe, flowering about July. *Root* annual, of many branched fibres. *Stems* ſeveral, branched, leafy, very ſmooth, near a foot high. *Leaves* ribbed, roughiſh, bright graſs-green, not glaucous; the long ſheath of the uppermoſt often reaching above the baſe of the *panicle*, which is two or three inches long, of the colour of the foliage, lobed, but crowded into a cloſe cylinder, feeling rough, like a file, from the very ſhort rigid awns. The *calyx* is abrupt, minutely rough; angular or furrowed below; remarkably tumid upward. Valves of the *corolla* elliptical. *Anthers* ſhort and pale. Barrelier's t. 28. f. 2. ſurely cannot but be this graſs, though doubted by Schrader.

5. Ph. *Boehmeri*. Purple-ſtalked Cat's-tail-graſs. Schrad. n. 4. (Phalaris phleoides; Linn. Sp. Pl. 80. Willd. Sp. Pl. v. 1. 328. Sm. Fl. Brit. 63. Engl. Bot. t. 459. Knapp. t. 5. Fl. Dan. t. 531. Hoſt. Gram. Auſtr. v. 2. 26. t. 34. Ehrh. Phytoph. n. 61. (Gramen typhinum, ſpicâ conoide ſtriatâ, culmo violaceo; Barrel. Ic. t. 21. f. 1.)—Panicle nearly cylindrical, ſpike-ſhaped. Valves of the calyx lanceolate, abrupt, roughiſh, ribbed, pointed. Stem ſimple. In dry elevated paſtures and hilly ground, eſpecially where the ſoil is ſandy, in various parts of Europe. In ſome parts of Cambridgeſhire and Norfolk, but not frequent, flowering in July. *Root* perennial, of numerous ſmooth fibres. *Stems* ſeveral together, but each of them quite ſimple, twelve or eighteen inches high, erect; leafy below; naked, poliſhed, and uſually conſpicuous for a beautiful purple hue, in their upper part. *Leaves* linear, rough, acute, rather glaucous; the upper ones ſhort, with very long cloſe ſheaths. *Stipula* very ſhort, abrupt. *Panicle* near two inches long, denſe, a little contracted at each end, glaucous green with a tinge of purple: occaſionally pale. *Calyx* rough, in various degrees, with ſhort hairs; the keel ſomewhat fringed; each ſide marked with a ſtrong rib; the inner margin membranous, ſmooth, coloured, abrupt, or at leaſt oblique, at the top: awns very ſhort, erect. Valves of the *corolla* elliptical. *Anthers* twice the length of the ball, moſtly purple. We have from Dr. Bellardi a Piedmonteſe ſpecimen of this graſs, marked *Phleum perenne*, which however he does not appear to have publiſhed. It is much to be wiſhed that ſome more expreſſive name could have been found, inſtead of that which we are obliged to adopt; ſuch as *violaceum*, or *purpuraſcens*.

6. Ph. *Michelii*. Michelian Cat's-tail-graſs. Allion. Pedem. v. 2. 233. Schrad. n. 5. t. 1. f. 2. Engl. Bot. t. 2265. (Ph. n. 1532; Hall. Hiſt. v. 2. 246. Phalaris alpina; Hænke in Jacq. Coll. v. 2. 91. Hoſt. Gram. Auſtr. v. 2. 26. t. 35. Gramen typhinum junceum perenne; Barrel. Ic. t. 21. f. 2.) Panicle nearly cylindrical, ſpike-ſhaped. Valves of the calyx lanceolate, taper-pointed, ribbed, with ſhort awns; the keel ſtrongly fringed. Corolla ribbed, hairy. Stem ſimple.—Native of lofty mountains in Germany, Switzerland, Savoy, and Scotland, flowering in July. Mr. G. Don diſcovered it on rocky parts of the hills of Clova, Anguſhire. *Root* perennial, tufted,

tufted, scarcely creeping. *Stems* a foot or more in height, ſimple, ſmooth, erect, leafy more than half way up. *Leaves* broadiſh, flat, pointed, rough-edged; their ſheaths ſmooth, the upper ones long, and rather tumid. *Stipula* ſhort, blunt. *Panicle* from one and a half to three inches long, erect, thicker than in the laſt, purpliſh except when it grows under buſhes, by which it becomes pale green and white. The long denſe fringes of the *calyx-keels* give the whole a hairy aſpect. Their taper-pointed figure, without any abrupt termination of the inner edge, diſtinguiſhes this ſpecies from all the foregoing, and indeed has induced ſome perſons to refer it to *Phalaris*. The *corolla* is larger, and has more of the habit of the *calyx*, than uſual in this genus, being ribbed and more or leſs hairy, reſembling the *corolla* of a *Feſtuca*, though more obtuſe. Villars has certainly, as Schrader obſerves, confounded this and the laſt, both in his deſcription and ſynonyms, under his *Ph. phalaroideum*, Dauph. v. 2. 60. Our ſpecimen from himſelf agrees with the laſt, not with the preſent.

7. Ph. *arenarium*. Sea Cat's-tail-graſs. Linn. Sp. Pl. 88. Ehrh. Calam. n. 132. Schrad. n. 6. Fl. Dan. t. 915. (Phalaris arenaria; Hudſ. 23. Sm. Fl. Brit. 62. Willd. Sp. Pl. v. 1. 328. Ait. Hort. Kew. v. 1. 138. Engl. Bot. t. 222. Knapp. t. 4. Dickſ. H. Sicc. faſc. 18. 2. Gramen typhinum maritimum minus; Pluk. Phyt. t. 33. f. 8.)—Spike ſcarcely panicled, ovato-lanceolate. Valves of the calyx lanceolate, ribbed, with ſhort awns; the keel ſtrongly fringed. Corolla ribbed, abrupt. Stem branched at the baſe.—Native of the ſandy ſea-ſhores of England, and moſt other parts of Europe. Occaſionally it occurs on dry elevated inland heaths; flowering in June. Though the ſpecific characters of this and *Ph. Michelii* come near each other, the appearance of the two graſſes is very different. The preſent is annual, of humbler growth, glaucous and pale, ſmooth, branched more or leſs from the very baſe. *Leaves* broadiſh-lanceolate, with long, rather tumid, ribbed, ſmooth ſheaths. *Spike* thick and rather ſhort, bluntiſh, though contracted towards both ends. *Calyx-valves* preciſely lanceolate, not taper-pointed, though tipped with ſhort awns. *Corolla* broad and ſhort, abrupt and ſomewhat crenate, ſmooth, with many ribs.

8. Ph. *dentatum*. Toothed Cat's-tail-graſs. (Phalaris dentata; Linn. Suppl. 106. Willd. Sp. Pl. v. 1. 327. Thunb. Prodr. 19. Retz. Obſ. faſc. 4. 14.)—Spike ſcarcely panicled, cylindrical. Keel of the calyx-valves ſtrongly and bluntly toothed. Stem branched at the baſe.—Native of the Cape of Good Hope. *Root* fibrous, ſmooth, apparently annual. *Stems* divided at the baſe into ſeveral branches, from three to ſix inches high, very ſmooth and ſhining, ſometimes bent at the joints, and ſtained below them with dark purple. *Leaves* ſhort and almoſt awl-ſhaped, with long, ſlightly tumid, ribbed ſheaths, that conceal nearly the whole ſtem. *Spikes* terminal, ſolitary, about an inch and a half long, obtuſe, ſomewhat lobed, but ſcarcely panicled, ſometimes rather downy, as in the Linnæan ſpecimen; Retzius found them ſmooth. *Calyx-valves* lanceolate, pale, tumid, and even at the ſides; their keels green, ſtrongly ribbed, and altogether ſingular in their numerous, prominent, triangular, globular-tipped teeth, which give them an almoſt artificial and very curious appearance.

9. Ph. *tenue*. Slender Cat's-tail-graſs. Schrad. n. 8. (Phalaris bulboſa; Linn. Syſt. Nat. ed. 10. v. 2. 869. Sp. Pl. 79. Amoen. Acad. v. 4. 264. Bellardi Act. Taurin. v. 5. 213. Willd. Sp. Pl. v. 1. 327, excluding all the ſynonyms except Am. Acad. Ph. tenuis; Hoſt. Gram. Auſtr. v. 2. 27. t. 36. *Schrad.* Gramen typhinum, longiſſimâ ſpicâ phalaridis, molli, albicante; Barrel. Ic. t. 14. f. 1.)—Panicle cylindrical, ſpike-ſhaped, very denſe. Valves of the calyx elliptic-oblong, roughiſh, minutely pointed; their lateral ribs very prominent. Stem branched at the baſe. Corolla obtuſe.—Gathered by Haſſelquiſt in the Levant; by Bellardi near Saviliano in Piedmont; by Hoſt in Iſtria, about vineyards, roads, and graſſy places. It flowers from May to July. Nothing can be more unaccountable than the name by which Linnæus has diſtinguiſhed this ſpecies, except that it was, probably, merely taken from the ſynonym of Scheuchzer, which he here erroneouſly applied, and which properly belongs to *Phalaris nodoſa*; ſee Phalaris, n. 2. His own ſpecimen, on which the name of *bulboſa* is twice written, and which has all other requiſite marks of authenticity, has nothing bulbous about it. The *root* is ſmall, of a few tapering, partly downy, fibres, and appears to be annual. *Stem* more or leſs branched at the lower part only, above a foot high, ſimple upwards, ſlender, erect, round, leafy; purple, ſmooth and poliſhed in all the naked parts, with ſlightly tumid joints. Dr. Bellardi's ſpecimen has more ſubdiviſions, though but half ſo tall. *Leaves* linear-lanceolate, graſs-green, roughiſh, with nearly ſmooth cloſe ſheaths. *Panicles* ſolitary, erect, about two inches long, cloſe, and exactly cylindrical, one-fourth or one-third of an inch thick. *Calyx-valves* rather obliquely or unequally elliptical, their inner edge being almoſt ſtraight, and their ſhort points approaching each other; their whole ſurface is roughiſh with very minute prominences, but no hairs; the ſolitary ſide-ribs very ſtrong and prominent, reſembling the keel. *Corolla* not half ſo long as the calyx; its outer valve much the broadeſt, ribbed, very obtuſe, crenate. This ſpecies, ſo long involved in obſcurity, is now made ſufficiently intelligible, and its ſpecific name is no longer a ſtumbling-block, or a contradiction. Willdenow and Schrader have juſtly enough remarked that the *Phalaris bulboſa* of Cavanilles, Ic. t. 64, deſerves that appellation much better than this fibrous-rooted plant; but Cavanilles's is *Phalaris nodoſa*, as well as *tuberoſa*, of Linnæus, ſo that a third name is quite needleſs. See Phalaris.

10. Ph. *geniculatum*. Bent Cat's-tail-graſs. Bellardi Oſſerv. Bot. 54. Mem. de l'Acad. de Turin v. 5. 213.—"Spike nearly ovate. Glumes fringed. Stem bent at the joints."—Gathered by Dr. Bellardi on Mount Cenis, in barren ground. "*Root* perennial, not bulbous. *Stems* a ſpan or more in height, with three or four bent joints." *Bellardi.*

Of this we have no ſpecimen from the author, nor did he advert to it, as a new ſpecies, when, in company with the writer of this, he gathered it in Auguſt 1787. We mention it here merely for future obſervation.

A few other ſpecies either have been referred by authors to this genus, or may ſeem to belong to it. Of the former is *Phleum crinitum* of Schreber, Sm. Fl. Brit. 71, which if not a good *Agroſtis*, as we have conſidered it in Engl. Bot. t. 1704, conſtitutes the genus Polypogon of Desfontaines and Schrader: ſee that article. Among the latter are *Phalaris geniculata* and *vaginiflora*, Sm. Prodr. Fl. Græc. Sibth. v. 1. 38. Theſe, according to our reformed ideas of *Phalaris*, cannot remain there; but we are become perſuaded that *Crypſis* is a good genus, diſtinguiſhed, not indeed by its original trifling, as well as erroneous, character, of two ſtamens, but by the *corolla* being longer than the *calyx*, and, like that, having, to one valve at leaſt, a ſtrong rough keel. On theſe grounds Schrader has admitted it, in his excellent *Flora Germanica*, where three ſpecies are deſcribed, to which we can add a fourth, ſuppoſed to come from Virginia, with a much branched *ſtem*, and long, ſlender, cylindrical,

drical, fpiked *panicles*. We apprehend however that Schrader mifapplies to his *C. fchoenoides*, Barrelier's t. 54, which more properly belongs to his *alopecuroides;* a plant formerly given us by the celebrated M. Gerard, at Cottignac, as a rare and little known fpecies. See CRYPSIS.

Ph. *Gerardi*, Jacq. Ic. Rar. t. 301. Willd. Sp. Pl. v. 1. 355. Schrad. n. 7, ftill remains in difpute. Jacquin reprefents it with a bivalve *corolla*, which Schrader confirms. Yet we have found in our fpecimens, gathered on mount Cenis, only a fingle valve to that part, which accords with the account of Villars, who had examined living wild plants. Hence we have judged this grafs to be an *Alopecurus*, which is confirmed by the dorfal awn of the *corolla*, omitted by Jacquin indeed, but properly defcribed in Schrader. This awn is effential to an *Alopecurus*, but quite unexampled in *Phleum:* and we are perfuaded our able friend laft mentioned has for once depended on a lefs important, and, as it feems, variable mark, in preference to the more effential. The cultivated plant perhaps acquires an inner valve, in confequence of luxuriance. Our opinion of this plant is ftrengthened by *Alopecurus anguftifolius*, Fl. Græc. t. 64, and *lanatus*, Prodr. Fl. Græc. v. 1. 43, which have every character of their genus, and yet are fo clofely akin to this reputed *Phleum*, (*Gerardi*,) that no greater violence could be done to nature than to disjoin them.

PHLEUM, in *Agriculture*, the title of a genus of graffes, fome of which have been found ufeful in the field. It is the cat's-tail-grafs.

PHLEUM *Nodofum*, the knotty cat's-tail-grafs, which is faid by fome to be a fine exuberant grafs fit for dairy paftures and where cow hay is required, as it affords rich milk, and cows are fond of it; but horfes and fheep are faid to reject it in favour of the poas, though not in other cafes. It is found in the dry hilly paftures in moft places.

PHLEUM *Pratenfe*, the meadow-cat's-tail-grafs. This is coarfe and late, but anfwers beft in moift foils and fituations. When kept well fed down, it is faid to be ufeful on the moift loamy foils where the fubftratum is of the clayey marle kind. It is afferted to furnifh a principal part of the herbage in the meadow lands in America. It affords much feed, and is the plant known by the title of Timothy-grafs. It is wholly rejected by fome as unworthy of cultivation, though others think well of it.

PHLIAS, in *Ancient Geography*, an ifland fituated in the environs of Ætolia.

PHLIUS, or PHLIUNTE, *Staphilica*, a town of Sicyonia, on the river Afopus, S.W. of Theranda. It was confiderable in the time of Paufanias, though it had fuffered much during the war of Achaia. In the midft of this place was a brazen goat, to which the inhabitants paid great refpect. This worfhip, without doubt, began, when the country, thinly inhabited, found itfelf expofed to the deftruction and lofs of their vineyards by the ravages of the wild goats, with which the mountains abounded. The Phliufians having loft fight of the original inftitution of this worfhip, pretended, that the conftellation of the goat, or Capra, afforded nourifhment to their vines, and that from this circumftance originated the worfhip of the goat. They pretended that their town was the centre, or "Omphalos" of the Peloponnefus. The town and citadel were adorned with many monuments. Ganymede or Hebe, for thefe were names of the fame divinity, had a temple in this place, which was regarded as a facred afylum. They had here alfo a temple of Ifis, who was regarded as the protectrefs of navigation.

PHLIUS, a maritime town of the Peloponnefus, in the Argolide, fituated between Nauplia Navale and Hermoine. Here were a cavern and a labyrinth. Ptolemy. Strabo.

PHLOGIDIAUGIA, formed from φλογιζω, *I inflame*, and αυγη, *tranfparence*, in *Natural Hiftory*, the name of a clafs of inflammable foffils, of a pure texture, and in fome degree tranfparent.

Of this clafs are the fulphurs, orpiments, zornics, and amber.

They are by this name diftinguifhed from the phlogifcieria. Hill.

PHLOGINOS, the name of a ftone found in Egypt, and called by fome *chryfitis*, from its colour refembling gold.

PHLOGISCIERIA, derived from φλογιζω, and σκιερος, *opaque*, the name of a clafs of foffils, the characters of which are, that the bodies contained in it are inflammable, of a coarfe and impure texture, and not pellucid.

The bodies of this clafs are divided into two general orders, and under thofe, into five genera. Thofe of the firft order are fuch as are found loofe, and in detached maffes: thofe of the fecond, fuch as are found conftituting whole ftrata. The genera of the firft order are ambergris, jet, and the afphalta; and thofe of the fecond, cannel and common coal.

PHLOGISTON, a term given by the old chemifts to what was conceived to be the principle of inflammability. Every fubftance capable of combuftion was fuppofed to confift of a certain incombuftible part, called a bafe, united to phlogifton, and the phenomena of combuftion were occafioned only while the phlogifton was prefent. Sulphuric acid, for inftance, was confidered as a fimple body, which, when united with phlogifton, conftituted fulphur. On the other hand, the fulphur, during combuftion, loft its phlogifton, and became fulphuric acid. The metals were confidered as earths united to phlogifton, while the oxyds were confidered as fimple bodies. To conceive the true meaning to be given to this imaginary body, we have only to conceive it prefent where oxygen is abfent, and *vice verfâ*. Nothing more was wanting to fhew the fallacy of the phlogiftic theory, than weighing the products in which it was fuppofed to be prefent. When a body was faid to have combined with phlogifton, it became juft fo much lighter as was equal to the oxygen now to be feparated, and the contrary. See COMBUSTION.

The procefs of combuftion, to an account of which we have juft referred, is unqueftionably one of the moft ftriking, as well as the moft familiar of natural phenomena. It has for ages engaged, and ftill engages, the attention of philofophers. We fhall endeavour to ftate, as briefly as poffible, the three hypothefes of modern times on the fubject. The firft is the phlogiftic theory of Stahl, which fuppofes that all inflammable bodies, or fuch as throw out light and heat during their combuftion, contain a portion of fubftance that is at once intangible and imponderable: this is the phlogifton to which they owe their inflammability. While a body is burning it parts with its phlogifton, which combines with the furrounding air, and by this means it is reduced to an afh, or, if it be a metal, to a calx or oxyd: both the afh and the oxyd differ from the original fubftances, whether they be wood, coal, iron, &c. in being merely deprived of their phlogifton. Hence, referring to metal for an example, in order to reduce an oxyd to the metallic ftate, it is neceffary to unite it with fome inflammable fubftance, as charcoal, which yields it phlogifton.

The difcovery of dephlogifticated air, or oxygen gas, by Dr. Prieftley, gave rife to the theory of Lavoifier. This philofopher demonftrated, that in all cafes of combuftion the inflammable fubftance united with oxygen, and produced either an acid, an oxyd, or water, or a mixture of the three; and

and that the weight of the product above that of the simple combustible, was equal to the quantity of oxygen that had disappeared. This has been esteemed as an improvement or addition to Stahl's hypothesis, by accounting for the increase of weight of the product of combustion above that of the combustible body. But combustion implies, as we have seen, the disengagement of light and heat, which is accounted for by Lavoisier, to the exclusion of phlogiston, by supposing oxygen gas to be a compound made up of that intangible substance oxygen with heat and light. According to this theory, a body, while in the act of burning, absorbs oxygen from the air, separating it from the heat and light with which it was united, and which escaping, then appears in the separate form of fire. Hence the difference between combustion and slow oxygenation is simply this, that, in the former case, the process advancing rapidly, the heat and light separated from the oxygen gas appear in the shape of flame, and in the latter they escape so slowly, as to be imperceptible to the senses.

There seems scarcely any doubt that the *heat* given out during combustion is derived from the oxygen gas, because the increase of temperature is found to be accurately proportioned to the quantity of oxygen consumed. There are, however, several objections that oppose the supposition that *light* is also a constituent part of oxygen gas; of these, one of the strongest is, that the quantity of light given out in the process is not proportioned to the quantity of heat; and the circumstance of the various colours which the flame assumes, according to the nature of the burning body, would lead one to infer that it is the burning body, and not the oxygen gas, which is the principal source of the light. This is the third theory, espoused by M. Gren, Dr. Thompson and others, and according to this, the process of combustion is a double decomposition, in which the combustible body unites with oxygen to form an oxyd, or water, or an acid, according to circumstances, while the light of the combustible body combines with the caloric of the oxygen, and produces flame.

This system bears a resemblance to that of the phlogistic theory, because the one and the other suppose something to be contributed by the combustible body towards the composition of the fire. There are however many difficulties attached to it, that require experiments to explain and confirm. Sir Humphry Davy has indeed, by his investigations, been led almost to conclude that there exists a distinct inflammable principle, which pervades the whole of nature, which would bring us back, in part at least, to the phlogistic theory. See Priestley's Doctrine of Phlogiston established, &c. 1803. Dr. Thompson's System of Chemistry, vol. i.

PHLOGITES, in *Natural History*, a name given by Pliny and other authors to a stone, which they say had the appearance of flames of fire, bubbling up and rising to several points within it. It is sometimes called also *phlogonites*.

Some have supposed that the ancients meant no more by this distinction than to express a fire-colour lodged in the stone.

Pliny ranks the phlogites among the gems, but Sabinus and others place it among the larger stones: and we have from some parts of Germany, a spar, with radiations of a fiery red in a white ground, which looks as like flames as any thing one could expect in a stone; but whether this, or some other, be the stone called petrified flames of fire by the collectors of that nation, we are not assured.

PHLOGONIÆ, the name of a class of fossils, usually included by authors with many others of a very different kind, under the general name pyritæ. These are defined to be compound, inflammable, metallic bodies, found in small masses, and of determinately angular figure. Of this class of bodies there are three genera, *viz.* the *pyrocubia*; the *pyroctagonia*; and the *pyropoligonia*. See PYRICUBIUM, &c.

PHLOGOSIS, in *Medicine*, from φλογιζω, *to inflame*, signifies literally *inflammation*. Sometimes it is employed to denote only the predisposition in the habit to be inflamed, or an inflammatory diathesis, as it is otherwise called; and sometimes it denotes an actual state of inflammation, being synonimous with phlegmon. Dr. Cullen, in his Nosology, makes *phlogosis* a distinct genus, including the varieties of external inflammation, *viz.* boils, pimples, whitlows, chilblains, &c. which he comprises under two species, Phlogosis *phlegmone*, and P. *erythema*. See his Nosol. Method. class i. gen. 7.

PHLOMIS, in *Botany*, a name borrowed by Tournefort from the ancient Greeks, when he separated the genus on which he conferred it, from *Verbascum*, with which indeed this genus has little or nothing in common, except woolly leaves. Φλομις of the Greeks however is supposed to be our Cowslip or Primrose, and is a diminutive of their φλομος, our *Verbascum*, Mullein, of which last several kinds are distinctly to be ascertained in Dioscorides. The name is scarcely an alteration of φλογμος, *a flame*, or *burning*; and is acknowledged to allude to the use made of the woolly clothing of the Mullein, from remote antiquity, for wicks of lamps. The very same appellation is given by the modern Greeks, not only to the different kinds of *Verbascum*, but also to several species of *Euphorbia*, Spurge. In the latter case, we presume, it applies to the well-known burning or caustic quality of those plants. Though they have no characters or sensible qualities in common with the Mulleins, both are used in Greece at present, for the purpose of apparently intoxicating, and thus easily catching, fish. The species of *Verbascum* are supposed to communicate a poisonous or narcotic property to the water; for Dr. Sibthorp records that the fish caught with *Verbascum* soon putrify. The *Euphorbia*, of which another species, the *hiberna*, is put to the same use in Ireland, as we are informed by Dr. Taylor, may be suspected to act in a different manner. Its milk scarcely mixes with water at all. A very few drops will spread instantaneously, in a fine unbroken oily film, over the surface of a large extent of water, and by cutting off the communication of the atmospheric air, must, sooner or later, destroy any fish that has no means of escape. The same application might perhaps kill gnats in their red aquatic state. We are not sure that the profuse mucilage of the *Verbascum* is not more likely to injure fish in this way, by clogging up the water, than the very weak narcotic quality of that genus.—Tourn. t. 82. Linn. Gen. 295. Schreb. 392. Willd. Sp. Pl. v. 3. 117. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 3. 406. Brown Prodr. Nov. Holl. v. 1. 504. Sm. Prodr. Fl. Græc. Sibth. v. 1. 414. Juss. 114. Lamarck Illustr. t. 510. Gærtn. t. 66.—Class and order, *Didynamia Gymnospermia*. Nat. Ord. *Verticillatæ*, Linn. *Labiatæ*, Juss. Brown.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, oblong, with five angles, permanent; its orifice with five acute, nearly equal, spreading teeth. *Cor.* of one petal, ringent, nearly closed; tube cylindrical; upper lip vaulted, incumbent, keeled, compressed, hairy, notched or jagged; lower about the same length, three-cleft, the middle segment largest, heart-shaped, obtuse, the lateral ones smaller and more acute. *Stam.* Filaments four, concealed by the upper lip, two of them longer than the rest; anthers of two oblong divaricated lobes. *Pist.* Germen superior, four-cleft;

 style

ftyle the length and pofition of the ftamens; ftigma cloven, acute, its upper fegment fhorteft. *Peric.* none, except the permanent calyx. *Seeds* four, oblong, triangular.

Eff. Ch. Calyx with five angles and five teeth. Upper lip of the corolla incumbent, compreffed, bearded, notched; lower about as long, three-cleft; the middle fegment largeft. Lobes of the anthers divaricated. Upper fegment of the ftigma fhorteft.

Obf. The Linnæan *Phlomis* is much leffened by the feparation of Leonotis and Leucas from it, fee thofe articles. What remains is a very natural genus, chiefly inhabiting warm funny countries in the fouth of Europe, of which Linnæus knew eight or nine fpecies, and to thefe a few have been added, either by fubfequent difcoveries, or by enquiries into what were already publifhed. *Leucas* is almoft entirely a tropical genus, and downy or hoary rather than villofe or woolly in its habit.

1. Ph. *fruticofa.* Shrubby Phlomis, or Jerufalem Sage. Linn. Sp. Pl. 818. Sm. Fl. Græc. Sibth. t. 563, unpubl. (Verbafcum Matthioli; Ger. Em. 767.)—β. Ph. latifolia capitata lutea grandiflora; Dill. Elth. 316. t. 237. γ. Ph. armeniaca; Willd. n. 5. (Ph. orientalis, angufto et longiore folio, flore luteo; Tourn. Cor. 10. Herb. Tourn.)—Leaves oblong, obtufe, foft, and denfely woolly, crenate. Bracteas lanceolate. Calyx-teeth horizontal. Stem fhrubby. Native of dry rocky fituations, efpecially near the fea, in Spain, Sicily, Crete, Greece, and the Archipelago. It has, ever fince the time of Gerarde, been a hardy fhrub in our gardens, flowering in June and July, and diftinguifhed by its hoary denfely woolly afpect, a peculiar foapy fcent when touched, and terminal whorls of large, golden, woolly-headed *flowers.* The *ftem* is ufually four or five feet high. *Leaves* various in fize and breadth, obtufe, but by no means "roundifh," as Linnæus defines them. Whether the large handfome variety figured by Dillenius, our β, may not be entitled to the rank of a fpecies, we do not feel quite certain. The γ appeared to us, in Tournefort's herbarium, a flight variety only of the common kind, though profeffor Willdenow has made it a fpecies.—*Ph. fruticofa* is doubtlefs the φλομος αγρια, or Wild Mullein, of Diofcorides, clearly enough defcribed by him.

2. Ph. *purpurea.* Purple Phlomis. Linn. Sp. Pl. ed. 1. 585. Syft. Nat. ed. 10. 1101. Willd. n. 2. Ait. n. 2. Sm. Spicil. 6. t. 7. (Ph. fruticofa lufitanica, flore purpurafcente, foliis acutioribus; Tourn. Inft. 178. Barrel. Ic. t. 405.)—Bracteas lanceolate, acute, fpinous. Angles of the calyx acute; teeth erect, fpinous. Leaves moft woolly beneath. Stem fhrubby.—Native of Spain and Portugal. Sometimes feen in gardens, where it is a humble hardy fhrub, flowering in fummer; but the authority of Plukenet for its having been cultivated here about 1661, refers to the following fpecies. Every part is fmaller than in the foregoing, and the *corolla* is of a fine light purple. *Leaves* refembling thofe of Sage, efpecially their upper furface; but the under is more woolly and white. The *calyx-teeth* are large and fpinous, fpreading but little.

3. Ph. *italica.* Italian Phlomis. Linn. Syft. Nat. ed. 10. 1102. Sm. Spicil. 6. Willd. n. 3. (Ph. purpurea; Linn. Sp. Pl. ed. 2. 818, defcr. Mill. Ic. t. 202. Verbafcum fubrotundo falviæ folio; Bauh. Pin. 240. Pluk. Phyt. t. 57. f. 6.)—Bracteas lanceolate, obtufe, without fpines. Calyx abrupt, unarmed. Leaves woolly on both fides. Stem fomewhat fhrubby.—Native of Italy and Portugal. Frequent in gardens. This was confounded with the laft by Linnæus, as it feems to be in the new edition of Hort. Kew. though diftinguifhed in Donn's Hort. Cant. Nothing can be more diftinct, as the abrupt unarmed *bracteas* and *calyx*, and more woolly *leaves*, abundantly prove. The *calyx* is correctly drawn by Plukenet. Miller's figure is lefs exact, and perhaps doubtful.

4. Ph. *Niffolii.* Niffolian Phlomis. Linn. Sp. Pl. 819. Willd. n. 4. Ait. n. 3. Mill. Ic. t. 204.—Bracteas fetaceous, minute. Calyx-teeth erect, oblong, obtufe, unarmed. Leaves woolly on both fides; the lower ones deeply heart-fhaped; the upper elliptic-lanceolate.—Native of the Levant. Linnæus had it from Arduino. It was cultivated by Miller, and is kept under the protection of a frame at Kew, flowering in June and July. The *root* is perennial. *Stem* herbaceous, very woolly, as are the younger *leaves*, and the *calyx*. *Flowers* yellow, in numerous leafy whorls. *Bracteas* certainly prefent, though fo fmall and flender as to be buried in the furrounding ftellated wool.

5. Ph. *lychnitis.* Lamp Phlomis. Linn. Sp. Pl. 819. Willd. n. 6. Ait. n. 4. Sims in Curt. Mag. t. 999, excluding Miller's fyn. (Verbafcum anguftis falviæ foliis; Ger. Em. 767.)—Leaves linear-lanceolate, hoary; the floral ones dilated at the bafe. Bracteas fetaceous, clothed, like the calyx, with long fimple hairs.—Native of Spain, Portugal, and the fouth of France, on dry open hills. It is rare in our gardens, and kept in the greenhoufe, where it blooms about July. The *ftem* is fomewhat fhrubby. *Leaves* moft hoary beneath; the floral ones gradually fhortened, and extremely dilated at their bafe. *Flowers* yellow, remarkable for the copious, long, fimple, filky hairs, which clothe their *bracteas* and *calyx*. When Linnæus wrote that "the *flowers* are fcarcely bigger than the *calyx*," he feems to have adverted to the *floral leaves*, which in his fpecimen are about the length of the *flowers*.

6. Ph. *crinita.* Thick-leaved Hairy Phlomis. Cavan. Ic. v. 3. 25. t. 247. Willd. n. 9.—Leaves heart-fhaped, obfcurely crenate, denfely woolly; floral ones ovate. Bracteas fetaceous, clothed, like the calyx, with long compound hairs.—Found by Cavanilles on hills in Spain, growing along with *Ph. purpurea.* The *ftem* is herbaceous. *Leaves* very thick and woolly on both fides, fnow-white, heart-fhaped, acute, finely crenate, on longifh woolly *ftalks*. *Flowers* pale orange, in numerous whorls, accompanied by feffile ovate *leaves*, lefs denfely woolly than the proper foliage. *Bracteas* and *calyx* thickly clothed with long, compound, entangled hairs.

7. Ph. *famia.* Samian Phlomis. Linn. Sp. Pl. 819. Willd. n. 8. Ait. n. 5. Sm. Prodr. Fl. Græc. Sibth. n. 1378. Fl. Græc. t. 564, unpubl. Venten. Choix, t. 4. Andr. Repof. t. 584. Desfont. Atlant. v. 2. 25. (Ph. famia herbacea, lunariæ folio; Tourn. Cor. 10.)—Leaves heart-fhaped, crenate, downy beneath. Bracteas in three deep, awl-fhaped, fpinous fegments, the length of the calyx.—Native of Greece and the north of Africa. Miller cultivated it, but his plants were killed by the froft of 1740. Dr. Sibthorp reftored this fine plant to the Oxford garden. The *root* is perennial, and furvives our ordinary winters in the open ground. *Stem* herbaceous, three feet or more in height, erect, ftraight, quadrangular, hairy. *Leaves* heart-fhaped, dark green and hairy above, more woolly, and paler, beneath; the radical ones a fpan long, on ftalks of a ftill greater length. *Flowers* dull purple, large, in feveral denfe leafy whorls. *Calyx* fpinous. The deeply three-cleft narrow *bracteas* conftitute an important character. The information of Desfontaines, that the fynonym of Tournefort belonged to a very different plant, induced us in the Prodr. Fl. Græc. to transfer that fynonym to the next fpecies; but Ventenat has afferted that fuch information was founded in error, and we here correct our miftake.

miſtake. We are certain of the plant of Linnæus and Sibthorp.

8. Ph. *lunarifolia*. Honeſty-leaved Phlomis. Sm. Prodr. Fl. Græc. Sibth. n. 1379; excluding Tournefort's ſynonym.—Leaves heart-ſhaped, crenate, downy beneath. Bracteas ovato-lanceolate, undivided, ſpinous, fringed with tufts of hairs.—Gathered by Dr. Sibthorp in Greece, and on Mount Athos. Like the laſt in general appearance, but diſtinguiſhed by its broad undivided *bracteas*, which are denſely fringed with cluſters of briſtly hairs. Teeth of the *calyx* rigid and ſpinous, ſpreading horizontally. The *corolla* appears to be yellow.

9. Ph. *biloba*. Cloven Phlomis. Desfont. Atlant. v. 2. 25. t. 127. Willd. n. 10.—Leaves ovate, hoary, nearly entire. Bracteas linear, hairy, as well as the deeply five-cleft calyx. Upper lip of the corolla deeply divided.—Gathered by Desfontaines, near Mayane on Mount Atlas. *Root* perennial. *Stems* herbaceous, erect, two or three feet high, woolly, with four obtuſe angles. *Leaves* rugoſe, ovate, or ovate-oblong, ſcarcely crenate, clothed with ſhort, branched, hoary hairs; the lowermoſt ſtalked. *Flowers* purple, few together, in numerous leafy whorls. *Bracteas* very narrow, undivided, clothed with long denſe hoary hairs, and about as long as the *calyx*, which is ſimilarly clothed, and divided half way down, into five upright lanceolate ſegments. The upper lip of the *corolla* is compreſſed, as in all the genuine ſpecies of *Phlomis*, but remarkable for being often divided lengthwiſe to the very bottom.

10. Ph. *pungens*. Needle-pointed Phlomis. Willd. n. 11. (Ph. orientalis, hormini folio, flore minore, calyce glabro; Tourn. Cor. 10. Ph. hormini folio anguſtiore, ſubtùs incano, flore minori purpuraſcente; Amm. Ruth. 41.)—Leaves oblong-lanceolate, ſerrated towards the point; rough above; downy beneath; the upper ones entire. Bracteas awl-ſhaped, deeply three-cleft. Teeth of the calyx horizontal, awl-ſhaped, pungent.—Native of Armenia, Perſia, and Siberia. *Root* perennial. *Stems* obtuſely quadrangular, purpliſh, with many oppoſite leafy *branches*, clothed with minute ſtarry pubeſcence. *Leaves* on ſhort ſtalks, ſpreading, two or three inches long, the lower ones only partly ſerrated; all green and rough above; clothed with hoary ſtellated pubeſcence beneath. *Flowers* purple, in numerous whorls. *Calyx* hoary; ſometimes rather hairy. *Bracteas* in three deep awl-ſhaped ſegments, like thoſe of *Ph. ſamia*. Linnæus conſidered this as not ſpecifically diſtinct from the following, in which opinion he may poſſibly be correct, though the breadth, as well as ſerratures, of their *leaves*, appear conſiderably different.

11. Ph. *Herba venti*. Rough-leaved Phlomis. Linn. Sp. Pl. 819. Willd. n. 12. Ait. n. 6. Sm. Fl. Græc. Sibth. t. 565, unpubl. (Herba venti; Lob. Ic. 532. Marrubium nigrum longifolium; Ger. Em. 701.)—Leaves ovate-oblong, ſerrated; rough above; downy beneath. Bracteas awl-ſhaped, deeply three-cleft, hairy, as well as the ſtem. Calyx hairy, its teeth awl-ſhaped, pungent, ſpreading.—Native of hedges and banks, in Spain, Italy, and the ſouth of France, as well as in Greece and Aſia Minor. It is hardy with us, flowering in July and Auguſt. The *leaves* are furniſhed with numerous cloſe ſerratures, and their form is ovate, at leaſt at the baſe. Whole plant larger than the laſt, and more hairy, eſpecially the *bracteas* and *calyx*. The teeth of the latter appear to us ſcarcely leſs ſpreading than in the foregoing. The upper lip of the *corolla* is conſiderably cloven.

This is the laſt of the true and indubitable ſpecies of this genus. The following recede ſomewhat from the proper character, having an oval, not compreſſed, upper lip, ſingularly briſtly within, approaching in their *corolla*, as well as habit, to LEONURUS; ſee that article. They ſeem however to have the unequal *ſtigma*, as well as the proper *calyx* and *bracteas* of *Phlomis*.

12. Ph. *laciniata*. Jagged-leaved Phlomis. Linn. Sp. Pl. 819. Willd. n. 7. Ait. n. 8. (Ph. orientalis, foliis laciniatis; Tourn. Cor. 10.)—Leaves alternately pinnate; leaflets laciniated. Calyx abrupt, woolly, with ſpinous upright teeth.—Gathered by Tournefort in the Levant. Miller cultivated it in 1731, but we much fear this handſome plant is loſt to our gardens, nor do we any where find a figure of it. The *root* is either biennial, or perennial. *Stem* two or three feet high, ſquare, woolly. *Leaves* chiefly radical, a foot long, nearly ſmooth, pinnate, deeply but obtuſely jagged and toothed, on long ſtalks. *Flowers* in numerous, looſely but copiouſly woolly, whorls. *Bracteas* linear-lanceolate, with ſpinous points; they appear to us ſimple. *Corolla* large, purple; its upper lip ſhaggy, lined with denſe, ſtraight, ſhining, parallel hairs, projecting beyond the margins.

13. Ph. *tuberoſa*. Tuberous Phlomis. Linn. Sp. Pl. 819. Willd. n. 14. Ait. n. 7. Schkuhr. Handb. v. 2. 160. t. 163. (Galeopſis maxima, foliis hormini; Buxb. Cent. 1. 4. t. 6.)—Radical leaves heart-ſhaped, rough; three-ribbed at the baſe: floral ones lanceolate, almoſt entire. Bracteas deeply three-cleft, awl-ſhaped, briſtly. Stem herbaceous, ſmooth.—Native of fields in Siberia. Buxbaum found it about hedges in Iberia, flowering in June. Miller cultivated this ſpecies, and it is marked by Mr. Aiton a hardy perennial, flowering from June to October. The *root* ſhould ſeem by the name to be tuberous. *Stem* a foot high, ſquare, ſmooth, purple. Radical *leaves* on long ſtalks, heart-ſhaped, acute, ſtrongly crenate, ſix inches long, and four broad, veiny, roughiſh; paler beneath; remarkably hollowed out at the baſe up to the ſide ribs. *Flowers* numerous, light purple, in many denſe whorls, accompanied by lanceolate, wavy, ſcarcely crenate, ſomewhat haſtate, ſmooth, ſtalked *leaves*. *Bracteas* very narrow, rough with horizontal briſtles. *Calyx* ſlightly angular, ſmooth, except at the margin and teeth, which laſt are lanceolate and ſpreading. Upper lip of the *corolla* downy, with a toothed or jagged edge, and denſe prominent internal hairs. Theſe *flowers* are but one-third the ſize of the laſt.

14. Ph. *alpina*. Alpine Phlomis. Pallas in Act. Petrop. for 1779. v. 2. 265. t. 13. Willd. n. 13. (Ph. hormini folio, floribus parvis, ſuavè rubentibus, villoſiſſimis; Amm. Ruth. 39.)—Radical leaves heart-ſhaped, downy; floral ones lanceolate, ſerrated. Bracteas deeply three-cleft, linear-awl-ſhaped, hairy, as well as the ſtem.—Native of the Altaic mountains, and various parts of Siberia, in a rich ſoil, flowering in June and July. Linnæus conſidered this as not diſtinct from his *tuberoſa*. His ſpecimen wants the radical *leaves*, but the floral ones are very unlike thoſe of the preceding, being much larger, and very deeply as well as ſharply ſerrated. The *bracteas* are ſomewhat broader, and much more hairy. *Flowers* large, the edge of their upper lip deeply jagged. The *root* is ſaid to be fibrous, and the *ſtem* ſometimes above five cubits high; both very remarkable differences from the humble *Ph. tuberoſa*. The downineſs of the *ſtem* is but ſlight in our plant, which was gathered by Gerber in the deſerts of Tula, Jebz, &c. towards mount Taurus.

PHLOMIS, in *Gardening*, contains plants of the ſhrubby and under-ſhrubby evergreen kinds, of which the ſpecies cultivated are; the ſhrubby phlomis, or Jeruſalem ſage (P. fruticoſa); the ſharp-leaved purple phlomis (P. purpurea); the blunt-leaved purple phlomis (P. italica); the ſage-

ſage-leaved phlomis (P. lychnitis); the jagged-leaved phlomis (P. laciniata); the tuberous phlomis (P. tuberoſa); the white phlomis (P. zeylanica); the cat-mint-leaved phlomis (P. nepetifolia); the narrow-leaved phlomis, or lion's-tail (P. leonurus); and the dwarf ſhrubby phlomis (P. leonitis).

There are of the firſt ſort two varieties; the narrow-leaved ſhrubby phlomis, or Jeruſalem ſage, which does not riſe ſo high as the other variety; the branches are weaker; the leaves longer, narrower, and rounder; the whorls of flowers ſmaller; but the flowers of the ſame ſhape and colour. Theſe have been long cultivated under the title of French ſage, &c.

The broad-leaved ſhrubby phlomis has a ſhrubby ſtalk, ſending out branches on every ſide; the leaves hoary, broader than the former, of an oblong ovate form, on pretty long footſtalks, and whiter; the whorls large, with bigger flowers, the upper lip of which is very hairy.

Of the ninth ſort there is a variety with variegated leaves.

Method of Culture.—All theſe plants may be increaſed by layers and cuttings. The two firſt hardy ſorts in particular grow freely by the firſt method; the young branches ſhould be choſen, and laid in the common way, any time in autumn, ſpring, or ſummer; when they readily ſtrike root, and commence proper plants by the autumn following, when they ſhould be planted where they are to grow.

The cuttings ſhould be made from the young ſhoots in ſpring and ſummer, being planted in a ſhady border, giving plenty of water in dry weather; when many of them will take root, and make good plants by the autumn following. The cuttings of the greenhouſe kinds ſhould, when made in the ſpring, be planted in pots, in order to be continued in ſhelter until May; or if the pots be plunged in a hot-bed, it will greatly forward their rooting; though, when the young ſhoots are planted in June or July, in a bed or border of rich earth, many of them take root, but may be much forwarded if covered down cloſe with hand glaſſes, removing the glaſſes when the cuttings begin to ſhoot.

The fifth may likewiſe be increaſed by ſlips planted at the ſame time; and the ſixth by offsets. The ſeventh ſhould be preſerved in the bark-ſtove.

Theſe are all very ornamental plants in the borders, greenhouſe, and ſtove collections, according to the kinds.

PHLOMON STEPHANOMATICON, in the *Botanical Writings of the Ancients*, a name given to the common white mullein. The upper part of the thyrſus, or ſpike of flowers of this plant, was frequently uſed in the garlands and coronæ of the ancients; and it is named by Dioſcorides and others among the yellow flowers in general uſe on that occaſion.

PHLORGIA, in *Ancient Geography*, a town of Africa, in Mauritania Cæſarienſis. Ptolemy.

PHLOX, in *Botany*, an American genus of plants, on which Linnæus has, apparently with great impropriety, beſtowed an ancient Greek name. Neverthеleſs, the aſſociation of ideas which ſeems to have induced this meaſure, may well excuſe it. The φλοξ of Theophraſtus is ſuppoſed by Dodonæus to be the *Viola tricolor*; but moſt critics have referred it to ſome kind of *Lychnis*, or *Agroſtemma*; and the name, which is ſynonimous with *flame*, has been imagined to allude to the bright or fiery hue of the flowers. A recent French author, De Théis, even aſſerts that the appellation in queſtion was given, by modern botaniſts, to the genus that now bears it, on account of the flame-colour of one of its ſpecies. For this we find no authority. The genus was termed *Lychnidea* by Plukenet and Dillenius, becauſe of its reſemblance to *Lychnis*. But a name ſo conſtructed being againſt rule, Linnæus evidently took up the idea of λυχνις, as alluding either to the ſhape or to the wick of a lamp, (ſee LYCHNIS and PHLOMIS,) and adopted *Phlox* as a word nearly expreſſive of the ſame thing.—Linn. Gen. 86. Schreb. 115. Willd. Sp. Pl. v. 1. 839. Mart. Mill. Dict. v. 3. Ait. Hort. Kew. v. 1. 324. Juſſ. 136. Lamarck Illuſtr. t. 108. Michaux Boreal-Amer. v. 1. 142. Gærtn. t. 62.—Claſs and order, *Pentandria Monogynia*. Nat. Ord. *Rotaceæ*, Linn. *Polemonia*, Juſſ.

Gen. Ch. *Cal.* Perianth inferior, of one leaf, tubular, with five angles, and five deep acute teeth, permanent. *Cor.* of one petal, ſalver-ſhaped: tube cylindrical, longer than the calyx, contracted downwards, incurved; limb flat, in five deep, equal, obtuſe ſegments, ſhorter than the tube. *Stam.* Filaments five, capillary, within the tube of the corolla, two of them longer, and one ſhorter, than the reſt; anthers in the throat of the corolla. *Piſt.* Germen ſuperior, conical; ſtyle thread-ſhaped, the length of the ſtamens; ſtigma in three acute ſegments. *Peric.* Capſule ovate, with three angles, three cells, and three valves. *Seeds* ſolitary, ovate. *Recept.* central, large, with three prominent angles.

Eſſ. Ch. Corolla ſalver-ſhaped. Stamens unequal. Stigma three-cleft. Calyx priſmatic. Capſule of three cells. Seeds ſolitary.

A handſome tribe of hardy, perennial, herbaceous, entire-leaved plants, valuable in our gardens for their copious ſhowy flowers, which are adorned with various hues of purple or pink, and in one inſtance are of a brilliant white. The 14th edition of Linn. Syſt. Veg. contains ten ſpecies. Willdenow has twelve; the recent edition of Ait. Hort. Kew. fourteen. All, except *Ph. ſibirica*, are natives of North America, and, as far as we know, of no other country.—Michaux has ten ſpecies only in his *Flora*, and three of thoſe are not cited by the above authors. He calls them *triflora*, *latifolia*, and *ariſtata*. They are each probably referrible to ſome one or other known ſpecies, though we cannot preciſely aſcertain to which they belong. The following examples will ſuffice.

Ph. *paniculata*. Great Common Phlox, or Panicled Phlox. Linn. Sp. Pl. 216. Willd. n. 1. Ait. n. 1. Mill. Ic. t. 205. f. 2. (Lychnidea folio ſalicino; Dill. Elth. v. 1. 205. t. 166. f. 203.)—Leaves lanceolate, flat, rough-edged. Stem ſmooth. Corymbs panicled, denſe, many-flowered. Segments of the corolla rounded.—Native of North Carolina. Cultivated in the Eltham garden in 1732, and now common in every border and ſhrubbery, flowering in Auguſt. It requires frequent ſupplies of water to appear to advantage; but in a favourable ſoil the *ſtems* are three or four feet high, crowned with immenſe cloſe tufts of innumerable bloſſoms of a fine lilac hue, without ſcent, which continue in beauty for above a month.

Ph. *ſuaveolens*. White Phlox. Ait. Hort. Kew. ed. 1. v. 1. 206. ed. 2. n. 3. Willd. n. 3.—Leaves ovato-lanceolate, ſmooth in every part. Stem very ſmooth. Cluſter panicled.—Introduced from North America about 1766, by the celebrated P. Collinſon. It is an elegant hardy perennial, requiring rather a moiſt ſoil to be laſting, and flowering in July or Auguſt. The *root* is ſomewhat creeping. *Stems* but half the height of the former, and the *flowers* much leſs numerous, though larger. Their delicate fragrance, and pure brilliant whiteneſs, render the plant very deſirable. The *flower-ſtalks* are finely downy, as in the former.

Ph. *pyradimalis*. Pyramidal Phlox. Donn. Cant. ed. 5. 39. Ait. n. 5. Sm. Exot. Bot. v. 2. 55. t. 87. (Lychnidea mariana, &c.; Pluk. Almag. 122.)—Leaves ovate or heart-ſhaped,

ſhaped, pointed, ſmooth. Stem rough. Flowers in a denſe pyramidal cluſter. Calyx-teeth nearly ſtraight.—Introduced from North America by Meſſrs. Lee and Kennedy, before the year 1800. The purple-ſpotted ſtem, and denſe pyramidal *cluſter* of rich purple honey-ſcented *flowers*, render this a very ornamental ſpecies. We ſuſpect it to be what is figured in Jacq. Hort. Vind. v. 2. t. 127, for the Linnæan *maculata*, a more ſlender and narrow-leaved ſpecies, frequent in gardens, diſtinguiſhed by the recurved teeth of its *calyx*. Miller ſent Linnæus a ſpecimen of our *pyramidalis*, with the above ſynonym of Plukenet, and perhaps had the plant growing.

Ph. *divaricata*. Early-flowering Phlox. Linn. Sp. Pl. 217. Willd. n. 8. Ait. n. 9. Curt. Mag. t. 163. Mill. Ic. t. 205. f. 1.—Leaves broadly lanceolate; the uppermoſt alternate. Stem divided. Flower-ſtalks in pairs.—This pretty ſpecies was introduced in Miller's time, and ſtill continues to ornament the Chelſea garden profuſely, flowering in May. We believe it requires, like the reſt of the genus, a rather moiſt ſoil, and hence is not ſo well calculated, as has been ſuppoſed, to adorn rock-work. The *ſtem* is about a foot high, roughiſh, as well as the *leaves*. *Flowers* diſtinguiſhed by a peculiar light, but brilliant, greyiſh-blue; the buds being of a violet hue. The ſegments of the *corolla* are inverſely heart-ſhaped, tapering at their baſe.

Ph. *ſtolonifera*. Creeping Phlox. Sims in Curt. Mag. t. 563. Ait. n. 11. (Ph. reptans; Michaux Boreal-Amer. v. 1. 145. Vent. Malmaiſ. t. 107.)—Scyons creeping. Leaves obovate, ſomewhat ſpatulate.—Found by the late Mr. J. Fraſer in Georgia. Michaux ſays it grows on lofty mountains, in the weſtern part of Carolina. It is ſuppoſed to be hardy, flowering from June to September, and was expected to prove a valuable plant for rock-work; but whether for want of due ſupplies of water, or from any other cauſe, we have not found it laſting. The copious rough leafy *ſhoots* from the *root* trail and throw out radicles in every direction. From the crown ariſes an erect *ſtem*, a ſpan high, bearing a cymoſe *panicle*, of ſeveral handſome deep-blue *flowers*, with orange *anthers*.

Ph. *ovata*. Ovate-leaved Phlox. Linn. Sp. Pl. 217. Willd. n. 9. Ait. n. 12. Curt. Mag. t. 528. (Lychnidea fiſtuloſa marilandica, clinopodii vulgaris folio, flore amplo ſingulari; Pluk. Mant. 122. Phyt. t. 348. pl. 4.)—Radical leaves ovate, acute, ſomewhat fleſhy, ſmooth; ſtem-leaves ovato-lanceolate. Corymbs level-topped.—Sent by Peter Collinſon to Linnæus, who by a ſtrange inadvertency deſcribed the flowers as ſolitary. To this he ſeems to have been led, rather by an attention to Plukenet's ſtarved figure, than to his own ſpecimen, in which latter they are abundant. This is one of the handſomeſt ſpecies, and diſtinguiſhed by its thick ſmooth ovate *leaves*, of which the uppermoſt, often narrower than the reſt, aſſume a likeneſs to thoſe of Privet. The *calyx-teeth* have taper points. The *corolla* is large, of a fine purple, externally pale. We have never ſeen it of ſo rich a crimſon as is exhibited in the Botanical Magazine.

Ph. *ſetacea*. Fine-leaved Phlox. Linn. Sp. Pl. 217. Willd. n. 12. Ait. n. 14. Curt. Mag. t. 415. (Lychnidea, &c.; Pluk. Phyt. t. 98. f. 3.)—Leaves awl-ſhaped, ſlender, ſmooth; fringed at the baſe. Flower-ſtalks elongated.—Native of Carolina, from whence Mr. Fraſer brought plants in 1786. It flowers in April and May, but requires the protection of a frame in winter. The long weak *ſtems* require ſupport; they are ſlightly hairy, clothed with numerous ſlender ſhining *leaves*, like thoſe of a *Stellaria*. *Flowers* at the ends of the branches, on long ſlender hairy *ſtalks*. *Corolla* of a beautiful light purple, with a dark eye, the ſegments jagged at the end.

This and the other ſlender-leaved ſpecies, *ſubulata* and *ſibirica*, are nearly akin, but the latter, at leaſt, is clearly diſtinct. We have never ſeen it but in the Linnæan herbarium.

Ph. *pinnata*. Cavan. Ic. v. 6. 17. t. 528. f. 1, ſent by the author, appears to us rather an Ipomopsis; ſee that article. The pinnate *leaves*, and the membranous *calyx*, do not accord with *Phlox*.—Ph. *linearis*, t. 527 of the ſame work, is very like the Linnæan *piloſa*.

Phlox, in *Gardening*, compriſes plants of the herbaceous, fibrous-rooted, flowery, perennial kind, of which the ſpecies cultivated are; the panicled lychnidea (P. paniculata); the white-flowered lychnidea (P. ſuaveolens); the ſpotted-ſtalked lychnidea (P. maculata); the hairy-leaved lychnidea (P. piloſa); the Carolina lychnidea (P. carolina); the ſmooth lychnidea (P. glaberrima); and the early-flowering lychnidea (P. divaricata).

Method of Culture.—Theſe are generally inceeaſed by parting their roots, as they do not often produce ſeeds in this climate. The beſt time for performing this is in autumn, when the ſtalks begin to decay. The roots ſhould not, however, be divided into too ſmall heads, when they are expected to flower well the following ſummer; nor ſhould they be parted oftener than every other year, as, when they are too often removed and parted, it greatly weakens the roots, ſo that they ſend out but few ſtalks, and thoſe ſo weak, as not to riſe their uſual height, and the bunches of flowers are much ſmaller.

The large root offsets may be planted out at once where they are to remain; but the ſmall ones in nurſery-rows, for further increaſe in ſize. As ſoon as the roots are parted and removed, it is a good way to lay ſome old tan, or mulch, upon the ſurface of the ground about their roots, to prevent the froſt from penetrating; for, as they will have put out new roots before winter, the froſt, when it is ſevere, often kills the fibres, whereby the plants ſuffer greatly, and are ſometimes wholly deſtroyed.

The firſt and ſixth ſorts may be increaſed pretty expeditiouſly by their ſpreading roots, but the others but ſlowly this way; of courſe it is a better method to have recourſe to cuttings. The beſt ſeaſon for planting the cuttings is about the end of April, or the beginning of the following month, when the young ſhoots from the roots, which are about two inches high, ſhould be cut off cloſe to the ground, and their tops ſhortened, being then planted on a border of light loamy earth, and ſhaded from the ſun until they have taken root; or if they are planted pretty cloſe together, and covered with bell or hand-glaſſes, or in pots, ſhading them every day from the ſun, they will put out roots in five or ſix weeks; but on their beginning to ſhoot, the glaſſes ſhould be gradually raiſed to admit the free air to them, otherwiſe they are apt to draw up weak, and ſoon ſpoil: as ſoon as they are well rooted, the glaſſes ſhould be taken off, and the plants inured to the open air; being ſoon afterwards removed into a bed of good ſoil, planting them about ſix inches diſtance every way, ſhading them from the ſun, and watering till they have taken new root; after whioh, when kept clean from weeds, they require no other care till autumn, when they ſhould be removed into the borders or other parts, where they are deſigned to remain.

When ſome of the plants are put into pots, and ſheltered under a hot-bed frame in winter, they flower ſtronger the following ſummer.

Theſe plants ſucceed beſt in a moiſt, rich, mellow ſoil, growing taller, and flowering more ſtrongly, and in larger bunches. In poor dry ſoils they often die during the ſummer, when not conſtantly watered with care.

 Some

Some of the plants afford ornament in the borders, clumps, and other parts of pleafure grounds; and thofe planted into pots to be placed in court-yards, or other places near the habitation, when they are in beauty, and being mixed with other flowers, are highly ornamental, having a fine effect.

PHLYACOGRAPHIA, formed from φλυαζειν, *to trifle*, or φλυαξ, *trifler*, of φλυω, among the *Ancients*, a merry and burlefque imitation of fome grave and ferious piece; particularly a tragedy travelted into a comedy.

The phlyacographia was the fame thing with the *hilarodia*, or *hilarotragedy*.

There were feveral kinds of phlyacography, which had their feveral names. See Salmafius on Solin.

The parodies which have been made of fome parts of the beft poets, as the Virgil Travetty of Scarron and Cotton; the Rival Queens of Cibber, from the Rival Queens of Lee; and fome pieces of operas, the mufic of which is applied to low and ridiculous words, are comprehended under the notion of phlyacographies.

PHLYCTÆNÆ, φλυκταιναι, in *Medicine*, and fometimes *Phlyftanæ*, from φλυω, *I am hot*, feem to have fignified, in the writings of the ancients, all fmall, inflamed elevations of the fkin, containing a fluid, fuch as puftules, veficles, blains, &c. By the tranflators of the Greek writers, the term is generally rendered *puftules*. *Phlyctænæ* are now, however, generally confidered to be *veficles*, that is, fmall elevations of the cuticle, containing a *watery* fluid, and not *pus*. Hippocrates fpeaks of phlyctænæ in one or two places, as containing a thin fanious humour, of an acrimonious quality. (Progn. ii. 60. Epid. l. ii. fect. i. 5.) And fome writers have called thofe veficles only phlyctænæ, which have a livid bafe.

PHLYCTÆNÆ alfo denote little ulcerous veficles, arifing fometimes on the adnata, and fometimes on the cornea of the eye, like fo many little bladders full of water: they are popularly called *blifters in the eyes*.

They appear like grains of millet; and, when produced by a fharp corroding humour, occafion violent pain: the puftules on the adnata are red; thofe on the cornea are blackifh, if near to the furface; but whiter, if deeper. They are cured by difcutients and driers.

PHLYCTIS, more commonly ufed in the plural, *phlyctides*, from the fame root, fignifies fmaller veficles, which ufually clufter together upon a circular inflamed bafe, the contained ferum being fometimes clear and pellucid, and fometimes milky, whey-like, or pearl-coloured.

PHLYSIS, a term ufed by the ancients to exprefs an eruption on the fkin, from a redundance of humours.

PHLYSTÆNÆ. See PHLYCTÆNÆ.

PHLYZACIUM, φλυζακιον, from φλυω, or φλυζω, *fervere*, *ebullire*, *to be hot*, or *to bubble*, a hot and inflamed puftule on the fkin. (See Celfus, De Medicinâ, lib. v. cap. 28. § 15.) In attempting to eftablifh a more definite nomenclature for the difeafed appearances of the fkin, Dr. Willan appropriated the term *phlyzacium* to one of four varieties of puftules, and defined it in thefe words: "a puftule commonly of a large fize, raifed on a hard circular bafe, of a vivid red colour, and fucceeded by a thick, hard, dark-coloured fcab." See Willan on Dif. of the Skin, p. i; and Bateman's Practical Synopfis of Cutan. Difeafes, p. xxi.

PHOBEROS, in *Botany*, φοβερος, *formidable*, in allufion to the thorns.—Loureir. Cochinch. 317.—Clafs and order, *Icofandria Monogynia*. Nat. Ord. . . .

Gen. Ch. *Cal.* Perianth inferior, permanent, in ten ovate, concave, fpreading fegments; five alternate ones twice the fize of the others. *Cor.* none. *Stam.* Filaments near 100, capillary, inferted into the bafe of the calyx, longer than its fegments; anthers very fmall, nearly ovate. *Pift.* Germen fuperior, roundifh; ftyle thick, the length of the ftamens; ftigma thickifh. *Peric.* Berry ovate, flefhy, fmooth, of one cell. *Seeds* about four, nearly ovate.

Eff. Ch. Calyx inferior, in ten fegments. Corolla none. Berry of one cell, with about four feeds.

1. Ph. *cochinchinenfis*. Lour. n. 1.—Whole ftem prickly. Flower-ftalks terminal.—Native of Cochinchina, where it forms impervious hedges. *Stem* fhrubby, woody, ten feet high, erect, covered with long, ftraight, awl-fhaped, axillary, folitary *prickles*. *Leaves* alternate, ovate, flat, hard, fmooth, fomewhat ferrated. *Stalks* terminal, each bearing many white *flowers*.

2. Ph. *chinenfis*. Lour. n. 2.—Lower branches prickly, barren; upper unarmed, flowering.—Native of China, where hedges are made of it, like the foregoing. *Stem* fhrubby, woody, erect, eight feet high. *Branches* fpreading; the lower ones only armed with long, ftraight, moftly folitary prickles. *Leaves* partly fcattered, partly oppofite, ftalked, ovate, entire, flat, fmooth. *Flowers* pale, many together, on lateral *ftalks*, from the upper *branches*. *Berry* flefhy, fmall, ovate, with few *feeds* in its folitary cell.—Such is Loureiro's account, the only information we have refpecting thefe plants. He cites under the 2d Oxyacantha javanica; Rumph. Amboin. auctuar. 39. t. 19. f. 3. This author fpeaks of the fruit as unwholefome, caufing vertigo, and the wounds caufed by the thorns are faid to be dangerous. The plant ferves for hedges in Java. Rumphius mentions a fpecies or variety with longer fpines, which makes formidable walking-fticks for thofe who go abroad by night.

PHOBOS, FEAR, in *Mythology*, was perfonified by the Greeks, and reprefented with the head of a lion. See FEAR.

PHOCA, the *Seal*, in *Zoology*, a genus of the clafs and order Mammalia Feræ. The generic character is as follows: the fore-teeth are acute; the fix upper teeth are parallel, the outer ones are larger; the lower fix are parallel, diftinct, equal, and rather obtufe; the tufks are twice as long, acute, robuft, folitary, the upper are remote from the fore-teeth, the lower form the grinders. There are five or fix grinders which are narrow and tricufpidate. There are nineteen fpecies, befides varieties. This is a dirty, quarrelfome tribe, eafily tamed, and polygamous; the flefh is fucculent, tender, and fat; the fkin is ufeful; the animals inhabit and fwim under water; they crawl on land with difficulty, becaufe of their retracted fore feet, and united hind feet; they feed on fifh and marine productions, and fwallow ftones to prevent hunger, by diftending the ftomach.

Species.

URSINA; Urfine Seal. The fpecific character of this is; head with external ears. It inhabits Kamtfchatka, New Zealand, and the adjacent iflands; fwims impetuoufly in large families; copulates on fhore; is fearlefs, biting at whatever is thrown at it; the old ones live by themfelves, and grow very fat; each has a peculiar ftone for its bed, which it never deferts; the males fight fiercely for their females and ftations; their combat is fingle and fair, two never fighting againft one; when grieved it fheds tears abundantly. This is one of the larger feals, growing to the length of eight feet, and weighing feven or eight hundred pounds. The female is much lefs. Though they lie by thoufands on the fhore, each family keeps itfelf feparate from the reft, and is fometimes fo numerous as to

amount

amount to above an hundred. Urfine feals are feen from June to September, during which time they breed and educate their young. In September they quit their ftations on the iflands, and return, fome to the Afiatic, and fome to the American fhore; but are generally confined to a fpace in thofe feas between lat. 50° and 56°. They are fo tenacious of life, as to live a fortnight after receiving fuch wounds as would inftantly deftroy almoft any other animal.

Leonina; Bottle-nofed Seal. The body of this is brown; the head is crefted on the fore part. It has two teeth in the lower jaw, a little projecting; the eyes are large; the whifkers white, annulate with red; all the feet are palmate; and there are five toes on each, with nails growing out behind the tip; hind feet ftretched back; with a tail between, two inches long. There is a pretty good fpecimen of this fpecies in the Britifh Mufeum, which formerly belonged to the Royal Society. It inhabits the feas about New Zealand, the ifland of Juan Fernandez, and the Falkland iflands. During the breeding feafon they are feen in great numbers attending their young on the fhore; they bring two young at a birth: the females are exceffively fierce during the time of rearing their young; towards evening both the male and female fwim out a little way to fea, the female bearing the young on her back, which it is faid the male frequently pufhes off, in order to oblige them to effay their fwimming powers. On the arrival of thefe animals on the breeding iflands, they are faid to be fo exceffively fat as to refemble fkins of oil; the tremulous motion of the blubber being plainly perceivable beneath the fkin. A fingle feal of this fpecies has been known to yield a butt of oil, and to be fo full of blood, that what has run out has filled two hogfheads. The flefh is eatable.
